**DITCH** is a common fence in marshes, or other wet land, where there are no hedges. They allow these ditches six feet wide against high ways that are broad: and against commons, five feet. But the common ditches about enclosures, dug at the bottom of the bank on which the quick is raised, are three feet wide at the top, one at the bottom, and two feet deep. By this means each side has a slope, which is of great advantage; for where this is neglected, and the ditches dug perpendicular, the sides are always washing down, besides, in a narrow-bottomed ditch, if cattle get down into it, they cannot stand to turn themselves to crop the quick: but where the ditch is four feet wide, it should be two feet and a half deep; and where it is five feet wide, it should be three feet deep; and so in proportion.

**DITHYRAMBICK, n. s. & adj.** *Lat. dithyrambus*. A song in honor of Bacchus; in which among the Italians, the distraction of ebriety is still imitated. Wild; distracted.

Pindar does new words and figures roll  
Down his impetuous *dithyrambick* tide.

Cowley.

**DITHYRAMBICS** were songs in honor of Bacchus, which first gave birth to dramatic representations, and are as ancient as the worship of Bacchus in Greece. Many of the most splendid exhibitions upon the stage, for the entertainment of the people of Athens and Rome, being performed upon the festivals of Bacchus, gave occasion to the calling all those that were employed in them, whether for singing, dancing, or reciting, servants of Bacchus. The dithyrambus owes its birth to Greece, and to the transports of wine. Horace and Aristotle tell us, that the ancients gave the name of dithyrambus to those verses wherein none of the common rules or measures were observed. As we have now no remains of the dithyrambus of the ancients, we cannot exactly tell what their measure was.

**DITMARSEN**, a district of Holstein, Denmark, separated from Sleswick on the north by the Eyder, and from Bremen on the south-west by the Elbe; and having Holstein Proper to the east, and the German Ocean to the west. It is marshy, and frequently inundated: yet by means of the internal navigation, a number of tracts have been drained, and are highly productive.

Its length is thirty-two miles, and its breadth twenty-seven. The chief towns are Meldorf and Lunden. It is fertile in corn and pasture.

**DITONE**, in music, an interval comprehending two tones. The proportion of the sounds that form the ditone is 4 : 5, and that of the semiditone is 5 : 6.

**DITRIHEDRIA**, in mineralogy. a genus of spars with twice three sides, or six planes; being formed of two trigonal pyramids joined base to base, without any intermediate column. See **SPAR**. The species of ditrihedria are distinguished by the different figures of these pyramids.

**DITTANDER**, *n. s.* The same with pepperwort. See **LEPIDIUM**.

**DITTANY**, *n. s.* Lat. *dictamnus*.

*Dittany* hath been renowned, for many ages, upon the account of its sovereign qualities in medicines. It is generally brought over dry from the Levant.

Miller.

Virgil reports of *dittany*, that the wild goats eat it when they are shot with darts.

More's Antidote against Atheism.

**DITTANY**, **BASTARD**, a species of marrubium.

**DITTANY**, OF CRETE. See **ORIGANUM**.

**DITTANY**, **WHITE**. See **DICTAMNUS**.

**DITTEAH**, a town and fortress of Bundelcund, Hindostan, about a mile and a half long, and nearly as much in breadth. It is populous and well-built; the houses being chiefly of stone, and tiled. It is surrounded by a stone wall and gates. On an eminence, which overlooks a handsome lake, stands the rajah's palace. The surrounding district yields an annual revenue of between £12,000 and £15,000 sterling. This place is mentioned in early history, and the rajah, who is one of the British allies, boasts of its having belonged to his family for several centuries. During the reign of Aurenzebe, Ditteah was the capital of Dhoolput Roy, a Bondelah rajah of some celebrity.

**DITTO**, in books of accounts, usually written Do, signifies the aforementioned. The word is corrupted from the Italian detto, 'the said:' as in our law-phrase, 'the said premises,' meaning the same as were before-mentioned.

**DITTY**, *n. s.* Sax. *teitit*; Swed. *dickt*;

**DITTEL**, *adj.* Germ. and Dutch, *dicht*, from Goth. *tin* to show, or, according to Minsheu, from Lat. *dictum*, a thing said or delivered as an oration. A poem to be sung; a song. Adapted to music.

Although we lay altogether aside the consideration of *ditty* or matter, the very harmony of sounds being framed in due sort, and carried from the ear to the spiritual faculties of our souls, is by a native puissance and efficacy, greatly available to bring to a perfect temper whatsoever is there troubled. Hooker.

Being young, I framed to the harp  
Many an English *ditty* lovely well,  
And gave the tongue a helpful ornament.

Shakespeare.

Strike the melodious harp, shrill timbrels ring,  
And to the warbling lute soft *ditties* sing. Sindys.

He, with his soft pipe, and smooth *dittied* song,  
Well knows to still the wild winds when they roar.

Milton.

His annual wound in Lebanon, all night  
The Syrian damsels to lament his fate,  
In amorous ditties, all a summer's day.

They will be sighing and weeping under  
Orable windows lamentable *ditties*, and call

**DIU**, OF DIVIPA, THE ISLAND, in the harbour at the southern extremity of the Peninsula, in lat. 20° 43' N., long. 71° island is not above four miles long and broad, but formerly contained a Hindu temple dedicated to Somnath, celebrated for its sanctity and riches. This was plundered in 1026 by the sultan Mahmood of Ghizni, who sent the image to Mecca and Mecca. The Portuguese obtained possession of the island in 1511, and were allowed by the sultan of Gujarat to fortify it, about twenty years after. It was, however, their establishment was soon plundered by the Muscat Arabs, and dwindled away. The island has a good harbour.

**DIVAL**, in heraldry, the herb used by such as blazon by flowers instead of colors and metals, for sable.

**DIVALIA**, in Roman antiquity, a festival in honor of the goddess ANGELO, called ANGERONALIA. See these articles.

**DIVAN**, *n. s.* Arab. *deuan*; Turk. probably from Heb. *din*, to judge. The council of Oriental princes: any council assembled.

Forth rushed in haste the great consoling  
Raised from the dark *divan*, and with him  
Congratulant approached him.

Swift to the queen the herald Medea  
Who heard the consult of the *divan*. Pope.

**DIVAN**, a court of justice among nations, particularly the Turks. The name signifies the same with sofa in the Turkish language. There are two sorts of divans; that of the signior, called the council of state, consists of seven of the principal officers of the empire; and that of the grand vizier, consists of six other viziers, or counsellors of state, the chancellor, and secretaries of state, and the tribulation of justice.

**DIVANDU'ROW**, the name of an island in the Indian Ocean, three miles from the Maldives, and twenty-four from the Malabar, almost opposite to Cananor.

**DIVARICATE**, *v. a. & v. n.* Lat. *divaricare*.

**DIVARICATION**, *n. s.* The act of dividing into two; to be parted into two bifid. Divarication is, division into two.

To take away all doubt, or any probability, the curse is plainly specified.

Brown's Vulgar.

Dogs running before their masters, or disavowal of the way, till they see what masters will take.

A slender pipe is produced forward throat, whereinto it is at last inserted, disoriented, after the same manner as the vessels.

The partitions are strained across, and divided into two, and another into several.

is, the art or act of descending under  
 considerable depths, and remaining there  
 time. The uses of diving are very  
 la, particularly in the fishing for  
 fish, sponges, &c. Various methods  
 proposed, and machines contrived, to  
 business of diving more safe and easy.  
 point is to furnish the diver with fresh  
 at which he must either make a short  
 water or perish. Those who dive for  
 the Mediterranean, assist themselves  
 down sponges dipt in oil in their  
 But considering the small quantity of

air that can be contained in the pores of the  
 sponge, and how much that little will be con-  
 tracted by the pressure of the incumbent water  
 such a supply cannot long maintain the respi-  
 ration of the diver. It is found by experiment,  
 that a gallon of air included in a bladder, and  
 by a pipe reciprocally inspired and expired by  
 the lungs, becomes unfit for respiration in little  
 more than one minute: for though its elasticity  
 be but little altered in passing the lungs, yet it  
 loses its vivifying spirit, and is rendered effete.

A naked diver, Dr. Halley assures us, without a  
 sponge, cannot remain above a couple of minutes  
 enclosed in water, nor much longer with one,  
 without suffocating; nor, without long practice,  
 near so long: persons not accustomed to dive,  
 beginning to be stifled in about half a minute.  
 Hence, where there has been occasion to continue  
 long at the bottom, some have contrived double  
 flexible pipes, to circulate air down into a cavity,  
 enclosing the diver as with armour, both to fur-  
 nish air and to bear off the pressure of the water,  
 as well as to give room to his breast to dilate  
 upon inspiration; the fresh air being forced down  
 one of the pipes with bellows, and returning by  
 the other. But this method is impracticable when  
 the depth surpasses three fathoms; the water  
 embracing the bare limbs so closely as to obstruct  
 the circulation of the blood in them; and pres-  
 sing so strongly on all the junctures where the  
 armour is made tight with leather, that, if there  
 be the least defect in any of them, the water  
 rushes in, and instantly fills the whole engine, to  
 the great danger of the diver's life. People being  
 accustomed to the water from their infancy, will  
 however at length be enabled, not only to stay  
 much longer under water than the time above  
 mentioned, but put on a kind of amphibious  
 nature, so that they seem to have the use of all  
 their faculties as well when their bodies are im-  
 mersed in water as when on dry land. Most  
 savage nations are remarkable for this. The  
 inhabitants of the South Sea islands are such  
 expert divers, that, when a nail or any piece of  
 iron is thrown overboard, they instantly jump  
 into the sea after it, and never fail to recover it,  
 notwithstanding the quick descent of the metal.  
 Even among civilized nations, many persons  
 have been found capable of continuing an incre-  
 dible length of time below water. The most  
 remarkable instance of this kind is the famous  
 Sicilian diver *Nicolo Pesce*. See *PESCE*.

To obviate the inconveniences of diving dif-  
 ferent instruments have been contrived, of  
 which the chief is the diving bell. The com-  
 mon bell is made in form of a truncated cone,  
 the smaller base being closed, and the larger  
 open. It is poised with lead; and so sus-  
 pended, that the vessel may sink full of air, with  
 its open basis downward, and as near as may  
 be in a situation parallel to the horizon, so as to  
 close with the surface of the water all at once.  
 Under this coverle the diver sitting, sinks down  
 with the included air to the depth desired; and  
 if the cavity of the vessel can contain a tun of  
 air, a single man may remain a full hour, with-  
 out much inconvenience, at five or six fathoms  
 depth. But the lower he goes, the more the  
 included air contracts itself, according to the

# DIVING BELLS

Spalding's Diving Bell

DeHalley's

am, by small flexible pipes; which pipes serve as a clue to direct him back again to where he would return to the bell.' Plate, Diving-Bell, fig. 1, shows Dr. Halley's diving bell. D B L R M represents the body of the bell; the glass which serves as a window. B, the cock for letting out the air which has been used. L M, the seats. C, one of the air pipes. H, another diver at a distance from the bell and breathing through the flexible tube of which F is a stop-cock, which I can turn to prevent the air being forced back into the bell by the pressure of the water when it is below the mouth of the bell. This diver is supposed to have a head-piece of lead, to fit quite close about his shoulders: this head-piece was capable of containing as much air as would supply him for a minute or two.

Mr. Triewald, F.R.S., military architect to the king of Sweden, invented a diving bell, fig. 2, which, for a single person, is thought to be more eligible than Dr. Halley's, and is constructed as follows:—A B is the bell, which is made of lead weights D D, hung to its bottom. The bell is of copper, tinned all over in the inside, which is illuminated by two strong convex lenses, G, G, with copper lids, H, H, to defend them. The iron plate, E, serves the diver to stand on when he is at work; and is suspended at such a distance from the bottom of the bell, by chains F F, that when the diver stands upon it his head is just above the water in the bell, so that the air is much better than higher up, because it is colder, and consequently more fit for respiration. But as the diver must always be within the bell, and his head of course in the air part, the inventor has contrived, that even when he has breathed the hot air as long as he can, he may, by means of a spiral copper pipe, f b c h c, placed close to the inside of the bell, draw the cooler and fresher air from the air parts.

But the greatest improvement which the diving bell has received was from the late Mr. Spalding, of Edinburgh. A section of his improved diving bell is represented in fig. 3. The construction is designed to remedy some inconveniences of Dr. Halley's, which are very dangerous, and of very dangerous tendency. By Dr. Halley's construction, the sinking or raising the bell depends entirely on the people who are at the surface of the water; and as the bell, when in the water, has a very considerable weight, the raising it not only requires a great deal of labor, but there is a possibility of the bell breaking by which it is raised, and thus every person in the bell would inevitably perish. If as there are, in many places of the sea, rocks which lie at a considerable depth, the figure of which cannot possibly be perceived from above, so is danger that some of their ragged promontories may catch hold of one of the edges of the bell in its descent, and thus overset it before any aid can be given to those above, which would probably be attended with the destruction of the people in the bell: and as it must always be unknown, before trial, what kind of a bottom the sea has in any place, it is plain that, without some contrivance to obviate this last danger, the descent

in Dr. Halley's diving bell is not at all eligible. How these inconveniences are remedied by Spalding's construction will be easily understood from the following description.—A B C D represents a section of the bell, which is made of wood; e, e, are iron hooks, by means of which it is suspended by ropes Q B F e, and Q A E R e, and Q S, as expressed in the figure: c, c, are iron hooks, to which are appended lead weights, that keep the mouth of the bell always parallel to the surface of the water, whether the machine, taken altogether, is lighter or heavier than an equal bulk of water. By these weights alone, however, the bell would not sink: another is therefore added, represented at L, and which can be raised or lowered at pleasure, by means of a rope passing over the pulley a, and fastened to one of the sides of the bell at M. As the bell descends, this weight, called the balance weight, hangs down a considerable way below the mouth of the bell. In case the edge of the bell is caught by any obstacle, the balance weight is immediately lowered down so that it may rest upon the bottom. By this means the bell is lightened so that all danger of oversetting is removed; for being lighter, without the balance weight, than an equal bulk of water, it is evident that the bell will rise, as far as the length of the rope affixed to the balance weight will allow it. This weight therefore will serve as a kind of anchor to keep the bell at any particular depth which the divers may think necessary; or, by pulling it quite up, the descent may be continued to the very bottom. By another very ingenious contrivance, Mr. Spalding rendered it possible for the divers to raise the bell, with all the weights appended to it, even to the surface, or to stop at any particular depth, as they think proper; and thus they could still be safe, even though the rope designed for pulling up the bell was broke. For this purpose the bell is divided into two cavities, both of which are made as tight as possible. Just above the second bottom, E F, are small slits in the sides of the bell; through which the water, entering as the bell descends, displaces the air originally contained in this cavity, which flies out at the upper orifice of the cock H. When this is done, the divers stop the cock; so that if any more air was to get into the cavity A E F B, it could no longer be discharged through the orifice H as before. When this cavity is full of water the bell sinks; but when a considerable quantity of air is admitted it rises. It therefore the divers have a mind to raise themselves, they turn the cock V, by which a communication is made between the upper and under cavities of the bell. The consequence of this is, that a quantity of air immediately enters the upper cavity, forces out a quantity of the water contained in it, and thus renders the bell lighter by the whole weight of the water which is displaced. Thus, if a certain quantity of air is admitted into the upper cavity, the bell will descend very slowly; if a greater quantity, it will neither ascend nor descend, but remain stationary; and if a larger quantity of air is still admitted, it will arise to the top. It is to be observed, however, that the air which is thus let out into the upper cavity must be immediately supplied from the air-barrel; from which the air is to be let

out very slowly, or the bell will rise to the top with so great velocity, that the divers will be in danger of being shaken out of their seats. But, by following these directions, every possible accident may be prevented, and people may descend to great depths without the least apprehension of danger. The bell also becomes so easily manageable in the water, that it may be conducted from one place to another by a small boat with the greatest ease, and with perfect safety to those who are in it. Instead of wooden seats used by Dr. Halley, Mr. Spalding made use of ropes suspended by hooks *b, b, b*; and, on these ropes, the divers may sit without any inconvenience. *K K* are two windows made of thick strong glass, for admitting light to the divers. *N* represents an air-cask with its tackle, and *O C P* the flexible pipe through which the air is admitted to the bell. In the ascent and descent of this cask, the pipe is kept down by a small weight appended, as in Dr. Halley's machine. *R* is a small cock by which the hot air is discharged as often as it becomes troublesome.

A considerable modern improvement is that of supplying air to a diving-bell, by means of a syringe or pump, which forces the air down in a continual stream into the bell, whence it escapes from beneath the lower edges of the bell, or from a waste pipe, as fast as it is supplied. In this way the air is kept very pure, and the people in the bell have no kind of trouble to obtain a supply. Mr. Smeaton was the first who put in practice the method to which we allude, though it had been frequently proposed by other inventors. His first attempt was in 1786, in shallow water, the bell being only intended to enable workmen to examine and repair the foundations of a bridge at Hexham, in Northumberland.

Mr. Smeaton, a few years afterwards, constructed another bell upon the same principle, for the works at Ramsgate harbour. It was used to raise up large stones, which had formerly been thrown into the sea around the base of the pier.

The bell was made of cast iron, of sufficient weight to sink without any extra ballast. In the top were lenses for the admission of light, and a strong shackle for the chain by which the bell was suspended. A strong leathern pipe was connected with the top of the bell, to convey air into it from an air-pump placed either in a boat or on the shore.

This kind of diving-bell has since been applied to the purposes of building foundations of masonry in deep water, under the direction of the late Mr. Rennie, who constructed machinery to move the bell under water in any direction, and which acts with such facility, that the masons in the bell make great despatch in laying the stones. It was used in Plymouth Sound to sweep the bottom for old anchors, &c. At Houth, in Dublin county, Ireland, the foundations for the pier were wholly laid by this machine. In many parts the rocky bottom was too uneven to work upon, and it was then necessary to blast it with powder. The divers bored the hole in the rock, and placed the powder in a tin cartridge, which was well secured in the hole, by running in small fragments of stone. A small tin pipe

was affixed to the canister, long enough to reach above the surface of the water. When prepared, the bell was drawn up out of the water, and a nail or other small piece of iron heated, was dropped into the tin pipe, the powder descended to the powder.

As the diving bell is, however, in any way improved, necessarily very large and unwieldy, several attempts have been made to enable a man sufficiently to enable him to bear the pressure of the water, and these the most successful is that of M. Breslau, which is made of strong tin plate, in the form of a cylinder, which goes over the head, and which consists of two parts, it may conveniently thrust his arms through, put it on; also a jacket with short sleeves and drawers of strong leather. All those being tight, and closely jointed round the body, secure every part of him, but his legs, from the pressure of the water, to the depth of twenty feet, will occasion inconvenience to these parts. Plate, Diver, &c., fig. 4, represents the diver covered with his harness and drawers. Figs. 5 and 6 are representations of the cylinder, the diameter of which is equal to the breadth of a man at the hipbone. It is fifteen inches in height, globular top, and is made of the strong plate. In the inside of the cylinder, there is a strong broad iron hoop, to enable it to better the pressure of the water; and on each side of the top there are two pieces of a hoop of the same kind, placed over each in the form of a cross at *b*; a strong ring of wire is soldered upon the outside at *c, c*, the jacket may be fastened to it with an elastic bandage, to prevent it from slipping downwards *d d* are the upper halves of the aperture for the arms; and *e, e*, are holes to afford light, in which the eye-glasses are screwed. *f* is a ring into which the mouth-piece of the tin pipe is screwed, and *g* is an aperture for the legs, as well as for the purpose of the water when out of the water, and which, by the cover *h* suspended from it, can be put up before the diver enters the water.

The lower part of the cylinder, which is fifteen inches in height, is strengthened by iron hoops on the inside, in the same manner as the former. To the lower hoop are soldered four small rings, to which are strong leather straps, three inches in breadth, can be buckled across over the shoulders, to support the whole machine; *l, l*, are the halves of the apertures for the arms, a ring of brass wire soldered to the cylinder serves to keep fast the jacket when the diver is in the water, and to support the upper cylinder *d d* slips over the under one; and on that under one is a little smaller, so as to fit the upper one: there is also another such ring to prevent the drawers from falling.

At *o* is a strong semicircular piece of wood, of which is to prevent the drawers from being pressed by the water, from touching the part of the body, otherwise the pressure at the depth of six feet, would be more than the strength of the leather. As it is not possible to sew the leather to

prevent water from forcing its way through *b*, a small pump is suspended at *p* for the purpose of pumping out the water, when it rises to the height of a few inches in the cylinder. Four hooks, *g, g, g, g*, soldered to the lower part of the cylinder, are for the purpose of suspending weights from them.

The jacket *r* (fig. 4), with short sleeves at the upper part of the arms, serves to prevent water from penetrating through the joints of the cylinders where the one is inserted into the other, as also through the holes for the arms; it is bound first round both parts of the cylinder, and likewise round the arms. The case is the same with the drawers, which are bound round the knees.

*f* represents a brass elastic bandage, employed for fastening on the jacket; and which, when looked together, is screwed fast by means of a screw *s*, three inches in length; a brass plate is here used, because leather is apt to stretch, and on that account might be dangerous. The reservoir *a* (fig. 4), applied in such a manner that it can be screwed off, is for the purpose of collecting the small quantity of water that enters itself into the breathing pipe when the diver is down, and which otherwise would be in contact with the diver, and render breathing disagreeable. The man, named Frederick William Joachim, a cooper by profession, dived in the above apparatus into the Oder, near Breslau, where the depth was considerable, and the current ran on the 24th of June, 1797, before a great number of spectators, and sawed through the trunk of a tree which was lying at the bottom.

DIVING BLADDER is a machine invented by Mr. Bladder, and by him preferred, though without success, to the diving bell. It is a globular vessel of brass or copper, about two feet in diameter, which contains the diver's head. It is covered with a goat's skin habit exactly fitted to his head.

Within the vessel are pipes, by means of which a circulation of air is contrived; and the diver carries an air-pump by his side, by which he can make himself heavier or lighter as he pleases, by contracting or dilating their air-pump. By these means he thought all the objections to which other diving machines are liable were entirely obviated, and particularly that of the want of air; the air which had been breathed, as he imagined, deprived of its noxious parts, by circulating through the pipes. These pipes, however, it is evident, are only imaginary.

The diver's limbs, being defended from the pressure of the water only by a goat's skin, he is inevitably crushed if he descended to a considerable depth; and, from the discovery made, by Dr. Priestley and others, it is fully evident, that air, which is once rendered unfit for breathing, cannot, in any degree, be rendered fit again by circulation through pipes.

The following description of a Diving-vessel is given by Mr. Bushnell, of Connecticut, in the Philosophical Transactions of America. The external shape of the sub-marine vessel bore some resemblance to two upper torpedoes, of equal size, joined together; the entrance into the vessel being represented by the opening made by the swell of the

shells, at the head of the animal. The inside was capable of containing the operator, and air sufficient to support him thirty minutes, without receiving fresh air. At the bottom, opposite to the entrance, was fixed a quantity of lead for ballast. At one edge, which was directly before the operator, who sat upright, was an oar for rowing forward or backward. At the other edge was a rudder for steering. An aperture, at the bottom, with its valve, was designed to admit water, for the purpose of descending; and two brass forcing-pumps served to eject the water within, when necessary for ascending. At the top there was likewise an oar for ascending or descending, or continuing at any particular depth. A water-gauge, or barometer, determined the depth of descent, a compass directed the course, and a ventilator within supplied the vessel with fresh air, when on the surface.

The entrance into the vessel was elliptical, and so small as barely to admit a person. This entrance was surrounded with a broad elliptical iron band, the lower edge of which was let into the wood, of which the body of the vessel was made, in such a manner as to give its utmost support to the body of the vessel against the pressure of the water. Above the upper edge of this iron band there was a brass crown, or cover, resembling a hat with its crown and brim, which shut water-tight upon the iron band; the crown was hung to the iron band with hinges, so as to turn over sideways when opened. To make it perfectly secure when shut, it might be screwed down upon the band by the operator, or by a person without.

There were in the brass crown three round doors, one directly in front, and one on each side, large enough to put the hand through. When open, they admitted fresh air; their shutters were ground perfectly tight into their places with emery, hung with hinges, and secured in their places when shut. There were likewise several small glass windows in the crown for looking through, and for admitting light in the day-time, with covers to secure them. There were two air-pipes in the crown. A ventilator within drew fresh air through one of the air-pipes, and discharged it into the lower part of the vessel; the fresh air introduced by the ventilator expelled the impure light air through the other air-pipe. Both air-pipes were so constructed, that they shut themselves whenever the water rose near their tops, so that no water could enter through them, and opened themselves immediately after they rose above the water.

The vessel was chiefly filled with lead fixed to its bottom; when this was sufficient, a quantity was placed within, more or less, according to the weight of the operator; its ballast made it so stiff, that there was no danger of upsetting. The vessel, with all its appendages, and the operator, was sufficient to settle it very low in the water. About 200 lbs. of the lead, at the bottom for ballast, would be let down forty or fifty feet below the vessel; this enabled the operator to rise instantly to the surface of the water, in case of accident.

When the operator would descend, he placed his foot on the top of a brass valve, depressing

it, by which he opened a large aperture in the bottom of the vessel, through which the water entered at his pleasure; when he had admitted a sufficient quantity, he descended very gradually; if he admitted too much, he ejected as much as was necessary to obtain an equilibrium, by the two brass forcing-pumps, which were placed at each hand. Whenever the vessel leaked, or he would ascend to the surface, he also made use of these forcing-pumps. When the skilful operator had obtained an equilibrium, he could row upward, or downward, or continue at any particular depth, with an oar, placed near the top of the vessel, formed upon the principle of the screw, the axis of the oar entering the vessel; by turning the oar one way, he raised the vessel, by turning it the other way he depressed it.

A glass tube, eighteen inches long, and one inch in diameter, standing upright, its upper end closed, and its lower end, which was open, screwed into a brass pipe, through which the external water had a passage into the glass tube, served as a water-gauge, or barometer. There was a piece of cork, with phosphorus on it, put into the water-gauge. When the vessel descended, the water rose in the water-gauge, condensing the air within, and bearing the cork, with its phosphorus, on its surface. By the sight of the phosphorus, the ascent of the water in the gauge was rendered visible, and the depth of the vessel under water ascertained by a graduated line.

An oar, formed upon the principle of the screw, was fixed in the fore part of the vessel; its axis entered the vessel, and being turned one way, rowed the vessel forward, but being turned the other way, rowed it backward; it was made to be turned by the hand or foot.

A rudder, hung to the hinder part of the vessel, commanded it with the greatest ease. The rudder was made very elastic, and might be used for rowing forward. Its tiller was within the vessel, at the operator's right hand, fixed, at a right angle, on an iron rod, which passed through the side of the vessel; the rod had a crank on its outside end, which commanded the rudder, by means of a rod extending from the end of the crank to a kind of tiller, fixed upon the left hand of the rudder. Raising and depressing the first-mentioned tiller, turned the rudder as the case required.

A compass, marked with phosphorus, directed the course, both above and under the water; and a line and lead sounded the depth when necessary.

The internal shape of the vessel, in every possible section of it, verged towards an ellipsis, as near as the design would allow, but every horizontal section, although elliptical, yet as near to a circle as could be admitted. The body of the vessel was made exceedingly strong; and to strengthen it as much as possible, a firm piece of wood was framed, parallel to the conjugate diameter, to prevent the sides from yielding to the great pressure of the incumbent water, in a deep immersion. This piece of wood was also a seat for the operator.

Every opening was well secured. The pumps had two sets of valves. The aperture at the bottom, for admitting water, was covered with a

plate, perforated full of holes, to let water, and prevent any thing from the passage, or stopping the valve from doing its office. The brass valve might likewise be forced place with a screw, if necessary. The vessel had a kind of hollow sphere, fixed round each, to secure the air-pipe valves from injury; these hollow spheres were perforated with holes, for the passage of the air through the pipes; within the air pipes were shutters, which, when the vessel was to be cured them, should any accident happen to the pipes, or the valves on their tops.

Wherever the external apparatus passed into the body of the vessel, the joints were made, and formed by brass pipes, which were inserted into the wood of the vessel; the holes in the pipes were very exactly made, and the rods, which passed through them, were in a lathe to fit them; the joints were filled with oil, to prevent rust and leaking. Attention was given to bring every part, necessary for performing the operations, both without the vessel, before the operator, as conveniently as could be devised; nothing might be found in the dark, but a water gauge and the compass, which were illuminated by the light of the phosphorus, and required the operator to turn to the right or to the left, to perform any thing necessary.

Description of a magazine, and of the magazine, designed to be conveyed, by a marine vessel, to the bottom of a ship. The fore part of the brim of the crown of a marine vessel was a socket, and an iron rod passing through the socket; the tube, which was right, and could slide up and down in the socket, six inches; at the top of the tube, a wood-screw, fixed by means of a rod, passed through the tube, and screwed into a screw fast upon the top of the tube. The wood-screw up against the bottom of the tube, and turning it at the same time, it would drive the planks; driving would also answer the purpose: when the wood-screw was fixed, it could be cast off by unscrewing the tube, which fastened it upon the top of the tube.

Behind the sub-marine vessel was a magazine, for carrying a large quantity of powder; this was made of two pieces of timber, large enough, when hollowed out, to contain 150 lbs. of powder, with the powder used in firing it, and was secured in a screw, turned by the operator, a piece of rope extended from the magazine, and wood-screw above-mentioned, and was fast to both. When the wood-screw was turned, it could be cast off from its tube, the magazine could be cast off likewise by unscrewing it, hanging to the wood-screw; it was light, and water, that it might rise up against the water, which the wood-screw and itself were.

Within the magazine was an apparatus constructed to run any proposed length under twelve hours; when it had run the time, it unpinioned a strong lock, a gun-lock, which gave fire to the powder apparatus was so pinioned, that it could not move, till, by casting off the magazine, the vessel, it was set in motion.

The skilful operator could swim so low on the surface of the water, as to approach very near a ship, in the night, without fear of being discovered, and might, if he chose, approach the stem or stern above water, with very little danger. He could sink very quickly, keep at any depth he pleased, and row a great distance in any direction he desired, without coming to the surface; and, when he rose to the surface, he could soon obtain a fresh supply of air, when, if necessary, he might descend again, and pursue his course.

The first experiment made was with about two ounces of gunpowder, which were exploded four feet under water, to prove to some of the first personages in Connecticut that powder would take fire under water.

The second experiment was made with two pounds of powder, enclosed in a wooden bottle, and fixed under a hoghead, with a two-inch oak plank between the hoghead and the powder; the hoghead was loaded with stones as deep as it could swim; a wooden pipe descending through the lower head of the hoghead, and through the plank, into the powder contained in the bottle, was primed with powder. A match put to the priming exploded the powder, which produced a very great effect, rending the plank into pieces, demolishing the hoghead, and casting the stones and the ruins of the hoghead, with a body of water, many feet into the air, to the astonishment of the spectators. This experiment was likewise made for the satisfaction of the gentlemen above-mentioned.

There were afterwards made many experiments of a similar nature, some of them with large quantities of powder; they all produced very violent explosions, much more than sufficient for any purpose had in view.

In the first essays with the sub-marine vessel, the inventor took care to prove its strength to sustain the great pressure of the incumbent water, when sunk deep, before he trusted any person to descend much below the surface; and he never suffered any person to go under water without having a strong piece of rigging made fast to it, until he found him well acquainted with the operations necessary for his safety. After that, he made him descend, and continue at particular depths, without rising or sinking, row by the compass, approach a vessel, go under her, and fix the wood-screw, mentioned before, into her bottom, &c., until he thought him sufficiently expert to put any design in execution.

It required many trials to make a person of common ingenuity a skilful operator; the first employed was very ingenious, and made himself master of the business, but was taken sick in the campaign of 1776, at New York, before he had an opportunity to make use of his skill, and never recovered his health sufficiently afterwards.

Experiments made with a sub-marine vessel. After various attempts to find an operator to his wish, Mr. Bushnell sent one, who appeared more expert than the rest, from New York, to a fifty-gun ship, lying not far from Governor's Island. He went under the ship, and attempted to fix the wood-screw into her bottom, but struck, as

he supposed, a bar of iron, which passes from the rudder-hinge, and is spiked under the ship's quarter. Had he moved a few inches, which he might have done, without rowing, he would probably have found wood where he might have fixed the screw; or, if the ship were sheathed with copper, he might easily have pierced it but not being well skilled in the management of the vessel, in attempting to move to another place, he lost the ship; after seeking her in vain, for some time, he rowed some distance, and rose to the surface of the water, but found day-light had advanced so far, that he durst not renew the attempt. The adventurer said he could easily have fastened the magazine under the stem of the ship, above water, as he rowed up to the stern, and touched it before he descended. Had he fastened it there, the explosion of 150 lbs. of powder, the quantity contained in the magazine, must have been fatal to the ship. In his return from the ship to New York, he passed near Governor's Island, and thought he was discovered by the enemy on the island; being in haste to avoid the danger he feared, he cast off the magazine, as he imagined it retarded him in the swell, which was very considerable. After the magazine had been cast off one hour, the time the internal apparatus was set to run, it blew up with great violence.

Afterwards, there were two attempts made in Hudson's river, above the city, but they effected nothing. Mr. Fulton, we believe, afterwards improved on this machine in England, but the attempts to use it proved equally abortive.

**DIVERGE**, *v. n.* } *Lat. divergo.* To tend  
**DIVERGENT**, *adj.* } Various ways from one point.

Homogeneous rays, which flow from several points of any object, and fall perpendicularly on any reflecting surface, shall afterwards *diverge* from so many points. *Newton.*

Thus when the mother-bird on moss-wove nest  
Lulls her fond brood beneath her plumy breast  
Warmth from her tender heart diffusive springs  
And charmed she shields them with *diverging* wings. *Darwin.*

**DIVERGENT**, or **DIVERGING LINES**, in geometry, are those which constantly recede from each other. They are opposed to convergent, or converging lines, whose distances continually approach nearer to each other, and become still less and less. Those lines which converge the one way, diverge the other.

**DIVERGENT RAYS**, in optics, are those which going from a point of the visible object, are dispersed, and continually depart one from another in proportion as they are removed from the object: in which sense it is opposed to convergent. See **OPTICS**.

**DIVERS**, *adj.* *Lat. diversus.* Several; sundry; more than one. Out of use.

We have *divers* examples in the church of such as, by fear, being compelled to sacrifice to strange gods, repented, and kept still the office of preaching the gospel. *Whigist.*

The teeth breed when the child is a year and a half old: then they cast them, and new ones come about seven years; but *divers* have backward teeth come at twenty, some at thirty and forty.

*Bacon's Natural History.*

Time travels in *diverse* paces with *diverse* persons.  
I'll tell you who time ambles withal, who time trots  
withal, who time gallops withal, and who he stands  
still withal. *Shakespeare.*

DIVERSE', v. n. & adj. } Lat. *diversus*. See  
DIVERSITY, n. s. } DIVERSIFY. To  
DIVERSE'LY, adv. } differ: different; in

various directions. Diversity, is dissimilitude;  
variety; distinct existence. Diversely, differently;  
variously.

A nothir clerenesse is of the sunne, a nothir clere-  
nesse of the moone, and a nothir clerenesse is of  
sterres, and a sterre *diversith* fro a sterre in clereness.

*Wiclif. 1 Cor. 15.*

Mi britheren, deme al ioie whanne ye fallen into  
*diverse* temptacions. *Id. James 4.*

Four great beasts came up from the sea, *diverse* one  
from another. *Dan. vii. 3.*

And for there is so grete *diversite*  
In English and in writing of our tonge  
So prae I to God, that none misurte the  
Ne the misse-metre for defeaute of tonge.

*Chaucer. Troilus and Criseida.*

Then is there in this *diversity* no contrariety.

*Hooker.*

But yet their various and perplexed course,  
Observed in *diverse* ages, doth enforce  
Men to find out so many eccentricque parts,  
Such *diverse* downright lines, such overthwarts  
As disproportion that pure form. *Donne.*

Both of them do *diversely* work, as they have their  
medium *diversely* disposed. *Bacon's Natural History.*

Leicester bewrayed a desire to plant him in the  
queen's favour, which was *diversely* interpreted by such  
as thought that great artizan of courts to do nothing  
by chance, nor much by affection. *Wotton.*

Eloquence is a great and *diverse* thing, nor did she  
yet ever favour any man so much as to be wholly his.

*Ben Jonson.*

They cannot be divided, but they will prove oppo-  
site; and, not resting in a bare *diversity*, rise into a  
contrariety. *South.*

Considering any thing as existing at any determined  
time and place, we compare it with itself existing at  
another time, and thereon form the ideas of identity  
and *diversity*. *Locke.*

William's arm

Could nought avail, however famed in war;  
Nor armies leagued, and *diversely* assayed  
To curb his power. *Philips.*

On life's vast ocean *diversely* we sail;  
Reason the card, but passion is the gale. *Pope.*

The most common *diversity* of human constitutions  
arises from the solid parts, as to their different degrees  
of strength and tension. *Arbuthnot on Aliment.*

And in the whole there is a magnificence like that  
ascribed to Chinese plantation, the magnificence of  
vast extent and endless *diversity*. *Johnson.*

DIVERSIFY, v. a. } Fr. *diversifier*; Sp.  
DIVERSIFICATION, n. s. } Portug. and Italian  
*diversificare*, from Lat. *diversum*, i. e. *dis*, di-  
versely, and *verso*, or *verso* to turn, and *facio* to  
make. To make different; discriminate; varie-  
gate: diversification is variety of form, color, or  
quality; change.

There is, in the producing of some species, a com-  
position of matter, which may be much *diversified*.

*Bacon.*

If you consider how variously several things may  
be compounded, you will not wonder that such fruitful

principles, or manners of *diversification*, should  
rate differing colours. *Bacon's*

This, which is here called a change of will,  
a change of his will, but a change in the  
which seems to make a *diversification* of the  
indeed is the same will *diversified*.

*Hale's Origin of*

The country being *diversified* between hills and  
woods and plains, one place more clear,  
more darksome, it is a pleasant picture.

It was easier for Homer to find proper names  
for Grecian generals, than for Milton to find  
infernal council with proper characters.

*Addison's*

Nor less attractive is the woodland scene  
*diversified* with trees of every growth,  
Alike yet various.

DIVERT, v. a.

DIVERSION, n. s.

DIVERTE, n. s.

DIVERTISE, v. a.

DIVERTISEMENT, n. s.

DIVERTIVE, adj.

Fr. *divertir*, to divert, to turn off, to amuse, hence, to please; to exhilarate. 'Diversion,' says Johnson, 'seems to be somewhat light amusement, and less forcible than pleasure.' Vertise is an obsolete synonyme of divertisement is an old word recently revived, applied to musical compositions of a similar cast. Divertive is recreative, amusing.

Knots, by the conflux of the meeting  
Infect the sound pine, and *divert* his grain  
Tortive and errant, from his course of growth.

*Bacon's*

Frights, changes, borrowings

*Divert* and crack, rend and deracinate

The unity and married calm of state

Cutting off the tops, and pulling off the  
retention of the sap for a time, and *diverting*  
the sprouts that were not forward.

*Bacon's*

The kings of England would have had a  
conquest of Ireland, if their whole power  
employed; but still there arose sundry  
which divided and *diverted* their power some-  
where.

*Divert*

Alas, how simple, to these cates come

Was that crude apple that *diverted* him

*Milton. Paradise Lost.*

Angling was, after tedious study, a rest  
a cheerer of his spirits, and a *diverting* of his

Let orators instruct, let them *divertise*, and  
move us; this is what is properly meant by  
salt.

He finds no reason to have his rent abated  
a greater part of it is *diverted* from his land.

You for those ends whole days be gone  
And the *diversions* of your youth forgot

How fond soever men are of bad *diverting*  
will prove mirth which ends in heaviness.

*Government of the*

What can that man fear, who takes care  
a Being that is so able to crush all his adversaries  
Being that can *divert* any misfortune from  
him, or turn any such misfortune to his advantage.

*Addison's*

They *diverted* railery from improper  
gave a new turn to ridicule. *Id.*

lections of wit and humour as expose  
ly, furnish useful *diversions* to readers.

II.

more is requisite for producing all the va-  
riety, and degrees of refrangibility, than  
if of light be bodies of different sizes; the  
it may make violet, the weakest and dark-  
blues, and be more easily *diverted* by re-  
flectors from the right course; and the rest,  
bigger and bigger, make the stronger and  
colours, blue, green, yellow, and red, and  
more difficultly *diverted*. *Newton*.

not exclude the common accidents of life,  
ings of a pleasant and *diverting* nature, so  
scent, from conversation. *Rogers*.

linked this *diversion* of Christian practice  
effects of our contentions.

*Decay of Piety.*

For, or } Fr. *devestir*;  
v. a. & n. s. } Lat. *devestire*, from  
DEVE, v. s. } *de*, privative, and  
vestis, a vestis; Gr. *εσθης*, a garment.  
strip: divesture the act of disrobing

IAL, adj. } vided thing being seen  
arts than one.—Ainsworth. To part  
ent pieces; hence to disunite; sepa-  
ribute: as a neuter verb, to sunder;  
lord or friendship; differ. A dividend  
led share; in arithmetic, however, it is  
be divided: *dividual* is used by Mil-  
ited; and *dividant* by Shakspeare, for  
distinguishable.

be a firmament in the midst of the  
let it divide the waters from the waters.

*Genesis*.

all five in one house be divided. *Luke*.

as in sunder, thou canst not divide  
es so, but that our souls are tied,  
can love by letters still and gifts,  
sights, and dreams; love never wanteth  
hita. *Donne*.

love cools, friendship falls off,

divide. *Shakspeare. King Lear*.

How could communities maintain  
commerce from *dividable* shores?

*Shakspeare*.

Twinned brothers of one womb,  
procreation, residence, and birth,  
A *dividend*, touch with several fortunes. *Id*.  
ing as the body moved, the *divider* did more  
enter into the *divided* body; so it joined  
the new parts of the medium, or *divided*  
did in like manner forsake others.

*Digby on the Soul*.

She shines,

Revolved on heaven's great axle, and her reign  
With thousand lesser lights *divided* holds,  
With thousand thousand stars! *Milton*.

If on such petty merits you confer  
So vast a prize, let each his portion share:  
Make a just *dividend*; and, if not all,  
The greater part to Diomedes will fall.

*Dryden's Fables*.

You must go

Where seas, and winds, and deserts will divide you,  
*Dryden*.

Cham and Japhet were heads and princes over their  
families, and had a right to divide the earth by families.

*Locke*.

Money, the great *divider* of the world, hath, by a  
strange revolution, been the great uniter of a divided  
people. *Swift*.

Each person shall adapt to himself his peculiar  
share, like other *dividends*. *Decay of Piety*.

To remedy this inconvenience, it will be necessary  
to divide their troughs into small compartments, in  
such a manner, that each of them may be capable of  
containing water; but this is seldom or never done.

*Franklin*.

It so happened that persons had a single office  
*divided* between them who had never spoken to each  
other in their lives; until they found themselves,  
they knew not how, pigging together, heads and points,  
in the same truckle-bed.

*Burke. Character of Lord Chatham*.

DIVIDEND. See ARITHMETIC.

DIVIDEND OF STOCKS is a share of the interest  
of stocks erected on public funds, as the  
South Sea, &c., divided among and paid to the  
adventurers half-yearly.

DIVINE, v. a., v. n., n. s., & adj.

DIVINATION, n. s.

DIVINELY, adv.

DIVINER, n. s.

DIVINENESS, n. s.

DIVINERESS, n. s., fem.

DIVINITY, n. s.

the gods; Gr. *διο*. See DEITY. To foreknow,  
foretell, or presage, truly or falsely: as a neuter  
verb to utter prognostics, or feel presages; to  
conjecture: divination is the foreseeing, or fore-  
telling, future events, or pretending so to do:  
diviner and divineress those who make this pre-  
tension. Divine, as an adjective, is partaking  
of the nature of, or proceeding from, God;  
superhuman; excellent: divinely, a correspond-  
ing adverb: divineness and divinity, participa-  
tion of the nature of God; Godhead: THE God-  
head, the Supreme Being.

And it was don whanne we gheden to preir, that  
a damysel that hadde a spirit of *dygynacioun* meete  
us which ghaif greet wynnayng to her lordis in *dygyn-  
acyng*. *Wiclif. Dedes*. 16.

Surely there is no enchantment against Jacob, nei-  
ther is there any *divination* against Israel. *Numbers*.

Certain tokens they noted in birds, or in the entrails  
of beasts, or by other the like frivolous *divinations*.

*Huher*.

The Grecians most divinely have given to the active  
perfection of men, a name expressing both beauty and  
goodness. *Id*.

Then is Caesar and he knit together.—If I were  
to divine of this unity, I would not prophesy so,

*Shakspeare*.

If secret powers

Suggest out truth to my *divining* thoughts,  
This pretty lad will prove our country's bias. *Id.*

By Jupiter, an angel! or, if not,  
An earthly paragon: behold *divineness*  
No elder than a boy. *Id. Cymbeline.*

Hear him but reason in *divinity*,  
And, all admiring, with an inward wish  
You would desire the king were made a prelate,  
*Shakespeare.*  
Give Martius leave to proceed in his discourse;  
For he spoke like a *divine* in armour.

*Bacon's Holy War.*

The *divinest* and the richest mind,  
Both by art's purchase and by nature's dower,  
That ever was from heaven to earth confus'd.

*Durieu.*

As with new wine intoxicated both,  
They swim in mirth, and fancy that they feel  
*Divinity* within them breeding wings,  
Wherewith to scorn the earth. *Milton.*

In the very shapes and colours of brute creatures  
there is a *divine* hand, which disposeth them to his  
own ends. *Bp. Hall. Contemplations.*

This man born and now up grown,  
To shew him worthy of his birth *divine*  
And high prediction, henceforth I expose  
To Satan. *Milton.*  
She fair, *divinely* fair! fit love for gods. *Id.*

The eternal cause in their immortal lines  
Was taught, and poets were the first *divines*.

*Denham.*

Her line

Was hero-make, half human, half *divine*.

*Dryden.*

His countenance did imprint an awe,  
And naturally all souls to his did bow;  
As wands of *divination* downward draw,  
And point to beds where sovereign gold doth grow. *Id.*

The mad *divineress* had plainly writ,  
A time should come, but many ages yet,  
In which sinister destinies ordain,  
A dame should drown with all her feathered train. *Id.*

If he himself be conscious of nothing he then  
thought on, he must be a notable *diviner* of thoughts,  
that can assure him that he was thinking. *Locke.*

Faith, as we use the word, called commonly *divine*  
faith, has to do with no propositions but those which  
are supposed to be *divinely* inspired. *Id.*

When he attributes *divinity* to other things than  
God, it is only a *divinity* by way of participation.

*Stillingfleet.*

Is it then impossible to distinguish the *divineness* of  
this book from that which is human? *Grew.*

The excellency of the soul is seen by its power of  
*divining* in dreams: that several such *divinations* have  
been made, none can question who believes the holy  
writings. *Addison.*

'Tis the *Divinity* that stirs within us,  
'Tis Heaven itself that points out an hereafter,  
And intimates eternity to man. *Id.*

Vain idols, deities that ne'er before  
In Israel's lands had fix'd their dre abodes,  
Beastly *divinities*, and droves of gods. *Prior.*

A *divine* has nothing to say to the wisest congrega-  
tion, which he may not express in a manner to be un-  
derstood by the meanest among them. *Suiff.*

God doubtless can govern this machine he could  
create, by more direct and easy methods than employ-  
ing these subservient *divinities*. *Chayne.*

This topik was very fitly and *divinely* man-  
ly by our apostle, in his conference with pharisees  
and the inquisitive people of Athens.

Instructed, you'd explore  
*Divine* contrivance, and a God adore.

I reduced the study of *divinity* into as far  
compass as I could, for I determin'd to study  
but my Bible, being much unconcern'd with  
opinions of councils, fathers, churches, and  
other men, as little inspired as myself. This  
proceeding being opposite to the general con-  
sistency to that of the Master of Peterhouse, who  
a great reader, he used to call me an *arbitrary*  
self-taught *divine*. *Bp. W.*

Glowing, and circumfused in speechless love,  
Their full *divinity* inadequate  
That feeling to express, or to improve,  
The gods become as mortals, and man's fate  
Has moments like their brightest.

DIVINATION, in antiquity, was *divine*  
Plato, Aristotle, Plutarch, Cicero, and  
into two species, viz. artificial and natural.  
Artificial divination was so called, because  
not obtained, or pretended to be obtained  
immediate inspiration, but proceeded upon  
certain superstitious experiments and observances  
arbitrarily instituted. Of this sort there were  
various kinds, as by sacrifices, entrails, cakes,  
flour, wine, water, birds, lots, omens, &c.  
In the sacred writings nine sorts of divination are mentioned. The first  
formed by the inspection of planets, stars, and  
clouds. The practisers of this are supposed to  
be those whom Moses calls *מנחמים* *menachems*,  
*anan*, a cloud, Deut. xviii. 10. 2. Those  
the prophet calls in the same place *חשוכים*  
*chesech*, which the vulgate and general inter-  
preters render *augurs*. 3. Those who consult  
the same place are called *מנחמים* *menachems*,  
the septuagint and vulgate translate 'a way  
to ill practices.' 4. Such *augurs* who consult  
in the same chapter, ver. 11, calls *חשוכים*  
*chesech*. 5. Those who consult the spirits called  
*חשוכים* *chesech*, or, as Moses expresses it in the same  
place, *שאל אור* 'those who ask questions of  
the dead.' 6. Witches or magicians, whom Moses  
calls *יודעוני* *judconi*. 7. Those who consult the  
necromancers. 8. The prophet Hosea, ch. xii.  
12, mentions such as consult staves, *חשוכים*  
*chesech*, which kind of divination is called *rhaddu*.  
9. The last kind is hepatoscopy, or the inspec-  
tion of the liver. Divination of this kind is  
being the offspring of credulity, nursed in  
superstition, and strengthened by superstition,  
necessarily an occult science, retained by the  
hands of the priests and priestesses, the  
soothsayers, the *augurs*, and other *diviners*,  
till the time of the coming of Christ. Since then  
the pure doctrine of Christianity, and the spirit of  
philosophy, have every day more widely diffused  
themselves, and concurred in banishing these  
visionary practices.

The following are the principal kinds of  
*divination* practised among the ancients. 1. A more  
minute description of which see in the separate  
articles. 1. Aeromancy, the *divining* by the air. 2. Astrology: *dividing*

al astrology and judicial. 3. Augury consisted in observing the flight, singing, &c., of birds. 4. Chiromancy, the art which pretends to discover, by inspecting the hand, not only the passions of a man, but his future destiny also. 5. Geomancy was a divination made by observing cracks or clefts in the earth. 6. Haruspicy consisted in the inspection of the bowels of animals, but principally of victims; and from these predicting incidents relative to the republic, and the good or bad events of its enterprise. 7. Horoscopy is a branch of Astrology, see. 8. Hydromancy is the art of divining by water. The Persians, according to Herodotus, invented it; and Pythagoras and Numa Pompilius made great use of it. 9. Physiognomy, or physiognomancy, is a science that pretends to teach the nature, the temperament, the understanding, and the inclinations of men, by inspection of their countenances, and is there thought by many, to be little less frivolous than chiromancy; though Aristotle, and the celebrated Lavater, have written express treatises concerning it. But as it is an undeniable fact, that our passions, especially when frequently and violently agitated, make indelible impressions on our features, by their repeated action on the facial muscles, inasmuch that the temperaments of many people may be known at first view by their looks; and as it is not improbable, that certain habits of vice may make impressions equally uniform and perhaps equally legible, if we were accustomed to study them, physiognomy appears to be worthy of rather more respect. 10. Pyromancy is a divination made by the inspection of a flame, either by observing which side it turns, or by throwing into it some combustible matter, or a bladder filled with wine, or any thing else from which they imagined they were able to predict. Natural divination was called, because it was supposed to be not attainable by any rules or precepts of art, but inspired or inspired into the diviner, without his requiring any further care about it, than to purify himself by fasting, and prepare himself for the reception of the divine affluence.

**DIVINING ROD.** We have anticipated, in the *BAQUETTE DEVINATOIRE*, which see, all that we feel disposed to give credence to on this subject: but an ingenious gentleman has lately exaggerated the pretensions of the hazel or willow rod to be naturally, under proper management, a discoverer of metals and springs of water, at any depth; and we insert, just as they are related to us, his directions for choosing the rod, and observations on their properties.

*Directions for choosing the Rods.*—The hazel and willow rods he has, by experience, found will actually answer with all persons in a state of health, if they are used with moderation, and at some distance of time, and in the evening, when the operator is in good spirits. The hazel, willow, and elm, are all attracted by springs of water. Some persons have the rod intermittently; the rod in their hands will tremble for one half-hour, and repel the next. The rod is attracted by all metals, coals, amber, and stones, but with different degrees of strength. The best rods are those from the hazel or nut-tree, as they are pliant and tough, and cut in the

winter months; a shoot that terminates, equally forked, is to be preferred, about two feet and a half long; but as such a forked rod is rarely to be met with, two single ones of similar length and size may be tied together with thread, and they will answer as well as the other.

The most convenient and handy method of holding the rod, is with the palms of the hands turned upwards, and the two ends of the rod coming outwards: the palms should be held horizontally, as nearly as possible; the part of the rod in the hand ought to be straight, and not bent backward or forward. The upper part of the arm should be kept pretty close to the sides, and the elbows resting on them; the lower part of the arm making nearly a right angle with the upper, though rather a little more acute. The rod ought to be so held, that in its working the sides may move clear of the little fingers.

The best manner of carrying the rod is with the end extended in an angle of about eighty degrees from the horizon, as by this method of carrying it, the repulsion is more plainly perceived than if it was held perpendicularly. But after all the directions that can be given, the adroit use of it can only be attained by practice and attention.

It is necessary that the grasp should be steady, for if, when the rod is going, there be the least succussion or counteraction in the hands, though ever so small, it will greatly impair, and, generally, totally prevent its activity, which is not to be done by the mere strength of the grasp; for provided this be steady, no strength can stop it.

*II. Properties observed in the Rod, and Directions for using it.*—As soon as the person's foremost foot comes near the attracting body (as far as I can observe its semi-diameter), the end of the rod is repelled towards the face; then open the hands a little, replace the rod, and approach nearer, and the repulsion will be continued until the foot is on or over the attracting body. When this is the case, the rod will first be repelled a little, viz. two or three inches, and then be attracted towards the metallic body, viz. its end will be drawn down towards it.

When it has been drawn down, it must not be thrown back without opening the hands, a fresh grasp being necessary to every attraction, but then the least opening of the hand is sufficient. As long as the person stands over the attracting body, the rod continues to be attracted; but as soon as the forefoot is beyond it, then the rod is drawn backward to the face.

Metals have different degrees of attraction; gold is strongest, next copper, then iron, silver, tin, lead, bones, coals, springs of water, and limestone.

In using the rod to discover springs and metals, let the person hold the rod as already directed, and then advancing north or south with a slow pace, just one foot before the other, at first the rod may be repelled; but as the person advances slowly, and comes over the spring or vein of ore, the rod will be strongly attracted.

A person who, by frequent practice and experience, can use the rod tolerably, may soon give the greatest sceptics sufficient satisfaction, except they are determined not to be convinced.

Some have supposed that the science called Rhabdomancy (divination by a rod), is alluded to in the following verse of Hosea:—'My people ask counsel at their stocks, and their staff declareth unto them.' ch. iv. As Europe received in very early times many superstitious customs from the east, together with many useful inventions, the conjecture is not improbable. Divination by arrows, a method of a similar kind mentioned in Ezekiel, chap. xxi., continued among the Arabs till the days of Mahomet, who, in the Koran, forbade his followers this idle attempt at prescience.

**DIVISION, n. s.**  
**DIVISIBLE, adj.**

**DIVISIBILITY, n. s.**

**DIVISIBILITY, n. s.**

**Division.** } Span. and Fr. *division*,  
from Lat. *divisio*, à *dividere*, *divisus*. Sep **Divide.** The act of dividing; state of being divided; the separated part, and that which separates: hence disunion, discord, dispute; a rule of arithmetic: divisible is capable of division; divisibility, quality of admitting it. Divisor, an arithmetical term for a given number by which another is divided.

I will put a *division* between my people and thy people. *Exodus.*

Thy tongue  
Makes Welsh as sweet as ditties highly penned  
Sung by a fair queen in a summer's bower,  
With ravishing *division*, to her lute.

*Shakespeare. Henry IV.*  
Naturalists disagree about the origin of motion, and the indefinite *divisibility* of matter. *Boyle.*

This will easily appear to any one, who will let his thoughts loose in the vast expansion of space, or *divisibility* of matter. *Locke.*

Express the heads of your *divisions* in as few and clear words as you can, otherwise I never can be able to retain them. *Swift.*

If we look into communities and *divisions* of men, we observe that the discreet man, not the witty, guides the conversation. *Addison's Spectator.*

The effects of human industry and skill are easily subjected to calculation: whatever can be completed in a year, is *divisible* into parts, of which each may be performed in the compass of a day. *Adventurer.*

When we frame in our minds any notion of matter, we conceive nothing else but extension and bulk, which is impenetrable, or *divisible* and passive. *Bentley's Sermons.*

In dread *divisions* marched the marshalled bands,  
And swarming armies blackened all the lands. *Darwin.*

**DIVISIBILITY, in physics,** is that property by which the particles of matter in all bodies are capable of a separation or disunion from each other. The Peripatetics and Cartesians hold divisibility to be an affection of all matter. The Epicureans, again, allow it to agree to every physical continuum; but they deny that this affection agrees to all bodies, for the primary corpuscles or atoms they maintain to be perfectly insecable and indivisible.

**DIVISIBILITY OF MATTER.** As it is evident that body is extended, so it is no less evident that it is divisible; for since no two particles of matter can exist in the same place, it follows, that they are really distinct from each other; which is all that is meant by being divisible. In this sense the least conceivable particle must still be

divisible, since it will consist of parts which will be really distinct. To illustrate this by a familiar instance.—Let the least imaginable particle of matter be conceived lying on a smooth plane surface, it is evident the surface will not touch it every where: those parts, therefore, which it does not touch may be supposed separable from the others, and so on as far as we please; and this is all that is meant when we say that matter is infinitely divisible. The infinite divisibility of mathematical quantity is demonstrated geometrically. All that is supposed, however, in this geometry, says Mr. Maclaurin, concerning the divisibility of magnitude, amounts to no more than that a given magnitude may be conceived to be divided into a number of parts equal to any given or proposed number. The number of parts, into which a given magnitude may be conceived to be divided, is not to be fixed or limited, because no given number is so great but that a greater may be conceived and assigned: but there is no, therefore, any necessity of supposing the number of parts actually infinite; and if some have drawn very absurd consequences from such a supposition, yet geometry ought not to be loaded with them. How far matter may be divided, may, it is supposed, be conceived from this fact, that a piece of wire gilt with so small a quantity of gold grains of gold, may be drawn out to a length of 13,000 feet, the whole surface of it will remain covered with gold. We have also a surprising instance of the minuteness of some parts of matter from the nature of light and heat. Let a candle be lighted, and placed in a plain, it will then be visible two miles distant and consequently were it placed two miles from the surface of the earth, it would fill with innumerable particles a sphere whose diameter was 160 miles, and that before it had lost any sensible part of its weight. A quantity of vitriol being dissolved, and mixed with 9000 times its weight of water, will tinge the whole; consequently it may be divided into as many parts as there are grains of sand in the world. With respect also to coloring substances, particularly carmine, which is a kind of powder obtained from the insect commonly called cochineal: dilute a small quantity of this powder in the weight of about three quarters of a grain, by putting it at the bottom of a vessel, in which afterwards poured nearly thirty pounds of water, the color will be so diffused as to be perceptible throughout the whole volume of the water. The weight of this water being 300,000 times greater than that of five centigrammes of carmine, if we supposed that each centigramme of the dried mixture contains only two molecules of the coloring principle, there will be 3,000,000 of vital parts in five centigrammes of carmine. Many perfumes also, without a sensible diminution of their quantity, fill a very large space with their odoriferous particles; which must therefore be of an inconceivable smallness, since there will be a sufficient number in every part of that space sensibly to affect the organ of smelling. Dr. Keill demonstrates, that any particle of matter, how small soever, and any finite space, how large soever, being given, it is possible for that small particle of matter to be diffused through

all that space, and to fill it in such a manner, as that there shall be no pore in it whose diameter shall exceed any given line. The chief objections against the divisibility of matter in infinitum are, That an infinite cannot be contained by a finite: and that it follows from a divisibility in infinitum, either that all bodies are equal, or that one infinite is greater than another. But the answer to these is easy; for the properties of a determined quantity are not to be attributed to an infinite considered in a general sense; and who has ever proved, that there could not be an infinite number of infinitely small parts in a finite quantity, or that all infinities are equal? The contrary is demonstrated by mathematicians in innumerable instances. Sir Isaac Newton is said to have derived from the system of Epicurus, the following opinion relative to the limits prescribed to the divisions of body in the actual state of things. We confess it seems to us nothing but a bold conjecture. This great philosopher conceives that the Supreme Being, in creating matter, formed it of various species of elementary molecules, solid, hard, unchangeable, the figures and the different qualities of which were appropriated to the respective ends they were proposed to answer. But such is the fixity of these molecules that no process of art, nor even any force existing in nature, can either divide or alter them, unless the essence of the body should be changed with time. Thus all the modifications experienced by bodies depend solely upon this, that these durable molecules separate the one from the other, and then become reunited in various ways forming new combinations. These different molecules are, hence, the simple substances of chemistry; and the results of the operations which they would present singly, should be the design of the efforts of this science; in the mean time we may consider as simple the substances which we have not yet been able to decompose, and wisely imagine simplicity to reside at the place where observation stops. See the article INFINITE.

**DIVISION**, in sea affairs, a select number of ships in a fleet or squadron of men of war, distinguished by a particular flag or pendant, and usually commanded by a general officer. A squadron is commonly ranged into three divisions, the commanding officer of which is always stationed in the centre. When a fleet consists of sixty sail of the line, that is, of ships having at least sixty cannon each, the admiral divides it into three squadrons, each of which has its divisions and commanding officers. Each squadron has its proper colors, according to the rank of the admiral, and every division its proper mast. Thus in Britain, the first admiral, or the admiral of the fleet, displays the union flag at the main-top-mast head; next follows the white flag with St. George's cross; and afterwards the blue. The private ships carry pendants of the same color with their respective squadrons at the mast of their particular divisions; so that the last ship in the division of the blue squadron carries a blue pendant at her mizen-top-mast head.

**DIVISIONS OF AN ARMY**, in the military art, the several brigades and squadrons into which it is cantoned.

**DIVISIONS OF A BATTALION** are the several platoons into which it is divided in marching or firing, each of which is commanded by an officer.

**DIUM**, in ancient geography, the name of a town of Macedonia, in Pieria, on the west side of the Sinus Thermaicus. Strabo and Livy place it on the borders of Pieria to the south, at the foot of mount Olympus towards Thessaly. That it was a splendid city, appears from Polybius; who relates, that its gymnasium and walls were overthrown by the Ætolians. From which overthrow, however, it again recovered, Alexander adding new splendor to it, by the brass statues cast by Lysippus and erected there in memory of those slain at the Granicus: an ornament which was continued down to the time of the Romans; who made it a colony, called Diensis.

**DIVODORUM**, in ancient geography, a town of the Mediomatrici in Gallia Belgica; situated on the Moselle, in the spot where Metz now stands. See METZ.

**DIVORCE**, *v. a. & n. s.* } Fr. *divorcer*; It. *divorzare*; from Barb.

**DIVORCEMENT**, *n. s.* } Lat. *divortere*; dis

**DIVOR'CEB.** } and *vertere*, *d marito*, to turn, from her husband. The legal separation of a husband and wife, the verb being derived from the noun: hence disunion, or separation generally; and separation by authority or force. Divorcement seems synonymous with the substantive; and a divorcer is, he who causes or procures a divorce.

Write her a bill of *divorcement*, and give it in her hand, and send her out of his house. *Deut. xxiv. 1.*

If so be it were possible, that all other ornaments of mind might be had in their full perfection, nevertheless the mind that should possess them, *divorced* from piety, could be but a spectacle of commiseration.

*Hooker.*

To restore the king,

He counsels a *divorce*, a loss of her,  
That like a jewel has hung twenty years  
About his neck, yet never lost her lustre.

*Shakespeare. Henry VIII.*

Go with me, like good angels, to my end;  
And, as the long *divorce* of steel falls on me,  
Make of your prayers one sweet sacrifice,  
And lift my soul to heaven. *Id.*

The continent and the island were continued together within men's remembrance by a drawbridge; but are now *divorced* by the downfallen cliffs.

*Curew's Survey of Cornwall.*

Such motions may occasion a farther alienation of mind, and *divorces* of affections, in her, from my religion. *King Charles.*

So seemed her youthful soul not easily forced,  
Or from so fair, so sweet a seat *divorced*. *Wallor.*

*Divorce* is a lawful separation of husband and wife, made before a competent judge, on due cognizance had of the cause, and sufficient proof made thereof.

*Ayliffe's Paragon.*

Death is the violent stranger of acquaintance, the eternal *divorce* of marriage.

*Drummond's Cyprian Grove.*

Aerial pasture the lungs with gentle force  
Constant embrace by turns, by turns *divorce*.

*Blackmore.*

**DIVORCE**. This is a topic connected with many moral and legal considerations; and those of sufficient importance, we apprehend, to justify

our entering upon it at some length. Scarcely has the country survived the moral effects of a recent discussion of it in the highest quarters, and in the inner sanctuary of British justice. It will be sufficient to remark, with regard to that unhappy circumstance, that both the learned professions appeared in a state of even unusual obscurity and doubt upon the subject. Lawyers, unquestionably well versed in the institutions of their country, were as singularly divided with regard to the fair effect of some of our statutes and usages respecting divorce, as the learned prelates were disagreed among themselves respecting what was really the law of God.

The writer of this paper has had occasion to pay considerable attention to this subject, both in a moral and legal point of view. He has seen the laws of his country to be in a remarkable state of confusion respecting it; he is convinced that their ordinary course, with regard to divorces, is opposed to the simple provisions of the law of Jesus Christ. He would therefore offer to the reader a brief statement of the actual laws and practices of this country on the subject, with a view to the examination of their moral effect and propriety; then compare them with the provisions and usages of antiquity generally; and finally, with the express injunctions of Holy Writ.

1. There are many kinds of divorce, say the law authorities mentioned in our books; as *causa præcontractus*; *causa frigiditatis*; *causa consanguinitatis*; *causa affinitatis*; *causa professionis*, &c. But the usual divorces are of two kinds, i. e. *à mensa et thoro*, from bed and board; and *à vinculo matrimonii*, from the very bond of marriage. A divorce *à mensa et thoro* does not dissolve the marriage; for the cause of it is subsequent to the marriage, and supposes the marriage to be lawful: this divorce may be by reason of adultery in either of the parties, for cruelty of the husband, &c. And as it does not dissolve the marriage, so it does not debar the woman of her dower, or bastardise the issue, or make void any estate for the life of husband and wife, &c. Co. Lit. 235; 3 Inst. 89; 7 Rep. 43. The woman under separation by this divorce must sue by her next friend; and in her own name she may sue her husband for alimony.

A divorce *à vinculo matrimonii*, absolutely dissolves the marriage, and makes it void from the beginning, the causes of it being *precedent* to the marriage; as *præcontract* with some other person, consanguinity or affinity, within the Levitical degrees, impotency, impuberty, &c. On this divorce dower is gone; and if, by reason of *præcontract*, consanguinity, or affinity, the children of the marriage are bastards. But in these divorces, the wife, it is said, shall receive all again that she brought with her, because the nullity of the marriage arises through some impediment; and the goods of the wife were given for her advancement in marriage, which now ceases: but this is where the goods are not spent; and if the husband give them away during the coverture, without any collusion, it shall bind her: if she knows her goods unspent, she may bring action of detinue for them; and as for money, &c., which cannot be known, she must sue in the

spiritual court. This divorce enables the parties to marry again.

In regard to the former case, it is the practice in the higher walks of life to apply to parliament to complete the divorce by an *ex post facto* act; when, if the divorce is grounded, as it always invariably is, on adultery, it is necessary that a clause be inserted in the proposed bill, releasing the offending parties from intermarriage. Evidence must be given, on the bill, that satisfaction for damages has been brought against the seducer, and judgment for the plaintiff thereon, or a sufficient reason given why such action was not brought, or judgment obtained. Upon the second reading of the bill in the house of lords (where, indeed, it usually originates) it is necessary that an official copy of the proceedings, and definitive sentence of divorce *à mensa et thoro*, in the ecclesiastical court, at the instance of the petitioner, be delivered at the bar on oath, and that the petitioner attend the house and be examined, if the house think fit, whether there be any collusion respecting the act of adultery, the divorce, or any action for criminal conversation; and whether the wife was living and free from her husband under articles of separation.

If after a divorce *à mensa et thoro*, the parties marry again, the other being living, such marriage is a mere nullity; and by sentence to confirm the first contract, she and her first husband become husband and wife *à second*, without any formal divorce *à second*. Also on this divorce, as the marriage continues, marrying again while either party is living, hath been held to be bigamy within the stat. 1 Jac. c. 11.

A divorce for adultery was anciently *à vinculo matrimonii*; and therefore in the beginning of the reign of queen Elizabeth the opinion of the church of England was, that after a divorce for adultery, the parties might marry again; but in Foliambe's case, H. 44 El. in the star-chamber, that opinion was changed; and archbishop Harcourt, by the advice of divines, held, that adultery was only a cause of divorce *à mensa et thoro*. Sentence of divorce must be given in the life of the parties, and not afterwards: but it may be repealed in the spiritual court, after the death of the parties.

It should be added that divorce is, according to our law, a judgment spiritual; hence it must be sued for and pronounced in the spiritual court, where also, 'says Coke upon Littleton' if there be occasion, it ought to be reversed; and that the canon law, by which these courts are regulated, is followed by the common law, considering the nuptial tie so strong as not to be capable of being dissolved for any cause whatever. Our law, in fact, refers throughout to the Romish notion of the sacrament of marriage, and its utter indissolubility. Such, without entering into minute provisions, is the law and practice of our enlightened country on this important subject.

2. Divorce was allowed in much greater freedom in all the celebrated nations of antiquity. At Rome, barrenness, age, disease, madness, and banishment, were the ordinary causes of divorce. Spurius Carvilius, between 500 and 600 years

ing of Rome, under the consulship of P. Valerius, was the first who divorced his wife because she was barren; and, in his Roman questions, maintenance was the first who permitted an husband afterwards added impotence, infidelity, and the profession of a false religion as valid reasons of divorce. The law distinguished between repudium and divorce, making the former to be the dissolution of the contract or espousal, and the latter the dissolution of the matrimony. Romulus enacted a law which suffered not a wife to leave her husband, nor the man the liberty of turning her out for adultery, for poisoning her, or counterfeiting his private keys. At other times, the women as well as the men were liable for a divorce. The common law was by sending a bill to the wife, setting forth the reasons of separation, and her goods which she brought with her, was called repudium mittere; or served in her presence, and before witnesses, and accompanied with the forwarding the writings, refunding the dowry, and turning the wife out of doors.

Laws concerning divorces were various. The Cretans allowed divorce to any man having too many children. The Romans seldom divorced their wives; and it was considered scandalous for a woman to desert her husband. The Athenians allowed divorce on small grounds, by a bill containing the reasons of the divorce, and approved, if signed, by the chief magistrate; and the husband was allowed to leave their husbands at will. Persons divorcing their wives were obliged to return their portions; the Athenian laws obliged them to wait a month for alimony. The laws concerning the separation of men and women were different; the men were called ἀπολυμένοι, to dismiss their wives, ἀπολυμένην, to leave their husbands.

Ricaut (State, Ottom. Emp. ch. ii. p. 26, 27; ch. lxxv. p. 454). Among the Turks three degrees of divorce are distinguished: the first only separates the man and wife from the same house and bed, the maintenance being still continued: the second divides them in that manner, but the wife is compelled to make good her share of a jointure or dowry promised her, so as to have no interest in him, and to remain in a free condition to marry again. The third sort of divorce, which is called Talak, is made in a solemn manner, with more rigorous terms, and in this case the husband, repudiating his wife, and desirous of retaking her, by the law is admitted to her, and contenting himself with being temporarily possessed by her, which the law requires as a punishment for the husband's lightness and incontinence, seem to have grown out of the law of Moses, who, in the second chapter, has ordered that if a man di-

vorces his wife the third time (for he may divorce her twice without being obliged to part with her) if he repent of what he has done, it shall not be lawful for him to take her again, until she has been first married and bedded by another, and divorced by such second husband. (Koran, ch. ii. p. 27). The precaution, on the whole, has had so good an effect, that the Mahomedans are seldom known to proceed to the extremity of divorce, notwithstanding the liberty given them; it being reckoned a great disgrace so to do: and there are few, except those who have little or no sense of honor, that will take a wife again on the condition enjoined. (Seld. ubi. Sup. l. iii. c. 21; Ricaut's Ottom. Emp. b. ii. c. 21). It must be observed, also, that though a man is allowed, by the Mahomedan law, to repudiate his wife, even on the slightest disgust, yet the women are not allowed to separate themselves from their husbands, unless it be for ill usage, want of proper maintenance, neglect of conjugal duty, impotency, or some cause of equal import; but then she generally loses her dowry, which she does not lose if divorced by her husband, unless she has been guilty of impudicity or notorious disobedience. (Koran, ch. iv. p. 62). When a woman is divorced she is obliged, by the direction of the Koran, to wait three months before she marry another; after which time, in case she be not found with child, she is at full liberty to dispose of herself as she pleases; but if she prove with child she must wait till she be delivered: and, during her whole term of waiting, she may continue in her husband's house, and is to be maintained at his expense; it being forbidden to turn a woman out before the expiration of the term, unless she be guilty of dishonesty. (Koran, ch. ii. p. 26, 27; ch. lxxv. p. 454). Where a man divorces a woman before consummation, she is not obliged to wait any particular time (Koran, ch. xxxiii. p. 348); nor is he obliged to give her more than one-half of her dower. (Koran, ch. ii. p. 28). If the divorced woman have a young child, she is to suckle it till it be two years old; the father, in the mean time, maintaining her in all respects: a widow is also obliged to do the same, and to wait four months and ten days before she marry again. (Koran, ch. ii. p. 27).

The divine law to the Jews on this subject is to this effect (Deut. xxiv. 1, &c.): 'When a man hath taken a wife, and married her, and it come to pass that she finds no favor in his eyes, because he has found in her some uncleanness; then let him write her a bill of divorce, and give it into her hand, and send her out of his house. And when she is departed, she may go, and be another man's wife; and if her second husband hate her, and write her a bill of divorce, or if he chance to die, her former husband shall not take her again to be his wife, after she is defiled, for that is an abomination to the Lord.' A question has occurred respecting the interpretation of this law, What is meant by the words, 'if he find any uncleanness, turpitude, or nakedness in her?' and the critics are divided in opinion about it. Dr. Geddes has rendered the Hebrew words, פְּטוּתָהּ, 'some defect,' but they are by Montanus rendered nuditatem verbi — by our translators, 'something unclean.' Sept.

αρχησαν παραγα. Vulg. aliquam fœditatem, and so equivalently Onk. Syr. and both Arabs. But Tharg. פתח ענייה, 'some transgression;' and this transgression is supposed by Rabbi Sammai and his followers to be adultery. R. Hillel and his party extend the ענייה רבך to whatever may displease the husband; and such appears to have been the loose construction of this law in our Saviour's time. The opinion of the Sammaïtes is untenable; for adultery was punished with death; while that of the Hillelites appears to be too lax. It was probably either some very great bodily blemish, or some base immoral habit, that was meant by the legislator. The form of the bill of divorce was to this effect: 'Such a day, month, or year, I, such an one, of such a place, upon, or, near such a river, do, of my own free consent and choice, repudiate thee, such an one, my late wife, banish thee from me, and restore thee to thy own liberty; and thou mayest henceforth go whither, and marry whom thou wilt: and this is thy bill of divorcement, and writing of expulsion, according to the law of Moses and Israel.' This writing was signed by two witnesses, and delivered in the presence of as many, at least. From this time, the wife was as much at her liberty, as if she had been a widow; only, in both cases, she was obliged to stay at least ninety days, before she was married to another, lest she should prove pregnant by the last. It does not appear that women were indulged by the law of Moses with the privilege of divorcing their husbands upon the same ground; unless in the case of a virgin betrothed by her parents before she was twelve years of age, who might then refuse to ratify the contract which her parents had made, without giving any other reason than that she did not like the person designed for her; but this cannot be called a divorce, because there is no marriage in the case. Josephus, therefore, thinks (Ant. lib. xv. c. 11; xviii. 7; xx. 15), that a divorce was so far from being permitted to women, that, if the husband forsook his wife, it was not lawful for her to marry another, till she had first obtained a divorce from him. He adds, that Salome, sister of Herod the Great, was the first who took upon her to repudiate her husband, whose example was soon followed by others, mentioned by the same author.

3. Let us now regard the subject more particularly in its various relations to society, and as a topic of legislation with the great Christian lawgiver.

Divorce is always an evil. The sufferings of the innocent, the regrets of the wise and virtuous, and the abhorrence of God, attend upon it; while it opens a breach in the foundations of human society to which no other domestic evil is comparable. That it may be the refuge of a good man from the vices of an incorrigible companion, and the prospect of indefinite future injuries, who can deny? but never can it be his remedy for the past; never will it offer any thing to his mind in the shape of compensation. It is of that species of punishment on the guilty, of which the innocent is compelled to share the shame and the suffering, in a peculiar manner; and to bear, perhaps, in this life the chief mis-

ries. The feelings of the mind that preserve that innocence, the very affections that preserve and support him in the path of duty, prepare for him present sufferings, against which the criminal party must be hardened; and to the same remote generations, that bear the weight of delinquency on the one side, the humbleness, and, generally, the groundless blame of the other, will be faithfully conveyed.

As far as the immediate parties to a divorce are concerned, all the objects and ties of marriage are ruinously overthrown and dissolved in it. The husband (following the supposition of his being the innocent party), can no longer—never more, perhaps, can he—regard the character of woman in its true light. No longer is she power to infuse a peculiar sensibility into his heart, to give candor and patience to his passions, or sweetness to his disposition. All his reflections of her influence are calculated to excite just the opposite feelings. 'More bitter than death,' have been the consequences of his submission to it. And when the husband is guilty, and the wife the innocent party, the only just cause of divorce will compel the Christian moralist to hold the balance even between the sexes), what must the widowhood of an all-confiding female endure! It would be possible that she should ever more love the man; that she should again believe that her judgment can strengthen hers, or his character become a safe pillar of her hope.

The mischiefs of divorce are but too observable of a still greater aggravation, in the children are connected with its consequences. For a father's authority (in our boyish days particularly) it is as impossible to find a substitute as for a mother's care in earlier life. Let parents forget, that no hireling, however faithful or respectable, can do their duty to their children—a duty ever, as a whole, intrinsically, because he is a hireling; but divorces generally pass into a family when all that is most important to the character of each parent should be exercised; when, if there are children, they are in tender years, and every thing in relation to their character and hopes is in the bud, or in bloom. Now, either 'father,' or 'mother' (names especially in conjunction, of greater moral weight than any other that belong to creatures), become a term worse than unmeaning, worse than empty. As soon as the mind can be influenced by the moral example, it is weakened on the side of virtue and influenced to evil by one or other of the endearing and important names; which it connects for life with the ideas of tyranny, cruelty, and profligacy—or with those of meanness, and folly, and female shamelessness. It is this all; though one of the less direct, is not one of the least blessings of marriage to society, that it frequently draws together many collateral parties into kindred, and, like a new branch of an inland navigation, unites the sources and blends the interests of the neighbourhoods. Imagine this one branch to be obstructed or annihilated, and the course felt wherever its waters flow. Something like this, or worse than this, occurs in every case

per just. Amongst all the parties  
 affinity with the original tie, the  
 it distils evil. Where only ordi-  
 naries were increased by it, and  
 its and smiling cousins felt it but  
 tober the relationship when it did  
 a their selfishness, or on prior  
 rmost discussion of the facts and  
 the merits and demerits of the  
 ad; and wounded pride will be  
 ective of hatred and of falsehoods,  
 ties ordinarily are of affection.  
 is thus a party affair with a num-  
 and individuals, an evil unseen,  
 with the increasing intelligence of  
 —and proportionably destroying  
 of virtue amongst them, by fami-  
 with the details of the worst of

remarkable that we have a most  
 position on this subject from the

As his prose writings generally,  
 scal sentiments in particular, have  
 ed considerable public notice, we  
 d to notice his views of divorce  
 detail. He had made what he  
 a disastrous and misyoked mar-  
 rital mistake; in which it were  
 about to compel the unhappy  
 flesh, as to weave a garment of  
 pel the vegetable and nutritive  
 re to assimilations and mixtures  
 alterable each by the other; or  
 octive stomach to turn that into  
 so totally unlike that substance  
 brought upon.' In other words,  
 oets had proved himself but man  
 a wife; and because she was not  
 fan in bearing with his learned  
 home, and not a well advised or  
 4, in refusing to return home after  
 e at her father's house, Milton  
 e 'no wife,' 'an adversary,' 'a  
 actually paid his addresses to  
 sh a view to supplying her place.  
 the poet's history speaks of a ro-  
 tation taking place between them  
 his feet in tears at the house of a  
 after a short reluctance, he sacri-  
 ficed to her entreaties, and the  
 surrounding friends. To this event,  
 mon, we owe much of the paint-  
 ethic scene in *Paradise Lost*, in  
 reases herself to Adam for pardon  
 low then, the 'mistake' was re-  
 congenial 'assimilations' mixed;  
 tion of divorce and his 'adver-  
 sary flesh;' but he had published,  
 e, his work on Divorce, and  
 ence of it; and he through  
 a theory he had, under these un-  
 stances, espoused. Milton coin-  
 cides on the treatment he received  
 , and particularly from the clergy,  
 these works. In one he says:—

of late, called Tetrachordon  
 nec, both matter, form, and style;  
 w: it walked the town awhile,  
 intellects; now seldom pored on.

Cries the stall-reader, 'Bless us! what a word on  
 A title-page is this!' And some in file  
 Stand spelling false, while one might walk to Mile-  
 End-Green.—

In the other he is more serious:—

I did but prompt the age to quit their clogs  
 By the known rules of ancient liberty.  
 When straight a barbarous noise environs me  
 Of owls and cuckoos, asses, apes, and dogs:  
 As when those hinds that were transformed to frogs,  
 Railed at Latona's twin-born progeny,  
 Which after held the sun and moon in fee.  
 But this is got by casting pearls to hogs,  
 That bawl for freedom in their senseless mood,  
 And still revolt when truth would set them free.

A definition of marriage, which the poet fur-  
 nishes in due form and order, certainly lies at  
 the basis of the 'Doctrine of Divorce.'

'The material cause of matrimony,' says  
 Milton, 'is man and woman; the author and  
 efficient, God and their consent. The internal  
 form and soul of this relation is conjugal love,  
 arising from a mutual fitness to the final causes  
 of wedlock,—help, and society in religious, civil,  
 and domestic conversation, which includes, as an  
 inferior end, the fulfilling of natural desire and  
 specifical increase; these are the final causes,  
 both moving the efficient and perfecting the  
 form.' p. 272.

Or again, and with all the eloquence of a dis-  
 appointed lover:—

'Marriage is a divine institution, joining man  
 and woman in a love fitly disposed to the helps  
 and comforts of domestic life. A divine insti-  
 tution. This contains the prime efficient  
 cause of marriage: 'Joining man and woman  
 in a love, &c. This brings in the parties' con-  
 sent, until which be, the marriage hath no true  
 being. When I say 'consent,' I mean not  
 error: for error is not properly consent; and  
 why should not consent be here understood with  
 equity and good to either part, as in all other  
 friendly covenants—and not be strained and  
 cruelly urged to the mischief and destruction of  
 both! Neither do I mean that singular act of  
 consent which made the contract; for that may  
 remain, and yet the marriage not true nor law-  
 ful; and that may cease, and yet the marriage  
 both true and lawful, to their sin that break it.  
 So that either as no efficient at all, or but a transi-  
 tory, it comes not into the definition. That  
 consent I mean which is a love fitly disposed to  
 mutual help and comfort of life; this is that  
 happy form of marriage, naturally arising from  
 the very heart of divine institution in the text, in  
 all the former definitions either obscurely, and  
 under mistaken terms expressed, or not at all.  
 This gives marriage all her due, all her benefits,  
 all her being, all her distinct and proper being.  
 This makes a marriage not a bondage—a bless-  
 ing not a curse—a gift of God not a snare.  
 Unless there be a love, and that love born of  
 fitness, how can it last? Unless it last, how  
 can the best and sweetest purposes of marriage  
 be attained? And they not attained, which  
 are the chief ends, and with a lawful love con-  
 stitute the formal cause itself of marriage, how  
 can the essence thereof subsist? How can it be,

indeed, what it goes for? Conclude, therefore, by all the power of reason, that where this essence of marriage is not, there can be no true marriage; and the parties, either one of them or both, are free, and without fault, rather by a nullity than by a divorce, may betake them to a second choice, if their present condition be not tolerable to them. If any shall ask, why 'domestic' in the definition? I answer, that because both in the Scriptures, and in the gravest poets and philosophers, I find the properties and excellencies of a wife set out only from domestic virtues; if they extend further, it diffuses them into the motion of some more common duty than matrimonial.' pp 276, 7.

We have but one objection to both these definitions. They envelope in a cloud of words the chief design of marriage; or rather they wholly mis-state its chief design to be the personal comfort of the immediate parties. 'Help and society in religious, civil, and domestic conversation;' 'a love fitly disposed to the help and comfort [of each other] in domestic life.' The relative bearing of the institution, or its aspect towards society at large, is almost wholly overlooked. Now we are not about to tempt an unequal warfare with the able quills, or still more formidable frowns, of our fair countrywomen, by denying for one moment the reality of the 'only want' of our primitive sire; or disputing the superior personal comforts he enjoyed, after the formation of his bride. But even a Milton must not be allowed to stigmatise, in prose, the dearest hope of the marriage state, the possession of children, as 'an inferior end' of marriage. We contrast such a sentiment with the nobler views of the author of *Paradise Lost*, and smile at the versatility of our nature:—

Hail wedded love, mysterious law, true source  
Of human offspring, sole propriety  
In Paradise, of all things common else!  
By thee adulterous lust was driven from men  
Among the bestial herds to range; by thee,  
Founded in reason, loyal, just, and pure,  
Relations dear, and all the charities  
Of father, son, and brother, first were known.

The Roman moralist (Cicero) understood the matter better than either of these definitions state it: or rather, unbiassed by his private grievances in respect to marriage (for he too had them, it will be remembered), he expressed its great objects far more correctly, when he called it 'The beginning of a city, the seminary of the commonwealth.' In fact, if either the Mosaic narrative of the original institution, or the positive declaration of the almighty Author, is to be held decisive on the subject, the relative objects of marriage, as a 'source of human offspring,' and a natural guarantee of their education, far from being subordinate to any other, constituted his principal design in it. Every other part of creation is represented by the sacred historian as containing, at its birth, some provision for its perpetuity. Light is divided into successive days; the graminaceous tribes are secured against destruction in the seed which they yield, and the fruits in that which they contain; all the inferior creatures of the deep, the earth, and the air, are created 'after their kind;' and God saw this arrangement,

in particular, to be *good, perfect, complete*. The male of the human species only was to be produced 'alone;' perhaps to teach him distinctly some of the lessons we are then to consider. This was 'not good,' not a perfect arrangement with regard to man; it did not provide for the complete development of the divine plans concerning him. Marriage was accordingly instituted; and the nuptial benediction pronounced in these terms: 'Be fruitful, and multiply, and replenish the earth, and subdue it, and have dominion over the fish of the sea, and over the fowl of the air, and over every living thing that moveth upon the earth.' Jehovah's plan for man 'a companion, a covenanted partner, that he not make (two) one flesh' And is there one spirit thereto? And what doth he seek? 'A godly seed.' Abp. Newcome's version of Mat. ii. 15. The endearing names of husband and wife are subordinated by revelation to the important duties of parents. It is truly surprising to see so accurate a textuary, so good a moralist, and so profound a divine, as Newcome, unquestionably was, bringing together a ponderous volume on marriage and divorce, in which this consideration does not occupy the extent of one page.

The parties then, as we contend, who are the first instance capable of forming a good and binding marriage, are incapable afterwards of dissolving the contract. The will that binds comes bound by its own act, and therefore neither be less strong nor less reasonable on account. Too common is the notion of negating the obligation of this, the most important of our voluntary engagements, by the same sort of capricious feeling in which it often originates. With regard, indeed, to the particular persons who marry, we are and may justifiably be directed by our own inclinations and preference; but if it is assumed, that inclination rather than duty may be a safe future rule, a decent recollection of the ends of marriage will show the fallacy of the conclusion; while to the Christian, who sincerely feels that 'the way of man is not in himself,' it will appear perfectly monstrous. Vows are the contracts that bring us into such new relations to others, that, after having once voluntarily engaged in them, no power of withdrawal is reserved to us. The formal promises and promissory undertakings of the merchant, most of the actual engagements of the learned professions, the acceptance of political office and military rank, but all marriages pre-eminently, are contracts of this description. They bring us into a new moral state; we disengage ourselves from one class of duties, and undertake another, and our good or evil conduct supports the good or evil, promotes the prosperity or adversity of all men of our class. If we would retreat, we cannot replace numerous other interested parties, nor can we be ourselves replaced in our respective situations before contracting. Amongst these other interested parties to marriage, the appointment of God and nature places pre-eminently—children. Their being is to be considered as a matter of course, and the promotion of their moral well-being as a matter of duty, attendant upon every marriage,—a sacred

and 'a godly seed.' The cases in which this relation may be lawfully entered into, without any view to the obtaining a family, are to be regarded as exceptions to the general purposes of the institution; they are clearly out of analogy with what we have seen to be its chief design.

We would press particularly on the consideration of the moral reader, married or unmarried, the divinely established connexion between marriage and education. Men and women are united, when God is duly acknowledged to join them together, for objects worthy their own future destiny. A new tribe of creatures, wearing the image of our Almighty Maker, is designed to spring from the union—creatures whose duties, and whose happiness, whose temporal, and whose everlasting destiny, will be more materially affected by the conduct of their parents, as such, than by that of any other human beings. These are the parties, for the sake of whom Christianity has banished polygamy, and restrained divorce; for the sake of whom, even the course of nature seems to dictate the expediency of pairing, and the permanency of the marriage tie, all animals, whose care is necessary for the rearing of their young, having a similar instinct; and none discarding them while their parental care is important:—but what animal has eternal destinies connected with that care, except man? In an age greatly distinguished for the promotion of education by substitute, we have never seen these considerations sufficiently insisted upon in print. Let us educate by substitute, we say, and let any adequate moral superintendence be introduced, when there are no means (from whatever cause) of bringing the parent to watch over and control the machinery of education. But where this can be done, let it be done. It ought to be done. It is the Divine appointment that it should be done; and in those classes of society that have so laudably stood forward for the benefit of others, it is ever practicable—it should ever be borne in view.

Our poet's 'Doctrine of Divorce,' proportionally defective with his definition of marriage, would place the most important of our voluntary contracts on the weakest of all possible grounds. With him, the peculiar temperament of mind and character which first determines us to marry a particular person may, if afterwards reversed, reverse and annul the bond. 'Indisposition, unfitness, or contrariety of mind!' It would be reverence to the memory of this great man, to multiply quotations from his mode of reasoning on the subject.

Milton defends his doctrine by contending that the law of Moses on this subject is not, in point of fact, repealed by Jesus Christ; and that as other reasons of divorce than actual adultery were allowed by the Jewish legislator, the Christian magistrate should yet admit of them. He remotely examines the celebrated text, Deut. xxiv. 1; and compares it with the original institution of marriage; insisting that no covenant whatever obliges against the main end of itself and the parties covenanting, which main end he calls, in marriage, the 'remedy of loneliness' in man. He then objects to the ignorance and in-

equity, as he terms it, of the 'canon law, providing for the right of the body in marriage, but nothing for the wrongs and grievances of the mind.' He contends, that the ordinary construction of Matt. v. 32, as repealing the Mosaic law, in reality charges that law with conniving at open and common adultery among the chosen people of God. Nine reasons are given (chap. ii. to xiii.) for the Mosaic precept, thus assumed to be still in force. 1. A meet and proper conversation is the chiefest end of marriage. 2. Without this law, marriage, as it happens oft, is not a remedy of that [kind] which it promises [to be]. 3. Without it, he who finds nothing but remediless offences and discontents, is in greater temptations than ever before. 4. God regards love and peace in the family more than a compulsive performance. 5. Nothing more hinders and disturbs the whole life of a Christian, than a matrimony found to be incurably unfit. 6. To prohibit divorce sought for natural causes is against nature. 7. Sometimes the continuance in marriage may be evidently the shortening or endangering of life. 8. It is probable, or rather certain, that every one who happens to marry hath not the calling. 9. Marriage is not a mere carnal coition, but a human society. Such are the contents of book I. of the *Doctrine and Discipline of Divorce*.

He examines, in his second book, the Christian doctrine on the subject. Christ, it is insisted, neither 'did nor could' abrogate the law of divorce, but only reprobated the abuse thereof. He afterwards combats the common exposition of divorce being permitted to the Jews, 'because of the hardness of their hearts,' and insists, that the law cannot permit, much less enact a permission of sin; that to allow sin by law is against the nature of law; that if divorce be no command, neither is marriage; and that divorce could be no dispensation, if it were sinful.

He further objects, that if a dispensation of the real law of marriage be supposed, Christians need it as much as the Jews did, and that the gospel is apter to dispense than the law. In defining (chap. viii.) the true sense in which Moses suffered divorce for hardness of heart, he says:—

'Moses, Deut. xxiv. 1. established a grave and prudent law, full of moral equity, full of due consideration towards nature, that cannot be resisted, a law consenting with the laws of wisest men and civillest nations; that when a man hath married a wife, if it come to pass that he cannot love her, by reason of some displeasing natural quality or unfitness in her, let him write her a bill of divorce. The intent of which law undoubtedly was this, that if any good and peaceable man should discover some helpless disagreement or dislike, either of mind or body, whereby he could not cheerfully perform the duty of a husband, without the perpetual dissembling of offence and disturbance to his spirit; rather than to live uncomfortably and unhappily, both to himself and to his wife; rather than to continue undertaking a duty, which he could not possibly discharge, he might dismiss her whom he could not tolerably, and so not conscientiously, retain. And this law, the spirit of God by the mouth of

Solomon, Prov. xxx. 21, 23, testifies to be a good and a necessary law, by granting it that 'a hated woman' (for so the Hebrew word signifies rather than 'odious,' though it come all to one) that 'a hated woman when she is married, is a thing that the earth cannot bear.' What follows then, but that the charitable law must remedy what nature cannot undergo? pp. 99, 100.

The opening of chap. ix. of this book is, perhaps, the most remarkable part of his whole reasoning. It shows indeed the difficulty of making the worse appear the better cause, in this instance. We recollect no equal display of dignified quibbling:—

'And to entertain a little their overweening arrogance,' he is speaking of our Lord's reply to the Pharisees on this subject, Mark x., 'as best befitted, and to amaze them yet further, because they thought it no hard matter to fulfil the law, he draws them up to that unseparable institution, which God ordained in the beginning before the fall, when man and woman were both perfect, and could have no cause to separate: just as, in the same chapter, he stands not to contend with the arrogant young man, who boasted his observance of the whole law, whether he had indeed kept it or not, but screws him up higher to a task of that perfection, which no man is bound to imitate. And in like manner, that pattern of the first institution he set before the opinionative Pharisees, to dazzle them, and not to bind us. For this is a solid rule, that every command, given with a reason, binds our obedience no otherwise than that reason holds. Of this sort was that command in Eden, 'Therefore shall a man cleave to his wife, and they shall be one flesh;' which we see is no absolute command, but with an inference, 'therefore:' the reason then must first be considered, that our obedience be not disobedience. The first is, for it is not single, because the wife is to the husband 'flesh of his flesh,' as in the verse going before. But this reason cannot be sufficient of itself; for why then should he for his wife leave his father and mother, with whom he is far more 'flesh of flesh, and bone of bone,' as being made of their substance? And besides, it can be but a sorry and ignoble society of life, whose inseparable injunction depends merely upon flesh and bones. Therefore we must look higher, since Christ himself recalls us to the beginning; and we shall find that the primitive reason of never divorcing, was that sacred and not vain promise of God to remedy man's loneliness, by 'making him a meet help for him,' though not now, in perfection, as at first, yet still in proportion as things now are.—To make a meet help is the only cause,' he goes on to assert, 'that gives authority to this command of not divorcing to be a command. And it might be further added, that if the true definition of a wife were asked at good earnest, this clause of being 'a meet help' would show itself so necessary and so essential, in that demonstrative argument, that it might be logically concluded; therefore she who naturally and perpetually is no 'meet help' can be no wife; which clearly takes away the difficulty of dismissing such a one.' p. 102—104.

According to the same lax mode of interpreta-

tion, 'whom God hath joined together,' as describes a married pair, 'when their nature is fitly disposed and enabled to maintain a sweet conversation to the solace and love of each other,' p. 127, and the term 'fornication,' in the restrictive clause of Matt. v. 32, &c., will include all things as give open suspicion of adultery, as the wilful haunting of feasts, and inviting of men not of her near kindred, the lying near her house, without probable cause, the frequenting of theatres against her husband's ear, p. 136.

We are not acquainted with the writings of any modern advocate of these notions who is also a believer in Christianity. The greatness of Milton, however, will ever confer a deep interest on his sentiments generally; and with pleasure reflect, how little it weighs in England, in point of authority on the subject of divorce:—a proof of the predominance of moral feeling on that topic in this country, as we retain our English household virtues, in the springs of virtuous life and life eternal still untouched. But modern infidelity, with its characteristic indifference to all our real good, has spun similar theories to those of Milton on the subject of marriage, even in this land of Balaam; and we cannot forget that the political rage of that abortion of the human mind in France distinguished for its numerous and most outrageous divorces. Infidelity has recently reared its head amongst us; and is ever likely to arise and act in this way. The idea of marriage, of all its engagements, being mere matters of right and private feeling, rather than of duty and irrepealable law between God and man, perhaps natural to us; but it is not a Christian sentiment: and because all classes of society are warmly interested in reprobating it, we venture a little deeper into the topics of marriage and divorce.

We are advocates for adverting at once to revelation, upon every subject on which it expressly treats; and few are the moral questions that are more copiously, or more definitely, prohibited in Scripture, than those of the married state. Few are the needful remedies for social evil, that, in our judgment, are more directly prescribed in Scripture, than the unhappy case of divorce. The divine Saviour, in referring to the original institution of marriage, calls to the heavenly Father, as Chrysostom long ago remarked, 'the Maker of all holy matches.' He professes to republish the primitive law of the institution; he defines it as embracing only two persons, 'They twain shall be one flesh,' he restores the woman to her station of equality, as to the nature and duration of the tie; which shows that it binds equally both parties firm to others, and through the whole of life. The apostolical epistles dwell upon its purport, honors, and duties. The earliest and most distinguished of the Christian teachers had no commandments from 'the Lord' on the topic (1 Cor. vii. 10, 11), which he distinguishes from his own warmest recommendations. He endeavours to illustrate the most profound Christian doctrines by a figurative use of the institution and its duties; which he presses, in detail, as

most important parts of Christian

a of morals Christianity must be decidedly friendly to marriage. It is grossly all the most abominable vices in the world to 'forsaking' its whole-ness, while, externally, it exhibits not beneficial influences in society, it has produced in the condition never it has spread. Unballowed before it. They are not merely re-politic, inconvenient, and ruin-temoral consequences, which they ly declared to exclude men from of God, 1 Cor. vi. 9, Gal. v. 19,

Other systems of religion trans-ities of human passion and lust to—Christianity brings down hea-into all our earthly affections and interposes a positive command in tuations of society: 'Let every man a wife, let every woman have her ' 'I will that the younger women children, guide the house, give none he adversary to speak reproach-

its in St. Paul's writings, which, from their connexion, have been sress a general preference for ce-then inculcating any such sentiment, when duly compared with their con-lish the very opposite doctrine. effect, that when marriage may be t degree imprudent, from circum-erations, it is not in all cases sinful; it may be advisable, and in others 1 Cor. vii. 9. In circumstances of es,' tribulation, (compare Luke xxi. some instances, as had not been e history of the world, and never ded; when all the powers of the ayed in open hostility against the e; when a false philosophy insti-ost able, and most amiable disciples, r Pliny and others, watched inqui- the execution of a deliberate at-riate Christianity from the earth; advocates and professors (for all the primitive Christianity were its open me intelligible way) not only were meet in cells and 'caves of the character, but had no certain dwell-ividuals; then, indeed, wrote I suppose—it is good, for the pre- for a [single] man so to be.' But adds, 'Art thou bound to a wife? e loosed.' Fear not, despair not. y, thou hast not sinned; and if a she hath not sinned.' Let this estrated with the too common spe-arents for the splendid misery of, in either persuading or compel- matches for the mere love of mo- compared with the undue severity hat are called imprudent marriages, are not the advocates, are ordina- y parents, amongst whom adultery de gaiety, especially if committed

with 'the lower orders,' and fornication a mere peccadillo; let it even be taken as a test of the antichristian application and effect of that part of our marriage law which respects the royal family; and the recent unhappy agitation of these topics may yield some ultimate good.

The clear and definite limitations of divorce in the Christian Scriptures occur but infrequently, for the best of all reasons—sincere and discreet Christians can very rarely be interested in them. It is a moral question, upon which no man need seek to be experimentally informed; and the Gospel would teach us to be 'simple concerning that which is evil.' But our great Master more than once delivers a formal judgment on the topic: and the apostle Paul enlarges and confirms the spirit of the Saviour's rule.

The great duties of marriage, common to both parties, are fidelity, the cultivation of love and peace, the joint pursuit of God's glory in the order of the family, and the education of children. All the individual duties of a husband are comprehended, by inspired wisdom, under one great admonition, 'Husbands, love your wives;' on the proofs of which, however, the New Testament is not silent: while those of a wife are contained in another, 'Let the wife see that she reverence her husband.' These duties supply the best view of the nature of the tie. In point of fact, they can never be fully exercised by one party, without the concurrence of the other. So far, then, there is an essential reciprocity in them: they impart rights to each; from both they command corresponding duties. Christianity knows nothing of human rights that are not thus connected with duty. Without meaning to afford to either a justification for individual negligence on this ground—or to give at once, even to the innocent party, all the power and right of punishing the guilty—clear it is, that revelation regards marriage as a mutual interchange of rights and privileges. Does it grant a husband peculiar, and almost absolute authority? It demands of him a peculiar and equivalent protection of the gentler sex. Does it give him the ruling arm? It also describes him as the moral head of his family, particularly of his wife (Eph. v. 23); and requires from him spiritual and moral wisdom, spiritual and moral conduct, accordingly. On the other hand, has Christianity conferred on woman privileges unknown to her in the ancient world, and even amongst God's chosen people? She is exhorted also to an intelligent submission and obedience, and to exhibit an unreserved devotion to the wants and comforts of man, never before required, and fully equal to the protection she claims. They are formed to develope each other's excellencies—to bear with, and to win away each other's faults: 'The man is not without the woman,' not himself—not the man that God made, ere he would rest from his works—says this unimpeachable authority; 'nor the woman without the man, in the Lord.' Only such views of the institution can give us a correct idea of its rupture.

The same divine system clearly regards marriage as a constant interchange of duties. It

knows nothing of the modern fashion of separation; it allows no sanction, as we think, to the modern laws of partial divorce. The consideration of these subjects will necessarily lead to the only legitimate cause of divorce the Scriptures acknowledge. Separation by mutual consent, as it is called, is nothing less (and how, in point of bad faith, could it be more!) than two accountable human beings undertaking privately to contradict and renounce what they had sworn publicly, in the name of God, to do and perform. Apart from its being wholly opposed to the general obligation of lawful vows, it holds up a man and woman to the world, it sends them into the world, as neither married nor unmarried—both and neither. ‘Joined together’ of God, or in obedience to a law under which he has placed them, and separated by the inconveniences of keeping it! The express determination of Scripture anticipates the awful moral evils to which such a monstrous system leads. ‘I wish not myself any other advocate, nor you any other adversary,’ says the devout bishop Hall, to a friend who inclined to a separation, ‘than St. Paul who never gave, I speak boldly, a direct precept, if not in this.’ Should the remaining part of our quotation grate a little ungraciously on a delicate ear, let the substantial interests of religion and virtue, and the possible prevention of such mischiefs in other ranks, as have lately stared upon us from a throne, be our apology. His express charge whereupon I insisted is, ‘defraud not one another; except with consent, for a time, that you may give yourselves to fasting and prayer: and then come again together, that Satan tempt you not for your incontinency.’ Every word, if you weigh it well, opposes your part, and pleads for mine. By consent of all divines, ancient and modern, ‘defrauding’ is refraining from matrimonial conversation. See what a word the Spirit of God hath chosen for this abstinence—never taken but in ill part!

But there is no fraud in consent, as Chrysostom, Athanasius, Theophylact, expound it: true. Therefore St. Paul adds, ‘unless with consent;’ that I may omit to say, that in saying, ‘unless with consent,’ he implies, both that there may be a defrauding without it, and with a consent a defrauding, but not unlawful. But see what he adds—‘for a time.’ Consent cannot make this defrauding lawful, except it be temporary: no defrauding without consent; no consent for a perpetuity. ‘How long then, and wherefore? Not for every cause; not for any length of time: but only for a while, and for devotion, ut vacetis, &c. Mark how the apostle adds, ‘that you may give yourselves to fasting and prayer.’ It is a solemn exercise which the apostle here intends, such as is joined with fasting and external humiliation; wherein all earthly comforts must be forborne. ‘But what if a man list to task himself continually?’ No: ‘Let them meet together again, saith the apostle; not as a toleration, but a charge.’ But what if they can both live safely thus severed? This is more than they can undertake: there is danger, saith our apostle, in this abstinence, ‘lest Satan tempt you for your incontinence.’ What can be more plain? Bishop

Hall’s *Epistles*, decad. 7. ep. 9.; *Works*, &c. p. 249.

The application of these remarks to our present legal practice with regard to divorce is plain. The apostolic rule will include prohibition of the divorce à thoro et mensa, and cases of adultery. *It sanctions no partial divorce.* There is but one scriptural cause for an divorce, and then it is to be a complete one, the ecclesiastical law (Can. 107) it is raised, ‘that in all sentences pronounced on divorce and separation à thoro et mensa, shall be a caution and restraint inserted in the act of the said sentences, that the parties separated shall live chastely and continently; neither shall they, during each other’s life, contract matrimony with another person. And the better observation of this last clause, the sentences of divorce shall not be pronounced until the party or parties requiring the same have given good and sufficient caution and security into the court, that they will not use break or transgress the said restraint or prohibition. We are not acquainted with the nature of a caution or security which is found to satisfy learned judges of this court in such cases. St. Paul would not have taken any. It is contrary to human nature, it would seem, according to a different rule; and would not believe even devout Christians could offer such a caution. He would prevent the crime of adultery by removing the temptations to it. His language is, Meet again when ye are—but let ye be tempted.

Permanent separation of every kind is contrary to our old English word for adultery, contrary to vow. ‘God will contemn the vouterers and whorekeepers,’ says an old translation of Heb. xiii. 4, now before us. So again the same translation of Matt. xv. 19, ‘that herte gon out yvel thoughtis, manseynen, covetises, &c. And of Mark x. 11. ‘Whoso leevith his wife, and weddith another, he breaketh his vow.’ We vow, in marriage, ‘I will be true to thee, and thou shalt be true to me, as long as we both do live.’ To take away a wife is a final and irrevocable breach of this vow, but not to keep to the espoused object is a breach of it: it proves and encourages domestic affection; it is the harlinger of all that is in the violation of this tie. Look at its consequences again in this way; the Jewish law of divorce, upon which the Christian system was introduced as an improvement, when it sent the wife away, provided for her freedom. ‘When she is departed out of the house of her husband,’ she may go, said Moses, ‘and become another man’s wife.’ It particularly pointed that the repudiating husband was never afterwards to reclaim her; Deut. xxiv. 4. This was a moral and merciful system, compared with which all articles of separation are both cruel and cruel. ‘They send away’ a wife, but they keep her bound; they expose her to second attachments, which she cannot lawfully maintain; they suspend over her a husband’s power, while they deprive her of his protection and his smile.

Of these remarks, we apprehend, the legislator pronounced the repudiation of wife unlawful, except for the sake of the marriage row. No man's morals can be more firm or the sermon on the Mount; and variously the simple and un-  
 'Whoever shall put away his wife the cause of fornication, πορνεία, redom, Campbell] causeth her to; and whosoever shall marry her committeth adultery.' The same is repeated in reply to the question on this point, 'Is it lawful for a man to put away his wife? He answered and said, Moses command you? And Jesus answered and said, I have suffered to write a bill of divorcement, and put her away. And Jesus said unto them, For the hardness of your hearts, I have written you this precept: but from the beginning God made man and [a] female.'—'And in the law he asked him again of the same law, unto them, Whosoever shall marry, and marry another, committeth adultery. And if a woman shall marry another, and be married to another, committeth adultery.' The exception here added; but it is clear, on the passage in St. Matthew, is fully understood.

The Christian moralist ask, why one kind of law upon this subject, and another, or rather no law at all in the majority of cases, for other real divorce is unattainable by any legal course. It must be an exception made for each specific case, and in the first instance, at an enormous expense of time and money, in all instances of its occurrence, the imperfect and crude state in which it is left in the statute-book, and in an expensive manner of proceeding, a greater portion of the people themselves of it. Is this a commendable way of opposing the crime, so conspicuous, never to desolate these? We are quite sure that the affectionate feelings of these classes in protection as those of the law. Let the same courts and course of law, which are now appealed to to prove the fact of adultery, proceed, where it is sought for, the right of divorce to poor or rich, without additional expense.

In conclusion, that Dr. Paley is right, says, 'the law of this country, our Saviour's injunction, canon of the marriage contract to commit adultery in the wife,' for all this evil, such as they are, re- husband or wife, as equally a crime; but we fully and heartily say, 'Whether a law might not be made, the fortune of the adulteress in case of her natural death:

—PART 2.

reserving a certain proportion of the produce of it, by way of annuity, for her subsistence (such annuity in no case to exceed a certain sum), and also so far suspending the estate in the hands of the heir, as to preserve the inheritance to any children she might bear to a second marriage, in case there was none to succeed in the place of their mother by the first, and whether such a law would not render female virtue in higher life less vincible, as well as the seducers of that virtue less urgent in their suit? I would recommend this,' continues he, 'to the deliberation of those who are willing to attempt the reformation of this important but most incorrigible class of the community. A passion for splendour, for expensive amusements and distinctions, is commonly found in that description of women who would become the subjects of such a law, not less inordinate than their other appetites. A severity of the kind proposed applies immediately to that passion. And there is no room for any complaint of injustice, since the provisions above stated, with others which might be contrived, confine the punishment, so far as it is possible, to the person of the offender; suffering the estate to remain to the heir, or within the family of the ancestor from whom it came, or to attend the appointments of his will.'

DIURETIC, *adj.* διουρητικός. Having the power to provoke urine.

Diuretics are decoctions, emulsions, and oils of emollient vegetables, that relax the urinary passages: such as relax ought to be tried before such as force and stimulate. Those emollients ought to be taken in open air, to hinder them from perspiring, and on empty stomachs. *Arbutus*.

Graceful as John, she moderates the reins,  
 And whistles sweet her diuretic strains. *Young*.

DIURETIC, DIURETICUS, διουρητικός; from διουρησις, a discharge of urine. That which, when taken internally, augments the flow of urine from the kidneys. It is obvious that such an effect will be produced by any substance capable of stimulating the secreting vessels of the kidneys. All the saline diuretics seem to act in this manner. They are received into the circulation; and, passing off with the urine, stimulate the vessels, and increase the quantity secreted. Murray, in his Elements of Materia Medica, classes the super-tartrate of potassa, or cream of tartar, and nitrate of potassa, or nitre, the muriate of ammonia, or crude sal-ammoniac, potassa, and the acetate of potassa, or kali acetatum, among the saline diuretics; and selects the following from the vegetable kingdom:—*scilla maritima*, *digitalis purpurea*, *nicotiana tabacum*, *solanum dulcamara*, *lactuca virosa*, *colchicum autumnale*, *gratiola officinalis*, *spartium scoparium*, *juniperus communis*, *copaifera officinalis*, *pinus balsamea*, and *pinus larix*; and the *lytta vesicatoria* from the animal kingdom. The principal articles included by Dr. Cullen, in his catalogue of diuretics, are *dulcamara*, *digitalis*, *scilla*; some of the *alliacea*; and *silquose*; the balsams and resins; *cantharides*, and the diuretic salts.

DIURNAL, *n. s. & adj.* } Lat. *diurnalis*:  
 DIURNALLY, *adv.* } from *diēs*, a day.  
 DIURNE', *adj.* } See DAY. A jour-  
 18

nal, or record of daily transactions: relating to or constituting the day; daily.

Performed hath the sonne his arke *diurne*,  
No longer may the body of him sojourn  
On the orisont, as in that latitude.

Chaucer. Cant. Tales.

We observe in a day, which is a short year, the greatest heat about two in the afternoon, when the sun is past the meridian, which is the *diurnal* solstice, and the same is evident from the thermometer.

Browne's Vulgar Errors.

The prime orb,

Incredible how swift, had thither rowled  
*Diurnal*.

Milton.

The *diurnal* and annual revolution of the sun have been, from the beginning of nature, constant, regular, and universally observable by all mankind.

Locke.

Why does he order the *diurnal* hours  
To leave earth's other part, and rise in ours?

Prior.

In my former I represented that the *diurnal* rotations of the planets could not be derived from gravity, but required a divine arm to impress them.

Sir Isaac Newton. Letters to Bentley.

As we make the enquiries, we shall *diurnally* communicate them to the publick.

Tatler.

You with soft breath attune the vernal gale,  
When breezy evening broods the listening vale;  
Or wake the loud tumultuous sounds, that dwell  
In echo's many-toned *diurnal* shell.

Darwin.

**DIUTURNITY**, *n. s.* Latin, *diuturnitas*.  
Length of duration.

Such a coming, as it might be said that that generation should not pass till it was fulfilled, they needed not suppose of such *diuturnity*.

Browne's Vulgar Errors.

**DIVULGE**, *v. a.* } Fr. *divulguer*; Span.  
**DIVULGER**, *n. s.* } and Port. *divulgar*; Lat.  
and Ital. *divulgare*; *dis* and *vulgo*, to spread a report, from *vulgus*; Gr *πῶλος*, the common people. To publish; make universally known; proclaim.

Men are better contented to have their commendations suppressed, than the contrary much *divulged*.

Hooker.

I will pluck the veil of modesty from the so seeming mistress Page, and *divulge* Page himself for a secure and wilful Acteon.

Shakespeare. Merry Wives of Windsor.

I think not any thing in my letters could tend so much to my reproach, as the odious *divulging* of them did to the infamy of the *divulgers*. K. Charles.

This is true glory and renown, when God,  
Looking on the earth, with approbation marks  
The just man, and *divulges* him through heaven  
To all his angels, who with true applause  
Recount his praises.

Milton's Paradise Lost.

These answers, in the silent night received,  
The king himself *divulged*, the land believed.

Dryden's Æneid.

The cabinets of the sick, and the closets of the dead, have been ransacked to publish private letters, and *divulge* to all mankind the most secret sentiments of friendship.

Pope.

**DIVULSION**, *n. s.* Lat. *divulsio*. The act of plucking away.

Aristotle, in his Ethics, takes up the conceit of the beaver, and the *divulsion* of his testicles.

Browne's Vulgar Errors.

**DIXAN**, a large town of Tigré, Abessinia, on the side of Taranta, under the government of Bahamegash. It is built on the top of a small hill: a deep valley surrounds it like a moat, and the road winds spirally up the hill. The houses are flat-roofed and without chimneys. Dixan is the seat of a considerable trade. The other commodities most common here are tobacco, black pepper, white cloths, mirrors, glasses, snuff, spirits, and large beads. It was formerly a fief under Axum. The place is very active in the disgraceful traffic in slaves.

**DIXCOVE**, a British African fort, in the country of Ahantah, on the Gold Coast. It stands at the entrance of a small cove, and will admit vessels of thirty or forty tons of water. The channel is narrow but safe, and the situation strong. It is forty miles south-west of Cape Coast Castle.

**DIXMUYDEN**, a town of West Florida, in the kingdom of the Netherlands, situated in a tract called the Freye Lande, on the river Apalachicola. The trade has of late declined; but there was a great yearly horse-fair in the month of June, and the place is noted for its butter and cheese. The sea came at one time up to the river, forming a small harbour. Here are salt-refineries, soap works, and breweries. The great church is a fine building. Eleven miles south of Orange, and twenty-four east of Dunkirk.

**DIZ'EN**, *v. a.* (Corrupted from *digite* to dress; to deck; to rig out. A low word.

Your ladyship lifts up the cash to be *even*.  
For sure I had *disen*d you out like a queen.

Swift.

**DIZIER** (St.), a town of France, in the department of Upper Marne, and ex-desert province of Champagne, seated on the Marne, at the place where it becomes navigable by boats, seventeen miles south-east of Vitry le François, and 157 east of Paris. The road between these two towns, being levelled and planted with trees, is one of the finest walks in France. St. Denis is famous for boat-building, and contains many inhabitants. It was formerly a strong town, being remarkable for a siege which it sustained in 1544, for six weeks against the emperor Charles V. A sharp action took place here between the French and allies on the 27th of January 1814, and again on the 26th of March of the same year.

**DIZUK**, a district of the province of Mikma, Persia, forming part of the country of Finkechistan. Within its precincts are seven or eight villages, designated by the general term *Dizuk*, though each has also a distinct name. It is governed by a chief, who receives a tenth of the produce, in wheat and dates. His revenues are computed at 60,000 or 70,000 rupan, or from £8000 to £9000 yearly.

**DIZZY**, *v. a. & adj.* } Sax. *deuzigh*; Dut.  
**DIZ'ZINESS**, *n. s.* } *duygh*. See DIZ.  
**DIZ'ZARD**, *n. s.* } Giddy; vertiginous.

having a swimming or whirling sensation in the head; thoughtless; the verb being derived from the adjective. Dizzard, says Johnson, is a blockhead; a fool.

How fearful

try 'tis to cast one's eyes so low!

It is thirty-two miles north of Moscow.

DR, DNEPR, or NIEPR, the ancient

name of a large river of Europe, rising in

the west of Smolensko, running a long

in the south direction, and falling into the

Don between Cherson and Oczakow.

It runs to its mouth, it flows entirely

through Russian dominions, a course of above

and its navigation is only once inter-

rupted by a series of cataracts which begin below

the Samara, and continue for about

They are not so dangerous but they

are led in spring by loaded barks. At

the mouth, the goods are landed at Kiemensk,

and by land to Kitchkase, six miles

from Kiew, where they are again em-

ployed to descend the river to Cherson. These

might be rendered navigable at all

times, although the expense would be

great, the navigation would soon repay

the empress Catherine II. caused

the rocks which occasioned these water-

falls to be thrown up, but without any material

improvement in navigation. Above its mouth the

river opens into a kind of lake or marsh, called

Liman. The lower part of its course has been the scene of many conflicts between the Turks and Russians, and the upper part, in the neighbourhood of Smolensko, was the scene of some severe conflicts in Buonaparte's retreat in November 1812. Its principal tributary streams are the Berezyna, the Priepitz, the Rose and the Bog. The water, though often unfit for domestic use, abounds in fish, particularly shad, sturgeon, pike, and carp. The chief towns which it passes are Smolensko, Orcha, Mohilev, Bobryow, Kiev, Kremenchong, Ekaterinoslav, Nicopol, and Cherson.

DNIESTER, or NIESTER, the ancient Tyras, a fine river of Europe, which rises in Austrian Galicia, and running south-east visits Choczim, dividing Podolia from Moldavia: it then separates the Turkish province of Bessarabia, from the Russian government of Catherinenslaf, and after watering Egerlik, Bender, &c., falls into the Black Sea, between the mouths of the Dnieper and the Danube. At its mouth it forms a large bay, and though somewhat dangerous to navigate, on account of rocks, the improvements lately made in it by the Russian government have induced the Poles to send a considerable portion of the produce of their soil through its medium, to the port of Odessa.

DO, v. a. & v. n. } Sax. *don*; Teut. *thuen*;

Do'ER, n. s. } Goth. *dogo*, from Goth.

Do'ING. } *tanjan*; Gr. *τενω*, to

build. Coming into our language in modern times from the same root as *to*, Mr. Tooke (*Diversions of Purley*) contends that it is the same word; and that, as we still put to before the infinitive, *do* used formerly to mark other parts of a verb not distinguished by their terminations. See *To*. We still, indeed, often say, when we wish to speak emphatically or formally, *I do love*; *I did go*, &c. Its present office, as an auxiliary verb, is, however, as Mr. Tyrwhitt observes, not very easy to define. But if a distinguishing termination is used with a verb, it is always omitted. It has a peculiar expletive use: thus it will perform the office of a substitute for other verbs, expressed or understood, as, *I shall go*, but if *I do not*, will you? and beside giving emphasis on other occasions, as we have noticed, it adds vehemence to a command or entreaty, as, *Do come*, *do*; and strength to a question or negative, as, *Do you love him*? *I do not believe him*. As an active verb it signifies to practise; perform; execute with any degree of success; as also to finish and complete: Spenser uses it for to cause to be done. As a neuter verb it signifies to behave in any manner; to fare in regard to health; to succeed; to cease. The meaning of the nouns obviously follows.

Therefore whence thou dost almes, nyle thou trumpe before thee as ypocrites *don* in synagogis and streitis, that thei be worshippid of men.

*Wiclif. Matt. vi.*

my soul, look back but a few years, and thou  
nothing — And how *didst* thou spring out of that  
— Thou couldst not make thyself. *Mason.*

What I have *done* is *done* ; I bear within  
nature which could nothing gain from thine :  
a mind which is immortal makes itself  
capital for its good or ill. *Byron.*

*Do*, in music, a note of the Italian scale, cor-  
responding to *ut* of the common gamut. See  
*ut*.

**DOAB**; a name which, according to Mr.  
Wilson, should include all the territory between  
Jumna and the Ganges; but the term is  
only restricted to the southern portion of it,  
included, for the most part, in the province  
Agra, and, during the Mogul government,  
divided into the districts of Furruckabad,  
Agra, Etawah, Korah, Currah, and Allahabad.  
There are several Doabs in Hindostan, the name  
signifying any tract of country included between  
rivers.

The cultivated part of this country is very fer-  
tile. Tamarind and mango trees abound every-  
where. The millet is also raised, and, although a  
coarse grain, furnishes straw ten feet long,  
which is of great use as provender. Barley and  
sugar-cane are likewise cultivated; and, in  
the neighbourhood of Kanoge, considerable  
quantities of tobacco. Indigo is found in a wild  
state, and of superior quality. The cattle are  
generally small. The climate of the Doab is  
generally sultry in April and May, before the  
commencement of the rains; and even in the  
winter season it is the morning only that is cool.  
The natives manufacture a coarse cotton cloth,  
and deal with cheap materials. Dowlet Row  
clashed on the 30th December 1803, ceded his part  
of the country to the British. The southern part  
of the Doab was ceded, during the administration  
of the marquis Wellesley, in 1801, by the reign-  
ing Nabob of Oude, Saadet Ali.

**DOABEH BARRY**, or **BARI RESIDENCE**, a  
tract in the province of Lahore, situated be-  
tween the Beyah and Ravey rivers, and the  
thirtieth and thirty-first degrees of north latitude.  
Modern maps place this territory in Mool-  
tan; but, according to Abul Fazel's arrangement,  
1582, says Mr. Hamilton, it belonged to  
Sind. This country, named also Manjha,  
contains the cities of Lahore and Amritsar;  
and, in consequence, the great centre  
of the power of the seiks. It is of the same  
climate and soil as

**DOABEH JALINDER**, another district in  
the province of Lahore, included between the

Sutuleje and Beyah rivers, and for the most part  
between the thirtieth and thirty-first degrees of  
north latitude. This is the most fruitful of all  
the possessions of the seiks. The soil is light,  
but well watered and very productive; and the  
country, which is open and level, abounds in  
grain. The principal towns are Julindra and  
Sultanpoor. This territory is principally occu-  
pied by the Malawa Singh Seiks, who are called  
the Doabeh Singhs, or Singhs who dwell betwixt  
two rivers.

**DOAT**, *v. n.* See **DOVE**.

**DOBSON** (William), an eminent English  
portrait and historical painter, born at London in  
1610. He served an apprenticeship with one  
Peck, a stationer and picture dealer; and owed  
his improvement to the copying some pictures of  
Titian and Van Dyck, whose manner he always  
retained. A picture of Dobson's being exposed  
at a shop in Snowhill, Van Dyck passing by was  
struck with it; and enquiring after the author,  
found him at work in a garret. Van Dyck  
generously equipped him in a manner suitable  
to his merit; and presented him to king Charles  
I. who took him under his protection, kept him  
with him at Oxford all the time he continued in  
that city, and not only sat to him several times  
for his picture, but caused the prince of Wales,  
prince Rupert, and most of the lords of his court,  
to do so too. Dobson, however, being extrava-  
gant, did not improve the many opportunities he  
had of making his fortune; and died very poor  
in 1647, at his house in St. Martin's Lane.

**DOBUNI**, or **BODUNI**, an ancient people of  
Britain, who possessed the territory which now  
forms the counties of Oxford and Gloucester.  
Both the names of this British people seem to  
have been derived from the low situation of a  
great part of the country which they inhabited:  
for both *Duvn* and *Bodun*, signify profound, or  
low, in the ancient language of Gaul and Britain.  
The Dobuni are not mentioned among the British  
nations who resisted the Romans under Julius  
Cæsar, which was probably owing to the distance  
of their country from the scene of action; and  
before the next invasion under Claudius, they had  
been so much oppressed by their ambitious  
neighbours the Cativellauni, that they willingly  
submitted to the Romans. Cogidunus, who was  
at that time prince of the Dobuni, recommended  
himself so effectually to the favor of Claudius, by  
his ready submission, that he was not only con-  
tinued in the government of his own territories,  
but had other states put under his authority.  
This prince remained so steady a friend and ally  
to the Romans, that his subjects never revolted,  
nor stood in need of forts or forces to keep them  
in subjection. So that we meet with very few  
Roman towns and stations in the country an-  
ciently inhabited by the Dobuni. The *Durocon-*  
*ovium* of Antoninus, and the *Corinium* of  
Ptolemy, are believed by antiquaries to have  
been the same place, the capital of the Dobuni,  
and situated at Cirencester, in Gloucestershire,  
where there are many marks of a Roman station.  
*Clevum* or *Glevum*, in the thirteenth iter of  
Antoninus, stood where the city of Gloucester  
now stands; and *Abone*, in the fourteenth iter,  
was probably situated at Avinton on the Severo,

The country of the Dobuni was comprehended in the Roman province, Britannia Prima.

DOCE RIO, a river of Brasil, which rises near the town of Villa Rica, and after a north course, through a fine country, turns eastward and discharges itself into the Atlantic, in lat. 19° 30' S. It has a course of about 500 miles. Until lately the fertile neighbourhood of this river has been totally neglected: otherwise the abundance of timber, cotton, and sugar, it is capable of yielding, would long since have found their way to European markets. There is another river of this name, which falls into the ocean in lat. 8° 10' S.

DOCETÆ, from *doceiv*, to appear, in ecclesiastical history, the followers of Julius Cassianus, one of the Valentinian sect, towards the close of the second century, who revived a notion that had been adopted by a branch of the Gnostics, against whom St. John, Ignatius, and Polycarp, had asserted the truth of the incarnation. They believed and taught, as their name imports, that the actions and sufferings of Jesus Christ were not in reality, but only in appearance.

DOCILITY, *n. s.* } Fr. *docile*; Span. and  
Do'CILE, *adj.* } Portug. *docil*; Ital. and  
Do'CIALE, *adj.* } Lat. *docibile, docile*, from  
Do'CIBleness, *n. s.* } *fucilis* easy, and *doceo*  
to teach; Gr. *doceiv*, to judge, *pro*, a Chald. to observe. Teachableness; aptness to receive instruction. The adjectives and substantives are respectively, synonymous.

The asinine feast of sow-thistles and brambles is commonly set before them, as all the food and entertainment of their tenderest and most docile age.

Milton.

I might enlarge in commendation of the noble hound, as also of the docibleness of dogs in general.

Walton's Angler.

What is more admirable than the fitness of every creature for our use? the docility of an elephant, and the insistency of a camel for travelling in deserts?

Grew.

All the perfection they allowed his understanding was aptness and docility, and all that they attributed to his will was a possibility to be virtuous.

South.

Soon docile to the secret acts of ill,

With smiles I could betray, with temper kill.

Prior.

Dogs soon grow accustomed to whatever they are taught, and, being docile and tractable, are very useful.

Ellis's Voyage.

DOCIMASIA, in Greek antiquity, a probation of the magistrates and persons employed in public business at Athens. It was performed publicly in the forum, where they were obliged to give account of themselves and their past lives before certain judges. Among several questions proposed to them, we find the following: whether they had been dutiful to their parents, had served in the wars, and had a competent estate?

DOCIMASTIC ART, a name given to the art of assaying by operations in small, the nature and quantity of metallic or other matters which may be obtained from mineral or other compound bodies. See METALLURGY and REFINING.

DOCIMENUM MARMOR, a name given by the ancients to a species of marble of a bright and clear white, much used in large and sumptuous buildings.

It had its name from Icnos, a city of Phrygia, near which it was and whence it was sent to Rome. It was counted little inferior to the Parian, and not capable of so elegant a polish, as was less used by the statuary, or in smaller works. Adrian used this marble in building the temple of Jupiter; and most of the great Roman buildings are formed of it.

DOCK, *n. s.* Sax. *doeca*. A plant.

Nothing teems

But hateful docks, rough thistles, teechous

Losing both beauty and utility.

Shakespeare

My love for gentle Dermot faster grows  
Than you tall dock that rises to thy nose:  
Cut down the dock, 'twill sprout again,  
Love rooted out again will never grow.

The species are seventeen, ten of which several of them being used in medicine; sort called the oriental burdock, is said to be a rhubarb.

Dock, in botany. See RUMEX.

Dock, *v. a. & n. s.* } From Fr. *couer*.

Dock'ET, *n. s.* } to dock, à Lat. *caedere*.

To cut short, or trim: as a substantive, trimmed or cut short: a docket is an writing, a summary of legal proceedings.

The Reve was a slender colente man.

His berd was shave as neighe as ever be

His here was by his eres round yshorne

His top was docked like a priest before.

Chaucer. Prologue to Canterbury Tales.

The tail of a great rhinoceros is not evil by Bontius. The dock is about half an inch and two inches broad, like an apothecary's

Urn's

One or two stood constant century, who favours handed down; and spread a net between the prince and subject, through which nothing of value could pass.

Swift's

Dock, *n. s. & v. a.* Flem. *dok*. Swed. *docka*; Suid-Goth. *docka*; *puta dekken*, to cover, protect, secure; and from Gr. *δοχίον*, a receptacle; *recepta* ship-house), a dock. An enclosed place for ships: see the article. Also a place for prisoners in a court of justice; verb, to put in dock.

The boatswain and mariner may bring what dock they please.

There are docks for their galleys and as well as work-houses for all land and sea-rations.

Duck, in the manege, is used for a cover of leather, as long as the dock of a horse which serves it for a cover. The French dock troussequeue. It is made fast to the crupper, and has leathern thongs between his thighs, and along his saddle straps, in order to keep the tail to hinder it from whisking about.

Docks, for shipping, are enclosures or basins formed in rivers and for the receiving, building, or repairing of ships. They are constructed of brick, stone, with locks or flood-gates, pointed to the tide, to keep the water in or out, and the nature of the docks require.

**WET DOCKS** are for the reception of ships lie afloat while loading or unloading, with gates pointed from the tide, to keep the water at low water. Locks are attached to them, generally with double gates, for the more easy admission and egress of shipping; and, to the operation of opening and shutting these gates, sluices are made within to regulate the water, until the same level is produced within as without. A wet dock without gates is called, both by the French and ourselves, a *basin*; a dry dock is with them *une forme*, and a slip, *en cale*. Wet docks are in fact artificial harbours for the keeping a vessel afloat at all periods of the tide; and to no other modern improvement do our great commercial towns owe so much of their general superiority and opulence. Liverpool, as it has been often remarked, might still have remained a poor fishing village without them.

**Basins**, or docks open to the tide, are called **DRY DOCKS**, because the vessels frequenting them ground at low water, and lie dry on the ebb tide, and float again on the next rise of the tide. They are used at Liverpool as entrances to the wet docks, and are frequented by coasters, and small or light vessels, that do not injure by lying on the shore. Dry as well as wet docks are enclosed with gates which exclude the tide as circumstances may require; and often have the interior water completely pumped out by means of horses and machinery, or the steam engine. Many ships are conveniently built and floated out: though generally there are places set apart for this purpose, called *slips*. The port of Liverpool, from the badness of its harbour, the rapidity of the river Mersey, and the shifting of its sands, resorted to the construction of docks in 1708. The management of the first undertaking of this kind was invested in the corporation for the term of twenty-one years, which gave for this purpose four acres of land; and they were empowered to borrow the sum of £6000. In 1717 the term was prolonged for fourteen years, and they were authorised to borrow £4000 more. In 1737 the term was further extended to thirty-one years, and powers given to make an additional one, to build a pier in the open harbour, and to light the docks. The corporation on this occasion gave seven acres of land, and they were empowered to borrow £6000. In 1761 the commerce of Liverpool was so much increased, and its shipping had become so numerous, and so enlarged in size, that further accommodation was wanting. The term of the corporation's management was again extended for twenty-one years, with powers to make another dock, and to erect a light-house for the benefit of the port; for these purposes they were authorised to borrow the sum of £25,000, and to raise the further sum of £2000 on the light-house duties. In 1794 the powers of all the former acts were enlarged, and the term extended to forty-one years, with liberty to make two additional docks and piers, and to borrow for this purpose £70,000. In 1799 an act was passed to alter and enlarge the powers of former acts, and to render the docks and the port more commodious and safe; by which a further extension of term was granted

for thirty years. The corporation again gave some lands, and they were empowered to make two additional docks, and other docks; with liberty to raise the sum of £120,000, and to double the former tolls.

Under the authority of these various acts of parliament the several docks have been constructed, and it has been found that each successive improvement, by affording additional convenience to foreign trade, has been followed by its increase, and prepared the way for the further extension of this excellent system of accommodation. In the course of the last century there were established within this port six wet and three dry docks, and five graving or repairing docks, independent of the Duke of Bridgewater's dock, for canal purposes. In the ten years, ending with 1808, the number of ships that entered these docks was 48,497, tonnage 4,954,204; and the dock duties received £329,566; in the following ten years, ending in 1818, the number of ships was 60,200, the tonnage 6,375,560, and the amount of duties £666,438. Hull, Bristol, and Leith, have successfully emulated this example.

In 1794 a general meeting of merchants was convened, to consider the great inconveniences of the port of London, arising from the crowded state of the river, and the confined extent of the legal quays; when a committee was appointed to consider of the best mode of relief, who took into consideration all the plans which had been suggested, when they approved of the plan for making *wet docks* in Wapping with wharfs and warehouses on their borders, as the most effectual means of remedying the evils of the port. In consequence of this determination, Mr. Daniel Alexander, an ingenious architect and surveyor, who was conversant with operations connected with the tide, was directed to make a survey, and prepare plans and estimates for forming docks at Wapping, with the addition of a cut or canal leading to them, from that part of Blackwall where the present East India docks are now situated, and a long line where the West India docks have been since constructed. The plan and estimates were laid before a meeting of merchants, held 22d December, 1795, and the sum of £800,000 subscribed towards their completion in a few hours. A committee was appointed to make application to parliament, who presented a petition in January 1796, which was referred to a select committee of the house of commons, who were directed 'to enquire into the best mode of providing sufficient accommodation for the increased trade and shipping of the port of London.' The project of the merchants experienced great opposition both from the corporation of the city of London and from private interests; and a great variety of plans and projects were brought forward for the extension of the legal quays above and below the bridge, and the improvement of the river with or without docks. At length, through the great exertions and perseverance of William Vaughan, esq. assisted by several other highly respectable mercantile characters, the various obstacles to the plan of the London docks were successively overcome, and in August, 1798,

the subscribers gave notice, that in the ensuing session of parliament they meant to renew their application for forming docks at Wapping. In December following they petitioned for leave to bring in a bill for this purpose. A few days after a petition was presented by the corporation of London, with a view to similar objects, by making a navigable canal or passage across the Isle of Dogs from Blackwall to Limehouse, purchasing the mooring-chains in the river, which were mostly private property, and appointing harbour-masters to regulate the navigating and mooring of vessels in the port; they also proposed to make wet-docks in some part of the Isle of Dogs for the reception and discharge of West India shipping. The latter part of the plan had, however, been taken up by a number of West India merchants and planters, who had formed themselves into a company distinct from the subscribers to the London docks, for the purpose of forming docks for the reception of the West India trade only, either alone, or in conjunction with the other improvements projected by the corporation. The general conviction of the necessity of some measure of this kind was not sufficient to produce a union of interests in favor of either of the proposed plans. At length the committee of the house of commons made a report, recommending the formation of wet-docks as the only remedy for the evils of the port, and that they should be made both at Wapping and the Isle of Dogs, but that the latter should be adopted first. The corporation and the West India merchants of London forming a junction, the act for making the West India docks passed in July, 1799. In the next session, on the 30th June, 1800, an act was passed for forming the docks at Wapping, which was followed by other acts for making docks at Blackwall for the East India trade.

The first stone of these last docks was laid on March 1805, and the first ship entered them in August, 1806. The dimensions of the dock for unloading, inwards, are 1410 feet in length, and 560 feet in width, containing about eighteen acres and one-eighth: the dock for loading outwards, which was a part of Mr. Perry's dock, is 780 feet in length, and 520 feet in width, containing nine acres and one-fourth. The extent of the entrance basin, which connects them with the river, is two acres and three-fourths; the length of the entrance lock 210 feet; the width of the gates forty-eight feet in the clear, and the depth of water at ordinary spring-tides twenty-four feet. The great West India dock is 420 yards in length, and 230 yards in width, covering an area of twenty acres. A basin of three acres nearly connects it with the river. The warehouses are most noble buildings: the tobacco warehouse is the most spacious erection of the kind in the world; being capable of containing 25,000 hogsheads of that article, and the vaults underneath as many pipes of wine. This single building, under one roof, is said to occupy upwards of four acres of ground. These docks were opened in February 1805.

The dry docks and slips of his majesty's yards have recently added to their other improvements, that greatest of the whole, the actual

covering or roofing in of vessels, a plan which seems to have been long since used at Wapping. Roofs have been thus constructed at Deptford of ninety-five feet span, without a single support, and one at Chatham, under the direction of Mr. Seppings, of 100 feet, and having an internal width of 150 feet.

The wicket-gate of docks, a contrivance resorted to where the abutments are too narrow for swinging gates, is represented below. Fig. 1 the plan; fig. 2 the elevation. It consists of three parts, which, when opened, are raised separately, and is the most simple, though means the most effective, contrivance for getting the water out.

Fig. 1.

Fig. 2.

We also give below a diagram of swinging gates, which open in the middle, and lie flat part against each wharf or side-wall of the dock, leading into the dock or basin. The frame of gate is made with sound timber, and lined with iron, of great strength, and the guides which the hinges turn, must be well secured to the abutments. The bottom of the panels of the gates, must be also perfectly parallel, to prevent leakage, and give ease in their opening and shutting. This is aided by rollers fixed in a groove, and is assisted by a small capstern on each pier. It is often placed a foot bridge with railing

In docking a ship formerly, if her keel required inspection or repair, it was found necessary to lift up her whole immense weight off the ground, but about twenty years ago, Mr. Seppings contrived a very simple and excellent machine, by which twenty men will suspend the ship in the navy, or, which amounts to the same thing, will disengage any vessel that may be required in the space of three minutes, without the necessity of moving her. This improvement may be thus

the keel; W the wedge on which the keel having its obtuse angle equal to  $170^{\circ}$ , and are two inclined planes, having each an angle of  $3^{\circ}$ . The wedge is of iron or wood, having its two sides lined with iron; the inclined planes are of cast iron. A few blows on the two sides of the inclined planes will disengage them, when the middle of the wedge drops.

**DOCK-YARDS**, in the navy, are magazines of stores, and timber for ship-building; the dock-yards in England are those at Chatham, Deptford, Pembroke, Plymouth, Portsmouth, Sheerness, and Woolwich. In time of war, ships of war are laid up in these docks, in ordinary; those of the first rates mostly at Chatham, where, and at other yards, they receive, in time to time, such repairs as are necessary. Chatham dock-yard consists of a line of wall, extending 5500 feet along the right bank of the Medway, being 400 feet in width at the upper end, at the lower end, and 1000 feet in the middle.

Its superficial area is about ninety acres. In front it has six building-slips of different sizes, and four dry-docks. At the southern extremity is the ropery, hemp, and yarn houses, long and general storehouses, 1000 feet in length, by about fifty in breadth; in front of which, along the wharf, are the anchor racks, nearly 100 feet long. Next to these are the slips and sheds, with the working sheds and artificers' shops in the rear, an excellent smithery, timber-rooms, deal and iron yard, seasoning sheds, &c. The commissioner's house and garden are in the middle, and, on the eastern extremity of the yard, officers' houses and gardens. The lower north-east part is occupied by mast-ponds, mast-houses and slips, store boat-houses and a ballast-wharf, timberbirths, and saw-pits. The river Medway forms the principal wet-dock or basin appertaining to this yard; and it is sometimes so shallow, and the navigation so difficult, that vessels are obliged to take in their stores and provisions at various different points of the river, a circumstance that often delays them here much longer than even at Deptford.

The improved saw-mill of Mr Brinell, erected in 1810, is supposed to be equal to the power of 1000 saw-pits, and one hundred sawyers; and is capable of supplying the dock-yards of Chatham and Sheerness with all their straight-sawn timber.

The greatest advantage of the plan is its application of the steam-engine to the management and arrangement of the timber, by which the labor and expense of a vast number of men are saved. See SAW-MILL.

In war the dock and ropery-yard of Chatham employed together about 2250 men.

Deptford yard has a front or wharf wall facing the Thames, of about 1700 feet in length, and the breadth of the yard 650 feet, and the superficial area about thirty acres. It has three slips for ships of the line, and two for smaller vessels on the face next the river, with a basin, wet-dock, 200 by 220 feet. Here are also two dry-docks, one of them a double dock, communicating with the Thames. The proximity of Deptford Dock-yard to the capital is a great convenience, and it became, during the last

war the general magazine of stores and necessaries for the fleet, whence they were transmitted as occasion required to the other yards, the out-ports, and foreign stations.

The great storehouse is a large quadrangular building surrounding a square, of three stories in height, with cellars underneath, for pitch, tar, rosin, &c. Its length is about 210 feet, but the sides vary in width from forty-six to twenty-four feet. Parallel to the west front is the rigging-house and sail-loft, 240 feet, and nearly fifty feet wide, in which all the rigging is fitted for ships and stowed away. On the eastern side is the pavilion, a long range of buildings, in which the beds, hammocks, and slop-clothing are kept, and in which also are the house-carpenters', the joiners', and wheelwrights' shops. This range is about 580 feet long by twenty-six feet wide. Other buildings are an excellent blacksmith's shop, plumbers', glaziers', and painters' shops, seasoning-sheds, store-cabins, saw-pits, mast-house and pond, boat-houses, mould-loft, timberbirths, besides houses and gardens, coach-houses and stabling, for the officers. The number of men employed here, in time of war, was about 1500, of whom about one-half were shipwrights. There were, besides, in constant employ, eighteen or twenty teams, of four horses each. Adjoining to the dock-yard is the victualling-yard, the most complete establishment of the kind in the kingdom. The principal naval stores kept at Deptford are small cordage, canvas and ship sails, hammocks, beds and hair for beds, slops and marine clothing, and anchors under the weight of about seventy-five cwt.

Pembroke dock-yard was a small establishment for the building of vessels undertaken at the close of the war. It contains an area of sixty acres, ascending from the southern shore of Milford Haven, about two miles from the town of Pembroke. Here are two dry-docks and twelve building-slips which are built of wood on a limestone foundation. There have never been above 500 hands employed here.

Plymouth dock-yard extends along the shores of Hamoaze, in a circular sweep of 3500 feet, its width about the middle being 1600, and at each extremity 1000 feet. Its superficial area is about ninety-six acres. In the front towards the harbour are two dry-docks for ships of the first rate, a double dock for seventy-four gun ships, communicating with Hamoaze, and another dock for ships of the line, opening into the basin, which is 250 feet long by 180 feet wide. There is also a graving dock without gates, and a canal or camber, similar to that in Portsmouth yard, for the admission of vessels bringing stores. This, communicating with the boat-pond, cuts the dock-yard nearly into two parts. Five jetties project from the entrances of the dry-docks into Hamoaze, along side of which ships are brought to be undocked. These are situated between the centre and the northern extremity of the harbour line. On the south are three building-slips for the largest class of ships, and two for smaller vessels, the smithery, the outer mast-pond and mast-houses, timberbirths, and saw-pits. Higher up on this end is an extensive mast-pond and mast-locks, with

plank-houses over them; and above these three hemp magazines, close to which is the noble ropery of this establishment, consisting of two ranges of buildings, one the laying-house, the other the spinning-house, each being 1200 feet in length, and three stories high. No wood has been used in the construction of the rope-house, excepting the shingles of the roof, to which the slates are fastened. All the rest is of iron; so that the whole building is considered as fire-proof.

The northern part of the yard, besides the docks and basin, working sheds and artificers' shops, contains a quadrangle of elegant stone buildings, the longer sides being about 450 feet, and the shorter 300 feet. Within are also two new ranges of magazines, built principally with iron instead of wood. The upper and northern part of the yard is occupied by a range of handsome houses, with good gardens, for the commissioner and principal officers of the yard, the chapel, guard-house, pay-office, stabling for the officers and teams, and a fine reservoir of fresh water. Plymouth is an excellent refitting yard, and employed, during the war, upwards of 3000 hands of various descriptions. Here, as at Portsmouth, is an unconnected victualling establishment.

In the time of Edward VI. *Portsmouth* was the only dock-yard that could be considered as a national one; indeed it was almost the only naval station in England. All the ships in the public service, amounting to fifty-three in number, lay in this port, with the exception of three, two of which lay at Deptford and one at Woolwich. The crews belonging to these vessels, including soldiers, marines, and gunners, did not amount to 8000 men; yet, from such beginnings has the naval power of England risen to a height unparalleled in history. Edward, sensible of the great consequence of this port to the future glory of his kingdom, augmented its fortifications by the addition of two strong castles. But *Portsea* has the advantage of having both the dock-yard and gun-wharf within its precincts.

The former is entered from the town by a lofty gateway, after passing which the first objects that attract attention, are the porter's residence, the mast-house, and a large modern guard-house. A little further on stands the pay office; and beyond it is the royal naval academy, which consists of a centre and two wings. This building is furnished with every requisite accommodation for naval instruction, and has an excellent observatory on its summit. The commissioner's house next appears, and to it succeeds an immense range of store-houses, to the right of which is a handsome modern chapel; thence a visitor is generally conducted through the anchor-wharf, where hundreds of anchors of every size and description are piled up ready for immediate service; then to the rope-house, a spacious pile three stories high, fifty-four feet broad, and 1094 feet long. Here the cables are formed with immense labor; but of late years the operation is much facilitated by the use of machinery. The operations in this division of the yard are particularly ingenious and highly interesting. Leaving it, and passing various store-houses, stables, and other buildings, and

many vast piles of timber for the wharf-  
yard, a sort of square presents itself  
and displays in its centre a statue of William III  
in a Roman habit. On the east side of  
the square is a row of handsome houses appropriated  
for the residence of the chief officers of the dock,  
and on the north and south sides are the  
offices, store-houses, &c. Proceeding  
the next impressing object that arrests at-  
tention is the vast building called the an-  
chor-house, and, on entering it, both the eye and ear are  
struck by the terrific noise and confusion, which  
spread throughout this volcanic whole  
of the anchors which are here wrought  
from seventy to ninety tons each.

Approaching nearer the harbour the beholds, in time of war, numerous the stocks, either building or repaired jetty heads, with the basins and docks in order, and, with the shipping to present a very grand and imposing scene which the extraordinary capacities and range of docks greatly contributes to. These works are all peculiarly adapted to respective purposes, and while the ships under repair are kept completely dry; but in the immediate vicinity, the depth of water is sufficient to float the largest vessels in the world. Many other parts of this celebrated arsenal particularly the rigging houses, claim the nation of the curious. The number of workmen employed in this dock-yard is very great and varies considerably. In time of peace not fewer than 2000 are kept at constant work in different departments. Here, as at Plymouth, workmen receive sixpence a day as a compensation for their former perquisite of chips.

The sea-wall of this yard extends from east to south about 3800 feet, and has a mean depth of about 2000 feet. The area enclosed is about 100 acres. The great basin, into which enter four fine dry-docks, is 380 feet in length by 200, and contains an area of two acres and one-half. Here are two docks, at the ends, opening into the harbour; the whole six being capable of receiving vessels of the largest dimensions. Here is a camber, with a wharf-wall on each side 600 feet in length, and of sufficient width to admit of transports and merchant-ships bringing up to the yard. In the same face of the yard are three building-slips capable of receiving the largest ships; a small one for sloops; two building-slips for frigates on the northern face of the yard, and a smaller slip for sloops. The range of store-houses on the north-east side, and the roping-house and sail-loft on the south-west side of the camber, are magnificent buildings. The two hemp-houses and the two sea-store-houses occupy a line of building which extends 800 feet. The rope-house, tarring-house, and other appendages of the ropery, are on the same scale. The two sets of quadrangular store-houses, and the two corresponding buildings, with the intervening timber-buths and saw-pits, at the head of the dry-docks, issuing from the great basin, are also all excellent. The smithery is on a large scale, and close by is an iron-mill, a copper-mill, and a copper refinery, at which is remelted and refined all the old copper which is taken from ships.

bottoms: here, also, are cast bolts, gudgeons, and various articles of copper used in the navy. The number of sheets manufactured in one year of the war amounted to about 300,000, weighing above 12,000 tons.

The *Wood Mills* are at the head of the north dock, at which every article of turnery, rabbiting, &c., is made for the use of the navy. The principal part of these mills is the machinery for making blocks contrived by Mr. Brunell. See *an article BLOCK-MACHINERY*.

Notwithstanding that every precaution that can be devised is taken, to guard against the destructive element of fire, three great conflagrations have occurred in this dock-yard since the year 1760. The first, which appears to have been accidental, broke out in the night of the 1st of July, 1761, and raged for a long time with dreadful fury. The night had been extremely tempestuous; and the fire was attributed to the lightning striking upon the hemp store-house, the windows of which had been left open to air it. By this conflagration many hundred tons of tar, 500 tons of cordage, 700 sails, and 1650 tons of hemp, were totally consumed. The second fire occurred on the morning of the 27th of July, 1770, when the damage done was still greater; and it was even for some time doubtful whether any part of the yard would escape destruction. From its bursting forth at different places at one time, and various other circumstances, great suspicions were entertained of its having been occasioned intentionally, but the officers were unable to discover the offenders. The third fire happened on the 7th of December, 1776, and in this instance was undoubtedly the effect of design, as the incendiary was traced, used, condemned, and executed, upon incontrovertible proof, afterwards confirmed by his own confession. The real name of this malefactor was John Aitken; but the appellation by which he is commonly known is that of 'Jack the Painter.' He is supposed to have acted under foreign influence, and had previously attempted to destroy the docks at Plymouth and Bristol, but failed in both those attempts, though he excited very considerable alarm. His plans were laid with great sagacity and forethought; and, in order the more effectually to ensure their success and avoid suspicion, he had invented a very ingenious machine, which he contrived to lodge among the cordage over night, and setting fire to it left it, and passed out of the gates in the morning unmolested. In the course of the same day the fire broke out, as it luckily happened, several hours before the incendiary had purposed, for, had it not begun to display itself till after the fall of night, the destruction would probably have been much greater than it was. The immediate and effective assistance which was given to check the progress of the flames, and the favorable direction of the wind, confined the damage to the rope-house, and a few adjoining store-houses. The incendiary immediately quitted Portsmouth, but was apprehended about two months afterwards, and, his villainy being distinctly traced, he suffered the penalty of the law on the 7th of March, 1777, having previously made all the reparation to his country in his power, by pointing

out some effectual measures for securing the dock-yards from similar attempts.

Portsmouth dock-yard, during the war, employed above 4000 workmen, of whom about 1500 were shipwrights and caulkers; 500 joiners and house-carpenters; the smiths nearly 200; the sawyers 250; the riggers 200; other laborers about 700; and the ropers 350.

Sheerness dock-yard is situated on the island of Sheppey, on a point of land composed of sand and mud, brought from the sea on the one side and down the Medway on the other. It commands the mouths of both this river and the Thames. Till a short time ago this was a very unhealthy and disagreeable place, and as a dock-yard totally destitute of convenience or arrangement. The whole premises of the dock-yard, indeed, divided among wharfs and buildings belonging to the ordnance department, did not exceed fifteen acres of ground. It had at this period only two small inconvenient docks for frigates or small vessels. These inconveniences of Sheerness suggested at one time an extensive project for a new naval arsenal at Northfleet, but a committee of engineers and others being appointed to report on the possibility of improving this station, among whom were Watt, Hoddart, and Jessop, their plan was afterwards examined, and some improvements suggested in it by Mr. Rennie. The first stone of a new establishment was laid on the 19th of August, 1814. This plan embraced the addition of nineteen acres to the area of the dock-yard, on the west shore of the Medway; the construction of a wet-dock or basin 520 feet long by 300 feet in width, entered by a lock from the Medway; the erection of three dry-docks on the east side of this basin; the enclosure of Major's marsh, as a further addition of ten to twelve acres of area; and the construction of store and mast houses, mast-ponds, a smithery, governor's and officers' houses, as at the other royal yards. The whole area of the new yard is about fifty acres.

We come, lastly, to the most ancient of our dock-yards, that at *Woolwich*. This occupies a frontage to the Thames 3300 feet; the breadth extends irregularly from 250 to 750 feet: the whole enclosed area being about thirty-six acres. It has five slips, which open into the river, three of which are for ships of the line, one for frigates, and one for small vessels. It has likewise three dry-docks, one double and one single dock; all of these are capable of receiving ships of the line.

Woolwich yard has produced some of the largest and finest ships in the navy, and is chiefly important as a building yard; but of late years the increasing shallowness of the river, and the immense accumulation of mud, which is often found in a few weeks to block up all the entrances into the docks and slips, has much injured it. In the Eighth Report of the Select Committee on Finance (1818) it is stated, that 'the wharf wall at Woolwich, owing to the action of the tide on the foundation, is in a falling state, and in danger of being swept into the river, it being secured only in a temporary manner, and requiring to be immediately rebuilt in a direction that will preserve it from similar injury hereafter.' This re-

commendation has been acted upon; but the works are as yet, we believe, incomplete.

The new mast-houses and mast-slip, the new mast-ponds, and the houses here for stowing yards, topmasts, &c., with the locks under them, are all excellent. The timber births are also well arranged, and the addition lately made to the western extremity of the yard will allow the stacking and classing of several thousand loads of timber.

The present situation of the ropery, at a distance from the yard, is very inconvenient: but it is of good dimensions, being 180 fathoms long, and having store room for 2000 tons of hemp and 6000 barrels of pitch and tar. The process of tarring, or passing the yards through heated tar, and then drawing them through apertures in an iron plate, is here performed by four horses. The laying of a cable of twenty-two or twenty-three inches is performed by the labor of 170 or 180 men, and requires upwards of an hour of the most severe exertion of strength, especially on the part of those who are stationed at the cranks. Woolwich dock-yard is pretty complete in its work-shops, store-cabins, offices for the clerks, houses and gardens for the commissioner and principal officers. The number of men employed during the war amounted to about 1800, of whom nearly 1100 were shipwrights and artificers. The spinners, knitters, layers, laborers, &c., in the ropery, were about 260. Upwards of twenty teams of horses were also employed here daily.

Henry VIII. first established a royal dock-yard at Woolwich; where it appears that the *Harry Grace de Dieu*, of 1000 tons, was built in 1512. This ship is stated to have been in length 128 feet, and in breadth forty-eight feet: she had three flush decks, a fore-castle, half-deck, quarter-deck, and round-house, and carried 176 pieces of ordnance: she had eleven anchors, the largest of which weighed 4400lbs. M. Dupin, who regarded all our establishments with the eye both of a man of science and of a jealous rival, says of our present ship-building: 'The English ships of war, with all the improvements which we have just made known, are superior to French ships of war, 1st. As fabrics that are solid, durable, and, as preserving their form, nearly unchangeable; 2d. As military machines, without any weak points, being capable, within the same space, to discharge a mass of fire much more considerable; and nevertheless to exercise more at ease this accumulated artillery; 3d. As habitable fabrics. They have banished from these ships of war the fantastical mixture of mean and highly finished ornaments, of a species of decoration more suited for dwelling houses, and fit only to degrade the austere beauties of naval architecture. They have banished all those refinements of bad taste; refinements which always produced a most miserable effect, which, nevertheless, giving to the exterior an air of luxury and magnificence, encourage naval officers to expend in the interior a still greater degree of luxury; in short, which pervert from its purpose a floating fortress, by changing it into a furnished hotel, supported at a great expense to the nation.' tom. i. p. 165.

The officers of an established dock-yard are, 1. The commissioner. 2. The master attendant. 3. The master shipwright. 4. The clerk of the check. 5. The store-keeper. 6. The clerk of the survey; to which have recently been added the subordinate officers of timber-master, and the master measurer. There are besides several assistants to the master attendant and master shipwright, foremen, sub-measurers, quartermen, and converters, surgeon, chaplain, boatswain, warden, &c. The establishment at Portsmouth, which will convey an idea of the others, consisted, at the close of the war, of—

1. The commissioner, having a salary of £1100 a year (all others £1000); three clerks with salaries from £400 to £120.
2. Two masters attendant, one at £650, the other at £500 a year; one clerk to both.
3. Master shipwright, £720 a year; three clerks from £300 to £120.
4. Clerk of the check, salary £600; eight clerks from £400 to £80.
5. Storekeeper, salary £600 a year; twelve clerks from £400 to £80.
6. Clerk of the survey, £500; eight clerks from £400 to £80.
7. Clerk of the rope-yard, £350; one clerk.
8. Engineer and mechanist, £600 (at Portsmouth only), with a draughtsman; one clerk.
9. Timber-master, salary £500; seven clerks from £250 to £80.
10. Three assistants to the master attendant at £220 each; one assistant to the timber-master, £200; three assistants to the master shipwright, £400 each.
11. The master-measurer, £250 a year; ten clerks from £200 to £80.
12. Thirty-five foremen, from £250 to £90 each.
13. Sub-measurers, quartermen, and converters, from £180 to £160 each.
14. The master mast-maker, sail-maker, boat-builder, joiner, house carpenter, bricklayer, smith, rope-maker, rigger, painter (wood-metal), metal-mills, mill-wright, at Portsmouth only, with salaries each, from £260 to £200 a year.
15. Twenty-two cabin-keepers from £160 to £60 each.
16. A surgeon, £500; assistant, £200.
17. Chaplain, £500.
18. Boatswain, £250.
19. Warden of the gate, £200.

Watchmen, warders, and rounders.

The total amount of the salaries paid to the above mentioned officers in the year 1817, in Portsmouth yard alone, was £50,065. See *Estimates of the Ordinary of the Navy, 1817*.

According to the above estimates the expenses of the principal of these establishments in 1817 were as follow:

Deptford dock-yard	£27,582	0	0
Woolwich ditto	32,440	12	0
Chatham ditto	36,843	10	0
Sheerness ditto	26,440	6	0
Portsmouth ditto	50,065	5	0
Plymouth ditto	45,209	13	0

See *Navy*.

DOCKUM, a town of the Netherlands, in Friesland, seated at the mouth of a canal which

at high water brings up large vessels. It has a good harbour, built in 1248, by Ulbo, duke of Friesland. The town is very well built, and fortified by ramparts and bastions. It is ten miles north-east of Lewarden, and thirty-three west of Deltzyl. Population 3100. The trade is in salt, cheese, and butter.

DOCTOR, *n. s. & v. a.* } Fr. *docteur*; Sp. *doctor*; and Port. *dotor*; }  
DOCTORAL, *adj.* } Ital. *dottore*; Lat. *doctor*, from *doceo*, }  
DOCTORATE, *n. s.* } to teach. See DO- }  
CTORSHIP.

CILE. He who teaches in any faculty; hence, one who has taken a high degree in the learned professions, and is an able or skilful man, generally. The verb is a low word derived from the noun. Doctorate and doctorship are the degree or rank of a doctor.

And prophetis and *doctouris* weren in the church that was at Antioche. *Wiclif. Dedis. 13.*

No woman had it, but a civil doctor,  
Who did refuse three thousand ducats of me,  
And begged the ring.

*Shakespeare. Merchant of Venice.*

By medicine life may be prolonged, yet death  
Will seize the doctor too. *Id. Cymbeline.*

Changing hands without changing measures, as if  
a drunkard in a drosy should change his doctors,  
and not his diet. *Saville.*

The physicians resorted to him to touch his pulse,  
and consider of his disease doctorally at their depart-  
ure. *Hakewill.*

From a scholar he became a fellow, and then the  
president of the college, after he had received all the  
graces and degrees, the proctorship and the doctor-  
ship. *Clarendon.*

Then subtle doctors scriptures made their pride,  
Cassists, like cocks, struck out each other's eyes.  
*Denham.*

To 'pothecaries let the learned prescribe,  
That man may die without a double bribe;  
Let them bat under their superiors kill,  
When doctors first have signed the bloody bill.  
*Dryden.*

He that can cure by recreation, and make pleasure  
the vehicle of health, is a doctor at it in good earnest  
*Collier.*

In truth, nine parts in ten of those who recovered,  
owed their lives to the strength of nature and a good  
constitution, while such one happened to be the  
doctor. *Swift.*

I thank you, my dear Lord, for your congratulations  
on my advancement to the doctorate; though I doubt  
it will seem a little incongruous in me to combat the  
scarlet whore in her own vestments. *Bp. Hurd.*

DOCTOR, *Διδασκαλος*, in the Greek church, is a particular officer appointed to interpret part of the Scriptures: he who interprets the gospels is called doctor of the gospels; he who interprets St. Paul's epistles doctor of the apostle; he who interprets the psalms doctor of the psalter.

DOCTOR is also an appellation adjoined to several specific epithets, expressing the merit of some of the schoolmen: thus, Alexander Hales is called the irrefragable doctor; Thomas Aquinas, the angelic doctor; St. Bonaventure, the seraphic doctor; John Duns Scotus, the subtle doctor;

Raimond Lully, the illuminated doctor; Roger Bacon, the admirable doctor, &c.

DOCTOR OF THE CHURCH, a title given to certain fathers whose doctrines and opinions have been the most generally followed and authorised. Of these there are four of the Greek church, and three of the Latin. The first are St. Athanasius, St. Basil, St. Gregory Nazianzen, and St. Chrysostom. The latter are St. Jerome, St. Augustine, and Gregory the Great. In the Roman breviary there is a particular office for the doctors. It only differs from that of the confessors, by the anthem of the Magnificat, and the lessons.

DOCTOR OF THE LAW, a title of honor among the Jews. The investiture of this order was performed by putting a key and table book in their hands; which is what some authors imagine our Saviour alluded to, when, speaking of the doctors of the law (Luke xi. 52), he says, 'Woe unto you doctors of the law, for you have taken away the key of knowledge: you entered not in yourselves, and them that were entering you hindered.'

The establishment of the doctorate, such as now in use among us, is ordinarily attributed to Irnerius, who himself drew up the formulary. The first ceremony of this kind was performed at Bologna, in the person of Bulgarus, who began to profess the Roman law, and on that occasion was solemnly promoted to the doctorate, i. e. installed juris utriusque doctor. But the custom was soon transferred from the faculty of law to that of theology; the first instance whereof was given in the university of Paris, where Peter Lombard and Gilbert de la Portree, the two chief divines of those days, were created doctors in theology, *sacre theologie* doctors. Spelman takes the title of doctor not to have commenced till after the publication of Lombard's sentences, about 1140, and affirms, that such as explained that work to their scholars were the first that had the appellation of doctors. Others go much higher, and hold Bede to have been the first doctor at Cambridge, and John de Beverly at Oxford, which last died A. D. 721. But Spelman will not allow doctor to have been the name of any title or degree in England, till the reign of king John, about 1207. By stat. 37, Hen. VIII. c. 17, sect. 4, a doctor of the civil law may exercise ecclesiastical jurisdiction, though a layman.

To pass D. D. at Oxford, it is necessary for the candidate to have been four years bachelor of divinity. For LL. D. he must have been seven years in the university; to commence LL. B. five years, after which he may be admitted doctor. Otherwise, in three years after taking the degree of M. A., he may take the degree of LL. B., and in four years more that of LL. D., which method and time are likewise required to obtain the degree of M. D. At Cambridge, to take the degree of D. D., it is requisite that the candidate have been seven years B. D., though in several of the colleges the taking of the bachelor's degree is dispensed with, and they may go out *per saltum*. To commence LL. D. the candidate must have been five years LL. B., or seven M. A. To pass M. D. he must have been five years B. D., or seven years M. A.

**DOCTRINE**, *n. s.* } *Fr. doctrine; Ital.*  
**DOCTRINAT**, *adj. & n. s.* } *Span. and Port.*  
**DOCTRINALLY**, *adv.* } *dottrina; Lat. doc-*  
*trina, from doceo, doctus, to teach. See DOCTRE.*  
 Principles or propositions taught; the act of teaching: doctrinal has been formerly used synonymously. As an adjective it signifies relating to, or containing doctrine; and doctrinally is the corresponding adverb.

Whiche things we spoken also not in wise wordis of manny's wisdom, but in the doctrine of the spyryt, and maken a liknesse of spyritual thingis to goostli men. *Wiclif. 1 Cor. ii.*

He said unto them in his doctrine.

*Mark iv.*

To make new articles of faith and doctrine, no man thinketh it lawfull: new laws of government, what church or commonwealth is there which maketh not, either at one time or other? *Hooker.*

What special property or quality is that, which, being no where found but in sermons, maketh them effectual to save souls, and leaveth all other doctrinal means besides destitute of vital efficacy? *Id.*

Humility is a virtue all preach, none practise, and yet every body is content to hear. The master thinks it good doctrine for his servant, the laity for the clergy, and the clergy for the laity. *Selden.*

Not such as assent to every word in scripture, can be said in doctrinals to deny Christ. *South.*

Scripture accommodates itself to common opinions, and employs the usual forms of speech, without delivering any thing doctrinally concerning these points. *Ray.*

Ye are the sons of clergy, who bring all their doctrines fairly to the light, and invite men with freedom to examine them. *Atterbury.*

That great principle in natural philosophy is the doctrine of gravitation, or mutual tendency of bodies toward each other.

*Watts's Improvement of the Mind.*

Spirits and doctrines therefore may be considered, the latter word as explanatory of the former: and error sometimes signifying idolatry, erroneous doctrines may comprehend idolatrous, as well as false doctrines. *Bp. Newton.*

**DOCUMENT**, *n. s.* } *Fr. document; Ital.*  
**DOCUMENT'AL**, *adj.* } *Span. and Port. docu-*  
*mento; Lat. documentum, from doceo, docui, to*  
*teach. The thing taught: precept; instruction.*  
 Hence written evidence in law.

It is a most necessary instruction and document for them, that as their majesty made them dispensators of her favour, so it becometh them to shew themselves equal distributors. *Bacon.*

It is not unnecessary to digest the documents of cracking authors into several classes.

*Harvey on Consumption.*

Gentle insinuations pierce, as oil is the most penetrating of all liquors; but in magisterial documents men think themselves attached, and stand upon their guard. *Government of the Tongue.*

Learners should not be too much crowded with a heap or multitude of documents or ideas at one time. *Watts.*

**DOD** (John), a puritan divine, was born at Shotledge in Cheshire, in 1547. He became fellow of Jesus College, Cambridge, and was ap-

pointed minister of Hanwell, in Oxfordshire, whence he removed to Fenny Compton, near Cannons Ashby, in Northamptonshire. In 1624 he was presented to the living of Ley, in the same county, where he died in 1677. He wrote, 1. An Exposition of the Ten Commandments, 4to., which work procured him the title of the Decalogist; 2. An Exposition of the Book of Proverbs, 4to.

**DODART** (Denis), a regent of the faculty of medicine at Paris, was born in that city in 1660. He had an exquisite taste for music and painting, and was in high esteem at court as a physician. He was a member of the Academy of Sciences, and wrote *Memoires pour servir a l'histoire naturelle des Plantes*; and a curious work, entitled *Metaphysica Statica Gallica*. He died in 1707. His son, Claude John Baptiste Dodart, became physician to Louis XV., and died in 1730.

**DODARTIA**, in botany, a genus of the class monoglossia, and didynamia class of the natural order fortieth, personate: *calycis* 5-dentate: *con.* under lip twice as long as the tube: *upper:* caps. bilocular and globose. *Spain, natives of Palestine.*

**DODBROOK**, a market town and parish in Devonshire, fifteen miles south-west from Exeter, and 207 W.S.W. from London. It is noted as being the first place where white wine was brewed, of which the rector claims the privilege. The lieu thereof receives 10d. from each householder. Market, third Wednesday in every month.

**DODD** (Charles), a Roman catholic divine, was born at Harvington in Worcestershire, where he died in 1745. He wrote *The Church of England*, 3 vols. folio, printed at Bristol in 1737 to 1742.

**DODD**, (Dr. William), an unfortunate English divine, born in 1729. He was educated at Cambridge. In 1749 or 1750 he took the degree of B.A. with considerable honor. At that university, he married in 1751; was made a deacon the same year; priest in 1753, and became a celebrated preacher. His first appointment was the lectureship of Westgate Street, in 1754 he was also chosen lecturer of St. Hart-Street; and in 1757 took the degree of M.A. at Cambridge. On the establishment of the Magdalen Hospital in 1758, he was chosen a supporter of that charity, and soon became preacher at the chapel. By the death of bishop Squire, he, in 1663, obtained the benefice of Brecon, and, by the interest of friends, was appointed one of the lay prebendaries; soon after which he had the education of the earl of Chesterfield, and he went to Cambridge and took the degree of LL.D. Impatient for further advancement, he adopted measures which eventually ruined him. On the living of St. George's Church, Square, becoming vacant, he wrote a famous letter to the lord chancellor's clerk, offering 3000 guineas if by her assistance he was promoted to it. This being traced to him, he was immediately made to the king, and was dismissed with disgrace from his office of chaplain. From this period he lived in poverty, if not despoised; and his extravagant

being, he became involved in difficulties, which compelled him to forge a bond from his late pupil Lord Chesterfield, February 4th, 1777, for £4200, which he actually received; but, being detected, was tried at the Old Bailey, found guilty, and received sentence of death. Notwithstanding numerous and, we believe, unprecedented applications for mercy, he was executed at Tyburn, June 27th, 1777. Dr. Dodd was a voluminous writer and compiler. He published a Commentary on the Bible, 3 vols. folio; Sermons on Young Men, 3 vols. 12mo.; Reflections on Death, 12mo.; The Visitor, a periodical paper, 2 vols. 12mo.; Sermons on the Miracles and Parables, 4 vols. 8vo.; Several Poems and Miscellaneous Pieces; and lastly, he left for the press Thoughts in Prison.

**DODD** (Ralph), a civil engineer, the original projector of a tunnel under the Thames, and various other public works of importance. In 1795, he published an Account of the principal Canals in the known World, with Reflections on the great Utility of Canals. In 1798, he laid before the public his plan for a tunnel under the Thames, which was approved by government; but the scheme was abandoned soon after its commencement. He had also a share in the improvement of steam vessels; and the first impetus to the scheme for navigating by steam in England was given by a patent which he obtained for a steam-boat on the Thames, from London to Gravesend, which, however, was not carried into effect. He afterwards navigated, in a steam-boat, round the coasts of England and Ireland. He died at Cheltenham, in April, 1832.

**DODDER**, *n. s. & v. a.* } According to

**DODDERED**, *adj.* } Skinner from Dut. *dodderen*, to shoot up; but Mr. Thomson says, from (Goth. *daudi*); Teut. *todter*, the slayer, because injurious to corn and flax. A plant. See the extract from Hill. The verb is derived from the noun. Doddered is overspread; dodder, weaknesses.

**DODDRIDGE** (Philip), D. D., an eminent Independent minister, born in London, 1702. Having completed the study of the classics, he was, in 1719, placed under the tuition of the Rev. John Jennings, who kept an academy at Kibworth in Leicestershire. He was first settled as a minister at Kibworth, where he preached to a small congregation of the Independent persuasion; but, on Mr. Jennings's death, succeeded to the care of his academy; and soon after was chosen minister by a large congregation at Northampton, to which he removed, and where the number of his pupils increased. He instructed them with the freedom and tenderness of a father; and never desired that they should blindly follow his sentiments. He checked every appearance of bigotry and uncharitableness. Yet while thus liberal to the opinions of others, he refused a very handsome offer of patronage made him by the duchess of Bedford, on condition of entering the church of England. He died at Lisbon, whether he went for the recovery of his health, in 1751. He wrote, 1. Free Thoughts on the most probable means of reviving the Dissenting Interest; 2. The Life of Colonel James Gardiner;

3. Sermons on the Education of Children; 4. The Rise and Progress of Religion in the Soul; 5. The Family Expositor, in 6 vols. 4to., &c.; of which several of the prelates of the church have spoken highly. Among others, the late bishop of Durham observes:—'In reading the New Testament, I recommend Doddridge's Family Expositor, as an impartial interpreter, and faithful monitor. Other expositions and commentaries might be mentioned greatly to the honor of their respective authors, for their several excellencies; such as, elegance of composition, acuteness of illustration, and copiousness of erudition; but I know of no expositor, who unites so many advantages as Doddridge; whether you regard the solidity of his version, the fulness and perspicuity of his composition, the utility of his general and historical information, the impartiality of his doctrinal comments, or, lastly, the piety and pastoral earnestness of his moral and religious applications.' Since the author's death a volume of his Hymns has been published, and his Theological Lectures. Several of his works have been translated into Dutch, German, and French.

**DODECAGON**, *n. s.* *δωδεκα* and *γωνία*. A figure of twelve sides.

**DODECAGON**, a regular polygon of twelve equal sides and angles. If the side of a dodecagon be 1, its area will be equal to 3 times the tan. of  $75^\circ = 3 \times 2 + \sqrt{3} = 11.1961524$  nearly; and, the areas of plane figures being as the squares of their sides, therefore 11.1961524 multiplied by the square of the side of any dodecagon, will give its area.

**DODECAGYNIA**; from *δωδεκα*, twelve, and *γυνή*, a woman; the fifth order in the class dodecandria; consisting of plants, which, along with the general characteristics of the class, have twelve female organs. See **BOTANY**.

**DODECAHEDRON**, in geometry, one of the Platonic bodies, or regular solids, contained under twelve equal and regular pentagons.

**DODECANDRIA**; from *δωδεκα*, twelve, and *ανδρ*, a man; the eleventh class in Linnæus's sexual system, consisting of plants with hermaphrodite flowers, that have twelve male organs. It is not, however, limited to this number. Many genera have sixteen, eighteen, and even nineteen stamens. The essential character is, that the stamens, however numerous, are inserted into the receptacle. See **BOTANY**.

**DODECAS**, in botany, a genus of the trigynia order, and dodecandria class of plants: *cal.* half quadrifid, having the corolla above; *con.* quinquefid; *caps.* unilocular, conjoined with the calyx. Species one only, a Surinam shrub.

**DEDECATEMORION**, *n. s.* *δωδεκαετηριον*. The twelfth part.

This *dodecatemorion* thus described:

Thrice ten degrees, which every sign contains,  
Let twelve exhaust, that not one part remains;  
It follows straight, that every twelfth confines  
Two whole and one half portion of the signs.

*Cresch.*

**DODECATHEON**, in botany, *meadia*; a genus of the monogynia order, and pentandria class of plants; natural order twenty-first, *precis*:

cont. verticillated and reflexed: STAM. placed in the tube: CAPS. unilocular and oblong. Species one only, a native of Virginia, with leaves like a lettuce, but bearing beautiful flowers somewhat resembling a cowslip.

**DODGE**, *v. n.* Dr. Johnson says from a corruption of dog, but more probably from Teut. *ducken*, *dongen*, to conceal. To deal craftily; shift place so as to hide; treat capriciously.

**DODINGTON** (George Bubb, lord Melcombe Regis), was the son of a gentleman of fortune; or, as others say, of an apothecary, named Bubb, who married into a wealthy family, in Dorsetshire. He was born in 1691, was elected member of parliament for Winchelsea, in 1715, and was soon after appointed envoy to the court of Spain. In 1720, by the death of his maternal uncle, he came into possession of a large estate, and took the surname of Dodington. In 1724, having closely connected himself with Sir Robert Walpole, he was appointed a lord of the treasury, and became clerk of the pells in Ireland. He afterwards joined the opposition, and, on the fall of Walpole, became treasurer of the navy. This party he also quitted, in order to lead the opposition under Frederic, prince of Wales, whose death for some time arrested his career. In 1755, he accepted his former post of treasurer of the navy, under the duke of Newcastle, but lost it the following year. On the accession of George III., he was early received into the confidence of lord Bute; and, in 1761, was advanced to the peerage by the title of lord Melcombe, and died the following year. This versatile politician was generous, magnificent, and convivial in private life, and the patron and friend of Young, Thomson, Glover, Fielding, Bentley, Voltaire, Lyttelton, and Chesterfield, who, with many of meaner pretensions, mingled at his hospitable table. He is best known by his celebrated Diary, published in 1784, by Henry Peruiddock Wyndham, Esq. A more curious exposition of avarice, vanity, servility, and selfishness, as a place-hunter and trading politician, has seldom been exhibited.

**DODKIN**, *n. s.* Dut. *duythen*. A doinkin or little doit; a contemptuous name for a low coin.

**DODMAN**, *n. s.* The name of a fish.

**DODO**, in ornithology. See **DIPOUS**.

**DODONA**, a town of Thesprotia in Epirus, or, as some say, in Thessaly. There was in its neighbourhood a celebrated oracle of Jupiter. The town and temple of the god were first built by Deucalion, after the general deluge. It was supposed to be the most ancient oracle of all Greece; and according to the traditions of the Egyptians, mentioned by Herodotus, it was founded in consequence of an oracular message by a dove. Two black doves, he says, took their flight from the city of Thebes in Egypt; one of which flew to the temple of Jupiter Ammon, and the other to Dodona, where with a human voice they acquainted the inhabitants that Jupiter had consecrated the ground, which in future would give oracles. This fable might have been founded on the double meaning of the word *rethnai*, which signifies doves in most parts of Greece, while in a dialect of the Epirots it

implies old women. In ancient times the oracles were delivered by the murmuring of a neighbouring fountain; but the custom was afterwards changed. Large kettles were suspended by a chain near a brazen statue, which held a lake in its hand. When the wind blew strong, the water was agitated, and struck against one of the kettles, which communicated the motion to the rest, and raised the clattering and din, which continued for a while, and from which an artifice of the priests drew the predictions. The ship Argo was built with wood of the same kind as Dodona, and some of the beams, it is said, were oracles to the Argonauts, and warned them against the approach of calamity. Within the forest of Dodona there was a miraculous tree, and a fountain of cool water, which had the power of lighting a torch as soon as it touched it. This fountain was totally dry at one time, and was restored to its full course at another, from which time till the following moon stops to decrease, and at the usual hour was again deprived of its waters. The oracles of Dodona were generally delivered by women. No trace of this town has been discovered in modern times, but in Mount Tomarus, there is a forest of an extent, spreading far to the westward, which seems to answer to the site. In the higher part where the oak does not thrive, there are immense ranges of pines and firs. Dr. Holland, one of the latest travellers in Albania, when descending the city of Ioannina, enters into the long and overgrown point of the site of Dodona, which he endeavours to fix between Thesprotia and Molossia. Strabo distinctly says, that it belonged at first to the Thesprotians, and afterwards to the Molossians. And we are not aware of its ever been assigned by any writers of the same name to these two different nations at the same time. It is singular that Dr. Holland should have overlooked one proof of the opinion supposed of him, as it occurs in the very passage of Iphigeneia, to which he refers in the note to *Æschylus* speaks of Io going to the Molossian plains and the temple of Thesprotian Jove.

ἰστέ γὰρ ἤλθες πρὸς Μολοσσᾶ γένεϊ  
τὴν αἰπύνατον τ' ἄμφι Δωδώνῃ, ἵνα  
μαντεῖα θύκῃς τ' ἥσσι θεσπρωτοῖ Ζεὺς,  
τερας τ' ἀπιστον, αἰ προσήγμεαι ἄνθρωποις.  
*Æschylus* 654-55

**DODONÆUS**, **DODONIAN**, in antiquity, an epithet given to Jupiter, because he was worshipped in a temple built in the forest of Dodona. Dodonians were the priests who gave oracles at this temple.

**DODSLEY** (Robert), an eminent bookeller, and ingenious writer, born at Mansfield in Nottinghamshire in 1703. He was originally a livery servant, but his natural genius, and a passion for reading, soon elevated him to a superior station. He wrote an elegant comedy farce called *The Toy Shop*, which was received with great applause in 1735, and which recommended him to the patronage of Pope. The following year he produced the *King and the Miller* of Mansfield. The profits of these two books enabled him to commence bookeller, and his own merit procured him eminence in that pro-

wrote some other dramatic pieces, a collection of his works in one of the modest title of *Trifles*; followed by *Public Virtue*, a poem, also collected several volumes of miscellaneous Poems and Fugitive; brevity would otherwise have been being totally lost to posterity. He original publisher of the *Annual* which Burke was the editor; and in which his best work, *The Economy*. He died in 1764.

D. (Henry), a learned controversialist at Dublin in the year 1641. He number of tracts; but bishop Burne accuse him of doing injury to by his indiscreet love of paradoxes and thus exposing himself to the believers. His pamphlet, *On the* of the Soul, gave rise to the well-known controversy between Mr. Collins and Dr. subject. He died in 1711.

From Sax. *dan*; Dan. *dan*; Lat. *deer*; the female of a buck.

Endure your food a little while,  
I go to find my fawn,

DOG'S-MEAT, n. s.

Fr. *dogue*, Dutch *dogge*; Teut. *dogge*, according to Minshew, from Belg. *ducken*, to shut up, because dogs are shut up in the daytime, or from Gr. *dogos*, a biter. See the article. A name of contempt for man. As a verb it signifies to watch or hunt as a dog does. Dog-bane, dog-berry, dog-briar, dog-rose, and dog-wood are plants; dog-bolt is a coarse fellow, as Dr. Johnson thinks, from the coarser part of flour having been called dog-bolt; dog-cheap, cheap as the food of dogs; dog-days begin when the dog-star rises and sits with the sun; a dog-draw is, says Cowell, a manifest apprehension of an offender against venison in the forest.

when he is found drawing after a deer by the scent of a bound which he leads in his hand. Dog-fish is another name for the shark; dog-fisher another and small, but voracious fish; doggly a voracious fly. Dogged and doggish is morose, ill-tempered, surly; and doggedly and doggedness the corresponding adverb and substantive; dog-hearted is doggish; dog-hole a mean hole or habitation, sometimes not equalling that of the dog, or a dog-kennel: dog-louse a louse that is frequently found on the dog: dog-sleep, pretended sleep: dog-star, Sirius, the star that gives name to the dog-days, once reckoned unhealthy: dog-teeth are those teeth next the grinders, which resemble the dog's: dog-trick is a mischievous or ill turn: dog-trot a gentle trot, like that of a dog: dog-weary, excessively weary dogs'-meat, a refuse, offal.

Beware of dogs, beware of evil workers  
Phil. iii, 2.

She bringeth me the grete clothed staves,  
And cryeth, slee the dogges everich on,  
And breke hem bothe bak and every bon.  
Chaucer. *Can't. Tales*.

I never heard a passion so confused,  
So strange, outrageous, and so variable,  
As the dog Jew did utter in the streets.  
Shakespeare.

I have dogged him like his murderer. Id.

Your uncle must not know but you are dead;  
I'll fill these dogged spies with false reports.  
Id. *King John*.  
2 C.

His unkindness,  
That stript her from his benediction, turned her  
To foreign casualties, gave her dear rights  
To his *doghearted* daughters. *Id. King Lear.*

Such smiling rogues as these sooth every passion  
Renege, affirm, and turn their halcyon beaks  
With every gale and vary of their masters,  
As knowing nought, like *dogs*, but following. *Id.*

France is a *doghole*, and it no more merits the tread  
Of a man's foot : to the wars. *Id.*

Oh, master, master, I have watched so long,  
That I'm *dogweary*. *Id. Taming of the Shrew.*

Sorrow *dogging* sin,

Afflictions sorted. *Herbert.*

I fear the dread events that *dog* them both,  
Lest some ill-greeting touch attempt the person  
Of our renowned sister. *Milton.*

Few miles on horse-back had they jogged,  
But fortune unto them turned *dogged*. *Hudibras.*

His only solace was, that now

His *dogbolt* fortune was so low,

That either it must quickly end,

Or turn about again, and mend. *Id.*

This said, they both advanced, and rode  
A *dogtro* through the howling crowd. *Id.*

Behold an Egyptian in the skin of an Hebrew !  
How *dogged* an answer doth Moses receive to so gentle  
a reproof ! *Bp. Hall Contemplations.*

Nor was it more in his power to be without promotion  
and titles, than for a healthy man to sit in the  
sun, in the brightest *dog-days*, and remain without  
warmth. *Clarendon.*

The *dog-fisher* is good against the falling sickness. *Walton.*

These spiritual joys are *dogged* by no sad sequels.  
*Glanville.*

The same ill taste of sense will serve to join  
*Dog* foxes in the yoke, and sheer the swine. *Dryden.*

But could you be content to bid adieu  
To the dear playhouse, and the players too,  
Sweet country seats are purchased every where,  
With land and gardens, at less price than here  
You hire a darksome *doghole* by the year. *Id. Juvenal.*

Good store of harlots, say you, and *dogcheap*. *Id.*  
A certain nobleman beginning with a *dogkennel*,  
never lived to finish the palace he had contrived. *Id.*

His reverence bought of me the flower of all the  
market; these are but *dogneat* to 'em. *Dryden.*

Learn better manners, or I shall serve you a *dog-*  
*trick*; I'll make you know your rider. *Dryden's Don Sebastian.*

Why should we not think a watch and pistol as dis-  
tinct species one from another, as a horse and a *dog* ? *Locke.*

Of the rough or hairy excrescence, those on the  
briar, or *dogrose*, are a good instance. *Derham's Physico-Theology.*

Thump-buckler Mars began,  
And at Minerva with a lance of brass he head-long  
ran ;

These vile words ushering his blows, Thou *dog-fly*,  
what's the cause

Thou makest gods fight thus ? *Chapman's Iliad.*

I am desired to recommend a *dogkennel* to any that  
shall want a pack. *Tatler.*

Juvenal indeed mentions a drowsy husband, who  
raised an estate by snoring; but then he is represented  
to have slept what the common people call *dog-sleep*. *Addison.*

All shun the raging *dog-star's* sultry heat  
And from the half-unscorped moon retreat  
It is part of the jaw of a shark or *dogfish*.

The best instruments for dividing of hard  
sor-teeth; for cracking of hard substances  
and nuts, grinders or mill-teeth; for dividing  
sharp-pointed or *dog-teeth*. *A shoemaker's gloss.*

Had whole Colepeper's wealth been hoarded  
Could he himself have sent it to the *dog* ?

I have been pursued, *dogged* and worried  
several nations, and even now scarce  
escap'd. *Johnson.*

Reverse your ornaments and hang them  
On some patched *doghole* clad with ash.

Hate *dogs* their rise, and insult meet  
Johnson. Vanity of Human Wishes.

Dog, in zoology, an animal remaining in  
natural docility, fidelity, and affection to  
master; qualities which mankind are  
improve for their own advantage. These  
creatures guard our houses, gardens, &c.  
with spirit and vigilance. By their help  
enabled to take not only beasts, but birds  
pursue game both over land, and through  
water. In some northern countries they dig  
and are also employed to carry burdens in  
parts of Africa and China dogs are esteemed  
as by the West Indian negroes, and as  
excellent food; and we have the testimony  
Mr. Forster, that dog's flesh in taste re-  
sembles mutton. They were also used  
by the Romans, and long before the  
Greeks, as we learn from several  
Hippocrates.

From the structure of the teeth, it  
that the dog is a carnivorous animal  
possessed of such strong digestive power  
draw nourishment from the hardest bones  
oppressed with sickness, to which he is  
subject, especially in the beginning of  
before ill weather, in order to procure  
he eats the leaves of the quicken, the  
bearded wheat-grass, or the rough  
grass, which give him immediate relief.  
His drink is water, which he takes in small  
at a time, by lapping with his tongue.  
His excrements are generally hard scybala,  
especially after eating bones, are white  
once in great repute as a drug; but  
justly disregarded.

The dog is an animal not only of  
tion, but remarkable for travelling  
journeys. He can easily keep up with  
ter either on foot or horseback for a  
When fatigued, he does not sweat, but  
his tongue. He lies generally on his side  
with his head turned to one side, and  
with his head above his two fore  
sleeps little, and even that does not  
very quiet; for he often starts, and  
with more acuteness in sleep than when  
He can trace his master by the smell  
in a church, or in the streets of a populous  
This sensation is not equally strong  
kind. The bound can trace game, or  
ter's steps, twenty-four hours after he  
barks more furiously the nearer he is to

the fourth, unless he be trained to silence. The females admit the males before they are twelve months old. They remain in season ten, twelve, or even fifteen days, during which time they admit a variety of males. They come in season generally twice a-year, and more frequently in the cold than in the hot months. The female goes with young about nine weeks. They generally bring forth from six to twelve puppies. Those of a small size bring forth four or five, sometimes but two. The whelps are commonly blind, and cannot open their eyes till the tenth or twelfth day: the males resemble the dog, the females the bitch. In the fourth month, they cut some of their teeth, which are soon succeeded by others.

Buffon has given a genealogical table of all the known dogs, in which he makes the chien de berger, or shepherd's dog, the origin of the whole species, because it naturally possesses the greatest share of instinct. This table is intended not only to exhibit the different kinds of dogs, but to give an idea of their varieties as arising from a degeneration in particular climates, and from a commixture of the different races. 'The chien de berger, or shepherd's dog,' says Buffon, 'is the root of the tree. This dog, when transported into Lapland, or other very cold climates, assumes an ugly appearance, and shrinks into a smaller size; but in Russia, Iceland, and Siberia, where the climate is less rigorous, and the people a little more advanced in civilisation, he seems to be better accomplished. These changes are occasioned solely by the influence of those climates, which produce no great alteration on the figure of this dog; for, in each of these climates his ears are erect, his hair thick and long, his aspect wild, and he barks less frequently, and in a different manner, than in more favorable climates, where he acquires a finer position. The Iceland dog is the only one that has erect ears entirely erect; for their extremities are a little inclined; and Iceland, of all the northern regions, has been longest inhabited by half-civilised men. The shepherd's dog, when brought into temperate climates, and among a people perfectly civilised, as Britain, France, Germany, would, by the mere influence of the climate, lose his savage aspect, his erect ears, his rude, thick, long hair, and assume the figure of the bull-dog, the hound, and the Irish greyhound. The bull-dog and the Irish greyhound have their ears still partly erect, and very much resemble, both in their manners and sanguinary temper, the dog from which they derive their origin. The hound is farthest removed from the shepherd's dog; for his ears are long, and entirely pendulous. The gentleness, docility, and even timidity of the hound, are proofs of his great degeneration, or rather of the great perfection he has acquired by the long and careful education bestowed on him by man. The hound, the harrier, and the terrier, constitute but one race; for, it has been remarked, that in the same litter, hounds, harriers, and terriers, have been brought forth, though the female hound had been covered by only one of these three dogs. I have joined the common harrier to the Dalmatian dog, or harrier of Bengal, because they differ only in

having more or fewer spots on their coat. I have also linked the turnspit, or terrier with crooked legs, with the common terrier; because the defect of the legs of the former has originally proceeded from a disease similar to the rickets, with which some individuals had been affected, and transmitted the deformity to their descendants.'

We shall now proceed to describe more particularly the principal varieties of this animal:—

1. The *Beagle*, the smallest hunting-dog used in this country, is chiefly employed in chasing the hare, and is remarkable for the melody of its tone. Huntsmen distinguish the rough and smooth beagle, but they are both the same species.

2. The *Bull-dog* derives its name from the barbarous diversion of bull-baiting in which it is used. It is of the mastiff kind, but is smaller with a somewhat flatter snout, the lower jaw projecting considerably beyond the upper one. Its aspect is very ferocious, and its courage and obstinacy in attacking the bull are well known. It generally seizes on the lip or other part of the face, pinning the bull, as it is called, to the ground, and maintaining its hold in spite of every effort of the animal to disengage himself. Goldsmith relates, that, at a bull-bait in the North of England, a young man wagered that his dog would attack the bull after his feet were cut off one by one. The cruel experiment was tried, and the dog seized the bull as eagerly as ever!

3. *Dalmatian*, or *Cosch-dog*, is an animal of great beauty, being of a white color, elegantly marked on all parts with numerous round black spots. The native country of this breed is uncertain; it is commonly termed the Danish dog, and is usually kept by gentlemen as an attendant on the carriage.

4. *Greenland*, or *Kamtschatdole dog*. Dogs of this species have a long sharp nose, erect pointed ears, and a long tail, and are more like the shepherd's dog of various parts of Europe than any other. They are of different colors, and many of them curiously spotted. In summer they scratch a hole in the earth in which they lie, as being cooler, and in the winter they bury themselves in the snow in the same way, as a shelter from the frost. They can bear any degree of cold better than heat; and in spring, when the weather begins to be warm, they pant as if come off a long journey. As soon as these dogs can eat, their training begins. They are then tied to a stake, and plentifully fed with soup made of fish, by which means they grow stronger and larger than if suffered to be loose. A dark place or pit is considered best for their confinement, as this makes them timid, and afraid of surrounding objects, and they exert their strength more effectually to avoid them. All those designed for the draught are castrated, and have their tails cropped, and such as have large bones, a broad foot, a wide mouth, and are thick made at the back of the head and in the breast, are considered as the best adapted for work. Each dog has a particular name, as with us, which is of great use in driving them, as the whole set is managed by the voice, neither reins nor whip being used for this purpose. They are

fed on fish, which is given them in all possible forms; raw, dressed, dried, fresh, frozen, or putrid. After they are full grown they are suffered to range at large during the summer, as their services are not then wanted, and they provide their own food without any trouble to their owners. They frequent the shore, and lurk on the banks of the rivers, often standing up to the belly in water catching the fish, at which they snap with such a certain aim, that they seldom miss it if within reach. When the salmon ascend the rivers in great numbers, their food is abundant, and they only eat the heads, as being the finest flavored. In autumn, want of food obliges them to return to the dwellings of their masters, where they are tied up, that they may be ready for use when wanted. They are then very fat, so that a small piece of dried fish is all that is given them, and this very sparingly, that they may be the sooner fit for work, as a fat heavy dog is never a good traveller. They do not bark like the European dogs, but make a sort of howl, and at this season they express the most piteous lamentations day and night for the loss of their liberty. The villages generally consist of fifteen or twenty houses, each of which has at least six dogs belonging to it, and when one dog sets up a howl, all the rest immediately follow, and make the most horrible noise imaginable.

Six of these dogs are the usual number yoked to a sledge, and they are capable of drawing a weight of 600 or 700 pounds, at the rate of ten or twelve versts an hour; the best dogs, however, will often go fifteen versts or more, which is from eight to ten miles. With about half a dried or frozen fish given them in the morning, they will run sixty or eighty, and sometimes even a hundred versts a day; after which they are well fed. At other times food is very sparingly administered to them. The price of the common dogs is from thirty to forty rubles, but a good leader will sometimes sell for 100 rubles.

5. The *greyhound* is remarkable for the slenderness of its form, its elongated snout, and the extreme swiftness of its course. It is indeed esteemed the fleetest of all the hunting dogs, but, as it wants the faculty of scent, follows by the eye. Formerly, the greyhound was held in such esteem, that, by the laws of king Canute, it was enacted that no one under the degree of a gentleman should presume to keep one.

6. *Irish greyhound*. This is the largest of the dog kind, and in its appearance the most beautiful and majestic. The breed is peculiar to Ireland, where it was formerly of great use in destroying the wolves, with which that country was much infested, but is now extremely rare. These dogs are generally of a white or cinnamon color, and more robust than the greyhound, their aspect mild, and their disposition gentle and peaceable. It is said that their strength is so great, that in combat the mastiff or bull dog is far from being equal to them. They commonly seize their antagonists by the back, and shake them to death.

7. *Italian greyhound*. has the body arched and the snout tapering, but its size is only half that

of the common greyhound. It is a delicate animal, not common in the climate being too cold.

8. *Hurrier*, another of the hunting dogs, closely allied to the beagle, and comprehending several varieties. Thinner than the beagle, more nimble, and better suited to endure the labor of the chase. In suit of the hare it evinces the warlike and frequently outstrips the speed of a sportsman. A hybrid breed between a terrier, is sometimes kept for hunting.

9. *Blood-hound* or *Sleuth dog*. This hound was held in high request among hunters, and as it was remarkable for its exquisite sense of smelling, was frequently employed in recovering game that had been lost from the hunter. It could follow, with certainty, the footsteps of a man to a considerable distance, and was therefore of great utility in those barbarous and uncivilized nations in tracing murderers and other felons to the most secret coverts. In many countries infested with robbers, a certain number of blood-hounds were maintained at the public expense, and in general proved the means of detecting the perpetrators of crimes when every other endeavour failed of success. The blood-hound kind of dog is not very generally kept at this time. Some few are kept for the purpose of shooting deer which have been previously wounded, so that to draw blood, the scent of which the dog to pursue with the greatest certainty. During the American war numbers of blood-hounds were sent to that country, and employed in tracing fugitives concealed in the woods and other places: they were in use also, for a short time, during the late revolts in the West India islands, and likewise in Ireland at the time of the last rebellion. They are sometimes employed in discovering deer-stealers, whom they trace by the blood that issues from the wounds of their victims. They are also said to be kept in convents situated in the lonely mountains of Switzerland, both as sentinels to guard the sacred mansions, and to find out and bring to the aid of men who have been unfortunately crossing those wild and dreary tracts.

10. *Old English hound* is distinguished by its great size and strength: the body is deep, the chest, its ears long and sweeping, the tone of its voice peculiarly deep and powerful. It possesses the most exquisite sense of smell, and can often discover the scent of a fox when the beagles have given it up. Dogs of this kind were once common in Britain, and have been formerly much larger than the present breed.

11. *Fox-hound*. The breeding of this kind of dog is attended to with great care in this country, that they may be of great strength, agility, and swiftness, to the other part of the world. It is seldom that fox-hounds reared in this country retain their native vigor, on being transported to other climates. In choosing these dogs, it is as much to stand high and appear light in the pursuit of the fox only, but also to hunt the stag and other deer,

equal to the most arduous contests of the chase. A chase of six or eight hours has been sustained by these hounds on many occasions; and in 1795, Merkin, a celebrated fox-hound bitch, was challenged to run any hound of her years, five miles near Newmarket, giving 220 yards, for 10,000 pieces, and as a run for trial, performed a race of four miles in seven minutes and a half.

12. *King Charles's dog*, a variety of the most kind, and which is sufficiently known in every country under the appellation above-mentioned.

The head is small and rounded, with the ears short, and the tail curved back; its legs are long, hair curled, and feet webbed. Its name is derived from its being a favorite of Charles II., who was always accompanied by these beautiful animals.

13. *Lion-dog*, an animal generally of small size, having the head and fore part of the body covered with shaggy hair, while the hind part is smooth, except a tuft at the end of the tail.

*Lurcher*, the usual attendant on the greyhound, is a dog of smaller size than the greyhound, and stouter in proportion; its hair rough and commonly of a pale yellowish color, and the aspect of its visage remarkable for its sullenness. This dog possesses the advantage of a fine scent, it is most commonly employed in killing foxes and rabbits during the night-time. When let loose into the warren it lurks about with the greatest precaution, and darts upon the rabbits, while feeding, without barking or making the least noise; and then conveys his booty in silence to his master.

15. *Maltese dog*, a variety with long soft and silky hair, appertaining to the spaniel kind, very small, and of a white color in general. This is one of the most elegant of the lap-dog kind, and in some varieties, as in the shock, is almost concealed in the hair which covers it from head to foot.

16. *Mastiff*. This is the size of a wolf, very rude in its form, and having the sides of the legs pendulous. Its aspect is sullen, its bark loud and terrific; and he appears every way formed for the important trust of guarding property committed to his care. As a house or yard dog, he may be perhaps more valuable than the Newfoundland breed, which is more commonly kept for this purpose. The mastiff, in its pure state, is seldom met with. The generality of dogs, distinguished by that name, are crossed breeds between the mastiff and bull-dog, or the terrier.

17. *Newfoundland dog*, a variety of large size, superior strength, sagacity, and docile disposition. The feet of this kind of dog are more palmated than usual, and the animal is remarkably partial to the water. The breed of Newfoundland dogs was originally brought from the country of which they bear the name, where they are extremely useful to the settlers on those coasts, who employ them as animals of burden, to bring wood from the interior of the country to the sea side; three or four of them yoked to a sledge will draw two or three hundred weight of wood piled upon it for seven or eight miles with great ease.

18. *Pointer*, originally a native of Spain, but long since naturalised in this country. This dog

is remarkably apt at receiving instruction, and is chiefly employed in finding partridges, pheasants, &c., for the dog or gun.

19. *Pug-dog* has the nose turned upwards, the ears pendulous, and body square. In its outward appearance this animal resembles the bull-dog in miniature: it was formerly very common in England, but has of late years become scarce.

20. *Setter*, a hardy, nimble, and handsome dog, possessed of an exquisite scent and sagacity in discovering various kinds of game, especially birds, and esteemed one of the most valuable of our hunting dogs.

21. *Shepherd's dog*, *canis domesticus* of Linnaeus, and *le chien de berger* of Buffon, is distinguished by its upright ears and remarkable velocity of the tail beneath; and stands at the head of the first class of farm dogs. This breed of dogs is said to be preserved in the greatest purity in the northern parts of Scotland. In driving a number of sheep to any distant part, a well-trained dog never fails to confine them to the road; he watches every avenue that leads from it, and pursues the stragglers, if any should escape, and forces them into order without doing them the least injury. If the herdsman be at any time absent from the flock, he depends upon his dog to keep them together; and, as soon as he gives the well-known signal, this faithful creature conducts them to his master, though at a considerable distance.

22. The *Spaniel* is known by its curled hair, and propensity to the water. It is far more elegant than the water dog, and its aspect more sagacious and mild: the ears are long and pendulous, and the hair beautifully crisped. It is chiefly used in discovering the haunts of water-fowl, and in finding birds that have been shot in marshy places.

23. *Terrier*, a small thickset dog, of which there are two kinds, one with the legs short, the back long, and most commonly of a black or yellowish color mixed with white; the other of more sprightly appearance, with the body shorter, and the color reddish-brown or black. In both the disposition is nearly the same; it has an acute smell, is generally an attendant on every pack of hounds, and is very expert in forcing foxes and other game out of their covers.

24. *Turnspit*, a spirited and active dog, once an indispensable attendant on the spit. The turnspit is distinguished by having the body long, the legs very short, and the tail curled on the back; its usual color is grayish, with black spots. Gmelin has three varieties of this family of dogs, one of which has the feet straight, another the feet curved, and the third having the body covered with long curly hair.

25. *Water dog*, a variety, distinguished by its curly hair, which much resembles wool. The webs between the toes are larger than in most other dogs, which sufficiently accounts for the ease with which it swims, and renders it useful in hunting ducks and other water-fowl. Dogs of this breed are also frequently kept on board ships, for the purpose of sending into the water after any small article that may chance to fall overboard.

In order to choose a dog and bitch for good whelps, take care that the bitch come of a generous kind, be well proportioned, having large ribs and flanks; and likewise that the dog be of a good breed and young; for a young dog and an old bitch breed excellent whelps. The best time for hounds to be lined in, are the months of January, February, or March. The bitch should be used to a kennel, that she may like it after her whelping, and she ought to be kept warm. Let the whelps be weaned after two months old; and though it be somewhat difficult to choose a whelp under the dam that will prove the best of the litter, yet some approve that which is last, and account him to be the best. Others remove the whelps from the kennel, and lay them severally and apart one from the other; then they watch which of them the bitch first takes and carries into her kennel again, and that they suppose to be the best. Others again imagine that which weighs least when it sucks to be the best: this is certain, that the lighter whelp will prove the swifter. As soon as the bitch is littered, it is proper to choose them you mean to preserve, and drown the rest: keep the black, brown, or of one color, for the spotted are not much to be esteemed, though of hounds the spotted are to be valued. Hounds for chase are to be chosen by their colors. The white, with black ears, and a spot at the setting on of the tail, are the principal to compose a kennel of, if of good scent and condition. The black hound, or the black tanned, or the all liver-colored, or all white: the true talbots are the best of the stronger line; the grizzled, whether mixed or unmixed, so they be shag-haired, are the best verminers, and a couple of these are proper for a kennel. In short, take these marks of a good hound: that his head be a middle proportion, rather long than round: his nostrils wide, his ears large, his back bowed; his fillet great, his haunches large, thighs well trussed, ham straight, tail big near the reins, the rest slender, the leg big, the sole of the foot dry, and in the form of that of a fox, with large claws. As pointers and spaniels, when good of their kinds, and well broken, are very valuable to sportsmen, it is worth while to take some care to preserve them in health. This very much depends on their diet and lodging; frequent cleaning their kennels, and giving them fresh straw to lie on, is very necessary; or, in summer time, deal shavings or sand, instead of straw, will check the breeding of fleas. A dog is of a very hot nature; he should therefore never be without clean water by him, that he may drink when he is thirsty. In regard to their food, carrion is by no means proper for them: it must hurt their sense of smelling, on which the excellence of these dogs greatly depends. Barleymeal, the dross of wheat flour, or both mixed together, with broth or skimmed milk, is very proper food. For elange, a small quantity of greaves, from which the tallow is pressed by the chandlers, mixed with flour, or sheep's feet well baked or boiled, are a very good diet: and when you indulge them with flesh, it should always be boiled. In the season of hunting, it is proper to feed the dogs in the evening before, and give them nothing in the

morning they are to be taken out for milk; but if you stop for your own convenience in the day, the dogs should also get a little milk. A pointer ought not to be kept oftener than two or three days in a kennel, unless you take care of his feet, and give him good lodging as well as proper food, so that he be able to perform that through the winter he should therefore, after a day's hard work, wash his feet with warm water and salt, and when dry, wash them with warm liniment, and butter, which will heal their sores, and prevent a settled stiffness from fixing. It has been already observed, that dogs are of a weak constitution; the greatest relief to them in summer is twitch grass, sometimes called dog grass. It will therefore be proper to plant some in a place into which the dogs may be taken in the morning; and by feeding freely on it, they will be cured of the sickness they are subject to, as well as of any extraordinary heat of the sun, but unless the grass be of this sort, they have no effect. Dogs are exposed to many casualties, such as bites, blows, poison, &c. If dogs are bitten by any venomous creature, as snakes, adders, &c., squeeze out the blood, and wash the place with salt and urine; then lay a plaster to it made of calamine, pounded in oil of tar, with turpentine and yellow wax, all mixed to a salve. If you give your dog some of the juice of calamine to drink in milk, it will be of service; or an ounce of treacle dissolved in a quart of wine. If a dog has received any little hurt by forcing through hedges, or gets any wound from a blow or strain, bathe the wound several parts with salt and cold vinegar (for vinegar only evaporates the fine spirit); and when it is if a wound, you may pour in it a little balsam, which will perform the cure sooner than any method hitherto experienced.

For stealing a dog a man is to forfeit his king, for the first offence, not less than £10, or more than £50, with the charges attending his conviction, or be imprisoned not less than six, or more than twelve, months. Any person keeping a dog accustomed to bite, is liable to be indicted for a common nuisance; and an action will lie against any person for any dog, horse, &c. torn by a dog, if it is proved that the animal has done so before.

**DOGS, DISEASES OF.** Dogs are subject to various diseases: the principal are thus described by Blaine, with the method of their cure. The canine asthma is hardly ever attended with attack any but either old dogs, or those who, by confinement, too full living, and want of exercise, may be supposed to have become diseased by these deviations from a state of nature. It is hardly possible to keep a dog very fat for any great length of time, without bringing it on. This cough is frequently confounded with one cough that precedes and accompanies distemper, but it may be readily distinguished from the latter by an attention to circumstances, as the age of the animal, its not affecting the general health, or producing immediate emaciation, and its not readily giving way to medicine. The cure is often very difficult, because the disease has generally been long neglected before it is sufficiently

medicated by the owners. As it is in general brought on by confinement, too much warmth, and over-feeding; so it is evident the cure must be begun by a steady persevering alteration in these particulars. The medicines most useful, are alteratives, and of these occasional emetics are the best. One grain of tartarised antimony (i. e. tartar emetic), with two, three, or four grains of calomel, is a very useful and valuable emetic. This dose is sufficient for a small dog, and may be repeated twice a week with great success—always with palliation.

Of diseases of the eyes dogs are subject to almost as great a variety as ourselves, many of which end in blindness. No treatment yet discovered will remove or prevent this complaint. Red eyes, though not in general ending in blindness, are very common among dogs. It is an affection of the eyelids, is not unlike the scrofulous affection of the human eyelids, and is equally benefited by the same treatment: an unguent made of equal parts of nitrated quicksilver ointment, prepared tully and lard, very lightly applied. Dropsy of the eyeball is likewise sometimes met with, but is incurable.

Cancer. The virulent dreadful ulcer, that is so fatal in the human subject, and is called cancer, is unknown in dogs; yet there is very commonly a large scirrhus swelling of the teats in bitches, and of the testicles (though less frequent) in dogs, and as it sometimes becomes ulcerated, so it may be characterised by this name. In the early state of the disease dissections prove useful, as vinegar with salt, and camphor and Spanish flies, with mercurial ointment, have sometimes succeeded, taking care to avoid irritating the part so much as to produce blister. But when the swelling is detached from the belly, and hangs pendulous in the skin, it had better be removed, and as a future preventive suffer the bitch to breed. Scirrhus testicles are likewise sometimes met with; for these no treatment yet discovered succeeds but the removal of the part, and then before the spermatic chord becomes much affected, or it will be useless.

Colic. Dogs are subject to two kinds of colic, one arising from constipation of the bowels, the other is of a kind peculiar to dogs, apparently partaking of the nature of rheumatism, and also of spasm. From a sudden or violent exposure to cold, dogs become sometimes suddenly paralytic, particularly in the hinder parts; having great tenderness and pain, and every appearance of lumbago. In every instance of this kind there is considerable affection of the bowels, generally sensitiveness, always great pain. A warm bath, external stimulants, but more particularly active aperients, remove the colic. Colic, arising from constipation, is not in general violently acute from the pain it produces: sometimes it appears accompanied with more spasm than is immediately dependent on the confinement of the bowels. In the former give active aperients, as calomel with pil. cochlear, i. e. aloetic pill and glysters; in the latter castor oil, with laudanum and ether.

Cough. Two kinds of cough are common among dogs, one accompanying distemper, the other in an asthmatic affection of the chest. See *Canine Asthma*.

*Distemper*. This is by far the most common and most fatal among the diseases of dogs; hardly any young dog escaping it; and of the few who do escape it in their youth, three-fourths are attacked with it at some period afterwards: it being a mistake that young dogs only have it. It, however, generally attacks before the animal arrives at eighteen months old. When it comes on very early, the chances of recovery are very small. It is peculiarly fatal to greyhounds, much more so than to any other kind of dog generally carrying them off by excessive scouring. It is very contagious: but it is by no means necessary that there should be contagion present to produce it; on the contrary, the constitutional liability to it is such, that any cold taken may bring it on: and hence it is very common to date its commencement from dogs being thrown into water, or shut out on a rainy day, &c. There is no disease which presents such varieties as this, either in its mode of attack or during its continuance. In some cases it commences by purging, in others by fits. Some have cough only, some waste, and others have moisture from the eyes and nose, without any other active symptom. Moist eyes, dulness, wasting, with slight cough, and sickness, are the common symptoms that betoken its approach. Then purging comes on, and the moisture from the eyes and nose from mere mucus becomes pus, or matter. There is also frequently sneezing, with a weakness in the loins. When the disease in this latter case is not speedily removed, universal palsy comes on. During the progress of the complaint, some dogs have fits. When one fit succeeds another quickly, the recovery is extremely doubtful. Many dogs are carried off rapidly by the fits, or by purging; others waste gradually from the running from the nose and eyes, and these cases are always accompanied with great marks of putridity. In the early stages of the complaint give emetics; they are peculiarly useful. A large spoonful of common salt, dissolved in three spoonfuls of warm water, has been recommended; the quantity of salt being increased according to the size of the dog, and the difficulty of making him to vomit. While a dog remains strong, one every other day is not too much: the bowels should be kept open, but active purging should be avoided. In case the complaint should be accompanied with excessive looseness, it should be immediately stopped by balls made of equal parts of gum arabic, prepared chalk, and conserve of roses, with rice-milk as food. Two or three grains of James's powder may be advantageously given at night, in cases where the bowels are not affected, and in the cases where the matter from the nose and eyes betokens much putridity, we have witnessed great benefit from balls made of what is termed friars' balsam, gum guaiacum, and chamomile flowers in powder: but the most popular remedy is a powder prepared and vended under the name of Distemper Powder, with instructions for the use of it. Dogs, in every stage of the disease, should be particularly well fed. A seton we have not found so useful as is generally supposed; where the nose is much stopped, rubbing tar on the upper part is useful, and when there

is much stupidity, and the head seems much affected, a blister on the top is often serviceable.

**Fits.** Dogs are peculiarly subject to fits. These are of various kinds, and arise from various causes. In distemper, dogs are frequently attacked with convulsive fits, which begin with a clamping of the mouth and shaking of the head, gradually extending over the whole body. Sometimes an active emetic will stop their progress, but more generally they prove fatal. **Worms** are often the cause of fits in dogs. These deprive the animal wholly of sense: he runs wild till he becomes exhausted, when he gradually recovers, and perhaps does not have one again for some weeks. Confinement produces fits and likewise costiveness. Cold water thrown over a dog will generally remove the present attack of a fit; and for the prevention of their future recurrence it is evident, that the foregoing account of causes must be attended to.

**Inflamed bowels.** Dogs are very subject to inflammation of their bowels, from costiveness, from cold, or from poison. When inflammation arises from costiveness it is in general very slow in its progress, and is not attended with very acute pain, but it is characterised by the want of evacuation and the vomiting of the food taken, though it may be eaten with apparent appetite. In these cases the principal means to be made use of are the removal of the constipation by active purging, clysters, and the warm bath. Colomel with aloes forms the best purge. But when the inflammation may be supposed to arise from cold, then the removing of any costiveness that may be present is but a secondary consideration. This active kind of inflammation is characterised by violent panting, total rejection of food, and constant sickness. There is great heat in the belly, and great pain; it is also accompanied with great weakness, and the eyes are very red. The bowels should be gently opened with clysters, but no aloes or colomel should be made use of. The belly should be blistered, having first used the warm bath. When the inflammation arises from poison, there is then constant sickness, the nose, paws, and ears are cold, and there is a frequent evacuation of brown or bloody stools. Castor oil should be given, and clysters of mutton broth thrown up, but it is seldom any treatment succeeds.

**Inflamed lungs.** Pleurisy is not an uncommon disease among dogs. It is sometimes epidemic, carrying off great numbers. Its attack is rapid, and it generally terminates in death on the third day, by a great effusion of water in the chest. It is seldom that it is taken in time, when it is, blood-letting is useful, and blisters may be applied to the chest.

**Madness.** The symptoms of madness are thus summed up by Mr. Daniel:—"At first the dog looks dull, shows an aversion to his food and company, does not bark as usual, but seems to mourn; is peevish, and apt to bite strangers; his ears and tail drop more than usual, and he appears slow; afterwards he begins to loll out his tongue, and froth at the mouth, his eyes seeming heavy and watery: if not confined he soon goes off, runs panting along with a dejected air, and endeavours to bite any one he

meets. If the mad dog escapes death, he seldom runs above two or three days, when he dies exhausted with heat, hunger, and thirst. Blaine describes this formidable disease as commencing sometimes by dullness, stupidity, or retreat from observation; but more frequently, particularly in those dogs which are much domesticated around us, by some alteration in their natural habits; as a disposition to growl, and swallow every minute object on the ground, or to lick the parts of another dog incessantly, or to lap his own urine, &c. About the first or third day the disease usually assumes one of two types. The one is called *rage*, and the other *dumb madness*. These diseases are not, however, always clear; and to some extent owing to so much discrepancy in the account given by different persons of the disease.

The *raging madness*, by its term, has given an erroneous conclusion, that it is attended with violence and fury; which, however, is seldom the case; such dogs are irritable and peevish, and will commonly fly at a child, or even a dog, and are impatient of restraint. *Rage* is seldom violent except when irritated or tried. On the contrary, till the last moment, it will often acknowledge the voice of the owner, and yield some obedience to it. None of them usually turn out of their way to bite persons; but they have an instinctive aversion to do it to dogs; and in a minor degree to other animals also: but, as before, almost all dogs attack mankind without provocation.

*Dumb madness* is so called because the dog seldom any barking heard, but more particularly, because the jaw drops paralytically, and the tongue lolls out of the mouth, black, and frequently strangulated. A strong general character of the disease, is the disposition to stretch towards their belly; and equally a general tendency to eat trash, as hay, straw, wood, coals, dirt, &c.: and it should be remembered, that this is so very common and so durable, that the finding these matters in the stomach after death, should always render a decision formed of the existence of the disease confirmed into certainty. Blaine is also at pains to disprove the notion generally entertained, that rabid dogs are averse to water, neither drink or come near it. This error contends has led to most dangerous consequences, is so far from true, that mad dogs from thirst and fever are solicitous for water, and lap eagerly. When the dumb kind exists in its force, dogs cannot swallow what they attempt to lap; but still they will plunge their heads in, and appear to feel relief by it: but in the instance out of many hundreds, did he ever cover the smallest aversion to it. He laps with great stress on the noise made by rubbing, which he says is neither a bark nor a howl, a tone compounded of both. It has been by some that this disorder is occasioned by bad or had food, and by others that it arises from any other cause but the bite. According to this malady is rare in the northern part of Turkey, more rare in the southern provinces, that empire, and totally unknown in the burning sky of Egypt. At Aleppo, where it

perish in great numbers, for want of food, and by the heat of the climate, disorder was never known. In other parts, and in the hottest zone of America, are never attacked with madness. Blaine of no instance of the complaint being although he has tried to their fullest extent particular remedies of profuse bleedings, strong cal and arsenical doses, vinegar, partial fog, night-shade, water plantain, &c.: he recommends the attention to be principally directed towards the prevention of the mal-

The preventive treatment of rabies or is, according to Blaine, always an easy in the human subject, from the immediate bitten being easily detected; in which the removal of the part by excision or cauterization is an effectual remedy. But, unfortunately for the agriculturist, it is not easy to detect the parts in cattle, nor in dogs; and it would be most desirable if a certain internal cure were generally known. Dr. Mead's, the Ormskirk powder, sea-bathing, and other nostrums are deservedly in disrepute, while a few country medicines, but little beyond their immediate precincts, have gained some character. Conceiving that must all possess some ingredient in common was at pains to discover it; and which seems to have realized, by obtaining, among the composition of Webb's Watford drink. A mixture, which is detailed below, he considers the active ingredient to be the buxus or which has been known as a prophylactic at the times of Hippocrates and Celsus, who mention it. The recipe, detailed below, is administered to nearly three hundred of different kinds, as horses, cows, sheep, and dogs: and appears to have succeeded been out of every twenty cases, where it is taken and kept on the stomach. It is also equally efficacious in the human in which case he advises the extirpation of bitten parts also. The box preventive is directed to be prepared:—Take of the fresh of the tree-box two ounces, of the fresh of rue two ounces, of sage half an ounce, these fine, and boil in a pint of water to a pint; strain carefully, and press out the very firmly; put back the ingredients into of milk, and boil again to half a pint; as before; mix both liquors, which forms doses for a human subject. Double this is proper for a horse or cow. Two of the quantity is sufficient for a large dog, for a middling-sized, and one-third for a dog. Three doses are sufficient, given subsequent morning, fasting; the quantity being that which forms these three doses. Sometimes produces strong effects on dogs, it is proper to begin with a small dose; in the case of dogs we hold it always prudence to increase the dose till effects are evident, sickness, panting, and uneasiness of the In the human subject, where this remedy is equally efficacious, we have never witnessed any unpleasant or active effects, neither observed in cattle of any kind: but it obliges us to add, that in a considerable

proportion of these, other means were used, as the actual or potential cautery: but in all the animals other means were purposely omitted. That this remedy, therefore, has a preventive quality, is unquestionable, and now perfectly established; for there was not the smallest doubt of the animals mentioned either having been bitten, or of the dog being mad who bit them, as great pains were in every instance taken to ascertain these points. To prevent canine madness, Pliny recommends worming of dogs; and from his time to the present it has had, most deservedly, says Daniel, its advocates. He tells us, that he has had various opportunities of proving the usefulness of this practice, and recommends its general introduction. Blaine, on the contrary, asserts that the practice of worming is wholly useless, and founded in error; and that the existence of any thing like a worm under the tongue is incontestably proved to be false; and that what has been taken for it, is merely a deep ligature of the skin, placed there to restrain the tongue in its motions. He also observes, that the pendulous state of the tongue in what is termed dumb madness, with the existence of a partial paralysis of the under jaw, by which they could not bite, having happened to dogs previously wormed, has made the inability to be attributed to this source, but which is wholly an accidental circumstance; and happens equally to the wormed and unwormed dog.

**Mange.** This is a very frequent disease in dogs, and is an affection of the skin, either caught by contagion, or generated by the animal. The scabby mange breaks out in blotches along the back and neck, and is common to Newfoundland dogs, terriers, pointers, and spaniels, and is the most contagious. The cure should be begun by removing the first exciting cause, if removable, such as filth or poverty; or, as more generally the contrary (for both will equally produce it), too full living. Then an application should be made to the parts, consisting of sulphur and sal ammoniac: tar-lime-water will also assist. When there is much heat and itching, bleed and purge. Mercurials sometimes assist, but they should be used with caution; dogs do not bear them well.

**Worms.** Dogs suffer very much from worms, which, as in most animals, so in them, are of several kinds: but the effects produced are nearly similar. In dogs having the worms the coat generally stares; the appetite is ravenous, though the animal frequently does not thrive the breath smells, and the stools are singular, sometimes loose and slimy, at others hard and dry; but the most evil they produce is occasional fits, or sometimes a continued state of convulsion, in which the animal lingers some time, and then dies; the fits they produce are sometimes of the violent kind, at others they exhibit a more stupid character, the dog being senseless, and going round continually. The cure consists, while in this state, in active purgatives joined with opium, and the warm bath; any rough substance given internally, acts as a vermifuge to prevent the recurrence. The worming of whelps is performed with a lancet, to slit the thin skin which immediately covers the worm; a small awl is then to be introduced under the centre of the worm to

raise it up: the farther end of the worm will, with very little force, make its appearance, and with a cloth taking hold of that end, the other will be drawn out easily; care should be taken that the whole of the worm comes away without breaking, and it rarely breaks unless cut into by the lancet, or wounded by the awl.

**DOGS' SKINS**, dressed with the hair on, are used in muffs, made into a kind of buskins for persons in the gout and for other purposes. Dressed without the hair, they are used for ladies' gloves, and the linings of masks, being thought to make the skin peculiarly white and smooth. The French import many of these skins from Scotland, under a small duty. Here, when tanned, they serve for upper leathers for neat pumps. Dogs' skins dressed are exported under a small, and imported under a high duty. The French import from Denmark large quantities of dogs' hair, both white and black. The last is esteemed the best, and is worked up in the black list of a particular kind of woollen cloth.

**DOGS, ISLE OF**, a small tract of low land in the county of Middlesex, opposite to Greenwich; where Togodumnus, brother of Caractacus, is said to have been killed in a battle with the Romans, A. D. 46. The Isle of Dogs is said to have derived its name from being the depot of the spaniels and greyhounds of Edward III.; and to have been chosen for this purpose because it lay contiguous to his sports of woodcock shooting, and coursing the red deer, in Waltham and the other royal forests in Essex. It is well known that, for the more convenient enjoyment of these sports, he generally resided, in the sporting season, at Greenwich.

One of the largest canals ever attempted in England has been cut, nearly one mile and a quarter in length, 142 feet wide at top, and twenty-four feet deep, across the Isle of Dogs, for shortening the passage of vessels to and from the pool, and to avoid the long circuit by Greenwich and Deptford. When the locks and other works of this canal were nearly finished, an unforeseen accident, by the blowing up of the coffer and preventer dams, just as the entrance-locks were completed, on the 24th of July 1805, prevented this canal from being opened until the 9th of December, when the Duchess of York West Indiaman, of 500 tons burden, passed through it, in presence of the lord mayor and corporation of London. Several large sums of public money having been granted out of the consolidated fund, in aid of this project, for the repayment of them, vessels passing through this canal of 200 tons or upwards paid, for three years after its completion, 2d. per ton; those from 200 to 100 tons, 1d. per ton; from 100 to 50 tons, 1d. per ton; 50 to 20 tons, 5s. each, and boats and craft 1s. each. This canal is now the property of the directors and company of the noble docks adjoining.

**DOG-BANE**, in botany. See *APOCYNUM*.

**DOG-BERRY-TREE**. See *CORNUS*.

**DOG-DAYS**. See *CANICULA*.

**DOGE**, *n. s.* Ital. *dodge*. The title of the chief magistrate of Venice and Genoa.

Doria has a statue at the entrance to the doge's palace with the title of deliverer of the commonwealth.

*Addition.*

**DOGE OF VENICE** was formerly the chief of the council, and the mouth of the republic. The Venetians did not go into mourning for him, as not being their sovereign, but only for a minister. At Venice he was elected for Genoa, only for two years; he was crowned under the title of serenity, which was superior to that of highness. In fact, the doge of Venice was only the shadow of a prince, the authority being reserved to the senate. Anciently, indeed, the doges were sovereigns, but, for a considerable time past, all the prerogatives reserved to the quality of doge were taken away; he gave audience to ambassadors, but he gave them any answer from himself, in matters of importance; only he was allowed to assent if he pleased to the compliments they made to his seignory. The doge, as being first magistrate, was head of all the councils; and the decrees which the senate furnished its ministers in the courts, were written in his name, but none of state signed and sealed them with the seal of the republic. The ambassadors directed all despatches to the doge; yet he was not allowed to open them but in presence of the senate. The money was struck in the doge's name, not with his stamp or arms. All the doges rose and saluted the doge when he came to council; but the doge rose to none but ambassadors. He nominated to all the offices in the church of St. Mark; he was patron of the monastery of the Virgin, and bestowed certain petty offices of ushers of the house, and led commanders of the palace. His children were not under the jurisdiction of the magistrate in ceremonies; and his children had studious and gondoliers in livery. But his grandeur was tempered with various circumstances, which rendered it burdensome. He could not go to Venice without leave of the council; and he did he was liable to receive affronts, and being entitled to demand satisfaction. His children and brothers were excluded from all the chief offices of state. They could not receive any benefice from the court of Rome; nor were allowed to accept of the cardinalate, as being benefices, nor including any jurisdiction. The doge could not divest himself of his dignity till his ease; and, after his death, his conduct was examined by three inquisitors and five counselors who sifted it with great severity.

**DOG-FISH**. See *SQUALUS*.

**DOUGGER**, in sea-language, a strong vessel with two masts, used by the Dutch, &c., for fishing in the German sea, and on the Dogger-bank. The main-mast are set two square-sails; the mizen-mast a gaff-sail, and above that a top-sail. Also a bow-sprit with a sprit-sail, and two or three jibs.

**DOUGGER-BANK**, in geography, a very extensive sand-bank in the German Ocean, between the coast of England and Germany. It stretches south-east and north-west, beginning about twelve leagues from Flamborough-head, and extending nearly seventy-two leagues towards the coast of Jutland. Between the Dogger and the Well-bank, to the south, are the shoals of Marinus, which supply London with cod, and which loves the deep water near the banks.

but indecisive engagement was on 5th August 1781, between the French.

*Do*, *adj.* & *n. s.* From *dog*. In measures or rules of regular application; mean.

Thus, he served his master poetaster.

Appropriate could make such of the almanack; begin and end could tell, Burns, in *doggerel*. *Hudibras*.

*Do* and *Dog* to rehearse, scratch their feeble sense on verse; due to all succeeding times, bits of their own *doggerel* rhymes.

*Dryden*. All heads were never lost of those *doggerel*, or who pined in prose.

*Dryden's Juvenal*. Among the critics, whether burlesque in heroic verse, like that of the *Doggerel*, like that of *Hudibras*.

*Addison's Spectator*. *Myrral* Grab-street tends wars with foes and friends. *Swift*.

(Thomas), an Irish comedian, was born in 1700. He played comic characters with applause, and finally became a first house. He died at Eltham in 1756, leaving a sum to provide a boat to be rowed for by six watermen, on the 1st of August, the day of the accession of George III. He wrote a comedy called *The Beggar's Opera*, afterwards altered to *Flora, Vell*.

The English alum-works, a name given to a sort of stone found near the true alum rock, and called alum, though not near so much as the true alum rock, which affords a considerable quantity of these *dog*-places they approach so much to the true rock, that they are in the image.

*Do*, *Fr. dogme*; *Lat. dogma*; *Grec. dogma*, from *do*, *dogma*, per. pass. of *docein*, to judge. Fixed principle or doctrine; see the extract from *Ay*-and dogmatical mean authority in the manner of a teacher. Dogmatism, positiveness of opinion in manner. To dogmatize, to affirm opinions positively.

being not entered into the confession, are not properly chargeable either as obstinate, but on particular *dogma*-tion. *Hammond*.

the vanity of bold opinion, which he does demonstrate in all the conversations engaged in. *Glennville's Sermon*.

bounded intellect of man seldom surrenders to be dogmatical about things

that approach to infinite, whether in vastness or little.

I shall not presume to interpose *dogmatically* in a controversy, which I look never to see decided.

Our poet was a stoic philosopher, and all his moral sentences are drawn from the *dogmas* of that sect.

Learning gives us a discovery of our ignorance, and keeps us from being peremptory and *dogmatical* in our determinations.

Critics write in a positive *dogmatical* way, without either language, genius, or imagination.

One of these authors is indeed so grave, sententious, *dogmatical* a rogue, that there is no enduring him.

*Dogma*, in canon law, is that determination which consists in, and has a relation to, some casuistical point of doctrine, or some doctrinal part of the christian faith.

A *dogmatist* in religion is not a great way off from a bigot, and is in high danger of growing up to be a bloody persecutor.

Nothing can be more unphilosophical than to be positive or *dogmatical* on any subject; and even if excessive scepticism could be maintained, it would not be more destructive to all just reasoning and inquiry.

Perhaps what I have here not *dogmatically* but deliberately written, may recall the principles of the drama to a new examination.

If the present establishment should fall, it is this religion which will triumph in Ireland and in England, as it has triumphed in France. This religion, which laughs at creeds, and *dogmas*, and confessions of faith, may be fomented equally amongst all descriptions, and all sects; amongst nominal catholics, and amongst nominal churchmen; and amongst those dissenters who know little, and care less, about a presbytery, or any of its discipline, or any of its doctrines.

At present, we can well conceive the probability of his *dogmatism* being patiently supported by attending admirers, awed by the literary eminence on which he stands.

*DOG MATISTS*, a sect of ancient physicians, of which Hippocrates was the founder. They are also called logici, logicians, from their using the rules of logic in medical subjects. They laid down definitions and divisions; reducing diseases to certain genera, and those genera to species, and furnishing remedies for them all; supposing principles, drawing conclusions, and applying those principles and conclusions to particular diseases under consideration; in which sense, the dogmatists stand contradistinguished from empirics and methodists.

*DOGS-RIBBED INDIANS*, a nation of North Americans, who inhabit round Lake Edland, in the north-west part of North America. They are often at war with the Arathapescow Indians. Both these tribes are among the most savage of the human race. They trade with the Hudson Bay Company's settlements.

*DOG-STAR*. See *SIRIUS*.  
*DOGS-TOOTH*. See *ERYTHROXIMUM*.  
*DOG-WOOD*. See *CORNUS*.  
*DOG-WOOD OF JAMAICA*, a species of *erythrina*.  
*DOG-WOOD TREE*. See *PISCIDIA*.

**DOIAGOI**, an island of Asiatic Russia, in the Frozen Sea, at the entrance of Vagatskoi, or Wygat's Straits. Long. 57° 14' E., lat. 70° 5' N.

**DOLLY**, *n. s.* A species of woollen stuff, so called, I suppose, says Dr. Johnson, from the name of the first maker.

We should be as weary of one set of acquaintance, though never so good, as we are of one suit, though never so fine: a fool and a dolly stuff, would now and then find days of grace, and be worn for variety.

*Congreve's Way of the World,*

**DOIT**, *n. s.* Dut. *dugt*; Erse. *dayght*. A small piece of money.

When they will not give a *doit* to relieve a lame beggar, they will lay out ten to see a dead Indian.

*Shakespeare. Tempest.*

In Anna's was a soldier, poor and old,  
Had dearly earned a little purse of gold;  
Tired with a tedious march, one luckless night  
He slept, poor dog! and lost it to a *doit*. *Pope.*

**DOTT** was the ancient Scottish penny piece; of which twelve were equal to a penny sterling. It was a small copper coin, as thin as a silver penny and not much larger. *Doits* were extremely numerous in Scotland before the Union, and were current for several years after it. Two of them were equal to the bodle, six to the baubee, and eight to the acheson. Some of them, struck in the reigns of Charles I. and II., with C. R. I or C. R. II on the one side, and the thistle on the other, are still to be found in the cabinets of antiquaries.

**DOL**, a town of France, in Brittany, department of the Ille and Vilaine. Population 3300. It is thirty-four miles north-west of Rennes, and 232 west of Paris.

**DOLBEN** (John), an English prelate, born at Stanwick, in Northamptonshire, in 1625. Was educated at Westminster School, and at Christ Church, Oxford. In the civil wars he served as an officer in the royal army, and rose to the rank of major. Returning on the decline of the king's affairs to college, he took his degrees and entered into orders. At the Restoration he obtained a canonry of Christ Church, and the deanery of Westminster. He was promoted in 1666 to the see of Rochester, and from thence in 1683 he removed to York, where he died of the small pox in 1686. Some of his sermons are still extant.

**DOLCE** (Charles, or Carlino), a celebrated historical and portrait painter, born at Florence in 1616. He was the disciple of Vignali, and was particularly fond of representing pious subjects, though he sometimes painted portraits. His works are easily distinguished by the peculiar delicacy with which he perfected all his compositions, by a pleasing tint of color, and by a judicious management of the chiaro scuro. His performance was remarkably slow; and it is reported that his brain was fatally affected by seeing Lucas Jordana despatch more business in four or five hours than he could have done in as many months. He died in 1646.

**DOLLE**, *n. s.* From *dealt*; Sax. *dealan*. The act of distribution or dealing. The thing dealt.

It was your presumptive,

That in the *dole* of blows your son might drop.

*Shakspeare.*

Now my masters, happy man be he who  
every man to his business.

The personal fruition in any man cannot  
feel great riches: there is a custody of the  
power of *dole* and donative of them, we use  
them, but no solid use to the owner.

Now thou art lifted up, draw me to thee  
And, at thy death giving such liberal *dole*  
Moist with one drop of thy blood my eye

*Donne. Hymns.*

What if his eye-sight, for to Israel's  
Nothing is hard, by miracle restored?  
He now be dealing *dole* among his host  
And over heaps of slaughtered slain

Let us, that are unhurt and whole,  
Fall on, and happy man be 'a *dole*

Clients of old were feasted; now a poor  
Divided *dole* is dealt at the outward door  
Which by the hungry rout is soon disposed  
*Dryden's*

At her general *dole*,

Each receives his ancient soul. *Chapman*

<b>DOLÉ</b> , <i>n. s.</i>	} Old Fr. <i>dole</i> to be the origin first class of words; and <i>la</i> of the second substantive <i>re-</i> mify, in both sorrow; and <i>la</i> causes, pain. tion; and <i>la</i> sinn, lamentation

<b>DOLÉFULLY</b> , <i>adv.</i>	
<b>DOLÉFULNESS</b> , <i>n. s.</i>	
<b>DOLÉSOME</b> , <i>adj.</i>	
<b>DOLÉSOMELY</b> , <i>adv.</i>	
<b>DOLÉSOMENESS</b> , <i>n. s.</i>	
<b>DOLOR</b> , <i>n. s.</i>	
<b>DOLORFUL</b> , <i>adj.</i>	
<b>DOLOROUS</b> , <i>adj.</i>	

**DOLOROUSLY**, *adv.*

For none but you, or who of you is true  
Can rightfully attend so *doleful* lay.

With kindly counter under mimic cheek  
Our pleasant Willy, ah! is dead of late;  
With whom all joy and jolly merriment  
Is also deadened, and in *dolour* drent.

We are taught, by his example, that the  
of *dolorous* and dreadful objects, even in the  
perfect, may, as clouds, overcast all seasons

Our sometime sister, now our quern,  
Have we, as *doers*, with a defeated pyre,  
With mirth in funeral, and with dirge in  
In equal scale weighing delight and *dole*.  
Taken to wife. *Shakespeare.*

I've words too few to take my leave of  
When the tongue's office should be proof  
To breathe the abundant *dolour* of the heart

You take me in too *dolorous* a scene  
I spoke t' you for your comfort

A mind fixed and bent upon some  
good, doth avert the *dolors* of death.

They might hope to change  
Tortment with ease, and soonest meet  
*Dole* with delight. *Milton's Paradise Lost.*

No light, but rather darkness visible,  
Served only to discover sights of woe,  
Regions of sorrow, *doleful* shades, where  
And rest can never dwell.

Yet to that hideous place not so con-  
fessing rigour unconvincing, but that oft  
Leaving my *dolorous* prison I enjoy  
Large liberty.

could comfort other : every man was too  
own sorrow : helping rather to make the  
lamentation more *doleful* and astonishing.

*Sp. Hall. Contemplations.*

screwed face, and *doleful* whine, they only  
senseless harangues of conscience against  
liances.

*South.*

On returned, dissipating that vapour which  
the nerves, and giving the *dolorifick* motion  
again.

*Ray.*

most earnestly entreated to know the cause thereof,  
if she might comfort or accompany her *dole-*  
ful.

*Sidney.*

Troubling him either with asking questions  
of fault with his melancholy ; but rather sit  
in *dolour*, *dolorous* discourses of their own and  
misfortunes.

*Id.*

all-ward bending o'er the beach descri  
dolorous passage to the infernal sky.

*Pope's Odyssey.*

of ruling in this *dolorous* gloom,  
vain words, he cried, can ease my doom.

*Pope.*

Happy the mortal man, who now at last  
thought this *doleful* vale of misery past ;  
to his destined stage has carried on  
arduous load, and laid his burden down.

*Prior.*

by the softness and rarity of the fluid, is in-  
and not *dolorifick*.

*Arbutnot on Air.*

a large well-built town of France, on  
Doubs, in Franche Comté, in the de-  
partment of the Jura. The country around has  
fertility and beauty, received the name  
d'Amour. It has several good edi-  
fices, the Palais de Justice, the former  
des Comptes, the church of Notre  
dame, the Collège d'Arc, and the Hotel Dieu.  
It has also a pleasant public pro-

was the Dola Sequanarum of the Ro-  
man, contains considerable remains of that

The great Roman road to Lyons passed  
this place, and here are two aqueducts  
public edifice near the river of their erect-  
ion was the capital of Franche Comté un-  
til 1793, and is twenty-three miles south of  
Paris, and twenty-eight south-east of Dijon.  
It lies on a lofty point of the Jura chain of  
mountains, between the department of Jura and  
the canton of Vaud, it is elevated 5600 feet  
above the level of the sea, and has the appear-  
ance of an immense rock. From its summit  
there is a most magnificent view for 100 miles in  
every direction, and, on the side of France, a  
view which extends into Burgundy.

DOLLY, or DOLGETH, a town of North  
Merionethshire, at the foot of the  
mountain of Cader-Idris. A new court-house has  
been erected, in which the summer assizes for the  
county are held. The county jail is situated at a  
distance from the town. The town and  
neighbourhood have a peculiar manufacture of  
coloured woollen cloth, called welshing or  
dolly, which is chiefly exported. It has a  
market on Tuesday. It is seated in a valley on  
the bank of the Aion, thirty-one miles north-  
west of Montgomery, and 212 north-west of

DOLICHOS, in botany, a genus of the de-  
candria order, and diadelphia class of plants ;  
natural order thirty-second, papilionaceæ. The  
basis of the vexillum has two callous knobs, ob-  
long, parallel, and compressing the ala below.  
There are fifty-three species, natives of the East  
and West Indies and of the Cape : the most re-  
markable are : 1. *D. lablab*, with a winding  
stalk, a native of warm climates, where it is fre-  
quently cultivated for the table. The Egyptians  
make pleasant arbores with it, by supporting the  
stem and fastening it with cords ; by which means  
the leaves form an excellent covering, and an  
agreeable shade. 2. *D. pruriens*, the couhage,  
cow-itch, or stinging bean, is also a native of  
warm climates. It has a fibrous root, and an  
herbaceous climbing stalk, which is naked, di-  
viding into a great number of branches ; and  
rises to a great height when properly supported.  
The leaves are alternate and trilobate, rising from  
the stem and branches about twelve inches dis-  
tant from each other. The foot-stalk is cylindri-  
cal, from six to fourteen inches long. From the  
axilla of the leaf descends a pendulous solitary  
spike, from six to fourteen inches long, covered  
with long blood-colored papilionaceous flowers,  
rising in clusters of three each, in a double alter-  
nate manner, from small fleshy protuberances,  
each of which is a short pedunculus of three  
flowers. These are succeeded by leguminous,  
coriaceous pods, like those of kidney beans, four  
or five inches long, densely covered with sharp  
hairs, which penetrate the skin, and cause great  
itching, stinging like a nettle, though not quite  
so painfully. This will grow in any soil in those  
countries where it is a native : but is generally  
eradicated from all cultivated grounds ; because  
the hairs from the pods fly with the winds, and  
torment every animal they happen to touch. If  
it was not for this mischievous quality, the  
beauty of its flower would entitle it to a place in  
the best gardens. It flowers in the cool months,  
from September to March, according to the situa-  
tion. The spicula, or sharp hairs, of this plant,  
have been long used in South America as a ver-  
mifuge, and have of late been frequently  
employed in Britain. The spicula of one pod  
mixed with syrup or molasses, and taken in  
the morning fasting, is a dose for an adult.  
The beans are used in the East Indies as  
a cure for the dropsy. 3. *D. soja* is a native of  
Japan, where it is termed daidsu ; and, from its  
excellence, mame ; that is, the pod, by way of  
eminence. It grows with an erect, slender, and  
hairy stalk, to the height of about four feet. The  
leaves are like those of the garden kidney bean.  
The flowers, of a bluish-white, are produced  
from the blossom of the leaves, and succeeded by  
bristly hanging pods resembling those of the yellow  
lupine, which commonly contain two, sometimes  
three, large white seeds. This legumen is doubly  
useful in the Japanese kitchens. It serves for  
the preparation of a substance named miso, that  
is used as butter ; and likewise of a pickle cele-  
brated among them under the name of soju or  
soy.

DOLL, *n. s.* A contraction of Dorothy ; and  
hence a child's toy.

*Doll* is a trisyllable

*Shakspeare.*

**DOLLAR, n.s.** Dutch *daler*. See below. A Dutch and German coin of different value, from about two shillings and sixpence to four and sixpence.

He disbursed

Ten thousand dollars for our general use.

*Shakespeare. Macbeth.*

**DOLLAR**, in this country, is chiefly applied to the Spanish silver coin, otherwise called a piece of eight. Dollars are also coined in different parts of Germany and Holland: and have their subdivisions into semi dollars, quarter dollars, &c. See COINS.

**DOLLART BAY**, or **THE DOLLERT**, an arm of the North Sea, extending between East Friesland in Hanover, and Groningen in the Netherlands, to the mouth of the Ems. It is said to have been formed by the sea breaking in here towards the close of the thirteenth century; when it swept away nearly fifty villages. On the side of East Friesland, the sea has in some measure receded.

**DOLLOND (John)**, a celebrated optician, the inventor of the achromatic telescope, was descended from that useful body of artificers the French refugees of Spitalfields, London, where he was born 10th June, 1706. His education was limited by the circumstances of his friends, who could only destine him to their own occupation, and he is said to have passed many years of his life as an operative silk-weaver. Mr. Dollond, however, possessed a mathematical and philosophical taste, which soon disclosed itself; he acquired the Greek and Latin languages, together with a considerable knowledge of anatomy and scholastic divinity; and though he married early, found means to continue his scientific pursuits, and bring up his family. In his eldest son Mr. Peter Dollond, he was happily afforded an heir of his own taste, and in 1752 he had so well established him in business as an optical instrument-maker, that he quitted Spitalfields to join him in partnership. This same year was read in the Royal Society, a letter of Mr. J. Dollond's to James Short, A. M. F. R. S., concerning a mistake in Mr. Euler's Theorem for correcting the Aberration in the Object Glasses of Refracting Telescopes, together with an introductory letter of Mr. Short, in which Euler's calculations are disputed; with Euler's answers to Short and Dollond. (*Phil. Trans.* 1753, p. 287.) 'It is somewhat strange,' says Mr. Dollond, 'that any body now-a-days should attempt to do that which so long ago has been demonstrated impossible;' and his discoveries were doubtless for a while retarded by his deference to the great name of Newton, whom Euler considered to agree with him; and whose experiments were certainly compatible with the doctrine of Euler, while Mr. Dollond was better acquainted than either with the mechanism of the eye. In 1753 he describes, in a second letter to Mr. Short, a telescope with six glasses, 'calculated for correcting, either wholly or in a great measure, the errors of refraction arising from the dispersion of the different colors, as well as from the spherical form of the surfaces of the eye-glasses;' appealing to the superiority of the telescopes, which he had thus constructed, above those

which had before been in use. He also gives the detail of his theory for a future occasion.

His great discovery is narrated in a full count of some Experiments concerning the different Refrangibility of Light, *Phil. Trans.* 1758, p. 733. Mr. Dollond commenced decisive experiments here described, by breaking a common prism of glass into a prism of water, and varying the angle of the prism; the mean refraction of the glass was calculated; when he found that the colors were destroyed, as they were supposed to be in a similar experiment of Sir Isaac Newton; for the remaining dispersion was nearly equal as that of a prism of glass of half the refracting angle. A thinner wedge of glass being then employed, our optician found that the image was colorless when the refraction of the water was about one-fourth greater than that of the glass. He next attempted to construct compound object-glasses by enclosing water between two lenses; but in this arrangement he was inconvenienced from the spherical aberration of the water, was, therefore, obliged to try the effect of different kinds of glass, and fortunately found that the refractions of flint and crown glass were extremely convenient for his purpose, as they were afforded by them being colorless, when the refractive powers were to each other nearly as two to three. He inferred that a convex lens of crown-glass and a concave one of flint, would produce a colorless image when their focal distances were in the same proportion. 'The spherical aberration, where the curvature was so considerable, produced some inconvenience; but, having surfaces capable of variation, he was enabled to make the aberrations of the two lenses correct each other, and since they were in opposite directions, thus corrected each other.' These instruments required great accuracy of execution to obtain complete success; but, in the hands of the inventor, they produced the most accurate instruments; and he was fortunate in obtaining a quantity of glass of remarkably uniform quality. He afterwards made some small Galilean telescopes, with triple object-glasses.

For these inventions Mr. Dollond received the Copleian medal of the Royal Society, and in 1761 he was chosen a fellow of that body, and appointed optician to the king. Other valuable contributions of his to the society were, A description of a Contrivance for Measuring Small Angles, and an Explanation of an Instrument for that purpose. *Trans. Phil. Soc.* 1754. His instrument consisted of a divided object-glass, with a scale for determining the distance of the images by measuring the near displacement of the two portions of the glass.

Mr. Dollond, however, did not receive these well-deserved honors. On the 11th November, 1761, as he was reading a new paper of Clairaut on the theory of the moon, he fell down in an attack of apoplexy, which soon became fatal. He left two sons who succeeded to his business.

**DOLLOND (Peter)**, eldest son of Mr. John Dollond, the optician, was born in 1732, and communicated, in 1765, a paper to the Royal

his improvement of telescopes; father's contrivance for measuring (see above); and in 1772 another one to and alterations in Hadley's. In 1779 he gave an account of his instrument for correcting the errors of refraction in altitude; and in 1789, of the discovery made by his reflecting telescopes, which became the publication. He died at Kensington, at the advanced age of ninety

EU (Deodate-Guy-Silvain Tancred) celebrated geologist, was born in 1750. He entered into the service of Malta, and became a member of the government, happening to kill one of his competitors, sentenced to death. The grand jury, granted him a pardon, but it was that this should be confirmed by the government. Dolomieu was closely confined for some time under suspense. This perhaps determined his studious habits. At the age of 30 he went to Metz, where he studied natural history. In 1783 he published a paper on the Lipari Isles, and a memoir on the earthquakes of Calabria. In 1788 he published *Memoire sur les Isles Ponces, et sur le défilé de l'Etna*.

Coming out of the revolution, Dolomieu embarked, with his friend Laffitte, in the supposed cause of liberty; but on the 14th of July, and when he felt a victim to the horrors of the guillotine, he died his last moments, and received the last messages which he sent to his wife. He now resumed his travels in other parts of Europe, and in its southern countries. He attended his researches into the physical history of Egypt, on which subject he published a memoir inserted in the *Journ. Phys.*, 1795 we find him again in France; he was established of the school of the same Professor of Geology and Insects. He was also one of the original members of the National Institute of Sciences from this time he redoubled his labors, and published a great number of papers in the course of a few years. He published various contributions to the *Méthodique*. On the scientific armaments made for the expedition to Egypt he was invited to take part in them: and he was employed as a negociator for Malta. In Egypt he visited the mountains, he examined some of the limits of the country; but his illness obliged him to return long before his journey.

On his voyage home, the vessel was taken in a tempest, and was only saved from being wrecked by running into a port in the Channel. Here, as a knight of Malta, he was pronounced a traitor to the existing government and committed to close confinement. In this unfortunate situation he remained until the peace of 1800, in which the government stipulated expressly for his release. During this period he had commenced

a Series of Lectures on the Philosophy of Mineralogy, written with bones and soot-water, on the margin of the few books he was allowed to read. He was appointed, during his confinement, the successor of Daubenton in the Museum of Natural History. His last publication was *Sur la Philosophie Minéralogique et sur l'espèce Minéralogique*. He died at Paris, universally respected, 27th of November, 1801.

**DOLomite.** Of this calcaireo-magnesian carbonate, we have three sub-species.

1. Dolomite, of which there are two kinds, viz. 1st. White granular. It occurs massive, and in fine granular distinct concretions, loosely aggregated. Lustre glimmering and pearly. Fracture imperfect slaty; hard as fluor, and brittle. Specific gravity 2.83. It effervesces feebly with acids, and is phosphorescent on heated iron, or by friction. Its constituents are 46.5 carbonate of magnesia, 52.08 carbonate of lime, 0.25 oxide of manganese, and 0.5 oxide of iron. 2d. Brown dolomite, or magnesian limestone of Tennant. Color, yellowish-gray and yellowish-brown. Massive, in minute granular concretions. Lustre, internally glistening. Fracture splintery. Harder than calcareous spar. Brittle. Specific gravity of crystals, 2.8. It dissolves slowly, and with feeble effervescence. Its constituents are, lime 29.5, magnesia 20.5, carbonic acid 47.2, alumina and iron 0.8. In the north of England it occurs in beds of considerable thickness, and great extent, resting on the Newcastle coal formation. In the Isle of Man it occurs in a limestone which rests on gray wacke.

2. Columnar Dolomite. Color, pale grayish-white. Massive, and in thin prismatic concretions. Cleavage imperfect. Fracture uneven. Lustre vitreous, inclining to pearly. Breaks into acicular fragments. Brittle. Specific gravity 2.76. Its constituents are, 51 carbonate of lime, 47 carbonate of magnesia, 1 carbonated hydrate of iron. It occurs in serpentine in Russia.

3. Compact Dolomite, or Gurhofite. Color, snow-white. Massive and dull. Fracture flat conchoidal. Semi-hard. Difficultly fragible. Specific gravity 2.76. When pulverised, it dissolves with effervescence in hot nitric acid. It consists of 70.5 carbonate of lime, and 29.5 carbonate of magnesia. This kind occurs in veins of serpentine rocks, near Gurhoff, in Lower Austria.

**DOLPHIN**, *n. s.* Fr. *dauphin*; Germ. *Span*. Ital. and Lat. *delphin*, from Gr. *δελφίς* à *δελφαι*, a pig, because the dolphin resembles a pig in its fatness, and the form of its intestines, &c., says Minshew after Beermanus. A fish. See our article **DELPHINUS**.

His delights

Were dolphin like; they showed his back above  
The element they lived in. *Shakespeare.*

Draw boys riding upon goats, eagles, and dolphins.  
*Penshaw.*

Minshew seals approach in circling flocks,  
In dusky mail the tortoise climbs the rocks,  
Torpedoes, sharks, rays, porpoise, dolphins, pour  
Their twinkling squadrons round the glittering shore.  
*Darwin.*

**DOLPHIN OF THE MAST**, in sea language, a peculiar kind of wreath, formed of plated cordage, to be fastened occasionally round the masts as a support to the puddening, whose use is to sustain the weight of the fore and main yards in case the rigging or chains by which those yards are suspended should be shot away in the time of battle; a circumstance which might render their sails useless at a season when their assistance is extremely necessary.

**DOLT**, *n. s.* } Teut. and Sax. *dol*. A heavy  
**DOLTISH**, *adj.* } stupid fellow; a blockhead; a  
thickskull; a loggerhead. It is clearly the past  
participle of *dull*, as Mr. Tooke says.

Thou hast not half that power to do me harm,  
As I have to be hurt: oh gull, oh dolt,  
As ignorant as dirt! *Shakespeare, Othello.*

Like men condemned to thunder-bolts,  
Who, ere the blow, become mere dolt;—  
They neither have the hearts to stay,  
Not wit enough to run away. *Hudibras.*

Dametas, the most arrant doltish clown that ever  
was without the privilege of a bauble. *Sidney.*

Let dolt in haste some altar fair erect  
To those high powers, which idly sit above. *Id.*

Wood's adulterate copper,  
Which, as he scattered, we, like dolt,  
Mistook at first for thunder-bolts. *Swift.*

**DO'MAIN**, *n. s.* *Fr. domaine*, from Lat. *dominium*. Empire; dominion; possession. Hence also, we may remark, our termination *dom* as birthdom, kingdom, &c.

Rome's great emperor, whose wide domain  
Had ample territory, wealth and power. *Milton.*

A Latian field, with fruitful plains,  
And a large portion of the king's domains.

*Dryden's Æneid.*

Ocean trembles for his green domain. *Thomson.*

So Howard, Moira, Burdett, sought the cells,  
Where Want, or Wo, or Guilt in darkness dwells;  
With Pity's torch illumed the dread domains,  
Wiped the wet eye, and eased the galling chains. *Darwin.*

Vain end of human strength, of human skill,  
Conquest, and triumph, and domain, and pomp,  
And ease, and luxury! *Byron.*

**DOMAIN**. See **DEMESNE**.

**DOMAT** (John), a celebrated French lawyer born in 1625, who, observing the confused state of the laws, digested them in 4 vols. 4to, under the title of *The Civil Laws in their Natural Order*; for which Louis XIV. settled on him a pension of 2000 livres. Domat was intimate with the famous Pascal, who left him his private papers at his death. He died in 1696.

**DOMBES**, a *ci-devant* principality of France, about twenty-four miles long, and twenty-one broad, lying around and partly in the late province of Burgundy, but not under its government, on the west bank of the Soane. Trevoux was the capital. It now forms part of the department of Ain.

**DOMBEY** (Joseph), a French botanist of celebrity, was born at Macon in 1742. He took the degree of doctor of physic at Montpellier, and in 1778 went to South America, where he discovered the mystic tree of the tribe of pines, now named after him, *Dombeya*. On his return

to Europe, in 1785, the revolution dur'd so much that he re-embarked for America, being captured on the passage, died in the island of Montserrat, February 1793.

**DOMBEYA**, in botany, a genus of the monodelphia and order dodecandria: calyx outer three-leaved, deciduous: pet. five: ten or twenty: styl. five-cleft: caps. five, one-celled, one or many seeded. Species chiefly natives of the isles of Bourbon and Mauritius.

**DOMBOO**, a considerable town of Africa, situated on the caravan road to Mourzouk, and the first which occurs after the desert of Bilma. It is situated among plains.

**DOMBOON LAKES** are situated on the extremity of Bornou, and supply that Cassina, and the states on the south of it with salt. The merchants of Agades hither annually a large caravan, which with this commodity, and convey it to the surrounding countries. These lakes are called the Chalonides Palus of Ptolemy.

**DOME**, *n. s.* *Fr. dome*, from Lat. *domus*. building, house; fabric. Also, from shape of roofs, probably a hemisphere or a cupola.

Best be he called among good men,  
Who to his God this column raised;

Though lightning strike the dome  
The man who built it shall be prais'd.

Stranger! whose'er thou art, entering  
Affianced in my faith, a friendly guest,  
Approach the dome, the social banquet  
Pope's

From dome to dome when flames infuriate  
Sweep the long street, invest the tower and  
Gild the tall vane amid the astonished air  
And reddening heaven returns the sanguine

While the vine-mantled brow  
The pendent goats unveil, regardless  
Of hourly peril, though the clefted dome  
Tremble to every wind.

**DOVE**, in architecture is a roof of spherical form, raised over the middle of a building, as a church, hall, pavilion, stair-case, &c., by way of crowning. It is the same with what the Italians call *cupola* according to Vitruvius, tholi. They are made round, though we have instances of ones; as those of the Louvre; and others polygons, as that of the *ci-devant* Jesus in the Rue St. Antoine at Paris. They usually columns ranged around them, both by way of ornament, and to support the vault. See **ARCHITECTURE**.

**DOVE**, in chemistry, the upper part of a furnace, particularly portable ones, in figure of a hollow hemisphere, or small use is to form a space in the upper part of a furnace, the air of which is continually by the fire; hence the current of air is greatly increased, which is obliged to pass through the fire, and to pass through the fire, the place of the air driven from the form of this piece renders it proper to reverberate a part of the flame upon

are in the furnace, which has occasioned the furnace to be called a reverberatory furnace. See CHEMISTRY.

DOOM, or DOOM, signifies judgment, sentence, &c. The homagers' oath in the black-book record ends: 'So help me God at his time, and by my trowthe.'

MENICHIINO, a famous Italian painter, of Bologna in 1591. He was at first a pupil of Calvart the Fleming, but soon quitted school for that of the Caraccis. He always applied himself to his work with much study and thoughtfulness; and never offered to touch a pencil but when he fancied a kind of enthusiasm upon him. His great skill in architecture procured him the appointment of chief architect of the apostolical palace from pope Gregory V. nor was he without a theoretical knowledge of music. He died in 1641.

DOMESDAY Book, an ancient record, made by order of William I. and containing a survey of the lands of England. It consists of two volumes. The first is a large folio, written on twelve pages of vellum, in a small but plain letter; each page having a double column of the capital letters and principal passages touched with red ink; and some strokes of red ink run across them, as if they were red lines. This volume contains a description of thirty-one counties. The other volume is written upon 450 double pages of vellum, upon a single column, and in a large but very fair character.

It contains the counties of Essex, Northampton, part of the county of Rutland in that of Northampton, and part of Lancashire in the counties of York and Chester. This survey was begun by order of William the Conqueror, with the advice of his parliament, in the year of our Lord 1086, and completed in the year 1086. The reason given for taking this survey was assigned by several ancient records and laws, was, that every man should be satisfied in his own right, and not usurp with impunity what belonged to another. But, besides this, it is said by others, that now all those who had landed estates became vassals to the king, and paid him so much money by way of tax in proportion to the lands they held. It appears very probable, as there was at that time a general survey of the whole kingdom made by order of king Alfred. For the purpose of the survey recorded in domesday, commissioners were sent into every county to take the names of the knights and freeholders; and juries summoned in each hundred, to take the names of all orders of freemen, from barons down to the lowest vassals. These commissioners were informed by the inhabitants, upon oath, of the name of each manor, and that of its owner; of whom it was held in the time of Edward the Confessor; the number of hides; the quantity of arable land, of pasture, and of meadow land; how many ploughs were in the demesne, and how many in the tenant's part of it; how many how many fish-ponds or fisheries belonged to the manor; the value of the whole together in the time of king Edward, as well as when granted to William, and at the time of this survey; whether it was capable of improvement, or not. Vol. VII.

of being advanced in its value: they were likewise directed to return the tenants of every degree, the quantity of lands then and formerly held by each of them; what was the number of villains or slaves, and also the number and kinds of their cattle and live stock. These inquiries being first methodised in the country, were afterwards sent up to the king's exchequer. This survey, at the time it was made, gave great offence to the people; and occasioned a jealousy that it was intended for some new imposition. But notwithstanding all the precaution taken by the conqueror, to have this survey faithfully and impartially executed, it appears, from indisputable authority, that a false return was given in by some of the commissioners; and that, as it is said, out of a pious motive. This was particularly the case with the abbey of Croyland in Lincolnshire, the possessions of which were greatly under-rated, both with regard to quantity and value. Perhaps more of these pious frauds were discovered, as it is said Ralph Flambard, minister to William Rufus, proposed the making a fresh and more rigorous inquiry; but this was never executed. Notwithstanding this proof of its falsehood in some instances, which must throw a suspicion on others, the authority of domesday book was never permitted to be called in question; and always, when it has been necessary to distinguish whether lands were held in ancient demesne, or in any other manner, recourse was had to that only to determine the doubt. From this definitive authority, from which, as from the sentence pronounced at domesday, or the day of judgment, there could be no appeal, the name of the book is said to have been derived. But Stowe assigns another reason for this appellation; namely that domesday book is a corruption of domus Dei book; a title given it because heretofore deposited in the king's treasury, in a place of the church of Westminster, or Winchester, called domus Dei. From the great care formerly taken for the preservation of this survey, we may learn the estimation in which its importance was held. The dialogue de Scaccaris says, 'Liber ille (Domesday) sigilli regis comes est individuus in thesauro.' Until lately it has been kept under three different locks and keys; one in the custody of the treasurer, and the others in that of the two chamberlains of the exchequer. It is now deposited in the chapter-house at Westminster, where it may be consulted on paying to the proper officers a fee of 6s. 8d. for a search, and 4d. per line for a transcript. Besides the two volumes above mentioned, there is also a third made by order of the same king; and which differs from the others in form more than matter. There is also a fourth called domesday, which is kept in the exchequer; which, though a very large volume, is only an abridgment of the others. In the remembrancer's office in the exchequer is kept a fifth book, likewise called domesday, which is the same with the fourth book already mentioned. King Alfred had a roll which he called domesday; and the domesday-book made by William the Conqueror, referred to the time of Edward the Confessor, as that of king Alfred did to the time of Ethelred. The fourth book of domesday having many pictures and gilt letters

in the beginning relating to the time of king Edward the Confessor, this led some to a false opinion that domesday-book was composed in the reign of king Edward.

In 1767, in consequence of an address from the House of Lords, his late Majesty gave directions for the publication of domesday-book, among other records. An engraved fac-simile was at first contemplated; but the great expense of such an undertaking caused it to be laid aside: and a tolerably exact fac-simile metal type having at length been obtained, the editing of the work was confided to Mr. Abraham Farley, Deputy Keeper of the Records in the Chapter-house, at Westminster, a gentleman of singular learning and experience in this department of literature, who had had almost daily recourse to the book for more than forty years. The work was commenced in 1770, and was completed early in 1783, at the press of Mr. John Nichols—the type with which it was executed, was destroyed in the fire which consumed his printing-office in February, 1808. Accurately as Mr. Farley accomplished the task which had been assigned to him, the printed Domesday was comparatively of little value for want of minute indexes. This deficiency has been supplied under the direction of the Record Commission, in a folio volume, containing indexes of names of persons, of places, and things, so minute, (and from frequent reference, we can state, so accurate,) that the object of enquiry, if in the work, may be readily ascertained. These indexes have been compiled

by the clerks in the Record Office of the Chapter-house, under the superintendence of the Right Hon. George Rose, the principal officer of that repository of our national annals, and to them is prefixed a very elaborate introduction to Domesday, by Mr. Ellis, one of the librarians of the British Museum, containing observations on the formation and execution of the Record, the principal matters therein contained, its original uses, conservation, and references to courts of law. From these disquisitions, which are comprised in eighty-eight well-bound pages, the preceding particulars have been abridged. In further illustration of the work, and important record, the Commissioners thought it their duty to print a supplementary volume of similar surveys, of nearly contemporary date, for Exeter, Ely, and Winton or Winchester, which appear to have been the original portions whence the general survey was derived, so far as relates to those districts: and the county palatine of Durham was not omitted within the Conqueror's survey, they have thought it expedient to add the contents of a similar survey for that county, denominated the Feudal Book, though its date is somewhat late. This supplement to Domesday forms a large volume in folio, and is enriched with a critical and historical dissertation on the records there contained, together with appropriate indexes, by Mr. Ellis.

The following extract will give our readers an idea of the nature of this venerable Record.

#### IN BRIKISTAN HUND

That is:

#### IN BRIKISTAN HUNDREDO.

Rex tenet BERMUNDESYE. Heraldus comes tenuit. Tunc se defendebat pro xiii hidis, m<sup>o</sup> p. xii hidis. Terra est viii carrucatarum. In dominio est una carrucata et xiv villani et xliiii bordarii cum una carrucata. Ibi nova et pulchra ecclesia, et xx acra prati. Silva v porcis de pasnag. Lundonia xiii burgenses de xliiii denariis. Tempore Regis Edwardi et modo valet xv libras. Comes habet xx solidos. Comes Moritoniensis tenet i hidam quae Tempore Regis Edwardi fuit in hoc Manerio.

In English thus:

#### In Brixtan Hundred.

'The king holds BERMUNDESYE. Earl HERALD held it [before]. At that time it was one and thirteen hides; now, at twelve. The arable land is eight carrucates [or plough-lands]. There is one carrucate in demesne; and twenty-five villans, and thirty-three bordars, with one carrucate. There is a new and handsome church, with twenty acres of meadow, and woodland for the husbandry [pasturage] time. In LONDON are thirteen burgesses at forty-four pence. In the time of King Edward it was valued, as it now is, at fifteen pounds; and the sheriff has twenty shillings. The Count of Moriton holds one hide, which, in the time of King Edward, and afterwards, was in the maner.

ently of the immediate uses of this Conqueror, it is to this day a record of importance to the historian and to y, for the light it throws on the dif- of persons into which the English divided—the different denominations their culture and measurement—the dominations of money, and the per- tees that enjoyed the liberty of coin- al jurisdictions and franchises— ervices—criminal and civil juris- ecclesiastical and historical matters and, besides many curious illustrations manners, which we have not room to

**KING**, in astrology, the dividing or  
the heavens into twelve houses, to  
be, by means of six great circles,  
of position. Regiomontanus makes  
if position pass through the intersec-  
meridian and the horizon: others  
pass through the poles of the zodiac.

*JOY.*

**DOMINANT**, among musicians, is used either  
live or substantive; but these different  
are far from being indiscriminate.

In both senses it is explained by Rousseau as  
follows:—

**DOMINANT**, *adj.* The dominant or sensible  
chord, is that which is practised upon the domi-  
nant of the tone, and which introduces a perfect  
cadence. Every perfect major chord becomes a  
dominant chord, as soon as the seventh minor is  
added to it.

**DOMINANT**, *n. s.* Of the three notes essential  
to the tone, it is that which is a fifth from the  
tonic. The tonic and the dominant fix the  
tone; in it they are each of them the fundamen-  
tal sound of a particular chord: whereas the  
mediant, which constitutes the mode, has no chord  
peculiar to itself, and only makes a part of the  
chord of the tonic. Rameau gives the name of  
dominant in general to every note which carries  
a chord of the seventh, and distinguishes that  
which carries the sensible chord by the name of  
a tonic dominant; but on account of the length  
of the word, this addition to the name has not  
been adopted by artists: they continue simply to  
call that note a dominant which is a fifth from  
the tonic; and they do not call the other notes,  
which carry a chord of the seventh, dominants,  
but fundamentals; which is sufficient to render  
their meaning plain, and prevents confusion.

A **DOMINANT**, in that species of church music  
which is called plain chant, is that note which is  
most frequently repeated or beaten, in whatever  
degree it may be from the tonic. In this species  
of music there are dominants and tonics, but no  
mediant.

**DOMINATE**, *v. a.* } *Fr. domain;*  
**DOMINATION**, *n. s.* } *Portug. and Ital. domi-*  
**DOMINATIVE**, *adj.* } *nio; Lat. dominium, from*  
**DOMINATOR**, *n. s.* } *domus; Gr. δόμος, a*  
**DOMINION**, *n. s.* } *house, à δέμω, to build.*

To prevail over: domination and dominion both  
signify supreme authority, power, as over a man's  
own house or territory: a dominator is he who  
thus rules.

Settunge him on his right half in heuenli thingis  
aboue ech principat and potestat and vertu and domi-  
nacious, and (above) ech name that is named, not  
oonli in this world, but also in the world to comyng.

*Wiclif. Effences i.*

By him were all things created, visible and invis-  
ible, whether they be thrones or dominions, or princi-  
palities or powers.

*Col. i. 16.*

Thou and thine usurp

The domination, royalties, and rights

Of this oppressed boy. *Shakespeare. King John.*

Jupiter and Mars are dominators for this north-  
west part of the world, which maketh the people  
impatient of servitude, lovers of liberty, martial,  
and courageous.

*Camden's Remains.*

Conquest and good husbandry both enlarge the  
king's dominions: the one by the sword, making the  
acres more in number, the other by the plough,  
making the same acres more in value.

*Fuller.*

The Law of Works is that empire and dominion  
which God exercised over man, using his utmost  
right, and obliging man to the rigorous observation  
of all that law he should impose upon him.

*Bp. Taylor.*

He gave us only over beast, fish, fowl,

Dominion absolute; that right we hold

By his donation: but man over man

His made not lord.

*Milton.*

Hear, all ye angels, progeny of light,  
Thrones, dominations, principdoms, virtues, powers.  
*Id.*

What can our travellers bring home  
That is not to be learnt at Rome?  
What politics, or strange opinions,  
That are not in our own dominions? *Hudibras.*

I thus conclude my theme,  
The dominating humour makes the dream.

*Dryden.*

He could not have private dominion over that which  
was under the private dominion of another. *Locke.*

Maximian traded with the Goths in the product of  
his own estate in Thracia, the place of his nativity;  
whither he retired, to withdraw from the unjust  
domination of Opilius Macrinus. *Arbutnot on Coins.*

Blest use of power, O virtuous pride in kings!  
And like his bounty whence dominion springs.

*Tickell.*

Of all the enemies of idleness, want is the most  
formidable. Fame is soon found to be a sound, and  
love a dream. Avarice and ambition may be justly  
suspected of being privy confederacies with idleness,  
for when they have, for a while, protected their vota-  
ries, they often deliver them up, to end their lives  
under her dominion. *Johnson.*

To sit on rocks, to muse o'er flood and fell,  
To slowly trace the forest's shady scenes,  
Where things that own not man's dominion dwell,  
And mortal foot hath ne'er, or rarely been.

*Byron.*

DOMINEER, *v. n.* Fr. *dominer*. See DOMI-  
NATE. To rule with absolute authority: hence  
to swell; to bluster.

Go to the feast, revel, and domineer,  
Carouse full measure.

*Shakespeare. Taming of the Shrew.*

The voice of conscience now is low and weak,  
chastising the passions, as old Eli did his lustful domi-  
neering sons. *South.*

Both would their little ends secure;  
He sighs for freedom, she for power:  
His wishes tend abroad to roam,  
And hers to domineer at home.

*Prior.*

DOMINGO (SL), HISPANIOLA, or HAYTI, one of the largest and most fertile of the West India islands, and the second in point of size, is situated between Porto Rico on the east, and Jamaica and Cuba on the west. It is approached on its northern side by the southern part of the Bahama chain, while southward the Caribbean sea runs between it and Terra Firma. The extreme length of St. Domingo is generally stated at about 400 miles; Rainsford, however, extends it to 490 miles, and its utmost breadth 150; but a considerable peninsula projects for nearly 140 miles towards the west, and, with a large promontory on the north, forms a spacious bay opposite the island of Cuba. Its medium length may therefore be computed at 300 miles, and its breadth at 100, which gives a superficial area of about 30,000 square miles, equal therefore to that of Ireland. Its most northerly point is in 19° 46'; and its most southerly in 17° 37' N. lat.; westward its extreme point (Cape Tiboron) is in 74° 15'; and eastward, Cape Engano, its extreme point in this direction, is 67° 35' W. long. Columbus, who discovered it in his first voyage to the New World,

found it known at Cuba as Hayti, and appears, a highland country; and it was also called it, and the name has been in late years by the independent black people who have revolutionised the French part of the island. This great navigator named it, according to Dr. Robertson, Española, Little Spain; or at first, as others say, Isabella, in honor of the queen of Spain; however, best known to Europeans as St. Domingo, the name of the capital of the Spanish part of the island.

St. Domingo, as it existed before the revolution of 1789, is described by the abbé Raynouard as 'delightful vales, where the sweets of spring are enjoyed, without the heat of summer. There are but two seasons, 'in the year, and they are both fine. The ground always laden with flowers, covered with flowers, realises the riches of poetical descriptions. When we turn our eyes, we are enchanted with the sight of objects, colored and reflected by the light. The air is temperate in the day, the nights are constantly cool.' The Spanish and French were the European masters of the island, until a very recent period; the demarcation, between their respective territories, commencing at the river Massacre on the east side, at the head of the bay of Manzanillo, extending to the river Pedernates on the west side, the country east of this line, being about four-fifths of the island, was claimed by Spain, and all to the westward by France. The French part of the island, of a very irregular shape, comprehended 2,500,000 acres, of which about one-third were in high cultivation previous to 1791.

The coast of St. Domingo is very rocky, and the navigation of the sea is dangerous: in his course from Cuba to François, Columbus, it is well known, sailed in a vessel in which he originally sailed from Spain. None of its harbours will admit vessels of considerable burden. On the north side, the bays of St. Domingo, Neyba and Acaoa. The first has become, of late years, very shallow and full of reefs. The bay of Neyba is a bay of thirty tons burden; but a river, the name flowing into it, divides itself, dividing the ocean, into various channels, changing in the rainy season, perplexing the navigation. Acaoa Bay has also several small rivers flowing into it. The entrance is two leagues wide, and widens inwards to nearly six leagues. On the east side is the capacious port of Cap-Haïtien, the best and safest of the island. On the south-east coast is the Bay of Samana, extending to its southern point, Cape Rafael, to the south side of peninsula of Samana, eighteen miles long, enclosed by a bulwark of rocks and reefs, the entrance only being left clear, but by a narrow and deep channel between the shore and some detached islands: it receives the waters of Yuna and Cambu after their union. The former has a course of about 100 miles, and the bay is about sixty miles deep, and is surrounded on every side by a fertile country. Plata is Halsama Bay, which has only five feet depth of water, and is of difficult

France being very narrow: the neighbour-  
 rich in valuable woods. *Bata Ecossaise*,  
 its Bay, is in this direction, but is a  
 rough, rocky inlet; and there are several  
 small harbours and bays on this side of the

None of the rivers are practicable, even  
 in the dry season. Eleven leagues  
 from Port-au-Prince is a salt lake, named  
*Saline*, twenty-two leagues in circuit; its  
 water is deep, clear, and bitter, and it abounds  
 with crocodiles and tortoises of a large size; in it  
 island, two leagues long, abounding with  
 goats, and having a spring of fresh water.

An independent portion of St. Domingo (the  
 French part), is mountainous and well-  
 wooded, containing mines of silver and iron.  
 The central part of the Spanish territory  
 is also composed of elevated mountains,  
 of them capable of cultivation, and having  
 extremely rich. They also have yielded  
 silver. From the city of St. Domingo  
 wide plains, from twenty to twenty-five  
 in breadth, stretch for about eighty miles to  
 the west. They are called the *Los Llanos*, and  
 are adapted to the growth of every tropical pro-  
 duce. A beautiful valley to the north of  
 the city, through which the river *Cotu flows*, is  
 still more productive. The mountains  
 are generally composed of two parallel chains,  
 the one from east to west, with several collateral  
 ridges. Excellent timber abounds throughout  
 the mountains. In those of *Cibao* originate the  
 principal streams of the island; and the influence  
 of the lofty ranges, in mitigating the winds and  
 regulating the atmosphere, is most important in this  
 island. Some of them rise to the height of  
 five thousand feet above the level of the sea.

St. Domingo, according to Edwards, is the unrivalled  
 fertility of the plains of this island, that they are  
 capable of producing more sugar and other  
 commodities than all the British West  
 Indies put together. Common attention to their  
 advantages was alone wanting in the  
 hands of the colonists to render this one of the most  
 fertile possessions of that crown. But when,  
 by acts of cruelty and oppression, they had  
 exterminated the aboriginal inhabitants, many of  
 them became speculators in adventures to South  
 America; while those who remained sunk into  
 slothful indolence, as to suffer this beau-  
 tiful country to become a luxuriant  
 waste. The *Savannahs*, and fine plains in  
 the interior, became, in consequence, entirely  
 covered by wild animals, such as swine, horses,  
 and cattle; and herds of domestic animals  
 filled in every direction. The export of  
 animals to the French settlements of the  
 neighbourhood, formed an important branch of  
 trade to the Spaniards; and it was in ex-  
 pectation of them chiefly that they received the  
 colonies of Europe.

The climate is moist, hot, and unhealthy to  
 Europeans; the thermometer in the plains rising  
 to 92°; and in the higher parts to 72°  
 at night. But these heats are moderated by the  
 sea-breeze, which sets in about ten in  
 the morning, and which is succeeded, towards  
 evening, by a land breeze. The heaviest  
 of the wet season fall in May and June;

and so impregnated with moisture is the atmos-  
 phere at this season, that the brightest metallic  
 polish becomes tarnished; the brooks now swell  
 into torrents, and not seldom overwhelm the ad-  
 jacent plantations. From time immemorial the  
 inhabitants of the dryer parts of the island have  
 reserved a portion of these copious streams by  
 an artificial irrigation. The sea-coast is said to  
 be more unfavorable to European constitutions  
 than the interior. On the northern coast severe  
 gales are felt, but the violent hurricanes of other  
 parts of the West Indies seldom blow here;  
 when they occur, it is chiefly on the southern  
 coast, where they are denominated southern  
 gales.

St. Domingo is chiefly valuable for its vegeta-  
 ble productions. The useful and elegant maho-  
 gany-tree here grows to a noble size and is of  
 very superior grain. The largest of its plants is  
 the cotton-tree, whose stem often furnishes the  
 entire body of the Indian canoes: the pine is  
 also abundant; and here is a species of oak,  
 resembling the American, which yields planks of  
 from sixty to seventy feet long. *Brasil*, satin,  
 and various hard and ornamental woods are also  
 found. Sugar, coffee, and cotton, of a fine qual-  
 ity, are produced in abundance. Indigo was  
 once cultivated, but it has been long since aban-  
 doned. *Vanilla* grows spontaneously in the woods,  
 and the plantain, also, is abundant. Flowers are  
 numerous, and are distinguished both by their  
 beauty and fragrance: all the tropical fruits are  
 produced in high perfection.

The only indigenous quadruped remaining is  
 the agouti cat, called by the natives *hectia*. But  
 the stock of horned cattle, horses, mules, asses,  
 sheep, and goats, is prodigious. Many of the  
 cattle, as we have stated, run wild, and are the  
 prey of any one who will pursue them: some  
 farmers of the interior own 10,000 or 12,000,  
 worth from six to eight dollars a head: the horse  
 is here very sure-footed, and useful, but of small  
 size and inferior paces. The whole number  
 of horses, mules, and asses, both the latter being  
 valuable breeds, is estimated at 150,000; the  
 horned cattle at 300,000.

Birds are numerous, particularly wild fowl;  
 but the Jamaica nightingale, or mocking-bird,  
 and the banana, are the only songsters. The  
 flesh of the wild pigeon is particularly savory,  
 though somewhat bitter; the parrot is also eaten,  
 and ortolans are numerous. The best fish of the  
 rivers are the mullet, snook, calapever, pargo,  
 grooper, baracooter, craw and rock-fish, and  
 particularly the land-crab. Turtle abounds on  
 the coast, and immense quantities of tarapins,  
 together with a small species of amphibious tor-  
 toise, which is a very delicate and luxurious food.

The serpent tribes, though numerous, are not  
 venomous, but the centipede is very annoying.  
 A venomous crab-spider is also found here; the  
 destructive white-ant, and abundant swarms of  
 insects. This ant will eat through any kind of  
 packing box, from side to side, and penetrate  
 every fold of goods.

The aborigines of St. Domingo have been  
 long since exterminated by the Spaniards. When it  
 was discovered by Columbus, 9th of December  
 1492, it formed five kingdoms, called *Maqua*,

Marien, Higuay, Maguana, and Xaraguay, each governed by its own cacique. The Spaniards had possession of the whole of it for 120 years. This island, their earliest settlement in the new world, was at first in high estimation for the quantity of gold it supplied. But its wealth diminished with the inhabitants of the country, whom they obliged to dig it out of the bowels of the earth; and the source of its wealth was entirely dried up, when they were extinct. Benzon relates, that of 2,000,000 of inhabitants, contained in the island when discovered by Columbus in 1492, scarcely 153 were alive in 1545. Bishop Las Casas makes the extermination of the natives by his countrymen still greater and more rapid. He states the original number at 3,000,000, and says they were reduced to 60,000 within fifteen years. A vehement desire of opening again this source of wealth first inspired the thought of obtaining slaves from Africa; but, besides that these were found unfit for the labors they were destined to, the multitude of mines, then beginning to be wrought on the continent, made those of St. Domingo no longer of any importance. An idea now suggested itself, that the negroes, who were healthy, strong, and patient, might be usefully employed in husbandry. The produce of their industry was at first extremely small, because the laborers were few. Charles V. had granted an exclusive right of the slave trade to a Flemish nobleman, who made over his privilege to the Genoese. These avaricious republicans conducted this infamous commerce as all monopolies are conducted: they resolved to sell dear, and they sold but few. When time and competition had fixed the price of slaves, the number of them increased. It may easily be imagined that the Spaniards, who had been accustomed to treat the Indians as beasts, did not entertain a higher opinion of these unfortunate Africans, whom they substituted in their place. Degraded still farther in their eyes by the price they had paid for them, even religion could not restrain them from aggravating the weight of their servitude. They made frequent attempts, however, to recover the undeniable rights of mankind, and thus procured somewhat better treatment. The cultivation of the island was, at times, therefore, pursued with tolerable success. About the middle of the sixteenth century, Spain drew annually from this colony 10,000,000 weight of sugar, a large quantity of wood for dyeing; tobacco, cocoa, cassia, ginger, cotton, and peltry in abundance. One might imagine, that such favorable beginnings would have given both the desire and the means of carrying them further; but a train of events, more fatal each than the other, ruined these hopes. The first misfortune arose from the depopulation of the island. The Spanish conquests on the continent should naturally have contributed to promote the success of an island, which seemed to have been formed to be the centre of that vast dominion arising around it. But it fell out quite otherwise: on a view of the immense fortunes raising in Mexico, and other parts, the richest inhabitants of Hispaniola began to despise their settlements, and the government endeavoured in vain to put a stop to emigration:

the laws were always either artfully evaded, or openly violated. The weakness, which was a necessary consequence of such conduct, along the coasts without defence, encouraged the armies of Spain to ravage them. See *CRUIZERS*. Even the capital of this island was taken and pillaged by Sir Francis Drake. Cruisers of less pretensions continued themselves with intercepting vessels in their passage through those latitudes, which were to be known at that time of any in the ocean. To add to these misfortunes, the Spaniards themselves commenced pirates. They attacked ships but those of their own nation; which were rich, worse provided, and worse defended than any others. The custom they had of fitting out ships clandestinely, to procure slaves, prevented them from being known; and the assistance purchased from the ships of war, contributed to protect the trade, insured to them success. The foreign trade of the colony was its resource in this distress; and that was continued as it continued to be carried on, notwithstanding the vigilance of the government, perhaps, by their connivance, the policy was exasperated and short-sighted court exerted in demolishing most of the sea-ports, and drove the miserable inhabitants into the inland parts. This act of violence threw them into a state of dejection, which the incursions and settlements of the French on the island afterwards carried to the utmost pitch. The latter, after having made some unsuccessful attempts to settle on the coast, had part of it yielded to them, in 1697, to the Spaniards. The court of Spain, totally ignorant of that vast empire which they had lost on the continent, used no pains to dissipate the lethargy. They even refused to listen to the solicitations of their Flemish subjects, who earnestly pressed that they might have permission to clear the fertile parts of the island. Rather than run the risk of seeing their contraband trade on the coasts, they buried in oblivion a settlement which had no considerable consequence, and was likely to become so. This colony, which no longer any intercourse with the mother country but by a single ship, of no great burden, arrived hence every third year, consisted in 1717, of 18,410 inhabitants, including Spaniards, Mestees, Negroes, and Mulattoes. The complexion and character of this population, according to the different proportions of European, and African blood they had derived from that natural and transient union, restored all races and conditions to the same level. Demi-savages, in fact, the greater part of them plunged into extreme sloth, from the fruits and roots, or dwelt in cottages without furniture, and most of them without clothes. The few among them, in whom indolence had not totally suppressed the sense of decency and taste for the conveniences of life, purchased clothes of their neighbours, the French, in exchange for their cattle, and the money sent to the government. A century after its first settlement it was found necessary to remit annually from Mexico 300,000 dollars, for the sup-

of the local government of this colony. But the company formed at Barcelona, in 1763, with exclusive privileges for the re-establishment of St. Domingo, ever make any consideration. They only sent out two small ships annually, which were freighted back with hides, and other commodities.

The Spanish government was, however, roused by the exertions in favor of St. Domingo at the end of the last century. Settlers were encouraged to come hither from the Canary Islands, and monopoly imposed on its trade was relaxed, and encouragements were held out to agriculture and commerce. Under the influence of these measures the colony began to improve, towns and villages were rebuilt and peopled, plantations were laid out, and the trade with the French part of the island became considerable.

At the period of the French revolution, in 1793, the Spaniards had twenty-four sugar-plantations in St. Domingo. They paid with raw hides, timber, and piastres for the small number of cargoes they received from Europe. They had 11,000 heads of cattle, they furnished the French part of St. Domingo with horses, mules, and some tobacco. Next to the ancient city of St. Domingo, their principal towns were in Christy, La Vega, St. Jago, Zeibo, St. Juan, Azua, and Isabella.

The French part of the island was ceded formally to Spain by the treaty of Basle, July 22nd, 1795: but it was not taken possession of by that power until 1801, when the unfortunate Toussaint arrived there before the capital at the aid of a considerable French force. At this time it is said 25,000 of the inhabitants emigrated to Cuba, South America, or other of the French settlements, so averse were they to the new yoke. At the close of 1808 attempts to free the French were openly made: in November the French commander was shut up in the city; but it was not until July of the following year that he surrendered, when a British agent, under General Carmichael, came to the aid of the Spaniards. Since this period they declared their independence of the mother country, and offered their allegiance to the new king of Colombia. At the period of its cession to France, the Spanish part of St. Domingo had 125,000 inhabitants, 110,000 of whom were free people, and 15,000 negro slaves. Land was valued at French livres, or five shillings the arpent; labor at two French livres, sixty-one centimes, or a little better than two shillings per arpent. Walton estimates the inhabitants of this colony in 1810, at 104,000. We have seen that there had been a considerable emigration, which included from this amount.

We have noticed the visits, and, under that name, the settlement, of the BUCCARIERS, in St. Domingo. That part of this singular community, which abandoned the sea for its fertile soil, consisted principally of Frenchmen, and were acknowledged subjects by the government of France at the close of the seventeenth century. In 1669 the planters here amounted to about 1500; Bertrand Dogeron, a man of considerable talents and probity, having been sent to form them into a regular colony. In

1670, however, the oppressive measures of the French West India Company caused the inhabitants of this part of St. Domingo to revolt: and tranquillity was only restored at the price of a free trade to France, subject to a duty of five per cent. paid to the company on the arrival and departure of all vessels.

Under the excellent management of Dogeron the colony continued to prosper; but after his death, in 1673, it languished under the monopoly of exclusive trading companies. Three years before his death the town of Cape François had been founded by Gobin, a French Protestant, whom the persecutions of Louis XIV. had driven from his native land. In 1688, several slaves having been taken from the English, the inhabitants of St. Domingo began to turn their attention to the culture of the sugar-cane. With this view they increased their stock of negroes, and in 1694, taking advantage of the misfortunes which had befallen the English colony of Jamaica, they effected a landing in that island, and carried off a considerable number of slaves. The English, in their turn, attacked the settlement of Cape François in the following year, which they plundered and reduced to ashes. It was, however, soon rebuilt. At the peace of Ryswick, the French obtained the first regular cession of the western part of St. Domingo, and in 1702, Port-au-Prince was made the seat of the government, but the town of the cape continued in every other respect the capital of the colony. The French in St. Domingo flourished as the Spaniards decayed. Their colony, which in the time of Herrera counted 14,000 Castilians, besides a proportional number of other inhabitants, had, in 1717, only 18,410 individuals of every description; whilst, according to the abbé Raynal, the produce of the French colony, in 1720, amounted to 1,200,000 lbs. of indigo, 1,400,000 lbs. of white sugar, and 21,000,000 lbs. of raw sugar. From 1722, when the French colony of St. Domingo was freed from the yoke of exclusive trading companies, it rose gradually to the highest pitch of prosperity. In the year 1754, the value of the various commodities of the colony was £1,261,469 sterling, and the imports from the mother country £1,777,509 sterling. There were 14,000 white inhabitants, 4000 free mulattoes, and upwards of 172,000 negroes; 599 sugar plantations, 3379 of indigo, 98,946 cocoa trees, 6,300,367 cotton plants, and nearly 22,000,000 cassia trees; 63,000 horses and mules, 93,000 heads of horned cattle, 6,000,000 banana trees; upwards of 1,000,000 plots of potatoes, 226,000 plots of yams; and nearly 3,000,000 trenches of manioc.

In 1789 the prosperity of the French part of St. Domingo was at its greatest height. It was divided into the northern, western, and southern provinces. The first extended about forty leagues along the northern coast, from the river Massacre to cape St. Nicholas, and contained, inclusive of the island of Tortuga, twenty-six parishes. The principal towns were Cape François, Port Dauphin, Port de Paix, and Cape St. Nicholas. The western province commenced at this cape, and terminated at Cape Tiburon. It contained fourteen parishes; its chief towns were Port-au-

Prince, St. Marc, Leogane, Petit Goave, and Jérémie. The southern province occupied the remaining coast from Cape Tiburon to l'Anse-à-Pitre, and contained ten parishes and two towns, Cayes and Jaemel. The cultivated land amounted to 2,290,000 English acres, or 771,275 carreaux of French measurement, 350 feet on every side to the carreau. But Barbé Marbois, in his *Compte rendu des finances de St. Domingue*, en 1789, reckons the cultivated land at 570,210 carreaux only. There were 792 sugar plantations, 2810 coffee plantations, 705 cotton plantations, 3097 indigo plantations, sixty-nine cacao plantations, and 173 distilleries of rum. The produce of these plantations, in 1788, consisted of 163,405,500 lbs. of sugar, 68,151,000 lbs. of coffee, 6,289,000 lbs. of cotton, 930,000 lbs. of indigo, 150,000 lbs. of cacao, 34,453,000 lbs. of syrup, worth in all, with some less important articles, 135,763,000 French livres. It was sent to France in 686 vessels of 199,122 tons. The goods imported into the colony from different ports of France, in 465 vessels of 138,624 tons, amounted to the value of 54,578,000 French livres. Before the revolution, the exportation from the whole island employed 1070 vessels, navigated by 7936 seamen.

The population consisted in 1788, according to Marbois, of 27,717 white inhabitants, of whom there were 14,571 males, 4482 females, and 8664 children; of 405,564 negro slaves, of whom there were 174,971 males, 138,800 females, and 91,793 children; and of 21,808 free people of color.

Soon after 1789 a most dreadful reverse took place. At this period, says Mr. Bryan Edwards, in his *Historical Survey of the French Colony in St. Domingo*, London, 4to. 1797, 'the mulattoes were in a situation more degrading and wretched, than that of the enslaved negroes in any part of the West Indies. No law allowed the privileges of a white person to any descendant of an African, however remote.'—'The laws, he adds, were dreadfully unequal.' In such a situation it is not to be wondered at, that they should have listened with pleasure to the news of the French revolution, and to the acts of the assembly, which abolished slavery, and established equality of rights. A colonial assembly met at St. Mark, on the 16th of April, 1790, composed of 213 members, which, says Mr. Edwards, 'fairly and fully represented the inhabitants.' 'They passed acts of indulgence, and rectified gross abuses. But persons interested in the continuance of these abuses were displeased. They counteracted the proceedings of the assembly, and misrepresented their intentions. M. Peynier, the governor, attempted to restore the old despotic system; whereupon eighty-five members of the assembly embarked for France; as did also M. Peynier, who resigned in November 1790. 'The pride of power,' adds this writer, 'the rage of reformation, the contentions of party, and the conflict of opposing interests, now produced a tempest, that swept every thing before it.' In October, 1790, James Oge, a free mulatto, who had been at Paris, and who is characterised by Mr. Edwards, as 'an enthusiast for liberty, but mild and humane,' returned from France, and put himself at the

head of the insurgent negroes, and people of color; but being defeated, in March 1791, he fled to the Spaniards, to whom he offered for refuge, and, with Mark Charles his lieutenant, broke alive on the wheel. The five members of the colonial assembly arrested in France, and their act of the 15th of October 1790, annulled. In March, 1791, troops arrived from France; and Martin, a new governor was murdered by his enemies, with circumstances of horrible barbarity. By decree of the National Assembly, of the 15th of May 1791, people of color were declared to be to seats in the colonial assembly. And on the 11th of September, a concordat, or truce, was signed between the whites and mulattoes. 'The operation of this truce,' says Edwards, 'was destroyed by the absurd decree of the assembly of the 24th of September, repealing the decree of the 15th of May, whereby, at a very moment when the justice and wisdom of this decree were acknowledged, and its observance promised by the colonial assembly, its repeal was pronounced by the legislative assembly in the mother country. To such vanity and absurdity must every government be driven, that attempts to regulate and direct the local concerns of a country 3000 miles distant. Open war in all its horrors was now renewed. All the workings of humanity were abolished; the raging and insatiable thirst of revenge was inflamed each class alike. It was no longer a contest for mere victory, but a diabolical contest which party could inflict the most execrable cruelties on the other.' (On the 22nd of August, 1791, Cape François was burnt, and the space of two months it was computed that upwards of 2000 white persons perished in the horrible massacres; and that of the whites and negroes not fewer than 10,000 died by the mine and the sword, besides several hundreds that suffered by the executioner. Monsieur de Saintonax, Polverel, and Ailhaud, sent from France as commissioners, accompanied by 6000 of the national guards; and after Ailhaud was appointed governor. Their mission, however, to stop these enormities proved fruitless, though they proclaimed the total abolition of slavery, and a general indemnity.

In October, 1793, a body of British troops under colonel Whitlock, were landed, and took possession of Tiburon, Treves, Jérémie, Leogane, Cape Nicolas Mole, and upwards of thirty miles of the eastern coast with little opposition. Though the loss of the British in these expeditions, or rather skirmishes, did not exceed 100 men, yet the victims of disease, within a short time after their arrival, were upwards of 6000, of whom were 150 officers. Leogane was retaken by the negroes, who now amounted to above 100,000, under their general Toussaint l'Ouverture; and Tiburon was taken by the French under general Rigaud. To counteract the disasters, and to supply the Mole with provisions, an expedition was undertaken against the fort of Bonbarde, but the reduction (which was not accomplished till the 18th of April 1796) cost an immense number of men, and after it was taken, instead of being able to supply

le, it was found necessary to supply it  
 at a vast expense, and with the loss  
 of brave troops. These and similar losses,  
 the deaths of lieutenant colonels Brishane  
 and Arkham, who were killed in 1795, together  
 with the faithlessness of the French emigrants,  
 whose suggestions this expedition had been  
 taken, at last determined the British com-  
 mand to surrender. Port au Prince, Cape  
 Nicolas Mole, the only places remain-  
 ing in the hands of the British, to general  
 Maitland, by capitulation in August 1798; and  
 on the 1st of October the island was totally  
 taken by the British. The name of Port au  
 Prince was at this time changed to Port Repub-  
 lic, and the Spanish part of the island, having  
 been ceded to the French by treaty was taken  
 possession of, as we have already intimated,  
 by Toussaint. We must refer our readers to  
 the history of this chieftain in another part of our  
 work for the detailed proofs of his very superior  
 talents and character. He applied himself at  
 once to heal the wounds of this his native  
 land with the greatest success; and such  
 was his popularity, that though the commis-  
 sioners who had been sent out by the French  
 government, remained in the island, and were  
 treated with every external mark of respect,  
 they were, in fact, mere cyphers, destitute of  
 power, and dependent on Toussaint for sup-

port. Agriculture and commerce were the first ob-  
 jects of his care. Many of the planters were  
 driven from their former estates, but no property  
 of free men was allowed. The blacks,  
 however, were not permitted to waste their lives  
 in idleness. The planters were obliged to em-  
 ploy their laborers as hired servants, and a third  
 of the crops was assigned for their remunera-  
 tion. While ample encouragement was af-  
 forded to industry, penalties were at the same  
 time pronounced for the punishment of idleness.  
 The beneficial effects of such an administration  
 were soon visible. The wasted colony began to  
 flourish; the plantations were again brought into  
 cultivation; the sugar-works and distilleries  
 rebuilt; the ports were opened to foreign  
 trade; and, notwithstanding the ravages of a  
 civil war, the exports of St. Domingo were  
 soon at the lowest ebb to one-third of their  
 former amount and value in the most prosperous  
 times. Population also increased with aston-  
 ishing rapidity; and while the planters of the  
 West-India Islands were continuing the necessity  
 of annual importations of slaves, to supply the  
 constant diminution of the negroes, in St. Domingo  
 their number was considerably augmented, notwith-  
 standing the waste of blood during the troubles and  
 the conflicts of the ten preceding years. The  
 churches were re-opened, public worship  
 restored; the elegant arts and amusements  
 and life began to resume their sway; and  
 the result of all these causes was a  
 striking improvement in every class  
 of the population. In the intercourse of the social  
 hour, there was a perfect equality; thus presenting a  
 contrast to the very strict subordination  
 which prevailed in the army.

The military establishment, when the British  
 forces evacuated the island in 1798, did not  
 exceed 40,000; but in two years it was more  
 than double that number. The soldiers regarded  
 Toussaint as an extraordinary being: his generals  
 trembled before him (Dessalines durst not look  
 him in the face); and every one trembled before  
 his generals. No European army, indeed, was  
 ever subject to a more rigorous discipline, than  
 that which was observed by the troops of Toussaint.  
 Every officer commanded, pistol in hand;  
 and had the power of life and death over the sub-  
 alterns. 60,000 men were frequently reviewed  
 and exercised together on the plain of the Cape.  
 On these occasions 2000 officers were seen in  
 the field, carrying arms, from the general to the  
 ensign, yet with the utmost attention to rank;  
 without the smallest symptom of the insubordi-  
 nation indulged in the leisure of the hotel. Each  
 general officer had a demi-brigade, which went  
 through the manual exercise with a degree of  
 expertness seldom witnessed; and performed  
 equally well several manœuvres applicable to  
 their method of fighting. At a whistle a whole  
 brigade would run 300 or 400 yards, then, sepa-  
 rating, throw themselves flat on the ground,  
 changing to their backs or sides, keeping up a  
 strong fire the whole of the time, till they were  
 recalled: then they would form again, in an  
 instant, into their wonted regularity. This single  
 manœuvre used to be executed with such facility  
 and precision, as totally to prevent cavalry from  
 charging them in bushy and hilly countries.  
 Such complete subordination, such promptitude  
 and dexterity, prevailed the whole time, as would  
 have astonished any European soldier who had  
 the least knowledge of their previous situation.  
 (History of St. Domingo, 1818.)

'In these reviews,' says M. de la Croix,  
 'Toussaint appeared like an inspired person, and  
 became the fetiche or idol of the blacks who  
 listened to him. In order to make himself bet-  
 ter understood, he frequently addressed them in  
 parables, and often made use of the following:—  
 In a glass vessel full of grains of black maize,  
 he would mix a few grains of white maize, and  
 say to those who surrounded him:—'You are  
 the black maize; the whites, who are desirous  
 of enslaving you, are the white maize.' He  
 would then shake the vessel, and presenting it to  
 their fascinated eyes, exclaim, 'See the white  
 here and there!' in other words, see how few the  
 white are in comparison of yourselves.' The  
 gleam of prosperity, however, which resulted  
 from his wise administration, was of short  
 continuance.

The independence of St. Domingo was pro-  
 claimed on the 1st of July, 1801; and, while the  
 inhabitants were indulging the hope of future  
 happiness, a storm was gathering, which burst  
 upon them with accumulated fury. Scarcely  
 was the peace of Amiens concluded, when a for-  
 midable armament of twenty-six ships of war  
 was equipped by order of the first consul, with  
 the determination of reducing the revolted co-  
 lony of St. Domingo. On board this fleet were  
 embarked 25,000 chosen troops, amply furnished  
 with all the apparatus of military slaughter. The  
 better to ensure success to the expedition (the

chief command of which was confided to general Le Clerc, the brother-in-law of Buonaparte), recourse was first had to perfidious means. Attempts were made to sow disunion among the free people of St. Domingo. Proclamations and letters, expressed in all the delusive jargon of the republic, were widely circulated. The chiefs of both colors, then in France, and the two sons of Toussaint himself, who had sent them thither for instruction, were pressed into the service of this expedition.

The French forces arrived in January, 1802; yet so little did Toussaint expect to have any enemy to combat, that he had given no orders for resistance in case of attack. When the French squadron was descried, he was making a tour round the eastern part of the island: and, if some of the generals resisted, it was only in consequence of the menaces and hostile manner in which they were summoned to surrender.

After his troops had disembarked, and previously to commencing operations in the interior of the country, and perhaps in the hope that the sight of so formidable a force would inspire the Haytians with terror, Le Clerc thought proper to try what effect these circumstances, the sight of his two sons, and a specious letter from Buonaparte, would produce upon Toussaint. Coisson, their tutor, who had accompanied them from France, and was one of the chief confidential agents in this expedition, was accordingly deputed on this errand, with instructions to press Toussaint's instant return to the Cape, and to bring back the children in case he should not succeed. When he reached Eunery, Toussaint's country residence, that chief was absent in a distant part of the island, whence he did not return till the second day. The wily Frenchman availed himself of this delay to work upon the feelings of their mother; whose tears, and the solicitations of the children, for a while shook the resolutions of Toussaint. Being at length confirmed in his suspicions of the snare that had been laid for him, by the conduct and language of Coisson, Toussaint suddenly composed his agitated countenance; and, gently disengaging himself from the embraces of his wife and children, he took their preceptor into another apartment, and gave him this dignified decision:—'Take back my children; since it must be so, I will be faithful to my brethren and my God.' Unwilling to prolong the painful scene, Toussaint mounted his horse, and rode to the camp. A correspondence was subsequently opened with him by Le Clerc, but it failed to produce Toussaint's submission.

Le Clerc now proceeded to hostilities, the minute circumstances of which we have not room to detail. It must therefore suffice to state, that the numbers and discipline of the French troops, added to the military skill of their commanding officers, overpowered all open resistance in the field, so that the blacks, after several obstinate conflicts, and after the burning of several of their principal towns, were finally compelled to retire into the inaccessible fastnesses of the interior, whence they carried on, under their brave chieftain, Toussaint, a desultory, but destructive, warfare against detached parties of their enemies.

This mode of fighting was dictated by the nature of their country. They would frequently place whole lines in ambush, and sometimes ranging from one part to another, and sometimes moving to a considerable distance from each other, a camp. By their admirable discipline, and astonishing celerity, their enemies were often disconcerted, and thrown into disorder; and sometimes, when the French thought themselves sure of a victory, detachments in ambush suddenly made their appearance, and routed them with a defeat. At length, however, the chiefs and cultivators were either subdued by the terror of the French army, or cajoled by the promises of the French general, who had published in his own name, and in that of the French, repeated solemn declarations, that the freedom of all the inhabitants of St. Domingo, of all colors, should be preserved inviolate. But when, after his successes, he now threw aside the mask, and issued an order, expressly restoring to the proprietors or their attorneys, all their former authority over the negroes upon their estates. This order opened the eyes of the negro population. Toussaint, descending from his fastnesses with several hundred men, effected a junction with Christophe, who was at the head of one hundred, and marched rapidly to the eastern island. Wherever he came, he summoned the cultivators to arms, multitudes of whom joined to his standard. His force speedily became formidable: they drove in the enemy's parties in all directions, and surrounded the town of Cap-François, within whose walls they had taken refuge. To save that place from being delivered to the infuriated black troops, Le Clerc was forced to abandon all his conquests in other parts of the island, and hasten by forced marches for relief. Sensible of his precipitancy in throwing off the mask, he again had recourse to former acts; and having issued a proclamation couched in the most specious terms, to his chieftains, who were weary of the war, and whose troops began to quit the ranks, agreed to his terms, on condition of a general amnesty, and the preservation of their own rank, and of their officers.

Scarcely had the French thus succeeded in extending their dominion over the whole island, when they began to put in execution their hateful system of slavery and destruction; and as a preliminary step towards this object, Le Clerc caused Toussaint to be privately seized, in the dead of the night, together with his family, and embark for France, on board a fast-sailing frigate, about the middle of May, 1802. He kept a close prisoner on the voyage, and heard no more by his countrymen. See *LOUISIANA*.

To justify this base act of treachery, Le Clerc accused Toussaint of having intended to excite an insurrection among the working negroes, in order to raise them in a mass. The only proof adduced by the French general was two intercepted letters, said to have been written by him to his de-camp Fontaine. M. de la Croix (who was an officer in the army of Le Clerc) has produced these letters as genuine: the first was addressed to the sovereigns of Europe by Toussaint on his accession to the throne of Hayti, after

be a forgery; and such is the opinion of M. Le Gastine, who observes further, that the pretended letters not only do not prove that Toussaint was preparing to take up arms again, but that every thing concurs to prove that they were forged, otherwise the French would have tried him before a special commission, instead of transporting him 2000 miles from his country, in defiance of the law of nations and of humanity.

The base treachery of Le Clerc aroused the black chieftains, and opened the eyes of their countrymen to the designs of the French. Dessalines, Christophe, and Clerveaux, again raised their standards, and were soon found at the head of considerable bodies of troops, ready to renew the struggle for liberty, and determined to succeed or perish in the attempt. During the latter half of the year, 1802, actions were fought with various success. And though the French were continually receiving fresh supplies of men, yet these did not suffice to supply the place of those who perished by the sword and by sickness. Their hospitals were crowded with sick, and disease daily made new ravages. At length Rochambeau, who had succeeded to the chief command on the death of Le Clerc, was compelled by Dessalines to evacuate Cape François, where the remains of the French army were surrounded; and, as the war had then recommenced between Great Britain and France, the French gladly surrendered themselves prisoners of war to a British squadron, and were conveyed to this country. We shall not harrow up the feelings of our readers by a recital of the refined cruelty and savage barbarity practised by the French during this residence of twenty-one months on the island of St. Domingo. According to the returns which have been subsequently made to the Haytian Government, more than 16,000 negroes and people of color perished under the various tortures inflicted by them. The barbarities committed by these modern conquerors upon the children of Hayti far exceeded indeed the crimes of the Pizarros, Cortez, and the Ruvadillas, those early scourges of the New World.

The French being expelled, at a general meeting of the National Assembly, on the 1st of January, 1804, the independence of the island was again proclaimed; the aboriginal name of Hayti was resumed and the Haytians pronounced the oath to die free and independent, and never again to submit to any foreign domination whatever. Dessalines was elected governor-general for life, which title, a few months afterwards, he exchanged for that of emperor, being crowned by the title of Jacques I. But his reign was of short duration; the cruelties he perpetrated caused a conspiracy to be formed against him; and, two years after his coronation, he was surrounded by the conspirators at his head-quarters, and, struggling to escape, received a wound, which terminated his life. His death produced a division of St. Domingo, and another civil war.

In the north, Christophe assumed the reins of government, with the modest designation of chief of the government of Hayti; while Pétion, a mulatto, asserted his claim to sovereign

power. For several years these rival chieftains carried on a sanguinary contest, with various success on both sides, until the year 1810, when hostilities were suspended; and, though no formal treaty was concluded, the country long enjoyed the blessings of peace. Christophe was crowned king of Hayti in March 1811, by the title of Henry I.; and Pétion, as president of the republic of Hayti, governed the southern part until 1818, when he died, and was succeeded by general Boyer, whom he was allowed to nominate his successor.

Both governments encouraged agriculture as the basis of their national prosperity, and displayed a laudable solicitude for the instruction of the rising generation. Christophe examined the rival claims of the two systems of mutual instruction practised in England, and gave the preference to that of the British and Foreign School Society. Schools, under the care of English teachers, were established in his dominions at Cape Henry, Sans Souci, Port de Paix, Gonaives, and St. Marc. In the primary schools, the instructions are principally given in English.

In the republican part of the island, a school was established at Port-au-Prince, on the British and Foreign Society's plan, by an English teacher, to whose conduct and ability the president, general Boyer, has borne the most honorable testimony. This school is under the superintendence of a native teacher. A lyceum has likewise been instituted for teaching the higher branches of literature and science.

Christophe, in imitation of other monarchs, created various orders of nobility, together with numerous officers of state, each of whom had a fixed order of precedence, according to the supposed dignity of their office. His dynasty, however, was like his predecessor's, but short-lived. In 1820 a successful conspiracy was formed against him, and finding himself surrounded by an overwhelming force, he committed suicide. See CHRISTOPHE. The president of the republic, Boyer, now advanced upon the kingdom, and succeeded, with but little opposition, in adding it to the republic of Hayti.

In 1822, Boyer took advantage of another event to unite the Spanish part of the island to the republic. The people, who were principally colored, revolted from the Spanish authorities, and Boyer, immediately hastening to the city of St. Domingo, with 12,000 men, was received without opposition. The Spanish soldiers were dismissed from the island, the republican flag was hoisted, and the slaves were emancipated. From that period the republic of Hayti has been co-extensive with the island of St. Domingo.

The revenues of the two governments are supposed to be about 48,000,000 francs; and the expenses of their administration, in 1817, scarcely exceeded 18,000,000 francs, thus leaving a surplus of 15,000,000 at the disposal of each.

The Catholic religion is declared to be that of both divisions of the island; the hierarchy of the northern part consists of an archbishop, three bishops, and a rector in each parish. At Sans Souci there is a royal and parochial church.

It was erected by Henry, and was mentioned in the royal almanack as 'a monument of his royal munificence and piety.' The archbishop, whom the pope has hitherto refused to consecrate, has a chapter, a seminary, and a college attached to the metropolitan see, all well endowed. He has also three archi-episcopal palaces assigned to him; and the bishops have each a chapter and a seminary, endowed with considerable revenues.

The armies of the two governments, in 1820, were composed of about 24,000 regular troops each; but not more than 5000 or 6000 were on duty at one time. They were relieved alternately every three months; and received pay while on actual service. During the remaining nine months of the year, they were quartered upon the great provision-grounds of the two governments. Since the revolution, commerce is said to have greatly declined. From 1804 to 1808, according to Walton, only about seventy-five vessels arrived annually, with cargoes amounting to about £150,000 sterling.

The Haytians express themselves with great energy and propriety, on moral and political subjects. Some of the state-papers of the late king might vie with those of far more advanced communities. 'Five-and-twenty years ago,' says the black baron de Vastey, in his *Political Reflections*, printed at the press of Sans Souci, 'we were plunged in the most complete ignorance; we had no notion of human society, no idea of happiness, no powerful feeling; our faculties, both physical and moral, were so overwhelmed under the load of slavery, that I myself, who am writing this, I thought that the world finished at the spot which bounded my sight; my ideas were so limited, that things the most simple were to me incomprehensible, and all my countrymen were as ignorant, and even more so than myself, if that were possible. I have known many of us,' he continues, 'who have learned to read and write of themselves without the help of a master; I have known them walking with their books in their hands, enquiring of the passengers, and praying them to explain to them the signification of such a character or such a word, and in this manner many, already advanced in years, became able to read and write without the benefit of education. Such men,' he adds, 'have become notaries, attorneys, advocates, judges, administrators, and have astonished the world by the sagacity of their judgment; others have become painters and sculptors from their own exertions, and have astonished strangers by their works; others again have succeeded as architects, mechanics, weavers; in short, others have worked mines of sulphur, fabricated saltpetre, and made excellent gunpowder, in mills and establishments similar to those of Europe, with no other guides than books of chemistry and mineralogy. And yet,' he continues, 'the Haytians pretend not to be a manufacturing and commercial people'—'like the Romans, we go from arms to the plough, and from the plough to arms.' But he contemplates the time when they shall call to their assistance the mechanical arts, the employment of machines, of animals, and of the natural agents, air, fire, and water, and put in practice those

means, 'which,' says he, 'will render our country the most beautiful, populous, and flourishing and its inhabitants, henceforward so numerous, the happiest people in the world.'

In July 1816, after Louis XVIII. was removed to the throne, commissioners were sent to France to St. Domingo, entrusted with the administration of all the affairs of the island, civil and military, but all their overtures were firmly rejected in both parts of the island. His majesty Charles X. has been more successful in asserting the claims of France to this island. He has procured that kind of recognition of the interest of the former planters, which has resulted in a treaty of indemnity in regard to the property whereby the French government stipulated to acknowledge the independence of Hayti. On the other hand to pay a sum of money to France, and give certain advantages to French commerce above that of other nations.

We conclude with the excellent remarks of a modern periodical publication. 'The empire of a black empire in the midst of the British West Indies,' observes this publication, 'excited the most fearful apprehensions in the minds of the planters. Subsequent events have shown that, however well founded those apprehensions might seem, they have little to do with the long as their slaves are treated with kindness and humanity. The abolition of the nefarious trade in slaves, and other wise measures of the legislature, have already contributed to ameliorate the condition of the slaves; and we may reasonably expect that, in proportion as these measures have their full effect, the condition of the negro in our West-India colonies will be progressively improved. In their present state entire freedom would be no boon to them. Nothing indeed would prepare their minds for its reception and enjoyment but the introduction of Christianity, and the diffusion of moral and religious education. We have no data by which we can estimate the actual number of Christian slaves in the West Indies; but we know generally that, in almost all the larger islands, there are active and zealous missionaries, who devote themselves to the pious and benevolent task of imparting religious instruction to those neglected outcasts. In Antigua, especially, this greatest of blessings has been imparted to many thousands of slaves, who, under the yoke of bondage with patience, cheered by the hope which the Gospel reveals, as the end and compensation of all their sufferings. In many other islands, the prejudice of passion against the tuition of their slaves is slowly wearing away; while the number of those, who from various causes, are favorable to their instruction, is gradually increasing; and a competition is gaining ground, most advantageous to the interests of all parties, of the inefficiency of harsh restraints and punishments to produce their uniform obedience, which is seen in well treated and religious slaves. These are truly encouraging signs of the times; and when we add to them the increasing liberality of British Colonies in this country, we may reasonably indulge the hope that the period is not far distant when the entire black population in the West Indies will hail with devout gratitude the day, that now

from their native deserts, to make men in the noble sense suggested by the event.

**DOMINICA**, the last of the Leeward or Windward Islands, taking them from north-west to south-east, so named by Christopher Columbus, having discovered it on Sunday, Nov. 3, 1493.

It is situated about half way betwixt St. Vincent on the north-west, and Martinico on the south-east, fifteen leagues from each, between  $15^{\circ} 44' 30''$  N. lat., and between  $61^{\circ} 10' 30''$  W. long. It is twenty-nine miles in length from Crab-Point on the south, to the Cape of Agusha Bay on the north; sixteen broad from Raymond Bay on the south-east to the west. It contains a great variety of land, and is divided into ten parishes, viz. St. John, St. Andrew, St. Peter, St. Paul, St. David, St. George, St. Luke, and St. Martin. It has many rugged mountains, interspersed with valleys, and is watered by upwards of thirty rivers and a number of rivulets. Several of these contain unextinguished volcanoes, which discharge vast quantities of sulphur. There are also several hot springs, esteemed effectually removing tropical disorders. Some of these are said to be hot enough to coagulate milk. Vast swarms of bees produce a great quantity of wax and honey: they live in the holes of the trees, and are thought to have been transported here by the native bee of the West Indies. Several other species, unprovided with a sting, are common in its manners from the European forests afford an inexhaustible quantity of wood. The fruits and other productions are similar to those in the neighbouring islands, but the soil, being generally thin, is more adapted to the rearing of cotton than sugar. The bees that are known, are found on the whole of this island. They are shaped like the European bee, but much smaller, and of a different color. The anchorage is good all round the island; but it has no port or bay of its own; but the vessels have the advantage of being able to anchor behind many of its capes. Charlevoix (Roussau of the French), the chief of the island, is a point of land between two bays on the west side of the island. It has 500 inhabitants, or Prince Rupert's Bay, on the west side of the island, is the only port from the island to England, and from the latter were,

Imports.	Exports.
£315,584	£161,291
282,002	39,686.

Principal imports were,

Coffee.	Sugar.	Rum.	Cotton.
cwt.	cwt.	galls.	lbs.

27,183	61,522	39,397	59,742.

and was reduced in 1778 by the French, Marquis de Bouille, governor of Martinique, made a descent with 2000 men, and 100 regulars, and a few companies of militia, to oppose him. Resistance therefore

being vain, the only thing the garrison could do, was to procure as favorable terms as possible. These were granted with such readiness as did great honor to the character of this officer; the inhabitants experiencing no kind of change except that of transferring their obedience from Britain to France. A large quantity of military stores, with 164 pieces of cannon, and twenty-four brass mortars, were found in the place; so that the French themselves expressed their surprise at finding so few hands to make use of them. It was restored to Britain at the conclusion of the peace in 1783; and, in 1795, the French attempted to take it again, but were unsuccessful; all the Frenchmen who landed being either killed or taken prisoners. The position of Dominica renders it of great consequence to England in war with France; for a squadron, stationed at Prince Rupert's Bay, may effectually cut off the communication between Martinique and Guadeloupe.

**DOMINICA**, or **HREVAROA**, is the largest of the Marquesas islands, called by the natives Hiwaoa and Ohiwana, extending east and west eighteen miles. It is about forty-eight miles in circumference; full of rugged hills, and of a barren surface, but is, however, inhabited. Long.  $139^{\circ} 3' W.$ , lat.  $9^{\circ} 44' N.$

**DOMINICAL**, *adj.* Lat. *dominicalis*. Relating to the Lord's day, or Sunday.

The cycle of the moon serves to shew the epacts, and that of the sun the dominical letter, throughout all their variations.

Holder on Time.

**DOMINICAL LETTER**, or **SUNDAY LETTER**, See **CHRONOLOGY**. The dominical letters were introduced into the calendar by the primitive Christians, instead of the nundinal letters in the Roman calendar.

**DOMINICANS**, an order of religious, so named from their founder Dominic de Guzman, who preached with great zeal against the Albigenses in Languedoc, where he laid the first foundation of this order. See **GUZMAN**. It was approved of in 1215, by Innocent III., and confirmed in 1216, by a bull of Honorius III., under the title of St. Augustin; to which Dominic added several austere precepts and observances, obliging the brethren to take a vow of absolute poverty; to abandon entirely all their revenues and possessions; and to take the title of Preaching Friars, because the public instruction was the main end of their institution. The first convent was founded at Thoulouse by the bishop thereof and Simon de Montfort. Two years afterwards they had another at Paris, near the bishop's house; and some time after a third in the rue St. Jacques, whence the denomination of Jacobins. Just before his death, Dominic sent Gilbert de Fresney, with twelve of the brethren, into England, where they founded their first monastery at Oxford, in 1221, and soon after another at London. In 1276 the mayor and aldermen of the city of London gave them two whole streets by the river Thames, where they erected a very commodious convent, whence that place is still called Black Friars, from the name by which the Dominicans were called in England. Dominic, at first, only took

the habit of the regular canons; that is, a black cassock and rochet: but this he quitted in 1219, for that which they now wear, which it is pretended was shown by the blessed Virgin herself to the beatified Renaud of Orleans. This order has been spread throughout the whole known world. Before the revolutionary wars, it had forty-five provinces under the general, who resided at Rome; and twelve particular congregations, governed by vicars general. There have been three popes of this order, above sixty cardinals, several patriarchs, 150 archbishops, and about 800 bishops; besides inasters of the sacred palace, whose office has been constantly discharged by a religious of this order, ever since St. Dominic, who held it under Honorius III. in 1218. Of all the monastic orders, none enjoyed a higher degree of power and authority than the Dominicans. Their credit was great, and their influence universal. But the measures they used to maintain and extend their authority were so perfidious and cruel, that their influence began to decline towards the beginning of the sixteenth century. The tragic story of Jetzer, conducted at Bern in 1509, for determining an uninteresting dispute between them and the Franciscans, relating to the immaculate conception, reflects indelible infamy on this order. See an account of it in Mosheim's *Ecl. Hist.* vol. iii. p. 294, 8vo. They were indeed perpetually employed in stigmatising with the opprobrious name of heresy numbers of learned and pious men; in encroaching upon the rights and properties of others, to augment their possessions; and in laying the most iniquitous snares and stratagems for the destruction of their adversaries. They were the principal counsellors, by whose instigation and advice Leo X. was determined to the public condemnation of Luther. The papal see never had more active and useful abettors than this order, and that of the Jesuits. The dogmata of the Dominicans are opposite to those of the Franciscans. There are nuns of this order, called in some places Preaching Sisters. These are even more ancient than the friars: St. Dominic having founded a society of religious maids at Proilles in 1206. There is also a third order of Dominicans, both for men and women.

DOMINIS (Mark Anthony de), archbishop of Spalatro in Dalmatia at the close of the fifteenth and beginning of the sixteenth centuries. Becoming acquainted with bishop Bedell, while chaplain to Sir Henry Wotton, ambassador from James I. at Venice, he became resolved to abandon the Roman Catholic religion, concerning the authority of which he had long had his doubts. He had written *De Republicâ Ecclesiasticâ*, but had hitherto dreaded to publish his work; he now therefore committed them to Bedell, and they were afterwards published at London, with his corrections. He came to England with Bedell; where he was received with great respect, and preached and wrote against the Romish religion. He had a principal share in publishing father Paul's *History of the Council of Trent*, which was inscribed to king James in 1619. But on the promotion of pope Gregory XIV., who had been his school-fellow and old acquaintance, he was deluded by Gondomar, the Spanish ambas-

sador, into the hopes of procuring a cardinal's hat, by which he fancied he should prove an instrument of great reformation in the church. Accordingly he returned to Rome in 1621, recanted his errors, and was at first well received; but he afterwards wrote letters to England, repenting his recantation; which being known, he was imprisoned by pope Urban VI. and died in 1625. He was the author of a philosophical explanation of the rainbow.

DOMINIUM DIRECTUM, in Scotch law, a right which a superior retains in his land, withstanding the feudal grant to the vassal.

DOMINIUM EMINENS, in Scotch law, a power which the state or sovereign has in private property, by which the proprietor is compelled to sell it for an adequate public utility requires.

DOMINIUM UTILE, in Scotch law, a right which the vassal acquires in the land, by feudal grant from his superior.

DOMINUS, a title anciently prefixed to the name, usually to denote the person of a knight or a clergyman. The title was also given to a gentleman not dubbed; as if he were lord of a manor. In Holy Scripture the title dominus distinguished a minister of a reformed church.

DOMUS, in antiquity, is sometimes used to signify all sorts of houses, either magnificent or mean; but it is often taken by writers to signify a mansion of some lord, or palace of a prince, as in Virgil, speaking of the palace of Dido.

At domus interior regali splendida locum.

These houses were built with much magnificence, and were of a vast extent; for many courts, apartments, wings, cabinets, stoves, and halls, either to accommodate their owners at table, or for transacting business of consequence. Before these houses was generally a large place or porch, where persons giving attendance to great men made their court. It is supposed that the houses were covered, for the convenience of people, who were sometimes waiting very long to be admitted.

There was a second part to these houses, called *cavum-atrium*, or *cavædium*: it was an enclosed court.

The third part was called *atrium*, and in general the whole inside of the house was used this word in this sense, when he says,

Apparet domus intus, et atria longa patet.

For it is plain that Virgil means by the *atrium* that all may be seen in the inside of a house, when the doors are opened. There was a place at the *atrium*, called *servus atrienus*, in which there were many figures; for the Romans raised every where trophies and statues in monuments of their great actions; not only in the provinces, which they had conquered, but also in public places in their own palaces at Rome.

Here were therefore painted or carved battles, axes, bundles of rods, and other badges of the offices that their ancestors

elves had obtained; and statues of wax or metal, representing their fathers in basso rilievo, were set up in niches of precious wood or rare marble. On the days of their solemn feasts, or triumphal pomp, these niches were opened, and the figures, crowned with festoons and garlands, carried about the town. When any of the family died, these statues accompanied the funeral parade; wherefore Pliny says, that the whole family was there present from the first to the last. There were also large galleries in these houses, adorned with pillars and other works of architecture.

The halls were built after the Corinthian or Egyptian order. The first had only a row of pillars set upon a pedestal, or on the pavement, and supported nothing but the architrave, and cornish of joiners' work or stud, over which was the ceiling in form of a vault; but the later halls had architraves upon pillars, and the architraves of the ceilings made of pieces joined together, which make an opened circular terrace. These houses had many apartments, some for men, and others for women; some for dining-rooms called triclinia, others for bed-chambers named dormitoria; and some others to lodge strangers. So large was ancient Rome, that there were 48,000 houses standing by themselves, or being so many insulae, and having a light on every side.

The Greeks built in a different manner from the Romans; for they had no porch, but from the first door they entered into a narrow passage; on one side of it there were stables, and on the other was the porter's lodge; at the end of this passage there was another door, to enter into a gallery supported with pillars, and this gallery had piazzas on three sides.

Within the Greek houses there were halls, for the mistresses of the family, and their servant maids to spin in; in the entry both on the right and left hand there were chambers; one called thalamus, and the other antichalamus. Round the piazzas there were dining-rooms, chambers, and wardrobes. To this part of the house was joined another which was considerably larger. The finest entries and most magnificent doors were at this part of the house. There were sometimes four square halls, so large and spacious, that they would easily hold four tables, with three seats in form of beds, and leave room enough for the servants and gainsters. They entertained their friends in these halls, for it was not the custom for women to sit amongst men. On the right and the left of these buildings were small apartments, and convenient rooms to receive the guests; and among the Greeks wealthy and magnificent men kept apartments, with all their conveniences, to receive any persons who came to lodge at their houses. The custom was, that after they had given them an entertainment the first day, they sent them afterwards every day some present, as chickens, eggs, pulse, and fruits; so that travellers were lodged as they had been at their own houses, and might live in these apartments privately.

The apartments were paved with mosaic or inlaid work. Pliny tells us, that the pavements that were painted and wrought with art came from the Greeks, who called them *lithostroma*. These were in fashion at Rome during the time

of Sylla, who had one made at Præneste, in the temple of Fortune. This pavement was not only used for paving the courts of houses and the halls, but also in chambers, and wainscoting the walls, and called *musæa*, *musia*, and *musiva*, because ingenious works were ascribed to the muses, and the muses and sciences were thereby represented.

DON, *v. a.* [To do on.] To put on; to invest with; the contrary to *do off*. Obsolete.

The purple morning left her crimson bed,  
And donned her robes of pure vermillion hue.

*Fairfax.*

Her helm the virgin donned.

*Id.*

What should I *don* this robe, and trouble you?

*Shakespeare.*

DON, *n. s.* } *Lat. dominus.* The Spanish  
Don'suit, *n. s.* } title for a gentleman; as, Don  
Quixote. It is with us used ludicrously: don-  
ship is the rank of a don or gentleman.

To the great *don*s of wit.

Phœbus gives them full privilege alone

To damn all others, and cry up their own.

*Dryden.*

I'm none of those,

Your bosom-friends, as you suppose

But Ralph himself, your trusty squire,

Wh' has dragged your donship out o' the mire.

*Hudibras.*

Here *don*s, grandees, but chiefly dames abound,  
Skilled in the ogle of a roguish eye.

Yet ever well inclined to heal the wound.

*Byron.*

DON, a river of Russia, anciently called Tanaïs, which takes its rise from the small lake of St. John, near Tula, in the government of Moscow, and passing through part of the province of Voronetz, a small portion of the Ukraina Slobovskaia, and the whole province of Azof, divides itself near Tcherkask into three streams, and falls in these separate branches into the sea of Azof. The river has so many windings, is in many parts so shallow, and abounds with such numerous shoals, as to be scarcely navigable, excepting in the spring, upon the melting of the snows; and its mouth is also so choked up with sand, that only flat-bottomed vessels can pass into the sea of Azof, at any other season. The banks of the Don, and the rivulets which fall into it, are clothed with large tracts of forest, whose timber is floated down the stream to St. Demetri and Rostof, where the frigates for the sea of Azof are chiefly constructed. The navigation of the Don, Mr. Coxe observes, may possibly hereafter be rendered highly valuable, by conveying to the Black Sea the iron of Siberia, the Chinese goods, and the Persian merchandise: which latter commodities, as well as the products of India, formerly found their way into Europe through this same channel.

DON, a river of Scotland, in Aberdeenshire, which rises about four miles north of the castle of Brae-Mar, runs through the district of Allford; so named from the river being almost Allford, or every where fordable, in that part of its course; afterwards joins the Ury at Inverury, and falls into the British Ocean at New Aberdeen, within two miles of the mouth of the Dee. It has been long famous for its salmon fishery

A space of within 500 yards of this river has in one year produced fish to the amount of £2000.

DONAGHADÉE, a post, market, and port town in the barony of Ardes, and county of Down, twenty-seven miles and a half distant from Port Patrick in Scotland, the corresponding packet station. Lat. 54° 45' N., long. 5° 40' W. The ancient quay, in form of a crescent, was built by lord Montgomery, and accommodated from twelve to fourteen sail. The present pier was built at the expense of government, and is intended to enclose a surface of 100 fathoms square, accessible at low water for vessels of fifteen feet draft. The south pier is completed, but shelter is much wanted on the north. Port Patrick lies N. E. by E.  $\frac{1}{4}$  N., or nearly north-east by compass from Donaghadee. It has been suggested that the execution of this harbour, according to the original design, i. e. with a funnel-shaped mouth, might possibly cause vessels to steer wildly when entering in a heavy swell.

DONALDSON (John), a painter and engraver of some repute, was born at Edinburgh in 1737. He painted portraits in miniature, and was distinguished also for his skilful imitations of the old engravers, which he executed so correctly as to deceive even connoisseurs. He published a volume of poems, and an Essay on the Elements of Beauty. He also cultivated chemistry, and discovered a method of preserving meat and vegetables during long voyages. He died in 1801.

DONARIA, among the ancients, in its primary signification, was taken for the places where the oblations offered to the gods were kept; but afterwards was used to denote the offerings themselves; and sometimes, improperly, the temples.

DONATIA, in botany, a genus of the trigynia order and triandria class of plants: CAL. triphyllous perianth, with short subulated leaves standing at a distance from one another: COR. petals from eight to ten, of an oblong linear shape, twice as long as the calyx: STAM. three subulated filaments, the length of the calyx; the anthers roundish, didymous, and two-lobed at the base. Species, one only, a native of Terra del Fuego.

DONATIO MORTIS CAUSA, in law, a disposition of property made by a person in his last sickness, who, apprehending his dissolution near, delivers or causes to be delivered to another the possession of any personal goods, to keep in case of his decease. If the donor dies, this gift needs not the consent of his executor; but it shall not prevail against creditors; and it is accompanied with this implied trust, that, if the donor lives, the property shall revert to himself, being only given in prospect of death, or mortis causa. This method of donation seems to have been conveyed to us from the civil lawyers, who borrowed it from the Greeks.

DONATION, *n. s.* } Fr. *donation*; Span.  
DONATIVE, *n. s.* } *donacion*; Ital. and Lat.  
DO'NOR, *n. s.* } *donatur*, from *dono*, ex-  
plicative of *do*, to give. A donation is a grant; the act of giving; and a gift: for donative see the following article. A donor is a giver or bestower.

The Roman emperor's custom was, at certain solemn times, to bestow on his soldiers a *donative*; which

*donative* they received wearing garlands on their heads.

Howsoever the letter of that *donum* may be regarded by men, yet the sense there is to be sought in their hearts, as if every one last thing be turned unto that which was conferred upon all.

*Railton's Emp.*

He gave us only over beast, fish, fowl,

Dominion absolute; that right we hold

By his donation.

*Milton's Paradise Lost*

After donation there is an absolute change of location made of the property of the thing given, and being so alienated, a man has no more to do with than with a thing bought with another's money.

*Smith*

Litters thick besiege the donor's gate,

And begging lords and teeming ladies wait

The promised dote.

*Dryden's Jern.*

It is a mighty check to beneficent temper to consider how often good designs are frustrated and converted to purposes, which, could the donors have foreseen, they would have been very likely to promote.

*Amesley*

Never did steeple carry double trust,

His is the donative, and mine the cure.

*Amesley*

DONATISTS, ancient schismatics so denominated from their leader Donatus. They had their origin A. D. 311, when, in the reign of Mensurius, who died in that year on his return to Rome, Cæcilian was elected bishop of Carthage, and consecrated without the concurrence of the Numidian bishops, by those of his own alone; whom the people refused to acknowledge, and to whom they opposed Majorinus accordingly, was ordained by Donatus bishop of Casae Nigræ. They were repeatedly condemned in different councils held at Rome and Milan, and particularly in one at Milan, in 316, when Constantine the Great, who deprived them of their churches, banished their bishops, and punished some of them with death. Donatus was espoused by another Donatus, called the Great, the principal bishop of that sect, who with numbers of his followers, was exiled to the islands. Many of them were punished with great severity. See CIRCONCELLIONES. However, after the accession of Julian, in 362, they were restored to their former liberty. Gratian, in 372, deprived them of their churches, and prohibited their assemblies. But, notwithstanding these severities, they had a very considerable number of churches towards the close of the fourth century; till they began to decline, on account of schism among themselves, occasioned by the election of two bishops, in the room of Primian, the successor of Donatus. One was elected Primian, and were called Primianists, and another Maximian, and were called Maximianists. Their decline was also prepared by the zealous opposition of St. Augustine, and by the violent measures pursued against them by Honorius, at the solicitation of two councils held at Carthage; the one in 404, and the other in 411. Many of them were fined, their bishops were banished, and some put to death. The sect revived and multiplied under the protection of the Vandals, who invaded Africa in 429, and took possession of this province; but it fell again under new severities, when that empire

returned in 534. Nevertheless, they remained in a separate body till the close of the century, when Gregory, the Roman pontiff, various methods for suppressing them; his succeeded, and there are few traces to be found of the Donatists after this period. They distinguished by other appellations; as *secesses*, *Campites*, *Rupites*, &c. They held councils, one at Cirta in Numidia, and at Carthage. The peculiar opinions of the Donatists were, 1. That baptism conferred out of a church, that is, out of their sect, was null; accordingly they rebaptised those who joined partly from other churches, and re-ordained ministers. Donatus seems likewise to have adhered to the doctrine of the Arians, with whom he was closely allied; and, accordingly, St. Epiphanius, Theodoret, and some others, accused the Donatists of Arianism; and it is probable that this charge was well founded, because they were persecuted by the Vandals, who were of these sentiments. But St. Augustine (Ep. 185, to Boniface, and Har. 69.) affirms, that the Donatists, in this point, were clear of the errors of their leader.

**DONATIVE**, in the canon law, a benefice given to a patron merely without a presentation to a bishop. If chapels founded by laymen be approved by the diocesan, and, as it is called, *malisec*, they are not accounted proper benefices, neither can they be conferred by the patron, but remain to the pious disposition of the founders, and their heirs, who may give such chapels without the bishop. Gwin observes, that the king might anciently found a free chapel, exempt it from the jurisdiction of the diocesan; so may he, by letters patent, give liberty to any common person to found such a chapel, and make it donative, not presentable; and the chaplain or beneficiary, is deprivable by the founder or heir, and not by the bishop. Donatives are within the statute against simony; and, if they have cure of souls, within that against pluralities. If the patron of a donative does nominate a clerk, there can be no lapse of office, unless it be specially provided for in the foundation; but the bishop may compel him to resign it by spiritual censures. But, if it be augmented by queen Anne's bounty, it will lapse to the crown, and not to the bishop. 1 Geo. I. stat. 2, c. 10. The ordinary cannot visit a donative, therefore it is free from procuracion, and the incumbent is exempted from attendance at visitation. All bishoprics anciently were donative to the king. Where a bishop has the gift of a donative, it is properly called a donative, because it is not present to himself.

**DONATIVE**, *DONATIVUM*, in antiquity, was a gift made to the soldiers, as a congruity to the people. The Romans made donatives to their soldiers. Julia Pia, wife of the emperor Severus, is called on certain medals *mater castorum*, because of the care she took of the soldiery, by interposing for the augmentation of their donatives, &c. Salmassius, in his notes to Lampridius, on his Life of Heliodorus, mentioning a donative that emperor gave of three pieces of gold per head, observes, that this was the common and legitimate rate of

a donative. Casaubon, in his notes on the Life of Pertinax by Capitolinus, observes, that Pertinax made a promise of 2000 denarii to each soldier; which amounts to upwards of £97 sterling. The same author writes, that the legal donative was 20,000 denarii; and that it was not customary to give less, especially to the prætorian soldiers: that the centurions had double, and the tribunes, &c., more in proportion.

**DONATUS** (*Ælius*), a celebrated grammarian, who lived at Rome, about A. D. 354. He was one of St. Jerome's masters; and composed commentaries on Terence and Virgil, which are esteemed.

**DONATUS** (*Jerom*), a learned and noble Venetian, who flourished in the end of the fifteenth century, and died in the beginning of the sixteenth. He was a benefactor to his country, both as a commander and as a negotiator, and procured its reconciliation with pope Julius II. He wrote many books, which remain in MS.; besides a translation of Alexander Aphrodisæus de Anima, which he published. He died of a fever at Rome just as he had completed his negotiation with Julius.

**DONAVESCHINGEN**, or *DONFESCHINGEN*, a town of Germany, in the circle of Suabia, situated in the Black Forest, where the prince of Fürstenberg has a palace, near which is a spring, said to be the source of the Danube, thirteen miles N. N. W. of Schaffhausen, and thirteen west of Duttlingen.

**DONAUEWERTH**, a strong and well built town of Bavaria, in the circle of the Upper Danube, on the left bank of that river. It has been taken and retaken several times in the wars of Germany; and was formerly an imperial city. It has a bridge over the Danube, four good churches and four hospitals: it lies thirty miles west of Ingoldstadt, and eighteen north of Augsburg. In this neighbourhood were the famous lines of Schellenberg, when the allies under the duke of Marlborough obtained an important victory over the Bavarians on the 2d July 1704.

**DONAX**, a genus of insects belonging to the order of vermes testacei. It is an animal of the oyster kind; and the shell has two valves, with a very obtuse margin in the fore part. There are nineteen species, principally distinguished by the figure of their shells.

**DONCASTER**, an ancient, large, and populous town, in the West Riding of Yorkshire, seated on the Don, with a castle, whence its name. It is incorporated, and is governed by a mayor, recorder, six aldermen, and twenty-four councillors. In this town is a handsome theatre, town-hall, bank, free grammar-school, almshouse, work-house, a public dispensary, and various other benevolent societies and institutions for the relief of sick and afflicted persons. The parish church is an ancient structure; and its steeple is a piece of excellent workmanship. Here are numerous meeting-houses for religious sects of different denominations. Doncaster has long been celebrated for its races; on the course, which is one of the most eligible in the kingdom, is erected an elegant stand for the accommodation of the spectators and visitors, who are always numerous and fashionable. It has a

market on Monday; and carries on manufactures of vests, petticoats, stockings, gloves, &c. It has two bridges over the Don, with a high causeway beyond them, the river being apt to overflow its banks. It has also the relics of an old Roman road, and lies thirty-seven miles south of York, and 160 north by west of London.

**DONE**, a kind of interjection. The word by which a wager is concluded: when a wager is offered, he that accepts it says 'Done!'

*Done: the wager!* *Shakespeare. Tempest.*

One thing, sweet heart, I will ask:  
Take me for a new-fashioned mask.

—*Done: but my bargain shall be this,*

I'll throw my mask off when I kiss. *Cleopatra.*

'Twas done and done, and the fox, by consent, was  
to be the judge. *L'Estrange.*

**DONEGAL**, anciently Tyrconnel, is a county in the province of Ulster, bounded on the north and west by the Atlantic Ocean, by parts of Leitrim and Fermanagh on the south, and by Tyrone, Londonderry, and Fermanagh on the east. It is divided into six baronies, and forty-two parishes. Its superficies measures about 679,550 plantation acres. The line of coast is adorned by many islands, of which seventeen are inhabited; and it is also indented by numerous excellent harbours and bays, capable of being made available either for the West-India trade, or the encouragement and growth of valuable fisheries. The chief islands are Aranmore, containing 2000 acres, 132 houses, and 778 inhabitants; Inisbofin, having forty-three houses and 252 inhabitants; Tory Island, supporting a population of 296 in fifty-nine houses. The most important harbours are, the noble inlet of Lough Swilly, extending thirty miles in length; Mulroy and Sheep-haven in the north; Teelin, Killybegs, and Brucklis in the south. The whale fishery was once successfully prosecuted on this coast, and a pier was erected at Inver, as an auxiliary, which now, unhappily, is a total ruin. Inver and Brucklis Bay continue to be the chief seat of the herring fishery; but from the want of shelter for boats, this mode of life is rendered in this place awfully perilous. In 1813 fifty fishermen were lost in the last-mentioned bay, entirely owing to the want of any rendezvous, when the squall came on. The safest, best, and largest harbour on this line, is Killybegs: here several hundred sail might anchor safely, but could not put to sea hence in west or south-west winds. The fishery along this coast has latterly decayed, and is not likely to be arrested in its melancholy decline, without either the countenance and assistance of government, or of the landed proprietors of the county.

The roads in Donegal are, in most places, unfit for carriages; and the traffic of the country is carried on generally by horses, with sacks and baskets. No mail-coach, as yet, passes through any part of this great district. The coast road should be all remade: a new line is wanted from the Rosses, by the Giddore River, to Gortahork; and also from the same place to Fintown, by Aragib Mountain. In fact, without coast improvements, the population will find it difficult to procure subsistence; and with the required road

improvements, a market would be found for the overplus of food obtained by the improver: in six hours, at the same time that civilisation would advance much more rapidly. Donegal abounds in valuable mineral substances; it has been visited by Dr. Berger, Dr. Stokes, and by Charles Giesecke. The surface may be termed both boggy and mountainous; the former is useless, from a scanty population and want of drainage; the latter unapproachable from want of roads. There is a valuable lead mine, at Kesh, near Kildrum. At Muckish there is a rich bed of silicious sand. Iron ore is found in Aranmore, Muckish, and other places. Coals are found at Dromore, Anis, and Ballynally, and slate near Ballyshannon and Letterkenney. Veins of primitive limestone and marble, fit for statuary, appear at Letterkenney, and porphyritic sienite, are had here in great abundance, besides several species of granite. Dykes are of frequent occurrence, and consist principally of trap and greenstone. There is but little trade of any description existing. Linen is made by the cottagers, and sold to the travellers from Derry, Sligo, and Strabane. Kelp is made along the coast; and the fishery now in a very low state, might be rendered a great blessing to the poor and peaceable inhabitants of this large county, by the adoption of a few of Mr. Nimmo's very beautiful designs for coast improvements.

There are some remarkable natural beauties and curiosities in Donegal: the pass of Ben Bulbin is the most sublime of the first description; M'Swine's Gun the most singular of the second. The climate, from its latitude and exposure to the Atlantic, is both colder and more dour than most of the other northern counties; yet fertility is said to be one of its attributes: the census returns upwards of twenty persons to the county as having attained the age of 100, and several as having reached the unusually advanced age of 115 years. The chief towns are Letterkenney, Raphoe, Ballyshannon, Lameen, Killybegs, Buncrana, Ballintra, Ballyshannon, &c. The chief, or county town is Letterkenney, situated on the river Finn. The assizes for the county are held here, but from its awkward situation, upon the boundaries of the county, and its proximity to Strabane, it has never risen to the importance to which shire-towns are raised; the population scarcely amounts to 1000 persons. Letterkenney is well situated for supplying the county with imports, but Ballyshannon is much better. The town of Ballyshannon is the property of Pakenham Conolly, Esq., and is situated at the embouchure of the river Erne. Here is the famous salmon fishery, the produce of which is all exported to London, carefully packed in ice. The fall of Ballyshannon is a beautiful object, and always supplied with a great body of water from Lough Erne. The harbour of Ballyshannon is obstructed by two bars; but, when they are passed, there is safe lying for small vessels in the pool below the waterfall. The harbour is much in want of improvement, and navigation from Lough Erne to the sea is in a very previous want. The Erne, the Finn, and the Glenties, are the principal rivers in the county. The

and mountain pools are very numerous. Derg is rendered famous in story by the ages to St. Patrick's Purgatory, on one of its rocks, annually performed by multitudes very part of Ireland; and Lough Esk is for the production of excellent char fish. There are few counties in Ireland possessing more interest, and at the same time less known public, than Donegal.

**DOAT TOWN**, in the barony of Tyrhugh, of Donegal, and province of Ulster, is 40 miles from Dublin. It is a post, market, & town. Here is a beautiful remnant of early antiquities of Ireland, O'Donnell's erected in the twelfth century, and at this remarkably perfect. The ruins of a monastery, in 1474, by Owen Rowe, stand at the end of half a mile from the town.

**DOERAIL**, a borough of Ireland, in Cork, in the Awbeg, near some quarries of beautifully veined marble. It sent two members to parliament before the Union. It is nineteen miles east of Cork, and 115 south-west of Dublin.

**DONGALA, DANGALA, or DANKALA**, as it is called by the Arabs, is a town of Africa, in Nubia, on the east bank of the Nile. The place is said to be half-deserted, being filled with sand brought down by the waters from the mountains. The castle is large but not strong; the account of it by Poreet, dated at the end of the seventeenth century, is the last we have. Persons of rank here go bareheaded, and are being disposed in tresses, and their attire consisting in a rude vest without sleeves.

The pride of Dongala is in its horses, which are as beautiful as their riders are skilful. After the expulsion of the Mamelukes from Egypt, those of that body which effected their flight have taken possession of Dongala, and have bred a species of petty kingdom there. The number, however, does not exceed 500, 600 or 4000 slaves. Dongala is 150 miles N. of Sennar, and 690 south of Cairo.

**DUNGEON, n. s.** Now corrupted to *dungeon*, from Lat. *dominionum*, according to Menage. The highest and strongest tower of the castle, in which prisoners were kept: as in Chaucer. It is used of subterraneous prisons.

*the grete toure, that was so thicke and strong, the chief of the castle was the chief dungeon, wherein the knyghtes were in prison, even joyuant to the garden-wall, as this Emely had her playenge.* Chaucer.

**DUNNE (John), D. D.**, a poet and divine of the seventeenth century. His parents were of English religion, and used their utmost efforts to keep him firm to it; but his early examination of the controversy between the church of Rome and the Protestants, at last determined him to choose the latter. He travelled into Spain, where he learnt their languages and customs. Soon after he returned to England, Thomas Egerton, keeper of the great seal, appointed him his secretary: in which post he continued five years. Marrying privately the daughter of Sir George Moore, then baron of the garter, he was dismissed from office, and thrown into prison: but he was

afterwards reconciled to Sir George by the good offices of Sir Francis Wolley. In 1612 he accompanied Sir Robert Drury to Paris, and during this time many of the nobility solicited the king for some secular employment for him. But king James, who took pleasure in his conversation, had engaged him in writing his *Pseudo-Martyr*, printed at London in 1610; and was so highly pleased with that work, that in 1614 he prevailed upon him to enter into holy orders; appointed him one of his chaplains, and procured him the degree of D. D. from the University of Oxford. In 1619 he attended the earl of Doncaster in his embassy into Germany. In 1621 he was made dean of St. Paul's, and vicar of St. Dunstan's, in London; the advowson of it having been given to him long before by Richard earl of Dorset. By these and other preferments, he was enabled to be charitable to the poor, and to make good provision for his children. He wrote besides the above, 1. *Devotions upon Emergent Occasions*. 2. *The Ancient History of the Septuagint*, translated from the Greek of Aristæus, in 4to. 3. Three volumes of sermons, folio. 4. A considerable number of poems, and other works. He died in 1631; and was interred in St. Paul's cathedral, where a monument was erected to his memory. His writings show him to have been a man of wit and learning; but his chief talent lay in satire; though it savors more of the coarse style of Juvenal, than of the elegant humor of Horace.

**DOWNE (Benjamin)**, a celebrated mathematician, was born in 1729, at Bideford, in Devonshire, where his father and brother Abraham were eminent teachers of the mathematics. Benjamin succeeded his father, but afterwards removed to Bristol, where he died in 1798. He was master of mechanics to his late majesty, and published—1. *Mathematical Essays*, 8vo., 1759. 2. A Map of Devonshire, from an actual survey, made by himself. 3. *The Accountant and Geometrician*, 8vo. 4. *The British Mariner's Assistant*, 8vo. 5. *Essays on Trigonometry*, 8vo. 6. *An Epitome of Natural Philosophy*, 12mo. 7. *A Treatise on Mechanical Geometry*, 12mo.

**DONNINGTON, or DUNNINGTON**, a town of England, in the county of Lincoln, with a good trade in hemp and hemp-seed, and a port for barges, by which goods are conveyed to Boston and the Washes. It has lately been much improved. Through the fens, a firm rampart of earth of considerable breadth has been constructed, which forms a convenient road to Donnington. The church is a convenient building: in the lower part of the steeple is a stone, on which are the remains of a Roman inscription, unintelligible, with the exception of the date of the year. It has a weekly market on Saturday; and is eleven miles W. S. W. of Boston, and 110 north of London.

**DOODLE, n. s.** A cant word, says Johnson, perhaps corrupted from do little: *foincant*. A trifler; an idler.

**DOOM, v. a. & n. s.** Sax. *dome*, *deman*; *DOOM'S-DAY*, Teut. *thum*, to *DEEM*, which see. To judge; *DOOM'S-MAN*, destine; hence to come.

mand judicially, denounce; and the sentence, determination, or judgment given. Doomsday is the day of future and universal judgment. For doom's-day-book, see DOMESDAY-BOOK.

Be thou consenting to thin adversarie soone, while thou art in the waye with him, lest peradventure thin adversarie take thee to the *domesman* and the *domesman* take thee to the minstre, and thou be sent in to prison. *Wiclif. Matt. v.*

He that etith and drynkith unworthile, etith and drynkith doom to him, not wiseli demynge the bodi of the lord. *Id. 1 Cor. xi.*

Have I a tongue to doom my brother's death,  
And shall that tongue give pardon to a slave?  
*Shakespeare.*

Revoke thy doom,  
Or whilst I can vent clamour from my throat,  
I'll tell thee thou dost evil. *Id. King Lear.*

Search Windsor Castle, elves, within and out:  
Strew good luck, ouphes, on every sacred room,  
That it may stand till the perpetual doom. *Id.*

Men, wives, and children stare, cry out, and run,  
As it were doomsday. *Id. Julius Cæsar.*

The Danes also brought in a reckoning of money  
by ores, per oras, which is mentioned in doomsday-  
book. *Camden.*

His business gives him not leave to think of his  
conscience, and when the time, or term of his life is  
going out, for dooms-day he is secure; for he hopes  
he has a trick to reverse judgment. *Bp. Earle.*

They may serve for any theme, and never be out  
of date until doomsday. *Brown's Vulgar Errors.*

Him through malice fallen,  
Father of mercy and grace! thou didst not doom  
So strictly, but much more to pity incline. *Milton.*

Minos, the strict inquisitor, appears,  
And lives and crimes, with his assessors, hears;  
Round in his urn the blended balls he rols,  
Absolves the just, and dooms the guilty souls.  
*Dryden's Æneid.*

Our souls, not yet prepared for upper light,  
Till doomsday wander in the shades of night.  
This only holiday of all the year,  
We privileged in sunshine may appear. *Id.*

In the great day, wherein the secrets of all hearts  
shall be laid open, no one shall be made to answer  
what he knows nothing of: but shall receive his  
doom, his conscience accusing or excusing him.  
*Locke.*

I have no will but what your eyes ordain;  
Destined to love, as they are doomed to reign.  
*Gracille.*

From the same foes, at last, both felt their doom;  
And the same age saw learning fall, and Rome.

*Pope.*  
Indeed, as there is a difference in constitutions,  
some rest well after these meals; it costs them only a  
frightful dream and an apoplexy, after which they  
sleep till doomsday. Nothing is more common in the  
newspapers, than instances of people, who, after eat-  
ing a hearty supper, are found dead a-bed in the  
morning. *Franklin.*

In groundless hope, and causeless fear,  
Unhappy man! behold thy doom;  
Still changing with the changeful year,  
The slave of sunshine and of gloom.  
*Johnson. Winter's Walk.*

When to the supper-hall we moved along,  
Why was I doomed to face her in the throng?  
With what provoking kindness did she stand,  
And loose her arm from his to press my hand.

And beg with well feigned sympathy  
Of head-aches which I felt three months  
*Id. T. 1.*

The very knowledge that he lived in  
That all was over on this side the tomb,  
Had made Despair a smilingness assume,  
Which, though 'twere wild,—as on the  
wreck

When mariners would madly meet their  
With draughts intemperate on the sinking  
Did yet inspire a cheer, which he forbore to

DOON, or Loch Doon, anciently  
Dohn, a lake of Scotland, six miles long,  
south-east part of the district of Kyle,  
shire. There is an island in it, with an  
called Balloch Castle. Also the name of  
of Scotland, which issues from Loch Doon,  
running north-west, divides the district  
from that of Carrick. After a course of  
meanderings for twenty-four miles, it  
the Frith of Clyde, a little south of  
abounds with salmon, trout, pikes, and

, or Felahi, a town of the province  
a Persia, situated on two branches  
a Jerahi. It is surrounded by mud  
moles in circuit, sixteen feet thick,  
at intervals, by round towers. The  
he seik occupies a large area, but is a  
ee, and in a decaying state. Dorak  
ed for the manufacture of Arabian  
here are few houses within the walls,  
the inhabitants prefer residing under  
of the date trees, in the suburbs.  
8000. Seventy-five miles south of

, a town of Arabia, in Yemen, the  
the chief or governor of the district  
en. It is situated on the declivity of  
, and was once surrounded by a wall  
gates. Twenty-eight miles south of

AS. See CAIRA.

FESTER, an ancient, neat, and well  
of England, the capital of Dorsetshire.  
on the river Frome, on a Roman road,  
ed with a fine terrace walk, planted with  
as three parish churches, with a court  
re the county assizes are held; and is  
y a mayor, twelve aldermen, a recorder,  
y four council-men. It has long been

famous for its excellent ale. The streets are  
broad and well paved. It has two markets on  
Wednesday and Saturday, and sends two mem-  
bers to parliament. The manufactures are serge  
and broad cloth. It lies eight miles north of  
Weymouth, fifty-three east of Exeter, and 120  
west by south of London.

DORCHESTER, a town in Oxfordshire, seated on  
the Tame, over which it has a bridge, three quar-  
ters of a mile above its junction with the Thames.  
It had five churches before the Norman conquest.  
It is ten miles south-east of Oxford, and forty-  
nine W. N. W. of London.

DORCHESTER, a county of Maryland, in North  
America. It is thirty-three miles long from east  
to west, and twenty-seven broad. Its produce is  
chiefly wheat, corn, and lumber. Cambridge is  
the chief town.

DORCHESTER, a town of the United States of  
America, in Grafton county, New Hampshire,  
seventeen miles north-east of Dartmouth.

DORCHESTER, a township of the United States,  
in Norfolk county, Massachusetts. It is two  
miles south by east of Boston, and is about six  
miles long, and three and a half broad. The  
chief manufactures are paper, chocolate, snuff,  
leather, and shoes.

DORCHESTER, a town of the United States, in  
Cumberland county, New Jersey, seventeen  
miles east of Fairfield.

DORCHESTER NECK, a peninsula of Massa-  
chusetts, on the coast of the township, in Norfolk  
county; the north-east point of which approaches  
within half a mile of Castle Island, and its  
north-west point within half a mile of the south  
part of Boston. During the American war forts  
were erected on the heights, and the township  
suffered greatly.

DORDOGNE, a department of France, com-  
prehending part of the ci-devant province of  
Perigord, bounded on the north-east by that of  
the Upper Vienne, on the east by those of the  
Lot and Corrèze, on the south by that of the Lot  
and Garonne, on the west by those of the Gi-  
ronde and the Lower Charente, and on the north-  
west by that of the Charente. Périgueux is the  
capital. Its superficial extent is about 3600  
square miles, and the population 425,000, of  
whom 8500 are Protestants. It was at first  
divided into nine districts, but now consists of  
the five arrondissements of Périgueux (the capi-  
tal), Bergerac, Sarlat, Ribérac, and Nontron.  
The south of the department, particularly the  
banks of the Dordogne, the Vézère, and the Ile,  
is fruitful; but the north is mountainous, and  
covered with wood; the deficiency of corn being  
supplied by chestnuts and potatoes. There are  
a few manufacturing establishments in various  
places, viz. for hardware, paper, glass, and pot-  
tery. Wine, oil, and cattle, form the chief  
articles of export. Of wine 150,000 hogheads  
are accounted an average vintage; the cattle and  
sheep are numerous.

DORDOGE, a considerable river of France,  
which rises about seven miles north-west of Besse,  
in the department of the Puy-de-Dôme. After  
forming the limit of the départements of the Puy-  
de-Dôme and the Corrèze it runs through an  
extensive tract, and falls into the Garonne, at

Bouge, about fifteen miles below Bourdeaux. Here the united stream takes the name of the Gironde. The course of the Dordogne is above 200 miles, during which it receives a great number of smaller rivers, the principal of which are the Vézère and Ille. The tide flows as high up as Castillon, about twenty-five miles from the confluence with the Garonne.

**DORIA** (Andrew), a celebrated patriot of Genoa, born in 1466. He entered into the service of Francis I. of France; but preserved that spirit of independence so natural to a sailor and a republican. When the French attempted to render Savona, long the object of jealousy to Genoa, its rival in trade, Doria remonstrated against the measure in a high tone; which, being represented by the malice of his courtiers in the most odious light, irritated Francis to that degree, that he ordered his admiral, Barbesieux, to sail to Genoa, then in the hands of the French troops, to arrest Doria, and to seize his galleys. This rash order being communicated to Doria, he retired with all his galleys to a place of safety; and, while his resentment was thus raised, closed with the offers of the emperor Charles V.; returned his commission, with the collar of St. Michael, to Francis, and hoisted the Imperial colors. To deliver his country, weary alike of the French and Imperial yoke, from the domination of foreigners, was now Doria's highest ambition; and the favorable moment soon offered. Genoa was afflicted with the pestilence, the French garrison was greatly reduced, and ill paid, and the inhabitants were disposed to second his views. He sailed to the harbour with thirteen galleys, landed fifty men, and made himself master of the gates and the palace, with very little resistance. The French governor, with his feeble garrison, retired to the citadel, but was quickly forced to capitulate; when the people ran together, and levelled the citadel with the ground. It was now in Doria's power to have rendered himself the sovereign of his country; but, with a magnanimity of which there are few examples, he assembled the people in the court before the palace, disclaimed all pre-eminence, and recommended to them to settle the form of government they chose to establish. The people, animated by his spirit, forgot their factions, and fixed that form of government which subsisted till the revolution in 1797, with little variation. This event happened in 1528. Doria lived to a great age, respected and beloved as a private citizen, and is still celebrated among his countrymen by the most honorable of all appellations, 'The father of his country, and the restorer of its liberty.'

**DORIC**, *adj.* Lat. *dorus*; Fr. *dorique*. The ancient Dorians.

Love warms our fancy with enlivening fires,  
Refines our genius, and our verse inspires;  
From him Theocritus, on Enna's plains,  
T'wixt the wild sweetness of his Doric strains.

*Littleton.*

**DORIC DIALECT**, one of the five dialects which prevailed among the Greeks. It was first used by the Lacedæmonians, and particularly those of Argos; thence it passed into Epirus, Libya,

Sicily, and the islands of Rhodes and Ionia. The Doric dialect, Archimedes and Theocritus wrote in; and were both Syracusans, as well as Pindar. The Doric dialect is properly the manner of speaking peculiar to the Dorians, after their removal from Parnassus and Asopus; and which dialect came to obtain among the Lacedæmonians. Some even distinguished between the Lacedæmonian and Doric; but, in reality, they are the same; setting aside a few particularisms in the language of the Lacedæmonians, as in Cicero, Rulandus, in his treatise *De Lingua Græca*, et *usque Dialectis*, lib. v. To these writers we might add Archytas of Tarentum, Busiris, Simonides, Bacchylides, Cypselas, Acrotas, Sophron, as writers in the Doric dialect. Most of the medals of the cities of Græcia Magna and Sicily, use the Doric dialect in their inscriptions, e. g. AMBPAKIQTAN, AHOAQNITAN, PONTAN, AXYPITAN, HPAX, AEDON, INIQN, OEPMITAN, KAYAONIATAN, TANTAN, TAYPOMENITAN, &c. Which shows the countries wherein the Doric dialect was used. The general rules of this dialect are thus given by the Port-royalists:

D's Hra, d'w grand, d'a, d'e, & d'o. Fa fait a ho  
D'a fait nra; d'o, w; & d'w au fait encan.  
Oste d de l' infini: & pour le singular  
Se sert au feminin du nombre plancier.

But they are much better explained in the book of Rulandus; where he even mentions the minutest differences of the dialects of Crete, Tarentum, Rhodes, Lacedæmon, Macedonia, and Thessaly.

**DORIC MODE**, in music, the first of the æsthetic modes of the ancients. Its character is severe, tempered with gravity and joy, and is proper upon religious occasions, as also used in war. It begins D, *la, sol, re, fa*, and admires the music of the Doric mode, and just it proper to preserve good manners and masculine; and on this account allows it to be commonwealth. The ancients had likewise a subdoric or hypodoric mode, which was of the plagal modes. Its character was to be grave and solemn: it began with *re*, a tone lower than the Doric.

**DORIC ORDER**, the second of the five orders of architecture. It is usually placed upon an Attic base, though originally it had none. **ARCHITECTURE.** The most considerable monuments of this order, are the theatre of Marcellus at Rome, wherein the capital, the base of the frieze, and its projecture, are most seen than in the modern architecture; and the Parthenon, or temple of Minerva, at Athens, which the short and massy columns bear upon the pavement without a base; and the capital a simple torus, with its cineture, and a square plain, and solid abacus.

**DORIS**, in ancient geography, a country in Greece, between Phocis, Thessaly, and Macedonia. It received its name from Doron, son of Deucalion, who made a settlement there. It was called Tetrapolis, from its four cities, Pindus or Dryopis, Erineum, Cytanium, and Borium. To these four some add Larissa in Carphria, and therefore call it Hexapolis. It

has been common to many parts of the Dorians in the age of Deucalion, which they exchanged for the age of Dorus. From thence they came to the town of Pindus. Thence they went to Pindus, and afterwards into Peloponnesus, having re-established the kingdom of Phthiotis or Doris, who had been driven from his country by the Lapithæ, and appointed Hyllus, the son of Peloponnesus, and the Heracleidæ, that part of the country to recover. The Dorians sent many colonies to various places, which bore the same name as their country. The most famous of these was the Dorians of Halicarnassus, capital. This part of Asia Minor was called Dorians, and afterwards Pentapolis. Dorology, a genus of insects, belonging to the order of vermes testacea. They are flat beneath; creeping: mouth at the front; vent behind, surrounded with a series of retractile. There are several species, particularly D. argo, the lemon doris, which is flat, convex, marked with numerous spots of a lemon color; the vent beset with small tubercles. It inhabits different parts of the world, and is called about Brighton

Dorology, the daughter of Oceanus and the wife of Nereus and mother of the Dorians.

Dorset, a market town of Surry, situated in the midst of beautiful hills. The church is a square tower, near the eight bells, and a set of chimes. A convenient workhouse, here are some almshouses, on a pleasant heath. Dean. A great traffic is carried on here; and this town is noted for alms, which is singular from their giving in each claw. Capons bred here weigh seven or eight pounds each, and are sold there. In the neighbourhood are hills, and in the suburbs are many villages. The custom of Borough-English is a manor, by which the youngest son inherits the copyhold estate. This practice is derived from the ancient custom of the manor having a right to the land with every bride on her wedding day on Thursday. Eight miles south and twenty-three S. S. W. from

**DOR**, adj. Fr. *dormant*, from Lat. *dormio*, to sleep. Sleeping; hence private; concealed. Dortour and dormitory, a place to sleep; hence a burial place. Dormitive,

awakened by revelation, hence, at home in our dortour.

Chaucer. Cant. Tales. Other dormant ministers of soldiers parts of the realm, that were put in it drawn together.

Bacon's War with Spain.

He led us to a gallery like a *dorture*, where he shewed us along the one side seventeen cells, very neat. Bacon.

Prayer is the only *dormitive* I take to bedward, and I need no other laudanum than this to make me sleep; after which I close mine eyes in security, content to take my leave of the sun, and sleep unto the resurrection. Sir T. Browne.

He a dragon? if he be, 'tis a very peaceful one: I can assure his anger is dormant; or, should he seem to rouse, 'tis well lashing him, and he will sleep like a top. Congreve's Old Bachelor.

With this radius he is said to strike and kill his prey, for which he lies, as it were, dormant, till it swims within his reach. Grew's Museum.

Query.—Whether churches are not dormitories of the living, as well as of the dead. Swift.

It would be prudent to reserve these privileges dormant, never to be produced but upon great occasions. Id.

The places where dead bodies are buried, are in Latin called *cimiteria*, and in English *dormitories*. Ayliffe's Parergon.

Old dormant windows must confess  
Her beams; their glimmering spectacles,  
Struck with the splendor of her face,  
Do the office of a burning-glass. Cleveland.

Naked mourns the dormitory wall,  
And Jones and Boyle's united labours fall. Pope's Dunciad.

Rooms that have thorough lights are left for entertainment, and those that have windows on one side for dormitories. Mortimer.

Many vegetables during the night do not seem to respire, but to sleep like the dormant animals and insects in winter. Darwin.

**DORMANT**, in heraldry, is used for the posture of a lion, or any other beast, lying along in a sleeping attitude with the head on the fore paws; by which it is distinguished from the couchant, where though the beast is lying, yet he holds up his head; as gules, a lion dormant, name Aylesworth.

**DOR'MOUSE**, n. s. *Dormio* to sleep, and mouse. A small animal which passes a large part of the winter in sleep.

Come, we all sleep, and are mere dormice flies,  
A little less than dead: more dullness hangs  
On us than on the moon. Ben Jonson's Catiline.

After they have lain a little while, they grow as drowsy as dormice, unless they are roused. Collier on Thought.

**DORN**, n. s. From German, *dorn*, a thorn. The name of a fish; perhaps the same as the thornback.

The coast is stored both with shell-fish, as scallops and abbeathfish; and flat, as turbot, *dorn*, and hollybut. Carver.

**DORNHAN**, or **DORNEM**, a town of Wirtemberg, in the Black Forest, in Suabia, and containing about 1050 inhabitants. It was burned down by lightning in 1718, but was soon after rebuilt. In the neighbourhood are the ruins of three castles. It is forty miles south-west of Stuttgart.

**DORNICK**, *n. s.* Of *Deornick* in Flanders, where first made. A species of linen cloth used in Scotland for the table.

**DORNOCH**, the county town of Sutherland, in a parish of the same name, on the Frith of Dornoch. It has five fairs; was made a royal borough in 1628; has a provost, four bailies, dean of guild, and treasurer; and joins with Tain, Dingwall, Wick, Kirkwall, and Cromarty, in electing a representative in parliament.

**DOROBAT**, a town of Arabia, in the capital of a district in the country of Yemen, situated on the crest of a mountain. Here is a remarkable prison excavated from the rock, wherein malefactors are secured by chains of considerable length. It is twelve miles west of Taas.

**DOROGOBUSH**, a town of European Russia, in the government of Smolensko, on the Dnieper. It is a place of great trade, and was burnt by the French, in 1812, in their retreat from Moscow. Forty-six miles E. N. E. of Smolensko.

**DORONICUM**, leopard's bane: a genus of the polygamia superflua order, and syngenesia class of plants; natural order forty-ninth, composite. Receptacle naked, the pappus simple; scales of the calyx in a double row, longer than the disc. The seeds of the radius naked without any pappus. There are six species; of which the

**DORONICUM PARDALIANCHES**, with obtuse heart-shaped leaves, is worthy of notice. It grows naturally in Hungary, and on the Helvetian mountains; but is frequently preserved in the English gardens. It has thick fleshy roots, which divide into many knobs or knees, sending out strong fleshy fibres which penetrate deep into the ground; from these arise in the spring a cluster of heart-shaped leaves, which are hairy, and stand upon foot-stalks: between these arise the flower-stalks, which are channelled and hairy, nearly three feet high, putting out one or two smaller stalks from the side. Each stalk is terminated by one large yellow flower. The plant multiplies very fast by its spreading roots; and the seeds, if permitted to scatter, will produce plants wherever they happen to fall; so that it very soon becomes a weed in the places where it is once established. It loves a moist soil and shady situation. The roots were formerly used in medicine as alexipharmics and purifiers of the blood, but their operation was so violent that they are now entirely laid aside.

**DORPAT**, or **DORP**, a town in Livonia, European Russia, in the government of Riga. It is situated on the small river Embach or Einbach, on the high road to St. Petersburg, and its annual fair is of great importance. A university has been established here since 1802, with a revenue of from £10,000 to £15,000 sterling. It has a library, museum, and botanic garden, liberally endowed. The environs are very agreeable. Dorpat is an ancient town. In 1704 it was taken and burned by the Russians, and in 1775 was consumed by accidental fire. Population 4500. Sixty-five miles south-west of Narva, 120 N. N. E. of Riga, and 132 south-west of St. Petersburg.

To **DORR**, *v. n.* Teut. *lor*, stupid. To deafen or stupefy with noise. This word I find only in *Sikuner*, says Dr. Johnson.

**DORR**, *n. s.* So named probably from the noise which he makes. A kind of flying insect, remarkable for flying with a loud noise.

Some insects fly with four wings, as all the *epennous*, or sheath-winged, as the *chrysids* and *crucians*.  
*Bronius*: *1. alper* *lucius*.

The *dorr* or hedge-chaffer's chief parts are: his head is small, like that of the *corcorus*; his thorax is black; his eyes black; his shoulder-piece, middle of his belly also black; but just above the wing-shells spotted with white. His wing-shells are black, and the end of his tail, which is long and fine, is of a light chestnut; his breast, especially, covered with a downy hair.

**DORSEL**, *n. s.* } From *dorman* the Sax.  
**DORSER**. } A pannier; a basket or

bag, one of which hangs on either side a horse's burden, for the reception of things of great bulk. It is corruptly spoken, and perhaps written, *dossel*.

**DORSET**, a township of Vermont, in Bennington county, bounded by those of Ripton to the west, Manchester on the south, and Unity on the north.

**DORSETSHIRE**, a county of England, bounded on the north by Wiltshire and Somersetshire, on the east by Hampshire, on the south by Devonshire and part of Somersetshire, and on the south by the British Channel. It is a maritime county, lying between 50° 30' and 51° 6' N. lat., and 1° 58' and 3° 18' W. long. From the centre, from north to south, it measured thirty-six miles; and from east to west about fifty miles. It is said to contain in all about 512,154 acres. The political divisions of the county consist of divisions, hundreds, boroughs, liberties, and tithings. There are nine divisions, thirty-four hundreds, twenty-four market towns, 248 parishes, and four sea-port towns. The county is in the diocese of Bristol, and is divided into five deaneries. It is included in the Western circuit, and the assizes are now held at Dorchester. According to Ptolemy and other ancient writers, Dorsetshire under the Romans was inhabited by the Durotriges or Morini; British words denoting maritime people, or dwellers on the sea-shore. The Saxon invaders gave the name of Dorsetta to this county, a word compounded of British and Saxon, and signifying the land of the Roman appellations. When the island was divided into Roman provinces, this county became part of Britannia Prima; and, on the conquest of the Saxons, it was included in the kingdom of Wessex. The varied beauty of this county, the mildness of its climate, and the value of its natural productions, have given it the appellation of 'The Garden of England.' This character, however, is disputed by Mr. Stevenson, in his excellent View of the Agriculture of the county, which, he remarks, is scarcely to be deemed to be so mild in its temperature, or so early in its seasons, as it would lead us to expect. The fact is, that the climate of Dorsetshire has undergone a very material alteration; and the air, as the same author remarks, has become more and salubrious rather than mild and healthy in the seasons, except in spots very peculiarly possessed of a very warm soil, are not much

ed as they are in other parts of England far southward.

county, in respect to soil, is naturally divided into three principal districts, viz. chalky, gravelly sand, and clay, or various soils of clay basis. The chalky district commences at the borders of Somersetshire, near Crewkerne in county, and runs in a very narrow slip across the interior of the county, as far as the point of Eversholt, where it suddenly widens, and spreads considerably to the north of Dorset. It then again abruptly contracts between Piddleton, south, and Bingham's Melbury, north; but immediately once more extending itself, branches out more than half the length of the whole county, and extends into the county of Wilts and the borders of Hampshire.

This district contains about 160,759

The sand district, occupying about 100,000 acres, approaches the borders of the Bristol Channel; and, commencing a little east of Bournemouth, forms a crescent, the east horn of which terminates near Ringwood in the county of Hampshire. The clayey soils are found in the central parts, west, north, and south of the county, but particularly on the northern borders, and in the western districts near Devonshire. This district contains altogether about 117,331

the rivers of this county we may notice the Hooke or Oke, the Ivel, the Piddle, the Stour, the Char, the Eype, and the Wey. The three last are the rivers of Dorsetshire running upon Devonshire. The celebrated bathing-place which is formed by the combined waters of Melcombe Regis and Weymouth, as Drine observes, graces the exit of the Wey into the sea, remarkable for its grand semicircular bay, and its excellent as well as level sands. The advantages, and the preference often given to this place by the royal family, have raised it to high consideration; splendid rows of houses are formed, with a superb esplanade in front of them, towards the coast, for a great extent, and they command the whole of the bay, backed by great chalky cliffs, and backed by Dorsetshire downs. The pier of Weymouth lies out beneath an opposite rock, crowned with a garrison, which defends the harbour from north and west winds, offering a convenient place for shipping, and possessing no small port trade. The village and high church of Melcombe Regis occupy the highest point of this district of hills on the west, immediately opposed to the vast protruding mass of Portland Island. The Wey and the Eype, which come in succession before the Wey, have no striking points; that Charmouth, at the exit of the former, is a great western road, is preferred by some, as a bathing-place, to Lyme, which is far more healthily situated in its neighbourhood. The Wey, joined by the Brit from Bournemouth, and the stream westward of it, falls into the sea at Bournemouth Harbour, a few miles below that point.

These rivers all descend from the Dorsetshire downs, and their course is nearly southward. The most considerable river is the Frome, rising, as we have seen, in that vast tract of downs which is called the Frome downs; it flows southward from Somersetshire; its two channels

uniting in a pleasant bourn at Maiden Newton, from whence it pursues a south-east course to Dorchester; fed afterwards by various streams from the hollows in the downs in the south, and, meeting the Piddle from the north as it turns more and more eastward to reach Wareham, it forms the great expanse of water constituting Poole Harbour. The country through which this river takes its course is but thinly inhabited, and bare of wood; but the range of downs that extend parallel with the latter part of its course, separating its vale from the coast, is formed by Nature in the boldest manner, containing many tumuli and ancient encampments, with the singular curiosity of one perfect Roman amphitheatre near Dorchester, within view of the old fortress of Maiden Castle. Dorchester may be called a pleasant town from the neatness of its streets, and, above all, from the avenues and planted walks by which it is environed and approached, after the manner of many French towns, which have an increased effect in the midst of so bare a country. Wild heaths succeed to the downs before the Frome reaches the sea; and Poole Harbour is a very extensive sheet of water, bounded towards the south-west by the Isle of Purbeck, in which the towers of Corfe Castle make a considerable figure. Poole is a flourishing port on its north shore. The Stour finds its source in six streams at Stourton in Wiltshire, three of which are in the park of Stourhead. Though perhaps somewhat less than the Frome, this is certainly by far the pleasantest of the Dorsetshire streams, forming in its passage the charming dell beneath the cliff of Brianstone. The vicinage of this river in particular, and indeed Dorsetshire in general, is noted for a profusion of fine seats, and a race of noblemen and country gentlemen who exercise the splendid and captivating hospitality of past ages, yet uncontaminated by the encroachment of manufactures. This beautiful river yields trout, eels, and tench; and the author now quoted, Mr. Hutchins, remarks that the sea on the Dorsetshire coast abounds with sturgeons, turbot, mackerel, plaice, soles, basse, whittings, congers, porpoises, lobsters, red and gray mullet, thornbacks, piper or gurnet, trill or scollop, shrimps, prawns, and oysters. The rivers furnish salmon, pike, carp, gudgeons, perch, &c. The Bay of Weymouth opens immediately below Portland; and that tract of Dorsetshire called the Isle of Purbeck stretches out on the opposite side to the south-east, terminating in the point called St. Alban's Head. The range of cliffs which bound this coast, as well as the shoals called The Race of Portland, are extremely dangerous to shipping, and wrecks are very frequent here in stormy seasons. The Cove of Lulworth presents an occasional refuge to small vessels, but its entrance is so narrow as to render it of little use. Immediately behind it, Lulworth Castle occupies a charming elevation, and exhibits a grand baronial pile, in the midst of some ornamented grounds, commanding the sea with good effect, through a gap in the rocks. In the centre of the Isle of Purbeck, Corfe Castle displays its ruined towers on a high eminence with great majesty; and this pleasant district is inhabited

by several respectable families, whose seats make a handsome appearance; the Grange being the most conspicuous. Turning round the point of Purbeck, towards the north, the Bay of Strudland fronts the east, within which is the great expanse of Poole Harbour, marked with several islands, and distinguished by the port of Poole. Mr. Hutchins remarks of the mineral waters, that 'they are chalybeate at Farringdon, Aylwood, and Corfe; sulphureous at Sherford, Morden, Nottingham, and Sherborne; salt at Chilcombe; and petrifying at Sherborne and Botherwood, near Winborne-Minster.' There are no canals in this county, though Mr. Stevenson says that a navigable one is intended to pass from Somersetshire by Chardstock and Dorchester to the sea, near Beer and Seaton, in the county of Devon. The principal produce of Dorsetshire are its fine sheep, its extensive mac-karel fishery, and the celebrated stone quarries in the peninsula or isle of Portland. There are no metallic mines nor coals of any value. The 'pebbly desert,' called the Chesil Bank, is, as Dr. Maton remarks, one of the most extraordinary ridges or shelves of pebbles in Europe, and perhaps the longest, except that of Memel in Polish Prussia. Its length is supposed to be about seventeen miles; its breadth in some places near a quarter of a mile.

Dorsetshire sends thirteen members to parliament: viz. three for the county, two for Dorchester, two for Poole, one for Lyme Regis, two for Weymouth and Melcombe Regis, one for Bridport, one for Shaftesbury, and one for Wareham.

This county has produced among other eminent persons, Anthony Ashley Cooper, Earl of Shaftesbury—Christopher Pitt, a very ingenious poet and divine, born at Blandford, in 1699, died 1748—the learned and celebrated Bishop Stillingfleet—Dr. Thomas Sydenham, one of the most learned and rational physicians of his time, who died 1689—Sir James Thornhill, nephew to the above, an eminent painter—The celebrated Archbishop Wake—The Rev. Samuel Wesley, father to the celebrated founders of Methodism—Thomas Creech, the poet—Matthew Prior, &c. &c.

The principal manufactory in this county is that of flax and hemp, near Bridport and Bournemouth. These produce twine, string, and cordage in general; also nets, sacking, bags, &c. There are also several woollen manufactories, as also for twisting and making up raw silk into skeins. Shirt-buttons are manufactured at Shaftesbury; and malting and brewing are carried on at Wareham, Dorchester, &c.

**DORSIFEROUS**, *adj.* ? Lat. *dorsum* and *fero*, or *pario*. Having

the property of bearing or bringing forth on the back. It is used of plants that have the seeds on the back of their leaves, as fern; and may be properly used of the American frog, which brings forth young from her back.

**DORSTENIA**, *contrayerva*, a genus of the monogynia order and tetrandria class of plants; natural order fifty-third, scabridæ: receptacle common, monophyllous, and carnosus; the seeds lying singly in the carnosus substances. There are eleven species, all low herbaceous plants,

growing in the warm countries of America. The root is used in medicine. It is a thick knot, an inch or two in length, about half an inch thick; externally of a red-brown colour, and pale within; long, tough, slender fibres shoot out from all sides of it, which are generally loaded with small round knots. The root has a peculiar aromatic smell, and a somewhat pungent, warm, bitterish taste, with a light and sweetish kind of acrimony when chewed. The fibres have little taste or smell, the tender part, therefore, should only be chosen. The *trayerva* is one of the mildest of alexipharmics and is a useful diaphoretic. Its virtues are extracted both by water and rectified spirit, and do not arise by evaporation with either. The plants cannot be propagated in this manner without the greatest difficulty.

**DORSUM**, the back, in anatomy, comprehends all the posterior parts of the body, from the neck to the buttocks. See **ANATOMY**.

**DORT**, or **DORDRECHT**, a city of the Netherlands, in the department of Delft, South Holland. It is seated in a small island, formed by the rivers Meuse, Merue, Rhine, and IJssel. The Meuse, on which it stands, gives it a fine harbour, and separates it from the island of Ysselmonde and Ablas. It is divided from Beyerland by a canal. The harbour is very commodious for the merchandise which comes down the Rhine and the Meuse. Its strength consists in being surrounded with water, being old and decayed. Dort is well built of brick, and had formerly the exclusive right of coining money. The church of Notre Dame is a good building, the tower lofty, and furnished with musical chimes. There is another church dedicated to St. Nicholas, built in 1568. Prior likewise, before the revolution, several religious houses for monks and nuns; and the town is a fine building. It is at present the chief town for wines, particularly Rhenish, though the exclusive privileges in this respect are abolished. It was detached from the main land in Holland the 17th November, by a flood occurred in the breaking down of the dyke, which overwhelmed seventy villages, and about 1000 persons. However, by time, and the assistance of the inhabitants, a great part of the land was recovered. It has two principal canals, called the New and Old Haven, by which heavy laden vessels may enter into the city. Over the Old Haven is a large bridge, well built with stone. Dort was almost reduced to ashes in 1782, and being then consumed 2000 houses, with the hospital, and church of Notre Dame. To company of tradesmen, and some other necessities, elect the magistrates, and some of the members of the city council. In former times, Dort was the residence of the stadtholder of Holland; and, on the foundation of the French republic, it became the first in rank of the cities of Holland at the States-general.

This city is famous for the meeting of the clergy, called the synod of Dort, in 1618. Calvinists obtained a sentence against the Remonstrants, who were called Remonstrants. The dispute between the contending parties was attended with disorders, skirmishes, and murders.

of the principal cities. The reformed churches in France, at first disposed to give a favorable recep- to the decisions of this famous synod, in of time espoused doctrines very different ose of the Gomarists; and the churches ndenburgh and Bremen would not suffer ctors to be tied down to the opinions and of the Dutch divines. The liberty of ridgment, with respect to the doctrines of nation and grace, which the spirit that ed among the divines of Dort seemed so adapted to discourage and suppress, ac- new vigor in consequence of the arbitrary ings of this assembly.

RTMUND, a rich, populous, and once l city of Germany, in the circle of West- and territory of Nassau-Dillenburg, to it was ceded in 1802; but it was ceded to in 1815. It is pretty large, but not well Formerly it was one of the Hanse Towns. tory was also formerly a county, and had f its own; but since 1504 it has been ed entirely by the city. Here are four n churches, one Catholic, a Dominican ranciscan monastery, a nunnery, three n, and a provincial academy. Population It is seated on the Emster, forty miles t of Cologne.

LYPHORI: from *δωρα*, a spear, and *φειω*, an appellation given to the life-guard of the Roman emperors. They were held in estimation as frequently to have the aid of armies conferred on them. It was

usual also for chief commanders to have their doryphori or life-guards to attend them.

DOSE, *v. n.* Fr. *dose*; Ital. Teut. Span. Port. and Lat. *dosis*, from Gr. *δοσις* à *διδωαι*, to give. A given quantity of medicine, or any other thing; hence any thing nauseous.

No sooner does he peep into  
The world, but he has done his doe;  
Married his punctual dose of wives,  
Is cuckolded, and breaks, or thrives. *Hudibras.*

The too vig'rous dose too fiercely wrought,  
And added fury to the strength it brought.

*Dryden's Virgil.*

If you can tell an ignoramus in power and place that he has a wit and understanding above all the world, I dare undertake that, as fulsome a dose as you give him, he shall readily take it down. *South.*

In a vehement pain of the head he prescribed the juice of the thapsia in warm water, without mending the dose. *Arbutnot.*

We pity or laugh at those fatuous extravagants, while yet ourselves have a considerable dose of what makes them so. *Gravelle.*

DOSITHEUS, the chief of a faction among the Samaritans, mentioned by Origen, Epiphanius, Jerome, and other Greek and Latin fathers. But the learned are not at all agreed as to the time wherein he lived. St. Jerome, in his Dialogue against the Luciferians, places him before our Saviour; in which he is followed by Drusius, who, in his answer to Serrarius, places him about the time of Sennacherib, king of Assyria. But Scaliger will have him posterior to our Saviour's time. And Origen intimates him to have been contemporary with the apostles; where he observes, that he endeavoured to persuade the Samaritans that he was the Messiah foretold by Moses. He had many followers; and his sect was still subsisting at Alexandria at the time of the patriarch Eulogius, as appears from a decree of that patriarch published by Phocius. In that decree, Eulogius accuses Dositheus of injuriously treating the ancient patriarchs and prophets, and attributing to himself the spirit of prophecy. He makes him contemporary with Simon Magus, and accuses him of corrupting the Pentateuch in divers places, and of composing several books directly contrary to the law of God. Archbishop Usher takes Dositheus to have been the author of all the changes made in the Samaritan Pentateuch, which he argues from the authority of Eulogius. But all we can justly gather from the testimony of Eulogius is, that Dositheus corrupted the Samaritan copies since used by that sect; but that corruption did not pass into all the copies of the Samaritan Pentateuch now in use among us, many of which vary but little from the Jewish Pentateuch. And in this sense, we are to understand that passage in a Samaritan chronicle, where it is said, that Dousis, i. e. Dositheus, altered several things in the law of Moses. The author of that chronicle, who was a Samaritan by religion, adds, that their high priest sent several Samaritans to seize Dousis and his corrupted copy of the Pentateuch. Epiphanius takes Dositheus to have been a Jew by birth, and to have abandoned the Jewish party for that of the Samaritans. He imagines him likewise

to have been the author of the sect of the Sadducees; which is inconsistent with his being later than our Saviour; and yet the Jesuit Serrarius makes Dositheus the master of Sadoc, from whom the Sadducees are derived. Tertulian observes, that Dositheus was the first who dared to reject the authority of the prophets, by denying their inspiration. But he charges that as a crime peculiar to this sectary, which in reality is common to the whole sect, who never allowed any but the five books of Moses to be divine.

**DOSSIL**, *n. s.* Corrupted from *dorsel*, something laid upon the part. A pledget; a nodule or lump of lint to be laid on a sore.

Her complaints put me upon dressing with such medicaments as basilicon, with præcipitate, upon a dossil. *Wiscman.*

**DOT**, *v. a., v. n. & n. s.* Derived by Skinner from *Ger. dotter*, the white of an egg; and interpreted by him a grume of pus. It has now no such signification, and seems rather corrupted from *jot* a point. A small point or spot made to mark any place in a writing. To mark with specks; to make dots or spots.

**DOTAL**, *adj.* Lat. *dotalis*. Relating to the portion of a woman; constituting her portion; comprised in her portion.

Shall I, of one poor dotal town possess,  
My people thin, my wretched country waste,  
An exiled prince, and on a shaking throne,  
Or risk my patron's subjects, or my own?

*Garth's Ovid.*

**NOTE**, *v. n.*

**DO'TAGE**, *n. s.*

**DO'TARD**, *n. s.*

**DO'TED**, *adj.*

**DO'TER**, *n. s.*

**DO'TINGLY**, *adv.*

fondness; often used with *on* or *upon*. Doted is stupid: dotage is a state of imbecility or decayedness of mind; excessive fondness. Dotard and doter, he who is thus imbecile.

A sword is upon the liars, and they shall dote; a sword is upon her mighty men, and they shall be dismayed. *Jer. i. 36.*

His senseless speech and doted ignorance

The prince had marked well.

*Spenser.*

Dotard, said he, let be thy deep advise,

Seems that through many years thy wits thee fail,

And that weak old hath left thee nothing wise,

Else never should thy judgment be so frail.

*Faerie Queene.*

Unless the fear of death make me dote,

I see my son. *Shakspeare. Comedy of Errors.*

I have long loved her, and bestowed much on her,

Followed her with a doting observance. *Shakspeare.*

If in black my lady's brow be deckt,

It mourns that painting and usurping air

Should ravish doters with a false aspect;

And therefore is she born to make black fair. *Id.*

*O vanity.*

How are thy painted beauties doted on,

My light and empty idiots!

*Ben Jonson.*

The soul in all hath one intelligence,

Though too much moisture in an infant's brain,

And too much dryness in an old man's sense,

Cannot the prints of outward things retain:

Then doth the soul want work, and idle set;

And this we childishness and dotage call. *Davies.*

No, no; I know the world too well to do.

*Bp. Hall. Letter from the*

What should a bald fellow do with a comb,  
doter with a pipe, or a blind man with a staff?

Our doters upon red and white are incumbered by the uncertainty both of the mistress's kindness, and of the lasting beauty.

All the beauties of the court besides

Are mad in love, and dote upon your person.

Time has made you dote, and vainly

Of arms unimagined in your lonely cell.

Go, be the temple and the gods your care;

Permit to men the thought of peace and war.

*Dryden.*

That he, to wedlock dotingly betrayed,

Should hope in this lewd town to find a maid.

*Id.*

We dote upon this present world, and the end of it; and 'tis not without pain and fear, and tancy, that we are torn from them, as if we lay all within the compass of this life.

The sickly dotard wants a wife,

To draw off his last dregs of life.

When an old woman begins to dote, chargeable to a parish, she is turned into a mill, and fills the country with extravagant fancies.

*Addison's*

O death all eloquent! you only prove

What dust we dote on, when 'tis man we love.

Some, for renown, or scraps of learning  
And think they grow immortal as they quene.

In vain their gifts the bounteous season  
The fruit autumnal and the vernal flower,  
With listless eyes the dotard views the show,  
He views and wonders that they please no more.

*Johnson. Vanity of Human*

A strict accountant of his beads,

A subtle disputant on creeds;

His dotage trifled well:

Yet better had he neither known

A bigot's shrine, nor despot's throne.

**DO'TTARD**, *n. s.* This word seems to signify a tree kept low by cutting; or a false spelling of dotard, and means a decayed.

For great trees, we see almost all overgrown church-yards, or near ancient buildings, and are pollards and dottards, and not trees of height.

**DOTTEREL**, *n. s.* From *dote*. The name of a bird that mimics gestures.

We see how ready apes and monkeys imitate all motions of man; and in carriages we see how the foolish bird playeth the same gestures.

**DOUAY**, a city of France, in the department of the North (of which it was time the capital), and ci-devant France. It has a fine arsenal, a foundry for cannon, military and artillery school. The fort on the river of that name, within the city, serves for a citadel. It has three colleges, incorporated of late into one great square in the centre of the city, principal church, are worthy of notice.

a university by Philip II. of Spain, in it a seminary for English Roman Catholics. In 1667 it was taken from us by Louis XIV. in person. The duke of Marlborough, took it; it was retaken by the French in the suspension of arms between us and France. During the late wars it was the scene of several operations. It has a communication with the Deule, and consequently, many of whom are the manufactures of linen, cotton, &c. It is fifteen miles north-west and eighty-three N. N. E. of Paris.

Sailing along the coast, he doubled the promontory of Carthage, yet famous for the ruins of that proud city.

Great honours are great burthens; but on whom They are cast with envy, he doth bear two loads: His cares must still be double to his joys, In any dignity.

*Ben Jonson's Catiline.*  
It is a curiosity also to make flowers double, which is effected by often removing them into new earth, as, on the contrary part, double flowers, by neglecting, and not removing, prove single.

*Bacon's Natural History.*  
Under the line the sun crosseth the line, and maketh two summers and two winters: but in the skirts of the torrid zone it doubleth and goeth back again, and so maketh one long summer. *Id.*

Here the double-founted stream Jordan, true limit eastward. *Milton.*  
And if one power did not both see and hear, Our sights and sounds would always double be.

*Davies.*  
Jarres concealed are half reconciled; which, if generally known, 'tis a double task, to stop the breach at home, and men's mouths abroad. *Fuller.*

Double-dealers may pass muster for awhile; but all parties wash their hands of them in the conclusion. *L'Estrange.*

Our foe's too proud the weaker to assail, Or doubles his dishonour if he fail. *Dryden.*

He saw proud Arcite and fierce Palemon In mortal battle doubling blow on blow; Like lightning flamed their falchions to and fro. *Id.*

Now we have the Cape of Good Hope in sight, the trade-wind is our own, if we can but double it. *Id.*

Who knows which way she points? Doubling and turning like a hunted hare, Find out the meaning of her mind who can. *Id.*

Throw Egypt's by, and offer in the stead, Offer—the crown on Berenice's head: I am resolved to double till I win.

*Id. Tyrannic Love.*  
Reverend, fat, old gouty friar, With a paunch swoll so high, his double chin Might rest upon it. *Id. Spanish Friar.*

But most their looks on the black monarch bend, His rising muscles and his brawn commend; His double-biting ax, and beamy spear, Each asking a gigantic force to rear. *Id. Fables.*

For much she feared the Tyrians double-tongued, And knew the town to Juno's care belonged. *Id. Virgil.*

Yes, I'll to the royal bed, Where first the mysteries of our love were acted, And double-die it with imperial crimson. *Id. and Lee.*

This power of repeating or doubling any idea we have of any distance, and adding it to the former, as often as we will, without being ever able to come to any stop or stint, is that which gives us the idea of immensity. *Locke.*

All things being double-handed, and having the appearances both of truth and falsehood, where our affections have engaged us, we attend only to the former. *Glanville's Science.*

In all the four great years of mortality above mentioned, I do not find that any week the plague increased to the double of the precedent week above five times. *Graunt's Mortality.*

He was

Among the rest that there did take delight  
To see the sports of *double-shining* day. *Sidney.*

'Tis observed in particular nations, that within the  
space of three hundred years, notwithstanding all  
casualties, the number of men *doubles*.

*Burnet's Theory.*

Haply at night he does with horror shun  
A widowed daughter, or a dying son :  
His neighbour's offspring he to-morrow sees,  
And *doubly* feels his want in their increase.

*Prior.*

He bought her sermons, psalms, and graces,  
And *doubled* down the useful places. *Id.*

He immediately *double-locked* his door, and sat down  
carefully to reading and comparing both his orders.

*Tatler.*

These men are too well acquainted with the chase,  
to be flung off by any false steps or *doubles*. *Addison.*

Our poets have joined together such qualities as  
are by nature most compatible, valour with anger,  
meekness with piety, and prudence with dissimula-  
tion : this last union was necessary for the goodness  
of Ulysses ; for, without that, his dissimulation might  
have degenerated into wickedness and *double-dealing*.

*Broome's View of Epic Poetry.*

I am not so old in proportion to them as I formerly  
was, which I can prove by arithmetick ; for then I  
was *double* their age, which now I am not. *Swift.*

So keen thy hunters, and thy scent so strong,  
Thy turns and *doublings* cannot save thee long. *Id.*  
The sum of forty thousand pounds is almost *double*  
to what is sufficient. *Id. Drap. Letters.*

*Double-plea* is that in which the defendant alleges  
for himself two several matters, in bar of the action  
whereof either is sufficient to effect his desire in de-  
barring the plaintiff. *Cowell.*

*Double-quarrel*, is a complaint made by any clerk  
or other to the archbishop of the province, against an  
inferiour ordinary, for delaying justice in some cause  
ecclesiastical. The effect is, that the archbishop di-  
rects his letters, under the authentical seal, to all  
clerks of his province, commanding them to admonish  
the said ordinary within nine days to do the justice  
required, or otherwise to cite him to appear before  
him or his official ; and lastly to intimate to the said  
ordinary, that if he neither performs the thing en-  
joined, nor appears at the day assigned, he himself  
will proceed to perform the justice required. And this  
seems to be termed a *double-quarrel*, because it is most  
commonly made against both the judge, and him at  
whose petition justice is delayed. *Id.*

Man is frail,

Convulsions rack his nerves, and cares his breast ;  
His flying life is chased by ravening pains,  
Through all his *doubles*, in the winding veins.

*Bluckmore.*

Lilies are by plain direction  
Emblems of a *double* kind,  
Emblems of thy fair complexion  
Emblems of thy fairer mind. *Cotton.*

The *double* rich scarlet nonsuch is a large *double*-  
*headed* flower, of the richest scarlet colour. *Mortimer.*

Every man hath a weak side. Every wise man  
knows where it is, and will be sure to keep a *double*  
guard there. *Mason.*

Since hope but soothes to *double* my distress,  
And every moment leaves my little less.

*Johnson's London.*

Far and wide

Temple and tower went down, our labours  
Chaos of ruins ! who shall trace the  
O'er the dim fragments cast a hasty glance,  
And say, ' here was, or is, ' where once

**DOUBLE EMPLOYMENT**, in music, is  
by M. Rameau to the two different  
which the chord of the subdominant  
regarded and treated, viz as the  
chord of the sixth superadded, or as  
the great sixth, invented from a fundamen-  
of the seventh. In reality, the dis-  
exactly the same notes, are figured in  
manner, are employed upon the same  
the tone, in such a manner, that they  
cannot discern which of the two chords  
the author employs, but by the assistance of  
quent chord, which resolves it, and is dif-  
ferent in these different cases. To dis-  
tinction, we must consider the dis-  
gress of the two notes which form the  
the sixth, and which, constituting be-  
the interval of a second, must one of  
constitute the dissonance of the dis-  
this progress is determined by the ma-  
bass. (Of these two notes, then, if  
be the dissonance, it will rise by one  
into the subsequent chord, the lower  
keep its place, and the higher note su-  
peradded sixth. If the lower be the  
it will descend into the subsequent  
higher will remain in its place, and  
be that of the great sixth. See the  
the double employment in Rousseau's  
Dictionary.

**DOUBLE FICHE**, or **DOUBLE FIGHT**, is  
the denomination of a cross, when it  
has two points ; in contradistinction  
where the extremity is sharpened to  
point.

**DOUBLE OCTAVE**, in music, an inter-  
posed of fifteen notes in diatonic pro-  
gress, and which, for that reason is called a  
'It is,' says Rousseau, 'an interval of  
two octaves, called by the Greeks *dis-  
diastole*.'

**DOUB'LET**, *n. s.* from *double*.  
garment of a man ; the waistcoat ;  
from being *double* for warmth, or  
makes the dress *double*.

What a pretty thing a man is, when he  
*doublet* and hose, and leaves off his waist-  
coat.

His *doublet* was of sturdy buff,

And though not sword, yet cudgel-proof.

Two ; a pair.

Those *doublets* on the sides of his waist  
strength to the muscles which move the  
arms. *Gray's*

It is common enough to see a country  
*doublet* and breeches of his great-grandfather.  
*Adams*

They do but mimic ancient wits at home  
As apes our grandfathers, in their *doublets*.

**DOUBLET**, among lapidaries, imple-  
mented stone composed of two pieces

glass softened, together with between them; so that they make France to the eye as if the whole a crystal had been tinged with the impracticability of imparting body of crystals, while in their tural state, and the softness of enders ornaments made of it in wear to crystal, gave inducement of coloring the surface light in a proper form, in such a surfaces of two pieces so colored her, the effect might appear the whole substance of the crystal had the crystals, and sometimes white so treated, were called doublets; were greatly in use, on account of the respect to wear, such doublets of crystal, over glass, and the colors which could with certainty to counterfeit stones this way, less could not be procured, or at out a much greater expense. not indeed the property which of bearing to be set transparent, required in drops of ear-rings; but when mounted in rings, in manner that the sides of the joint is made cannot be in error, when formed of crystal, pre-colored glass; and the art of is therefore, in some degree, of tance with that of preparing glass gems; and is therefore properly to it, as being entirely subservient to it.

game on dice within tables; the only fifteen, being placed thus. cinque, and quatre points, there in apiece; and upon the trey, only two. He that throws benefit of throwing first, and what goes down, and so does the other: grows, and has not, the other lays but on his own account; and thus the men are down, and then they it is down first, bears first; and win the game, if the other throws overtake them: which he is sure advances or bears as many as the viz eight for two fours.

Double, among hunters, is applied to a said to double, when she keeps and winds about to deceive the

in the manege, a term used of a ad to double his reins, when he mes together to throw his rider. in the military art, is the putting lies of soldiers into one. Thus, d of command is, Double your nd, fourth, and sixth ranks march Abird, and fifth, so that the six end to three, and the intervals be- come double what they were

from, in naval tactics, the act of part of a hostile fleet between two monading it on both sides. It is

usually performed by the van or rear of that fleet which is superior in number, taking the advantage of the wind, or other circumstances, and tacking or veering round the van or rear of the enemy, who will thereby be exposed to great danger, and can scarcely avoid being thrown into general confusion.

**DOUBLOON**, *n. s.* Fr. A Spanish coin containing the value of two pistoles.

**DOUBS**, a department of France, bounded on the north by those of the Upper Saone and Upper Rhine; on the south-west by the department of Jura, and on the north-west by that of Upper Saone. It comprehends part of the ci-devant province of Franche Comté. Besançon is the capital.

<b>DOUBT</b> , <i>v. a., v. n. &amp; n. s.</i>	Fr. <i>douter</i> ; from Lat. <i>dubi-</i> <i>to</i> , i. e. <i>duo</i> and <i>eo</i> , <i>ito</i> , to go. To hold ques- tionable or in danger; to fear; suspect; dis- trust; fill with distrust and fear. As a neuter verb, to question: be in uncertainty; hesitate; waver; suspect; sometimes taking <i>of</i> . As a substantive it means, uncertainty; difficulty of determination; suspension of mind, as well as the causes of it; and the effects, danger and fear. Doubtless is, without doubt. The examples will make the other derivatives plain.

What heaven's high Lord had powerfullest. *Id.*  
I doubt not to make it appear, to be a monstrous folly to deride holy things. *Tillotson.*

All their desires, deserts, or expectations, the Conqueror had no other means to satisfy, but by the estates of such as had appeared open enemies to him, and doubtless many innocent persons suffered in this kind. *Hale's Common Law.*

Nor did the goddess doubtfully declare  
Her altered mind, and alienated care. *Dryden.*

At first the tender blades of grass appear,  
And bade, that yet the blast of Eurus fear,  
Stand at the door of life and doubt to clothe the year. *Id.*

Those who have examined it, are thereby got past doubt in all the doctrines they profess. *Locke.*

In arguing, the opponent uses as comprehensive and equivocal terms as he can, to involve his adversary in the doubtfulness of his expressions: and therefore the answerer, on his side, makes it his play to distinguish as much as he can. *Id.*

Let no man, while he lives here in the world, doubt whether there is any hell or no, and thereupon live so, as if absolutely there were none. *Bowth.*

In doubtful cases, reason still determines for the safer side; especially if the case be not only doubtful, but also highly concerning, and the venture be a soul and an eternity. *Id.*

Doubtless many men are finally lost, who yet have no men's sins to answer for but their own. *Id.*

Can we conclude upon Luther's instability, because in a single notion, no way fundamental, an enemy writes that he had some doubtings? *Atterbury.*

The king did all his courage bend  
Against those four which now before him were,  
Doubting not who behind him doth attend. *Daniel.*

This is enough for a project, without any name; I doubt more than will be reduced into practice. *Swift.*

Most of his philosophy is in broken sentences, delivered with much doubtfulness. *Baker on Learning.*

To teach vain wits a science little known,  
To admire superior sense, and doubt their own. *Pope.*

Doubtless, oh guest! great laud and praise were mine,  
If after social rites and gifts bestowed,  
I stained my hospitable hearth with blood. *Id. Odyssey.*

Though doubtfulness or uncertainty seems to be a medium between certain truth and certain falsehood

in our minds, yet there is no such medium in themselves.

Hippocrates commends the Beak of the wild as above the tame; and no doubt but the same is more or less healthy, according to the air it breathes. *Arbuthnot on Human*

Should reason guide thee with her lightning eye,  
And pour on misty doubt resistless day;  
Yet hope not life from grief or danger far,  
Nor think the doom of man reversed for thee. *Johnson. Vanity of Human Wishes.*

If I were to form a judgment from experiments than theory, I should doubt much whether democracy, or even the possession of, a seat in parliament, did really convey much of power to be profitable political.

But dreadful is their doom, when doubt has come  
To censure Fate and pious Hope forgoe  
Like yonder blasted boughs by lightning torn,  
Perfection, beauty, life, they never know,  
But frown on all that pass, a monument of woe. *Johnson.*

Here Cocks heroic burn with rival rage,  
And Quails with Quails in doubtful fight engage  
Of armed heels and bristling plumage proud,  
They sound the insulting clarion shrill and loud. *Johnson.*

Well was taught my brow that pride wears  
Which looks no triumph where no doubt has been  
That easy scorn, all tranquil as before,  
Which speaks no insult, and insults the man,  
And with calm air, the surest to torment,  
Strals angry Spite's last torment, to reveal. *Johnson.*

DOUBTING, the act of withholding assent from any proposition on suspicion that it is not able peremptorily to decide between reasons for and against it. Doubting is distinguished by the schoolmen into two kinds, *ratio sterilis*, and *dubitatio efficax*. The first is that where no determination ensues in manner the Sceptics and Academics doubt, who withhold their assent from every thing in Sceptics, &c. The latter is followed by assent, which distinguishes truth from falsehood; such is the doubting of the Peripatetic philosophers. The last in particular perpetually calculate the deceitfulness of our senses, and tell us that we are to doubt of every thing we hear reports, till they have been examined and confirmed by reason. On the other hand, the Pyrrhonians teach, that our senses always deceive, and that if we go ever so little from the evidence within the province of doubting.

DOUBTING, in rhetoric, a figure where an orator appears some time fluctuating, and undetermined what to do or say. Tacitus illustrates us with an instance of doubting, showing the degree of distraction, in those words of Tiberius written to the senate: *Quid scribam, et quomodo scribam, aut quid omnino mihi in hoc tempore, dii me denique populi precibus perire quotidie sentio, si sciam.*

DOUCET, *n. s.* Fr. *doucet*. A cool. This word I find only in Skinner and Johnson says Dr. Johnson. The Archæologist mentions it frequently as a part of the dress of Charles I. when duke of York.

DOUCINE, in architecture, a moulding, which is concave above and convex below, serving to connect

to a delicate corniche. It is like-  
 a.

*It. n. s. Columbus*; from *To douch*,  
*To duck*. A bird that dips in the

geography, a river of England, in  
 which rises in the Peak, divides that  
 Shropshire, and falls into the Trent,  
 th of Burton.

LE, one of the most romantic spots  
 where the Dove runs in a chain  
 patus rocks. It is situated near

cinq-ue-port, sea-port, and market  
 is a place of considerable historical  
 ical interest. Camden and others  
 derive its name from the British  
 in, which signifies a steep place:  
 led it Dorfa, and Antoninus, to his  
 bris. It is probable that the Roman  
 in the south side of the Dour, and  
 VII.

that the Watling Street entered it near the old  
 Biggen-gate.

That the ancient Britons possessed it as a  
 military post, anterior to the Roman conquest, is  
 also extremely probable: and that the Romans  
 fortified and adapted it to their system of tactics  
 is universally admitted. The old tradition, quoted  
 and confirmed by Mr. King in his *Monimenta*  
*Antiqua*, vol. ii., is, that 'Arviragus, the British  
 chief, here fortified himself, when he refused to  
 pay the tribute imposed by Julius Cæsar; and  
 that here, afterwards, king Arthur also held his  
 residence.' Darrell, in his *History of Dover*  
 Castle, has given currency to another tradition,  
 which assigns the foundation of this fortress to  
 Cæsar: and Lambard quotes Lidgate and Rosse,  
 as saying, that 'they of the castle kept till this  
 day certeine vessels of olde wine and salte, which  
 they affirme to be the remayne of suche provision  
 as he (Cæsar) brought into it.' Cæsar's own nar-  
 rative, however, would lead us to no such con-  
 clusion. He speaks of being repulsed by the  
 inhabitants of this part of Kent; and most prob-  
 ably landed, in his first expedition, at Deal.  
 The Roman writers, indeed, do not affect to speak  
 of him as having made any conquest here, but  
 merely as having led the way into Britain:

*Territa quasit ostendit terga Britannis.*

The fortifications, and all the works we can  
 now trace of the Romans, upon the hill, near  
 Dover, are bounded by the deep ditch, and it  
 will be a vain attempt to search after any mili-  
 tary works of that people in the castle beyond it.  
 The form of the camp, the ditch, the parapet,  
 and the octagon building, all point out the hand  
 of the Roman engineer and architect. It was  
 common for them, where the ground would ad-  
 mit of it, to make their camp in the form of a  
 parallelogram, with the angles rounded off, and  
 to secure it with a deep ditch and a high parapet:  
 and this appears to have been the original plan  
 of the Roman camp on this hill, before it was  
 altered, either by the Saxons or the Normans.  
 The former, at an early period, became masters  
 of Dover; and, soon after their conversion to  
 Christianity, the ancient church within the walls  
 of the castle is said to have been consecrated by  
 St. Augustine, at the request of king Ethelbert,  
 whose son and successor, Eadwald, founded a  
 college near it for secular canons. In the reign  
 of Edward the Confessor, if not before, the great  
 earl Godwin was governor of the castle, and is  
 said to have strengthened it by new fortifications.  
 It is well known that William the Norman, when  
 he was contriving the conquest of England, re-  
 fused to permit earl Harold to depart from Rouen,  
 until he had bound him by a solemn oath to de-  
 liver up, after Edward's death, 'the castle of  
 Dover, with the well of water in it.'

Domesday Book informs us that, 'in the time  
 of king Edward, Dover paid £18, of which sum  
 Edward had two parts, and the earl Godwin the  
 third part of one moiety, and the canons of St.  
 Martin the other. The burgesses have furnished  
 the king with twenty ships once in each year for  
 fifteen days, and in each ship were twenty-one  
 men; thus they had done because he had freed  
 them from sac and soc. Whoever constantly  
 resided in the town, and paid custom to the

king, was quit of toll throughout England. All these customs were in use there when king William came into England. For several succeeding centuries, Dover Castle was regarded as the 'key and barrier of the whole kingdom'; and, in every civil broil, the possession of this fortress was eagerly sought. Henry II., on his arrival from Normandy, rebuilt the keep, and fortified the castle, on the Norman plan, so that its strength was materially increased. Louis, the dauphin, besieged it when he landed to assist the barons, in the reign of king John; but was repulsed with great loss, by Hubert de Burgh, then governor.

In the civil wars of the seventeenth century, it was seized for the parliament, by a merchant named Drake, who, on the night of August 1st, 1642, took it by surprise, with the aid of ten or twelve men only. He contrived, by the means of ropes and scaling ladders, to lead his party to the top of the cliff on the sea-side, which, being considered as inaccessible, was left unguarded. After these commotions had subsided, this ancient pile was, for upwards of a century, left to moulder into ruins; though, in 1745, barracks had been built here sufficiently large to contain a regiment of soldiers. The wars of the French revolution, however, and the many threats of invasion then thrown out, occasioned a great alteration in the defences of this coast; and Dover Castle has been put in modern times into a respectable state of defence.

It at present consists of an immense mass of almost every kind of fortification; and is divided into two courts, a lower and an upper, defended into by deep, broad, and dry ditches, from which communications with the inner towers have been made by subterraneous passages. The buildings occupy nearly the whole summit of the eminence which bounds the south-east side of the deep valley in which Dover stands; the lower court is surrounded by an irregular wall, excepting on the side next the sea, where a considerable part of the cliff, with the remainder of the wall, was thrown down by an earthquake on the 6th of April, 1680. This wall is called the curtain, and is flanked, at unequal distances, by a variety of towers of different shapes, semi-circular, square, polygonal, &c., the workmanship of different ages. The oldest of them, which is on the eastern side of the castle, bears the name of earl Goodwin. Nine of the other towers are stated to have been built in Norman times, and to have derived their names from Sir John de Fiennes, and the eight approved warriors whom he had selected to assist in the defence of this fortress. These towers, according to their relative situation on the wall, beginning from the cliff on the western side, are: 1. The Old, or Canons' tower, which anciently had a drawbridge and battery. 2. A pentagonal tower, originally named after its first commander Albrancie, but afterwards Rokesly tower, from one of its captains. 3. Chilham, or Calderscot tower, built by Fulbert de Lucy, lord of the manor and castle of Chilham. 4. Hurst. 5. Arsic, or Sayes. 6. Gatten tower. These three were named after adjacent manors appropriated to their repairs. 7. Peveril, Beauchamp, or Marshal's tower, so

successively called after William de Peveril, Hugh de Beauchamp, ancient commander of the marshalmen who had the superintendence of military stores, &c. 8. Port, or Portico tower, which took its name from William de Portico, who was also called Gasting's, from one of its captains, but now bears the name of Mary's tower, after queen Mary, by whom it was rebuilt. 9. Fiennes tower, as it was originally named, after Sir John de Fiennes, now more generally called Norport, to distinguish it from the ancient entrance, and a stable's tower, from its having been the occasional residence of the constable or governor of the castle. 10. Clopton's tower, built in Edward IV., and deriving its name from the name of a manor assigned for its repair. 11. Tower tower, so called from an ancient count. 12. Crevequer's, Craville's, or the earl of Norfolk's tower, a work of great magnificence, and has a subterraneous passage leading to a vast extent, and strongly defended. 13. William's, or St. John's tower, which bore the former name from Adam Fitz-William, named for his valor at the battle of Hastings, the conqueror gave the scarf from his own arm, and the latter name from lord St. John, who was lord of the lands allotted to it. 14. Averanche's tower, a fine remain of Norman architecture, so named from Averanche, an ancient commander of this castle, and his successor, who was lord warden of the cinque-por in the reign of Henry III. 15. Vexille, or the tower, so called from two of its commanders, the latter of whom assisted Hubert De Burgh in the defence of the castle against the Duke of Earl Goodwin's tower, built by the earl when governor of the castle. The upper court, like the lower one, is surrounded by a ditch and various towers; and near the centre of this spacious keep, erected in the beginning of Henry III.'s reign. This building is in the form of a square, and is constructed on a singular plan, built by bishop Gundulph, and patterned after that at Rochester. It is now used as a magazine, the roof having been rendered bomb-proof. On the eastern side of this court are three towers which derive their names from Gilbert de Yvetot, or Mainmouth, who was one of the knights that accompanied the conqueror to England, and was appointed marshal of this castle by John de Fiennes: these towers command the western side and ascent leading to the principal entrance of this court; near the south angle of the castle, another entrance, by a gate called Peveril's Subterranean Gate.

The new works recently formed for the defence of this fortress consist of different batteries, furnished with a very formidable train of artillery, casemates dug in the solid chalk-rock, covered-ways, and various subterraneous communications and apartments for soldiers. The works are sufficiently spacious for the ascent of about 2000 men, and, with their interior, form a very curious spectacle: light and air are conveyed into them by well-like apertures in the chalk, and by other openings in the face of the cliffs. A new road has also been cut under the direction of the Board of Ordnance from the town to the top of the hill, where

Deal road, in a direction to be commanded by the batteries. A branch from this runs to the right nearly opposite Gatton and enters the castle by a new bridge and near the edge of the cliff stands a piece of ordnance, twenty-four feet long, cast at sea in 1544, and called Queen Elizabeth's Pistol.

The castle occupies altogether about thirty acres of ground: the hill on which it stands steep and rugged on the side of the town towards the sea; and towards the sea it is a cornices of upwards of 320 feet from its base to the shore. But it is commanded by eminences both to the north-west by West Hill west. Like other royal castles, it was subject to both extra-parochial and extra-judicial; several of the ancient franchises are either dissolved, the civil power has of late years increased within its limits, independently of control from the warden. At the renewal of the charter, in 1803, the heights on the western side of the town were strongly fortified, agreeably to the new system, and a new military road lead-ham made. Other fortifications here are the Fort, at the extremity of the pier, and the Battery, at the north Pier-head: these, in conjunction with the heights and castle, command the road to the town.

The harbour of Dover was evidently at one considerably more inland, particularly towards the north-east. At what period the ancient haven became useless is not known, but it flourished in Edward the Conqueror's time. A round tower was built on the west side of the present harbour, A.D. 1013, to protect the shipping from the violence of south-west winds: to this tower it is said the ships were moored by rings; and the haven called Little Paradise. In 1533 Sir J. Mon, then holding the living, first projected a pier at Dover, which was begun at Archway on the south-west side of the bay, and ran out directly eastward into the sea, to an extent of 131 rods. The bottom was laid with stones, of twenty tons weight, brought from the sea by water. The king himself came several times to Dover to view the works, and is said by Harris to have expended about £80,000 on the pier. Attempts were made in the two reigns to forward the work, but no advance was made till the time of Elizabeth, to whom Sir Walter Raleigh presented a memorial, stating that 'no promontory, town, bay, or Christendom, is so placed by nature for navigation, both to gratify friends and annoy enemies, as this town of Dover.' An immense quantity of beach thrown up by the sea, had at a bar across the harbour in her reign, totally impeded the passage. The queen then granted the town the free exportation of 30,000 quarters of wheat, 10,000 quarters of barley, and 4000 tons of beer, in aid of the duty; and for the same purpose a duty of 3d. in the pound was laid on every vessel passing this port, of twenty tons burden: this duty produced about £1000 annually in 24 and 25 Eliz. and has been since provided for by several acts of parliament. Agreeably to

the idea of captain Perry, in his report after a survey in 1718, several jetties have been erected towards the east, to prevent the encroachments of the sea. In 1737 the mole or cross wall was faced with Portland stone, and several flood-gates or sluices were constructed in it. When the tide had receded from the mouth of the outer harbour the immense back-water, confined by these sluices, was conveyed through them, to dislodge the beach that accumulates at its entrance. During a violent storm, in 1802, several rods of the north-pier head were beaten down by the fury of the waves. This was immediately rebuilt, in a most substantial manner, under the inspection of Mr. James Moon, the present harbour-master. A dry dock, and several other extensive and important works, have also been completed under the direction of this able and ingenious gentleman. The back-water, which formerly lost its force in passing through the outer harbour, is now carried round it, in cast-iron culverts or tunnels, seven feet in diameter, to the extremity of the south-pier head, where it branches off in several directions, and effectually removes the beach from the entrance of the harbour, during the spring tides. These works were accomplished by Mr. Moon in 1822. The depth at spring tides is now between eighteen and twenty feet, and at neap tides about fourteen; so that ships of 400 or 500 tons may enter in safety.

The town of Dover was formerly defended by a strong embattled wall, which included a space of about half a mile square, and in which were ten gates; though not a trace of the wall or gates now remains, except of the foundation in some places. From the hills above, the town has an interesting appearance. It extends in contrary directions, to the east, south-west, and north, three long streets meeting at one point in the centre. There were formerly six parishes, each of which had its distinct church; four of these edifices have long been destroyed, with the exception of some parts of those of St. Nicholas and St. Martin-le-Grand; and the town is now divided into the two parishes of St. Mary the Virgin, and St. James the Apostle. Great part of the priory buildings still remains: a Maison Dieu, or hospital, on the left of the entrance to the town, was endowed by Hubert de Burgh, the great justiciary of England, about the beginning of the reign of Henry III.; after the dissolution, this was converted by queen Mary into an office for victualling the navy, to which use it was appropriated up to the close of the late war. In times of war, all ships in the downs, belonging to the royal navy, are supplied hence by vessels engaged for that purpose.

St. Mary's, the principal church of modern times, is a spacious and curious edifice, in length about 120 feet, in breadth fifty-five, consisting of a nave and aisles, with a tower at the west end. It is said to have been built by the priory and convent of St. Martin, in the year 1216. The west front is of Norman architecture, as are also the first three arches and their supporting columns on each side of the nave. Two years after the dissolution, this church, which had previously belonged to the Maison Dieu, was given to the parishioners by Henry VIII., who was then at

Dover; and every house-keeper, paying scot and lot, has now a right to vote in the election of a minister. The other church, St. James's, is an irregular structure, and its interior, which is kept particularly neat and clean, displays its origin to have been Norman: it has a square tower, built in arches, directly over the centre of the north aisle, and the pulpit is placed under it.

This town is governed by a mayor, twelve jurats, and thirty-six common-council-men; from the latter of whom a town-clerk and chamberlain are annually chosen. The mayor was formerly elected by the resident freemen, in St. Mary's church, on the 8th of September, the nativity of the Virgin. The two members of parliament were also chosen in St. Mary's church by the whole body of freemen, resident and non-resident, in number about 2300. But in 1826 these elections were removed by act of parliament to the town hall, or to hustings erected in the market place. Freedom is acquired by birth, servitude, marriage, and burgage tenure: the franchise obtained by marriage ceases at the death of the wife, and that by tenure at the alienation of the freehold.

Both in times of peace and war the trade of Dover is extensive; this being the principal place of embarkation for the continent. From thirty to forty vessels, exclusive of packets, are employed in the passage to the opposite shores: some are from sixty to seventy tons burden each; and have been considered as the handsomest sloops in the kingdom. They have frequently reached Calais, with a favorable wind, in three hours: the shortest passage ever known was two hours and forty minutes. Several steam vessels are now also employed in the passage to the continent, which, as well as his majesty's steam packets stationed here, well sustain the honor of the ports for elegant accommodations. In the year 1778 an act was obtained for the better paving, cleansing, lighting, and watching the town; and, in 1822, an act was passed to light it with gas, which has been very completely carried into effect: so that Dover may now be said to be, on the whole, well paved and lighted.

Dover is distant seventy-two miles from London, sixteen from Canterbury, twenty-two from Margate, and eighty-eight from Brighton. It has two weekly markets, viz. on Wednesday and Saturday; the latter being the principal. There is an annual fair, which begins on the 22d day of November, and continues three market days. The number of persons of all ranks passing through the town, is generally very great. Including the garrison of Dover Castle, and the heights, together with those districts of other parishes which form a part of the town, the population may, with much probability, be fixed at from 16,000 to 18,000. It has of late become a favorite watering place. Numerous lodging houses have been erected, and fitted up in an elegant style, for the accommodation of visitors, and many others are in progress. During the bathing season, musical promenades are established at Batcheller's King's Arms Library and Assembly Rooms, and at Warren's Marine Library. The former is an extensive and elegant structure, and was finished in 1826. No place can boast of local attractions more numerous (and

which want of space alone compels us to pass over), or prospects more interesting. Seepeare's beautiful description of the cliff that bears his name, on the south-west of the town, is well known.

DOVER, a considerable township of the United States, in Stafford county, New Hampshire, incorporated in 1633. It is situated on the east side of Cochecho River, about four miles from its junction with Salmon Fall River, which together form the Piscataqua. Ten miles south-east of Rochester.

DOVER, a large township of New Jersey, in Monmouth county, between Shrewsbury and the Stafford, extending from the sea to the river line.

DOVER, a township of Massachusetts, in Norfolk county, incorporated in 1650. It is thirteen miles southward of Boston.

DOVER, the metropolis of Delaware, in Kent county, on the south-west side of Jones Creek, about four miles and a half from its mouth, in the Delaware; twelve miles from Duck Creek; forty-eight from Wilmington and seventy-six S. S. W. of Philadelphia. The town has a lively appearance, and drives a considerable trade with Philadelphia, chiefly in flour.

DOVER, a small town in York county, Pennsylvania, seated on the Fox Run.

DOVER, STRAITS OF, the narrow channel between Dover and Calais, which separates Great Britain from the French coast. It has been supposed by many to have been once penetrated by the present straits occupying the site of the isthmus which joined it to Gaul. 'No certain reason,' says Mr. Pennant, in his *Arct. Zool.* *vol. i.* *Intro.* p. ii., 'can be given for the magnitude of the vulsion which tore us from this country, whether it was rent by an earthquake, or whether it was worn through by the continual dashing of the waters. The correspondence of strata adds, 'on part of the opposite shores of Britain and France, leaves no room to doubt but that they were once united. The chalky cliffs of Britain between Calais and Bologne, and those of France westward of Dover, exactly tally: the former vast and continued; the former short, and the termination of the immense bed. Between Bologne and Folkstone (about six miles from the former) another memorial of the junction of the two countries; a narrow submarine hill, called the Rip-raps, about a quarter of a mile broad, and ten miles long, extending eastwards to the Goodwin Sands. Its materials are boulder stones, adventitious to many strata. The depth of water on it, in very low spring tides, is only four feet. The fishermen from Folkstone have not touched it with a fifteen feet oar; so that it is justly the dread of navigators. Many a vessel has perished on it, and sunk instantly in twenty-one fathoms of water. In July, 1797, the *Belleisle* of sixty-four guns struck, and lay on its side during three hours; but, by starting her bottom with water, got clear off.' These celebrated straits are only twenty-one miles wide in the narrowest part, from the pier at Dover to that of Calais, and only four. It is said that their breadth is decreasing, and that they are two miles narrower than

In ancient times. An accurate ob-  
servation remarks, that the increased  
water, from a decrease of breadth, has  
not even in that space. The depth  
is at a medium, in the highest spring  
not twenty-five fathoms; the bottom  
is sand or rugged scars, which have  
known resisted the attrition of the  
From the straits both east and west is  
increase of depth through the channel  
banks, till soundings are totally lost.  
Tides in the straits rise on an average  
four feet, the neap tides fifteen. The tide  
in the German Sea, passes the straits, and  
is a great rippling, the western tide  
can, between Fairleigh near Hastings  
be; a proof that, if the separation of  
is effected by the seas, it must have  
the overpowering weight of those of the

fidence, he ought to beg pardon. *Sittingfleet.*

She smiled to see the *doughty* hero slain;  
But, at her smile, the beau revived again. *Pope.*

DOUGLAS (John), bishop of Salisbury, a  
native of Scotland, was born in 1721. He  
received his early education at Glasgow, whence  
he removed to Baliol College, Oxford, where he  
obtained a fellowship, and proceeded to the de-  
gree of master of arts, October 14th 1743. He  
accumulated the degrees of bachelor and doctor  
in divinity, May 6th, 1758. Not long after his en-  
tering into holy orders he obtained the rectory of  
Eaton Constantine in Shropshire, on the presen-  
tation of the earl of Bradford. In 1747 William  
Lauder, a native of Edinburgh, and a man of  
considerable talents and learning, excited general  
attention by publishing a paper, to which he gave  
the title of an *Essay on Milton's Use and Imita-  
tion of the Moderns*; the design of which was  
to prove that our great epic poet had made free  
with the works of some obscure Latin poets of  
modern date, in the composition of his immortal  
poem of *Paradise Lost*. Mr. Douglas published  
a detection of Lauder's forgeries in a letter to the  
earl of Bath, entitled, *Milton Vindicated from  
the Charge of Plagiarism*, brought against him  
by Mr. Lauder. In this masterly pamphlet the  
learned critic proves, that the passages which had  
been cited by Lauder from Masenius, Staphorstius,  
Taubmannus, and other obscure writers, had  
been interpolated by the forger himself, who had  
also foisted into his quotations entire lines from  
Hog's Latin translation of *Paradise Lost*, into  
which no examiner but Mr. Douglas had been  
inquisitive enough to look. The detection of  
this infamous fraud was so complete, that Lauder  
acknowledged it, and published a letter in  
which he assigned the reasons for his conduct,  
and his pretended contrition for the offence.  
Soon after the impostor published another attack  
on the character of Milton, charging him with  
having made additions to the Icon Basiliké of  
king Charles I. for the purpose of injuring that  
unfortunate monarch's reputation. This foul ca-  
lumnny, which was soon made manifest, rendered  
Lauder so infamous that he quitted the kingdom,  
and died some years after in the island of Barba-  
does. In his next literary work Mr. Douglas  
detected the pretensions of Archibald Bower, the  
author of the *Lives of the Popes*, whose story is  
too long for this place. In 1754 our author  
published his principal work; entitled, *Criterion*,  
or a *Discourse on Miracles*; in which he settles  
the distinction between true and false miracles in  
a masterly manner. And of all the answers to  
the sophistry of David Hume, except that of Dr.  
Campbell, this may be safely pronounced the  
clearest and most convincing. In 1757 the author  
was presented to a prebendal stall in the cathe-  
dral of Durham, in which he took his degree of  
doctor in divinity. In 1762 he was made canon  
of Windsor, on the promotion of Dr. Keppel to  
the bishopric of Exeter. His next elevation was  
to the episcopal bench on the death of Dr. Ed-  
mund Law, bishop of Carlisle, in 1763. From  
that see bishop Douglas was translated to Salis-  
bury, on the removal of Dr. Barrington to  
Durham, in 1791. Bishop Douglas was one of  
the first members of the celebrated beef-steak  
club, rendered so famous by Goldsmith's hu-

morous poem, entitled *Retaliation*. By the appointment of the lords of the admiralty, he arranged the journals and papers of captain Cook for publication, and he prefixed to the work a most admirable and perspicuous introduction. He died in 1807, and was buried in the collegiate chapel at Windsor.

DOUGLAS (Gavin), bishop of Dunkeld in Scotland, the third son of Archibald earl of Angus, was born in 1474. Where he was educated, is not known; but it is certain he studied theology; which did not, however, estrange him from the muses; for he employed himself at intervals in translating into beautiful verse the poem of Ovid, *de Remedio Amoris*. The advantages of foreign travel, and the conversation of the most learned men in France and Germany, to whom his merit procured him the readiest access, completed his education. His first preferment was to be provost of the collegiate church of St. Giles in Edinburgh; a place at that time of great dignity and revenue. In 1514 the queen regent appointed Douglas abbot of Aberbrothock, and soon after archbishop of St. Andrew's; but her power not being sufficient to establish him in that dignity, he relinquished his claim in favor of his competitor Foreman, who was supported by the pope. In 1515 he was by the queen appointed bishop of Dunkeld; and was soon after confirmed by Leo X. Nevertheless it was some time before he could obtain peaceable possession of his see. The duke of Albany, who in this year was declared regent, opposed him because he was supported by the queen; and, in order to deprive him of his bishopric, accused him of acting contrary to law in receiving bulls from Rome. On this accusation he was committed to the castle of Edinburgh, where he continued in confinement above a year; but the regent and the queen being at last reconciled, he obtained his liberty, and was consecrated bishop of Dunkeld. In 1517 he attended the duke of Albany to France; but returned soon after to Scotland. In 1521, the disputes between the earls of Arran and Angus having thrown the kingdom into violent commotion, he retired to England, where he became intimately acquainted with Polydore Virgil the historian. He died in London of the plague in 1522; and was buried in the Savoy. His most celebrated work was entitled *Thirteen Bukes of Eneides*, of the famous poet Virgil, translated out of Latin verses into Scottish metre, every buke having its particular prologue. Imprinted at London 1553, in 4to; and reprinted at Edinburgh 1710, in folio. He undertook it at the desire of lord Henry Sinclair, a munificent patron of arts in those times: and he completed it in eighteen months. It is said also that he compiled an historical treatise, *De Rebus Scoticis*.

DOUGLAS (Sylvester Baron Glenbervie) was of a noble family in Aberdeenshire, and born May 24th, 1743. He entered as a member of one of the English inns of court, and was called to the bar, where he received a silk gown. His first political situation was that of secretary to the earl of Westmoreland, when lord-lieutenant of Ireland. In 1800 he was appointed governor of the Cape of Good Hope, but relinquished

that situation the same year, and was succeeded by baron Glenbervie of Kincardine. In 1801 he was appointed joint paymaster-general of the forces; and in 1803 surveyor-general of the king's woods and forests. His last publication was *An Account of the Wines of Europe*, in the *Philosophical Transactions* for 1772, three of the *Cases of Controverted Election*, 1780, 8vo.; *Reports of Cases determined at the Court of King's Bench*, 2 vols. 8vo.; *Riccardus*, a humorous poem, translated from the Italian of Fortiguerra, with an introduction, 1802.

DOUGLAS, a town in a parish seated on a river above Lanark, thirty-seven miles from Edinburgh. Its ancient castle was built about forty years ago, but an elegant new one is built on its site. Two cotton-works were erected in it, in 1791, when it contained 60 inhabitants.

DOUGLAS, the capital of the Isle of Man, has lately increased both in trade and building. The harbour, for ships of a tolerable burden, is the safest in the island, and is much frequented by a fine mole that has been built on the east side. Population about 3000.

DOUGLAS, a township of Massachusetts in southernmost in Worcester county, lying on the state of Rhode Island on the south, and on Connecticut on the south-west. It is remote, and lies sixteen miles south of Worcester, and forty-seven south-west of Boston. It was incorporated in 1746, and named in honor of William Douglas, M.D. of Boston, a native of Scotland, and a considerable benefactor to his town.

DOUGLAS, CAPE, a promontory on the north-west coast of North America, which forms the west side of the entrance into Cook's River, opposite Point Bode, which forms the east side. It is a very lofty promontory, and its highest summit appears above the clouds, forming an exceedingly high mountains. Long. 104° 14' W. lat. 58° 56' N.

DOUGLAS ISLAND, an island between Arran Island and the west coast of America, is about twenty miles long, and six miles wide in the middle; but becomes narrow towards each end; eastward it terminates in a sharp point. The channel between this island and the mainland is generally choked up with ice.

DOULEIA, *δουλεια*, in antiquity, a punishment among the Athenians, by which the criminal was reduced to the condition of a slave. It was never inflicted upon any but the alien and the poor, and was never inflicted upon any but the alien and the poor, and was never inflicted upon any but the alien and the poor.

DOVRFIELD, the highest range of mountains in the Scandinavian peninsula, which, with another chain, divides the kingdom of Norway into north and south. Its highest peak is upwards of 8000 feet above the level of the sea. It derives its name from the village of Dovre.

DOURO, or DUERO, a river of Spain, rising on the borders of Arragon, and flowing westward, traverses more than half the width of the peninsula. It receives a number of rivers from the mountains of Biscay and Leon to the north, and from those of Old Castile to the south. In part of its course, it forms the boundary

Spain and the province of Tras los montes. In the lower part of its mouth, in Portugal, and forms a bay between Beira and the north.

It finally discharges itself into the little bay of Oporto. The banks were the scene of various movements of the English and French armies in 1812, and of the battles of Salamanca.

*v. a. & v. n.* Gr. δῶς; but prominent word formed from the sound. Heard suddenly in the water. To stoop to the water.

Nothing trivial matter.

(the) air, or *douse* in water.

*Hudibras.*

(hard), a celebrated painter, born 1613. At the age of fifteen he copied from Rembrandt, and continued six years. From Rembrandt he learned the principles of coloring, and complete knowledge of the chiaroscuro; that knowledge he added a delicacy and a patience in working up his highest degree of neatness, superior to most. His pictures are usually composed of figures so exquisitely transparent, so wonderfully delicate, and astonishing as well as pleasure. Every object after nature, and with a singular, that each figure separates perfect in respect to color, freshness.

Of his patience Sandrart gives an instance. Having once, in company with Caravaggio, visited Douw, they took a view of a broom he was then painting; their surprise at the excess of that minute object, Douw told them to spend three days more on that, he should account it complete. The picture of Mrs. Spiering, the same as that the lady sat five days for the use of her hands that leaned on an arm, therefore, would sit to him for so long; so that he indulged himself in fits of fancy, on which he could spend time as suited his inclination. In 1674, aged sixty-one. He is most wonderful in his finishing of his masters. His pictures are also valued only for retaining their original having the same beautiful effect. In the gallery at Florence it is a piece by candle-light, which is best; and, in the same apartment, attended by a number of figures, it is impossible either sufficiently to describe.

*D.*, n. s. Fr. *douairiere*. A widow. A title also given generally to an old woman.

Give my desires,

hence or a *dowager*.

Give on a young man's revenue.

*Shakespeare.*

Whither no more

is queen; but princess *dowager*,

princess Arthur. *Id.* Henry VIII.

Widows have a greater interest in property than either maids or wives; so that it is as unnatural for a *dowager* as a freeholder to be an enemy to our constitution.

*Addison.*

*DOW'DY*, n. s. & *adj.* From *dowd*, or *dey*-hood; *dey* a nurse, and *hood* a cap. An awkward ill-dressed woman: slatternly.

Laura, to his lady, was but a kitchen wench; Dido, a *dowdy*; Cleopatra, a gipsy; Helen and Hero, slatterns and harlots. *Shakespeare. Romeo and Juliet.*

The bedlam train of lovers use

To inhance the value, and the faults excuse;

And therefore 'tis no wonder if we see

They doat on *dowdies* and deformity. *Dryden.*

No housewifery the *dowdy* creature knew;

To sum up all, her tongue confessed the shrew.

*Gay.*

Let *dowdies* simper, and let bumpkins stare,

The strolling pageant hero treads in air.

*Churchill.*

*DOWER*, n. s. } Fr. *donaire*, from Lat.

*Dow'ry*, } *donare*, expletive of *do*, *dare*,

*Dow'ered*, *adj.* } to give. The portion given

*Dow'erless*. } with a wife, or for a wife;

the settlement on a widow; hence endowment: generally; gift.

Ask me never so much *dowery* and gift, and I will give according as you shall say unto me; but give me the damsel to wife. *Gen. xxiv. 12.*

Returne from whence ye came, and rest awhile, Till morrow next, that I the elfe subdew, And with Sansfoyes dead *dowry* you endew.

*Spenser. Faerie Queene.*

And ask no other *dowry* but such another jest.

*Shakespeare.*

Will you with those infirmities she owes, Unfriended, new adapted to our hate, *Dow'erd* with our curse, and strangered with our oath, Take her, or leave her? *Id. King Lear.*

Thy *dow'reless* daughter, king, thrown to my chance, Is queen of us, and ours, and our fair France. *Id.*

His patrimonial territories of Flanders were in *dower* to his mother-in-law. *Bacon's Henry VII.*

Our first mother Eve bequeathed this *dowry* to her daughters, that they should be our helpers to sin.

*Bp. Hall. Contemplations.*

What spreading virtue, what a sparkling fire, How great, how plentiful, how rich a *dower*, Dost thou within this dying flesh inspire? *Devises.*

Thine own hand

An hundred of the faithless foe shall slay,

And for a *dow're* a hundred foreskins pay.

*Cowley.*

I could marry this wench for this *dow're*. *Sidney.*

His wife brought in *dower* Cilicia's crown,

And in herself a greater *dower* alone. *Dryden.*

The king must die, that I may make you great,

And give a crown in *dowry* with my love.

*Id. Spanish Friar*

His only daughter in a stranger's power;

For very want, he could not pay a *dower*? *Pope.*

Rich, though deprived of all her little store,

For who can seize fair virtue's better *dower*?

*Melmoth.*

Yes, when he shines in gold

Girl, you but grasp your *dowry*.

*Byron.*

*DOWER*, *NOTARIUM*, *DOARIUM*, or *Dos*, is the estate, for life, which a widow acquires in a certain portion of her husband's real property, after his death, for the maintenance of herself and the education of her children.

The custom of dower is derived from the Germans, amongst whom it was a rule, that a woman should have no marriage portion, but that the husband should allot a part of his property for her use, in case she survived him. Thus Tacitus, in his treatise, *De Moribus Germanorum*, sect. 18, says, '*Dotem non uxor marito, sed uxori maritus offert.*' The Saxons, also, were acquainted with it, as appears from the laws of King Edmond; by which a widow was entitled to a moiety of her husband's property for her life. And no alteration seems to have been made in this custom at the conquest, nor indeed until the reign of Henry II.; when, according to Glanville, every man was bound, both by the civil and ecclesiastical law, to endow his wife, at the time of marriage, either of all his lands, generally, or of some particular part thereof: if endowed generally, the wife was entitled to her *dos rationabilis*, which was one third part of her husband's freehold; if specially, to the particular land named, provided it did not amount to more than a third. Similar regulations with respect to dower are contained in the *Grand Coutumier* of Normandy.

The following are the five different kinds of dower which once existed, but the first two only are now in use. 1. *Dower by the common law.* This entitles the widow, after the death of her husband, to the enjoyment, during her life, of a third part of all the lands and tenements of which he was seized in *fee simple* or *fee tail* at any time during the coverture. This right is not prejudiced by the husband's conveyance of such lands, even though the wife join therein (unless a fine or recovery be used, as stated subsequently in this article), nor by his disposing of the same by will. 2. *Dower by custom* is where a widow becomes entitled to a certain portion of her husband's lands in consequence of some local and peculiar custom. Thus, by the custom of gavelkind (a tenure by which a great part of the land in Kent is still held), she is entitled to a moiety of the lands held by her husband in that tenure; and by the custom of some boroughs she is entitled to all the tenements that were her husband's. Copyhold lands are not at common law subject to dower; but, by the custom of most manors, the widows of copyholders are entitled to a certain part, and sometimes to the whole, of the copyhold lands of which their husbands die possessed. This kind of dower is generally called the widow's free bench.

The species of dower now out of use are, 3. *Dower ad ostium ecclesie*, which was where the husband, at the church door, after the marriage, endowed his wife with the whole or a certain portion of his lands. 4. *Dower ex assensu patris*, in which species the husband being heir apparent of his father, with his consent, endowed the wife, at the church door, with a part of the lands of the father. And, 5. *Dower de la plus beale*. This was merely a consequence of tenures by knight-service, and was abolished by the statute of 12 Car. II., when those tenures were converted into socage.

As to the persons entitled to dower.—Alien women are not generally capable of acquiring dower: an alien queen is, however, an exception

to this rule; and, by an act passed in the reign of Henry V. (not printed among the statutes contained in Rot. Parl. vol. iv. 1324-1325), alien women, who from thenceforth should be married to Englishmen, by license from the king, are enabled to have their dower. Naturalization also removes this disability; as does the denization, so far as relates to the lands of which the husband was seized when his alien wife was created a denizen, but not to any of which she was seized before, and which he had then parted with. Jewesses also, as long as they profess that religion, cannot be endowed. With the above exceptions every woman, who has attained the age of nine years, is by the common law entitled to dower; but she may be deprived thereof in the several ways following. 1. By attainder of the husband for treason, but not by misprision of treason or felony. 2. By surrender of herself for treason or felony, unless afterwards pardoned, in which case her capacity is restored as fully as if it had not been lost. 3. By divorce *a vinculo matrimonii*; it must be observed that a divorce *a mensura thoro* will not deprive the wife of dower, a divorce being merely a permission to the parties to live separate, and not a dissolution of the marriage. 4. By elopement from the husband, or living with an adulterer: but if the former afterwards voluntarily reconciled, and returned to dwell with him, the incapacity is removed. 5. By withholding the title from the property from the heir at law. 6. By joining with the husband in levying a fine or making a common recovery of his lands: but this can only prevent her from claiming dower out of the lands comprized in the fine or recovery. Also, by the custom of London, a married woman may bar herself of dower by a bargain and sale acknowledged before the lord mayor, a recorder, and one alderman, and enrolled in the court of husting: in this case the wife must be examined separately from her husband, and with her consent. 7. The last and most usual mode in practice, of barring dower, is a jointure made on the wife before marriage. See *Jointure*.

**DOWLAS, n.s.** A coarse kind of linen.

*Dowlar*, filthy dowlar; I have given thee and thy bakers' wives, and they have made booties of thee. *Shakespeare*.

**DOWLAS HEAD**, a cape of Ireland, on the coast of Kerry, in Munster. Near this are several large caves, one of which has its entrance low as hardly to admit of a boat with a person standing up in it; but, further in, the roof is as high as that of a Gothic cathedral, and the fine echo.

**DOWLETABAD**, a district of Hindustan, the nizâm's dominions, in the province of Aungababad, situated between the nineteenth and twentieth degrees of north latitude, and extending along the north side of the Godavery.

**DOWLETANAD**, DEOGHIN, or DEOGH, a town and strong fortress in the province of Aungababad, deemed by the natives impregnable. It stands on the summit of a mountain, surrounded with other enclosures, of which the plain contains a large town. The two forts are overtopped by the upper, and the

In 1595 Dowletabad surrendered to Shah, of Ahmednuggur, and his dynasty it was taken possessed by Amber, an Abyssinian slave, named one of the ablest generals of his age. His successors reigned until it was taken by the Moguls in of Shah Jehan, and the capital of the neighbouring town of Gurka, named AURUNGABAD, which see.

*Bel. dons; Swed. dun; Dan. duun.* The softest part of a bird's plumage; hence soft fibres of plants, and any thing soft or soothing.

By his gates of breath downy feather, which stirs not : that light and weightless down, it move. *Shakespeare.* Donalbain! Malcolm! awake! in downy sleep, death's counterfeit, death itself. *Id. Macbeth.* That have prickles, yet have a downy upon their leaves, as stock-gillyflowers which down or nap consisteth of a soft substance.

*Bacon's Natural History.* down, by howling Eurus blown, winds from his mansion thrown.

*Sandys.* Give me flattery, bed of courts, that I may rock him, in the down of his desires. *Bouaumont.* Virtue is the roughest way, at night a bed of down. *Wotton.* Ave, fair bride! your solitary bed, till you return to it alone; address : and your body's print, ave, the yielding down doth dint.

*Donne.* On our down, and court the blessing of his slumber. *Derham's Sophy.*

In her hand she held sweet fruit, that downy smiled, red, and ambrosial smell diffused. *Milton.* From westward waits their sails to fill, these high beds his downy wings. *Dryden.*

I love my husband still; as he was when youthful grace, down began to shade his face. *Id.* Weakly constitution is very much owing down beds. *Locke.*

Softness, down of all my cares! my thoughts upon this breast press of all my griefs, *Southern's Oroonoko.*

When the springing heard began a doubtful down, and promise man. *Prior.*

He quit the world, just made their own, deeply downed, and built so high! build who build beneath the stars. *Young.*

Will her downy pillow preest, an cypsel prolonged the balmy rest. *Pope.*

Do they mistake, how little know kingdoms, and the pains which flow, who fancy that a crown, must be lined with down.

*Churchill.*

How long shall sloth usurp thy useless hours, Unnerve thy vigour, and enchain thy powers; While artful shades thy downy couch inclose, And soft solicitation courts repose?

*Dr. Johnson's Poems.*

For the preservation of the immature seed nature has used many ingenious methods; some are wrapped in down, as the seeds of the rose, bean, and cotton-plant; others are suspended in a large air-vessel, as those of the bladder-sena, staphyliza, and pea.

DOWN'WARDS, *adv.*

*Saxon dun; Erse, dune; a-hill.* The substantive has here originated the other uses of the word, and still retains in Sussex, and in some other parts of England, its primitive meaning. To down is used by Sidney for to subdue; beat downwards. As a neuter verb it signifies, to descend; be received. As an adjective, dejected; and sometimes firm; positive (figuratively). As a preposition, it means along or towards a lower point. As an adverb, on or tending to the ground; below the horizon, answering and opposed to up; also from former to later times, and from higher to lower station or repute. As an interjection, it encourages to, or pronounces, degradation or destruction. Downcast is, bent towards the ground. Downfal, ruin; calamity. Downgyved, hanging down like fetters. Downright is, plain; open; or, as we say, by a similar figure, straightforward; direct; unqualified. The meaning of the other compounds is apparent.

And now the axe is put to the roote of the tree, therfor every tre that makith not good fruyt schal be hit down and schal be cast into the fyr.

*Wiclif. Matt. 3.*

Let them wander up and down for meat, and grudge if they be not satisfied. *Psaln lix. 15.*

Thou knowest my downmitting and mine uprising; thou understandest my thoughts afar off.

*Id. cxxxix. 2.*

Then thought the prince all peril sure was past, And that he victor onely did remayne, No sooner thought, then that the carle as fast Gave heap huge strokes on him, as ere he down was cast. *Spencer.*

How goes the night, boy?

—The moon is down; I have not heard the clock, And she goes down at twelve. *Shakespeare. Macbeth.*

Down, down to hell, and say I sent thee thither.

*Shakespeare.*

Go, some pull down the Savoy; others to the innns of courts: down with them all. *Id.*

Why dost thou say king Richard is deposed; Darest thou, thou little better thing than earth, Divine his downfal? *Id. Richard II.*

Lord Hamlet, with his stockings loose, Ungartered and downgyved to his ancles.

*Shakespeare.*

Elves away!

We shall chide down jits if I longer stay. *Id.*

A ring the count does wear,  
That *downward* hath succeeded in his house,  
From son to son, some four or five descents. *Id.*

Mahomet puts his chief substance into certain boats,  
to be conveyed *down* the river, as purposing to fly.  
*Knolles.*

An admonition from a dead author, or a caveat  
from an impartial pen, will prevail more than a *down-*  
*right* advice, which may be mistaken as spoken ma-  
gisterially. *Bacon.*

I would rather have a plain *downright* wisdom,  
than a foolish and affected eloquence.

*Ben Jonson's Discoveries.*  
Lord of much riches, which the use renowns :  
Seven thousand broad-tailed sheep grazed on his  
*downs.* *Sandys.*

The idolatry was direct and *downright* in the peo-  
ple, whose credulity is illimitable.

*Browne's Vulgar Errors.*  
No bread will *down* with them, save that which  
the earth yields ; no water but from the natural wells  
or rivers. *Bp. Hall. Contemplations.*

To come from all things to nothing, is not a descen-  
t but a *downfall* ; and it is a rare strength and con-  
stancy, not to be maimed at least. *Id.*

We can naturally like no view of ourselves, unless  
we look *downwards*, to teach us what humble admirers  
we ought to be of our own value. *Butler.*

He shared our dividend o' the crown,  
We had so painfully preached *down* ;  
And forced us, though against the grain,  
To' have calls to preach it up again. *Hudibras.*

A giant's slain in fight,  
Or mowed o'erthwart, or cleft *downright*. *Id.*  
Whom they hit, none on their feet might stand,  
Though standing else as rocks : but *down* they fell  
By thousands. *Milton's Paradise Lost.*

But first I mean  
To exercise him in the wilderness,  
There he shall first lay *down* the rudiments  
Of his great warfare. *Milton.*

Not all the fleecy wealth  
That doth enrich those *downs* is worth a thought,  
To this my errand, and the care it brought. *Id.*

Look *downward* on that globe, whose hither side,  
With light from hence, shines. *Id.*

It is *downright* madness to strike where we have no  
power to hurt. *L'Estrange.*

*Down* sinks the giant with a thundering sound,  
His pond'rous limbs oppress the trembling ground.  
*Dryden.*

But now they cry, *down* with the palace, fire it,  
Poll out the' usurping queen. *Id.*

My wily nurse by long experience found,  
And first discovered to my soul its wound ;  
'Tis love, said she ; and then my *downcast* eyes,  
And guilty dumbness witnessed my surprize. *Id.*

Heavy the third, and stiff, he sinks apace ;  
And though 'tis *downhill* all, but creeps along the race.  
*Id.*

Jealousy, suffused with jaundice in her eyes,  
Discolouring all she viewed, in tawny dressed ;  
*Downlooked*, and with a cuckoo on her fist. *Id.*

When Aurora leaves our northern sphere,  
She lights the *downward* heaven, and rises there.  
*Id.*

A *downright* scholar is one that has much learning  
in the ore, unwrought and untried, which time and  
experience fashions and refines. *Bp. Earle.*

It has been still preached up, but acted *down* ; and  
dealt with as the eagle in the fable did with the oyster,

carrying it up on high, that by letting it fall,  
dash it in pieces.

We have seen some, by the ways of which  
had designed to rise uncontrollably, to have  
procured their utter *downfall*.

The hidden beauties seemed in vain to  
To *down* proud hearts that would not admit.

On the *downs* we see, near Wilton far,  
A hastened hare from greedy greyhound  
Wanton languishing borrowed of her  
*downcast* look of modesty.

A man falling *down* a precipice, though  
is not at liberty, because he cannot stop there  
if he would.

If he be hungry more than wanton, bread  
*down* ; and if he be not hungry, 'tis not the  
same.

Hills are ornamental to the earth, afford-  
ing pleasant prospects to them that look *downward* ;  
upon the subjacent countries. *Ray on the*  
Hills afford pleasant prospects ; as they  
acknowledge who have been on the *downs* of

There are few, very few, authors, that  
themselves in a mistake, though all the  
them to be in *downright* nonsense.

There is not a more melancholy object  
learned world, than a man who has entered  
*down*.

Thy *downcast* looks, and thy disordered  
Tell me my fate : I ask not the success  
My cause has found.

It is then (in old age) we have nothing to  
as the phrase is ; we speak the *downright* truth  
whether the rest of the world will give us  
lege or not, we have so little to ask of them,  
can take it.

What remains of the subject, after the  
is continued to be boiled down, with the addition  
fresh water, to a rapid fat. *Arbutnot on*

And the first steps a *downhill* greensward

As you lift up the glasses, the drop of  
slower and slower, and at length rest, being  
*downward* by its weight as much as upward  
attraction.

O happy plains, remote from war's alarms  
And all the ravages of hostile arms !  
And happy shepherds ! who, secure from  
On open *downs* preserve your fleecy care.

To compass this, his building is a  
His pond an ocean, his parterre a *down*.

What would this man ? Now upward will  
And, little less than angel, would be more,  
Now looking *downwards*, just as grieved ap-  
To want the strength of bulls, the fur of bears  
Religion seems not in danger from  
atheism, since rational men must reject that  
of proof.

Who shall dispute what the reviewer  
Their word 's sufficient ; and to ask a man  
in such a state as theirs, is *downright* reason.

This structure in some degree obtains in  
phagus or throat of cows, who by similar  
convey their food first *downwards* and then  
wards by a retrograde motion of the same  
or cartilages, for the purpose of a second  
of it.

A more unsafe and uncertain rule  
be laid *down*, than this of estimating property  
ing to its value at some remoter period of

on his Trojan bride,  
 once within for Hector slain  
 quing, mingled with deep passion  
 youngest virgin, whose young hand  
 who slew her brother. *Byron.*  
 to form a thin robe twining,  
 bled her bosom shining;  
 parting of her hair,  
 dy downward there,  
 arm showed white and bare.

*Id. Siege of Corinth.*

immerce, the fine feathers from  
 several birds, particularly of the  
 at of the eider duck, see *ANAS*,  
 ble. These birds pluck it from  
 d line their nests with it. We  
 quantity of down found in one  
 filled the crown of a hat, yet  
 e than three quarters of an ounce.  
 f this down may be compressed  
 tely bigger than one's fist; yet is  
 labile as to fill a quilt five feet  
 und in the nests is most valued,  
 down; it is infinitely more elas-  
 cked from the dead bird, which  
 d.

nty in the north of Ireland, com-  
 pric of the same name, founded  
 bury: it contains eight baronies,  
 p, is fifty miles in length, by forty  
 ing a surface of 364,118 plan-  
 Down is thickly inhabited by  
 ; and is extensively engaged in  
 e of linen. The towns of this  
 te of the most comfortable and  
 od. The surface is rather hilly:  
 rock, slate; the soil clay loam,  
 y sand. A group of lofty granite  
 the south occupies an area of  
 uare miles, between Newry and  
 ; in these mountains beryls, not  
 s, are frequently found, and sold  
 high prices. The Sliebh Croob  
 ntre of the county, is also a gra-  
 sand-stone is also met with, but  
 tly at all. If we except the above  
 fects, this county may be said to  
 r tillage or pasture. The chief  
 for, Donaghadee, Hillsboro' (the  
 te marquis of Downshire), Ros-  
 tresque bathing village, Bann-  
 patrick, the assizes town; and  
 doime flourishing town, in the  
 t name. There are several valu-  
 ations on the sea-coast of this  
 languor to Carlingford. Dundrum  
 od trawling-ground: Strangford  
 herto been avoided, from a sup-  
 p of navigation, and from being  
 a bar-harbour; but it has been  
 Nimothat Strangford Lough is  
 far on the coast, at the same time  
 acted the existence of a rock in  
 lled the Buller Pluddy, hitherto  
 Carlingford harbour is obstructed  
 Cranfield and Stalken: this har-  
 a new chart. A pier has lately  
 t Ardglass, at the public expense,  
 Killyough, by the proprietor, lord

Granite is found in two great districts of  
 Down, the Mourne and Sliebh Croob groups.  
 Slate is also abundant, and it is probable that, at  
 their junction, valuable mines will yet be dis-  
 covered. Lead mines have been opened near  
 Newton-Ardes, Portaferry, and Castlevellan, but  
 not yet worked to any extent. Copper is found  
 at Rostrevor, Portaferry, and Clonliff. Slate,  
 of superior quality, is raised at Ballywalter and  
 Doonarah: limestones at Cultra and Moira;  
 and several quarries of blackish marble are suc-  
 cessfully worked in this last-mentioned district.  
 Pearls, of some value, are often found in the  
 rivers Bann and Lagan. This county is rich in  
 remains of antiquity; here are stone altars and  
 cromliachs; the giant's ring; raths and mounds  
 of singular formation: round towers stood at  
 Drumboe and Downpatrick, and many beautiful  
 ecclesiastical buildings, though now almost  
 ruined, bear testimony to the ancient learning  
 and piety of this county; the remains of thirty-  
 six are still discoverable. Amongst the natural  
 curiosities, the chief are the caves of Ardglass  
 and Ballycam. Many military antiquities also  
 exist here: several of the finest castles were  
 erected, during the civil wars, by colonel Monck.

DOWNHAM, a town of Norfolk, ten miles  
 south of Lynn, famous for its butter; there being  
 nearly 1000 firkins bought here every Monday,  
 and sent up the river Ouse to Cambridge; from  
 whence it is conveyed to London in the Cam-  
 bridge waggons, and hence called Cambridge  
 butter. The church is a neat building, situate  
 on a rising ground; the ascent to it on the north-  
 west is by a flight of brick steps, and on the  
 south by a gradual ascent, ornamented with a  
 row of lime-trees. In the vicinity of this  
 church were formerly several religious founda-  
 tions, particularly a priory of Benedictine  
 monks. Downham has a market on Saturday,  
 and is seated on the Ouse; thirty-five miles  
 north-east of Cambridge, and eighty-four north  
 by east of London. Long. 0° 20' E., lat. 54°  
 40' N.

DOWNINGS, a post town of Pennsylvania,  
 in Chester county, on the east side of Brandy-  
 wine Creek; thirty-three miles west by north of  
 Philadelphia, and nearly seven north-west of  
 Westchester.

DOWNPATRICK, the assizes town of the  
 county of Down, in Ireland: it is ninety-two miles  
 from Dublin, is a borough, post, and fair town.  
 Here St. Patrick is said to have been interred,  
 along with St. Bridget and St. Columb. There  
 are several monastic ruins in the vicinity, also  
 St. Patrick's well, still supposed to possess very  
 singular healing virtues, and used as Holy-well,  
 in Flintshire, both for partial and total immer-  
 sion. This town has a handsome court-house; a  
 capacious jail, lately erected; a diocesan school;  
 an establishment for the support of clergymen's  
 widows; Southwell's hospital; a poor school;  
 and meeting-houses for Presbyterians and Metho-  
 dists. The staple is linen.

DOWNS, a celebrated road for ships, extend-  
 ing six miles along the east coast of Kent, be-  
 tween North and South Foreland; where both  
 the outward and homeward-bound ships fre-  
 quently make some stay, and squadrons of men

of war rendezvous in time of war. It affords excellent anchorage; and is defended by the castles of Deal, Dover, and Sandwich, as well as by the Goodwin Sands.

**DOWNTON, or DUNKTON**, an ancient borough in Wiltshire, which sent two members to parliament. It retained this privilege until 1832, when it was disfranchised by the first and second clauses in the Reform Bill. Its chief trade is in malt, paper, leather, laces, &c. It has a neat church, the tower of which has been raised about thirty feet, at the expense of the earl of Radnor. Here is a good free-school, chiefly supported by the produce of the fairs, and also a well-regulated workhouse. It is seated on the Avon, six miles south-east of Salisbury, and eighty-four W.S.W. of London. Lon. 1° 36' W., lat. 51° 0' N.

**DOXOLOGY**, *n. s.* Δόξα and λόγος. A form of giving glory to God.

David breaks forth into these triumphant praises and *doxologies*, Blessed be the Lord God of Israel, who has kept me this day from shedding blood, and from avenging myself with my own hand. *South.*

Little did Athanasius imagine, that ever it would have been received in the Christian church, to conclude their books with a *doxology* to God and the blessed virgin. *Stillington.*

**Doxology**, an hymn used in praise of the Almighty, distinguished by the title of greater and lesser. Both the *doxologies* have a place in the church of England, the former being repeated after every psalm, and the latter used in the communion service.

**Doxology, the Greater**, or the angelic hymn, was of great note in the ancient church. It began with these words, which the angels sung at our Saviour's birth, Glory be to God on high, &c. It was chiefly used in the communion service, and in private devotions.

**Doxology, the Lesser**, was anciently only a single sentence, without response, running in these words, Glory be to the Father, and to the Son, and to the Holy Ghost, world without end, Amen. Part of the latter clause, As it was in the beginning, is now, and ever shall be, was inserted some time after the first composition. Some read this ancient hymn, Glory be to the Father, and to the Son, with the Holy Ghost: others, Glory be to the Father, in or by the Son, and by the Holy Ghost. This difference of expression occasioned no disputes in the church, till the followers of Arius began to make use of the latter as a distinguishing character of their party, when it was entirely laid aside by the Catholics, and the use of it was sufficient to bring any one under suspicion of heterodoxy. The *doxology* was used at the close of every solemn office. The western church repeated it at the end of every psalm. Many of their prayers were also concluded with it, particularly the solemn thanksgiving or consecration prayer at the eucharist. It was also the ordinary conclusion of their sermons.

**DOXY**, *n. s.* A whore; a loose wench. A diminutive of **DUCE**, which see.

When daffodils begin to pure,  
With heigh! the *dory* o'er the dale.

*Shakespeare.*

**DOYEN** (François), a celebrated painter, born at Paris in 1726, was, while a boy, distinguished by his school-books with sketches. Some of these being seen by an amateur, he persuaded the parents of the lad to place him under Vanloo, and at twenty years of age he was chosen for the prize of the academy and gained it. In virtue of this he went to Rome, where he devoted himself principally to the works of Annibale Caracci, but became equally enamoured afterwards, of the style of Pietro da Cortona. On his return to Paris he employed himself a year on a large picture of the death of Vercinorix. His principal object was to gain the approval of Vanloo. But that artist had been previously against him, and it was with difficulty he could be prevailed upon to look at it. At last, regarding it silently for some time, he commended Doyen affectionately, and applauded the performance every where. From this time he rose rapidly into fame. One of his best pictures was a representation of winter, of which there is an engraving. He visited Peterburg at the invitation of the Empress Catharine, and was chosen professor of the academy of painting, where he died in 1806.

**DOZE**, *v. n. & v. a.* Sax. *dræ*; *Doziness*, *n. s.* } *doers*; *Teut. dā*  
*Dozy*, *adj.* } *Swed. dāsa*. See *Doze*.

To slumber; sleep lightly; become undrowsy. The active verb signifying to make dull, seems derived from the noun; *doziness* is sleepiness; and figuratively idly; *dory*, drowsy.

He was now much decayed in his parts, and immoderate drinking *dozed* in his understandings.

There was no sleeping under his roof, *dozed* opened to *doze* a little, the jolly cabler *waked*.

It has happened to young men of the greatest talents to waste their spirits with anxiety and *doze* as to *doze* upon their work with too much idleness of doing well.

The yawning youth, scarce half awake, *dozes* His lazy limbs and *dazy* head to raise.

A man, by a violent fit of the gout in his head, finds a *doziness* in his head, or a want of spirits.

How to the banks, where hardy departed lie,  
They led him soft. *Pope's Dunciad.*

**DOZEN**, *n. s.* *Fr. douzaine*; *Teut. dōzēn*; *Ital. Span. and Port. dozzena*; probably a corruption of *Lat. duodecim*. Twelve, taken collectively. Dr. Johnson says, it is a word used on light occasions. But see the definition of Locke: its convenience in fact has occasioned it to be in constant use in modern times, but it is serious as well as light occasions.

We cannot lodge and board a *dozen* of ladies and gentlemen, but we keep a bawdy house *strong*.

That the Indian figs bear such huge *dozens* of delicate fruit, I could never find; yet I have seen a *dozen* miles together under them.

We have more words than notions, and *dozen* words for the same thing. Sometimes we give a new signification to an old word, as when we call a piece a *gun*.

twelve units together, we have the com-  
mon.

Locke.

of dissenters was something under a  
man.

Swift.

A, or DREYEU, a well-built town  
the capital of the Wahbees sect. It  
is as 160 leagues south-east of Jeru-  
salem, situated at the base of lofty moun-  
tainous country.

s. Sax. drapbe, lees. A whore;

ship will take order for the *drabs* and the  
need not fear the bawds. *Shakespeare.*

the wretch so venal and so vain,  
proud as *drabs* in Drury-lane. *Pope.*

In botany, a genus of the siliculosa  
namia class of plants; natural order  
siliculosæ. The silicula is entire,  
long; with the valves a little plain,  
the partition: there is no style.  
seventeen species; of which the one  
of notice is the *D. verna*, or early  
one. It has naked stalks with leaves  
petioled. The blossoms are white, and at  
times hang down. It grows on old  
banks. It is one of the earliest  
plants we have, and is good to eat as a  
salad, sheep, and horses eat it: cows are  
not so swine refuse it.

CIUS (Nicholas), a celebrated enthu-  
siast of Moravia in 1587. He was admitted  
in 1516; but, on account of the severe  
persecution of the Protestants, he retired to Hun-  
gary. He then commenced woollen-  
weaving about fifty years of age, assumed  
ecclesiastical office, and had his first vision on  
January, 1630, by which he was pro-  
phesied great armies from the north and  
should crush the house of Austria.  
Drabricius was restored to his ministry,  
more visions than ever, which he com-  
municated to his coadjutor Comenius, that he  
showed them to all nations. Comenius,  
if he did not print them he should  
and if he did he would be exposed  
to the scorn of men, printed them, but would  
not send the copies, and entitled the book  
*Drabricius*. Some say Drabricius was  
a false prophet; others, that he died in

It, in the sea language, a small sail  
which is the same to a bonnet, that a  
course, and is only used when the  
bonnet are too small to clothe the  
bonnet and courses.

FG, in angling, is a method of catch-  
ing. Take a large line of six yards;  
fasten it to the rod, must be a  
piece of lead, that, if the fish bite,  
it will sink, and so the water may  
be drawn to the ground; bait with a  
hook secured, and so by its motion the  
fish is enticed into the danger without  
the best places are in running water,  
under wooden bridges, supported  
by stones and slugs.

In the salt works, a kind of wooden  
railing the salt when taken out of the

boiling pan, the bottoms of which are made  
shelving or inclining forwards, that the briny  
moisture of the salt may drain off.

DRAC, an imaginary being, formerly much  
dreaded by the country people in many parts of  
France. The dracs were supposed to be mali-  
cious, or, at least, tricksome demons; said to lay  
gold cups and rings over the surface of pits and  
rivers, as baits to draw women and children in.

DRACÆNA, in botany, a genus of the mono-  
gynia order, and hexandria class of plants: con-  
sexpartite and erect; the filaments a little thicker  
about the middle; the berry trilobular and  
monospermous. Species, one only, a native of  
the West Indies.

DRACHM, n. s. } Fr. *dragme*; Span. and  
DRAM, n. s. & v. n. } Port. *drama*; Lat. *drach-*  
*ma*; Arab. *drum*; Gr. *δραχμή*; Heb. דרמן,  
from דרך, a way, סנה, to spend; i. e. as much  
as would be expended by a traveller.—Or, says  
Parkhurst, because anciently equal to six οβολοι,  
or bars of iron, that a man could grasp in his hand,  
thus deriving it from the verb δρασσα, δειραγμα,  
to clutch. A coin; a weight; the eighth part  
of an ounce; a small definite quantity; a dose.  
The verb is sometimes used, vulgarly, for to  
drink drams.

True be it said, whatever man it said,  
That love with gall and honey doth abound;  
But if the one be with the other weighed,  
For every dram of honey therein found,  
A pound of gall doth over it redound. *Spenser.*

I could do this, and that with no rash potion,  
But with a lingering dram, that should not work  
Maliciously like poison. *Shakespeare. Winter's Tale.*

See here these movers, that do prize their honours  
At a cracked drachm. *Id. Macbeth.*

The trial being made betwixt lead and lead,  
weighing severally seven drams in the air, the balance in  
the water weigheth only four drams and forty-one  
grains, and abateth of the weight in the air two drams  
and nineteen grains: the balance kept the same depth  
in the water. *Bacon.*

No hallowed oils, no gums I need,  
No new-born drama of purging fire,  
One rosy drop from David's seed  
Was worlds of seas to quench thine ire:  
O, precious ransom! which, once paid,  
That consummation eat was said. *Wotton.*

He that has not religion to govern his morality, is  
not a dram better than my mastiff-dog. *Selden.*

If there had been but any drachm of good nature in  
these Hebrews, they had relented.

*Bp. Hall. Contemplations.*

No dram of judgment with thy force is joined,  
Thy body is of profit, and my mind.

*Dryden's Fables.*

Every dram of brandy, every pot of ale that you  
drink, raiseth your character. *Swift.*

A second see, by meeker manners known,  
And modest as the maid that tips alone;  
From the strong fate of drama if thou get free,  
Another Darfy, Ward! shall sing in thee. *Pope.*

DRACO, a celebrated lawgiver of Athens.  
When he exercised the office of archon, he made  
a code of laws for his fellow-citizens, wherein all  
crimes were made capital; and even idleness was  
punished with death as well as murder. These  
laws were at first enforced, but they were after-

eruptions, with a small mixture of

DRUS, in botany. See ARUM.

DRUS, a township of the United States, part of Middlesex county, on the Merrimack, opposite Patucket Falls, miles north by west of Boston, and south-west of Exeter, in New

Engl. for dread, or the part. passive of which see. Terrible; formidable.

Land-breach they shortly fetch,  
Of danger does behind remain.

*Fairie Queene.*

n. s. } Sax. *drif*; Dutch, *drif*;  
adj. } from Saxon, *drabbe*. Filth;

in St. Austin's opinion; and is not

to *drag* me at his chariot-wheels, but ho

of me.

*Sidlingfleet.*

seen, that had been out with a *drag-net*.

being, had a draught towards the even-

them in hope of a sturgeon at last.

*L'Ettrange.*

*Dragnets* were made to fish within the deep,  
And casting-nets did rivers' bottoms sweep.

*May's Virgil.*

'Tis long since I, for my celestial wife,  
Loathed by the gods, have *dragged* a lingering life.

*Dryden.*

From hence are heard the groans of ghosts, the  
pains

Of sounding lashes, and of *dragging* chains. *Id.*

The creatures are but instruments in God's hand:  
the returning our acknowledgments to them is just the  
same absurdity with theirs who burnt incense to the  
drag, and sacrificed to the net.

*Rogers.*

While I have any ability to hold a commerce with  
you, I will never be silent; and this chancing to be a  
day that I can hold a pen, I will *drag* it as long as I  
am able.

*Swift.*

Can I, who loved so well,

To part with all my bliss to save my lover,

Oh! can I *drag* a wretched life without him?

*Smith.*

The *drag* is made somewhat like a low car: it is  
used for the carriage of timber, and then is drawn by  
the handle by two or more men.

*Mason's Mech. Exerc.*

A door is said to *drag*, when, by its ill hanging on  
its hinges, the bottom edge of the door rides in its  
sweep upon the floor.

*Id.*

Whatever old Time, with his huge *drag-net*, has  
conveyed down to us along the stream of ages, whe-  
ther it be shells or shellfish, jewels or pebbles, sticks  
or straws, sea-weeds or mud, these are the ancients,  
these are the fathers.

*Watts.*

Warburton attacks the revival of Shakespeare's  
text with a gloomy malignity, as if he were *dragging*  
to justice an assassin or incendiary.

*Johnson.*

We can only lament their fate, and still more that  
of a sailor, who is often *dragged* by force from his  
honest occupation, and compelled to imbue his hands  
in perhaps innocent blood.

*Franklin.*

Thou wast the veriest slave in days of yore,

That ever *dragged* a chain, or tugged an oar.

*Carper.*

Here, sheltering from the sons of murder,

The hares *drag* their tired limbs no further. *Bentley.*

DRAG, in sea language, is a machine consisting  
of a sharp, square, iron ring, encircled with a net,  
and commonly used to take the wheel off from  
the platform or bottom of the decks. The word  
is also used for whatever hangs over the ship in  
the sea, as shirts, coats, or the like; boats, when  
towed, or whatever else may retard the ship's  
way when she sails.

DRAG-GILE, v. a. & v. n. From drag. To  
make or become dirty, by dragging on the  
ground

His *dragging* tail hung in the dirt,

Which on his rider he would dirt.

*Hudibras.*

He wore the same gown five years, without *drag-*

gling or tearing.

*Swift.*

You'll see a *dragged* damsel, here and there,

From Billingsgate her fishy traffick bear.

*Gang's Trivia.*

DRAGOMAN, or DROUEN, a term of gene-  
ral use through the east for an interpreter, whose  
office is to facilitate commerce between the ori-  
entals and occidentals. These are kept by the  
ambassadors of Christian nations residing at the  
Porte for this purpose. The word is formed  
from the Arabic *targemen* or *targman*, of the  
verb *targain*, 'he has interpreted.' From dia-

goman the Italians formed dragomano, and, with a nearer relation to its Arabic etymology, turcimanno; whence the French and our truchemau, as well as dragoman and drogman.

DRAG'ON, *n. s.*

DRAG'ONET, *n. s.*

DRAG'ON-FLY, *n. s.*

DRAG'ONISH, *adj.*

DRAG'ON-LIKE, *adj.*

because the dragon is said to be possessed of a keen and watchful eye.—Minsheu. A real or supposed flying serpent; hence a fierce animal or man, and a fierce kind of fly: dragonet is a diminutive of dragon.

He caught the *dragon*, the elde serpent, that is the deucl and sathanas, and he boond hym bi a thou- synde gheeris. *Wiclif. Apoc. xx.*

And ever as he rode, his hart did earne  
To prove his puissance in battell brave  
Upon his foe, and his new force to learne;  
Upon his foe, a *dragon* horrible and stearne.

*Spenser. Faerie Queene.*

Or in his womb might lurk some hidden nest  
Of many *dragonets*, his fruitful seed. *Id.*

I go alone,  
Like to a lonely *dragon*, that his fen  
Makes feared and talked of more than seen.

*Shakespeare.*

He fights *dragonlike*, and does achieve  
As soon as draw his sword. *Id. Coriolanus.*

The body of the cantharides is bright-coloured, and it may be, that the delicate coloured *dragon-flies* may have likewise some corrosive quality.

*Bacon's Natural History.*

ake *dragonsblood*, beat it in a mortar, and put it in a cloth with aqua vitæ, and strain them together.

*Peacham.*

And you, ye *dragons!* of the scaly race,  
Whom glittering gold and shining armours grace;  
In other nations harmless are you found,  
Their guardian genii and protectors round. *Rowe.*  
On spery volumes there a *dragon* rides;  
Here, from our strict embrace, a stream he glides.

*Pope.*

*Dragonsblood* is a resin, so named as to seem to have been imagined an animal production. *Hill.*

So, borne on brzen talons, watched of old  
The sleepless *dragon* o'er his fruits of gold. *Darwin.*

DRAGON, in botany. See ARUM.

DRAGON, in zoology. See DRACO.

DRAGON, WILD. See ARTEMISIA.

DRAGONET, or DRAGON-FISH, in ichthyology. See CALLIONYMUS.

DRAGON FLY. See LIBELLULA.

DRAGON GUM, or GUM TRAGACANTH. See ASTRAGALUS.

DRAGONS-BLOOD, a gummi-resinous substance brought from the East Indies, either in oval drops wrapped up in flag leaves, or in large masses composed of smaller tears. It is said to be principally obtained from the dracena draco, the pterocarpus draco, and several other vegetables. The fine dragon's blood of either sort breaks smooth, free from any visible impurities, of a dark red color, which changes, upon being powdered, into an elegant bright crimson. Several artificial compositions, colored with the true dragon's blood, or Brasil wood, are sometimes sold for this commodity. Some of these dissolve like gums in water; others crackle in the fire without proving inflammable; whilst the genuine

sanguis draconis readily melts and enters heat and is not acted on by watery liquors. It dissolves in pure spirit, and tinges a large quantity of the menstruum of a deep red color, likewise soluble in expressed oils, and gives a red hue, but less beautiful than that communicated by anchusa. This drug, in substance, has no sensible smell or taste; when dissolved, it covers some degree of warmth and pungency. A solution of dragon's blood in spirit is used for staining marble, to which it gives a red tinge, which penetrates more or less deep according to the heat of the marble during the time of application. But as it spreads at the same time that it sinks deep, for fine deep marble should be cold.

DRAGON'S HEAD. See DRACOCEPHALUS.

DRAGON'S HEAD AND TAIL, capital letters draconis, in astronomy, are the nodes of the planets; or the two points in which the ecliptic is intersected by the orbits of the planets, particularly that of the moon; making equal angles of 5° 18'. One of these points is northward, the moon beginning then to rise north latitude, and the other southward, as she commences south. Thus her descent in the ecliptic seems, according to the fancy of the ancients, to make a figure like that of a dragon, the belly is where she has the greatest latitude of intersection representing the head and tail, which resemblance the denomination owes. In these points abide not always in one place, but have a motion of their own in the ecliptic, to grade-wise 3' 11" per day; completing the circle in eighteen years 225 days; so that there can be but twice in the ecliptic during a monthly period, but at all other times they have a latitude or declination from the ecliptic. About these points of intersection all eclipses happen. They are usually denoted by the characters  $\Omega$  dragon's head, and  $\gamma$  dragon's tail.

DRAGON TREE. See DRACONTIUM.

DRAGON WORT. See ARTEMISIA.

DRAGOON, *v. o. & n. s.* *Fr. dragon.* Supposed to have been derived from dragon, because mounted on horseback with figure and armor he seemeth like a fiery dragon' (Preston's Meyrick's Ancient Armour); or from draconarius, horse-soldiers who bore dragon ensigns. See the article. The verb is used from the noun.

Two regiments of *dragoons* suffered much action. *Id.*

In politicks I hear you're staunch,

Directly bent against the French

Deny to have your free-born foe

*Dragooned* into a wooden shoe. *Pro.*

Will the famished wretch who has tried bayonets be appalled by your gibbets? What is a relief, and the only relief it appears that afford him, will he be *dragooned* into tranquility. *Id.*

DRAGOONS are divided into brigades of cavalry: and each regiment into troops, each troop having a captain, lieutenant, cornet, quarter-master, two sergeants, three corporals, and two drums. Some regiments have more. They are very useful on any expedition.

despatch; for they can keep pace with cavalry, and do the duty of infantry: they go, generally, on the wings of the army, or in masses leading to the camp; and sometimes are brought to cover the general's quarters: they march in front and rear of the army. The first regiment of dragoons raised in England was in 1661, and called the regiment of dragoons with Britain. In battles or attacks they carry light sword in hand after the first fire. Their arms are, a sword, firelock, and bayonet, and pistols are now generally added.

**DRAGONING**, a term that has been used to express the horrible persecution and oppression inflicted on the French Protestants under Louis XIV. after the revocation of the edict of Nantes. By these means the Protestants in Languedoc alone were, in four or five days, valued at above a million of money. Their houses were turned into stables; and the rooms of the houses where the military were quartered were treated with every possible injury and cruelty, without intermission. At Nîmes, a town near Montauban, they hung up a Protestant citizen of that name, by his arm-pits, and tormented him all night, by pinching and tearing off his flesh with pincers. They made a great fire round him of about twelve years old, who, with hands raised, cried up to heaven, cried out, 'My God, help me;' And when they found the youth would not die rather than renounce his religion, they watched him from the fire just as he was at the point of being burnt. In several places soldiers applied red-hot irons to the hands and feet of men and breasts of women. At Nîmes they hung up several naked women by the feet, and others by their arm-pits, and exposed them to public view. They also posted mothers that gave suck, and let sucking infants lie languishing in their beds for several days and nights, crying, mourning, and gasping for life. Some they bound to a great fire, and, being half roasted, let them die. Amidst a thousand hideous cries and screams, they hung up men and women on the chimneys by the hair, and feet, and fastened them with wisps of wet hay. Some they tied under the arms with ropes, and plunged them again and again into wells: but we cannot dwell in these shocking details. If any to escape these barbarities endeavoured to save themselves by flight, they pursued them into the forest and woods, where they were hunted down like wild beasts, and prohibited at the same time from departing the kingdom, upon pain of execution of their effects.

**DRAGUIGNAN**, a town of France, the capital of the department of the Var, Provence, situated in a fertile plain, on the river Pis. The bishops of Fréjus had formerly a palace here. The town is the seat of the courts of provincial justice, and has a public library. There is a trade, and the manufactures are coarse soap, oil, and sugar of lead, the two last made in considerable quantities. The town is raised on the sides of the neighbouring hills, is remarkable for its strength. The general population is by no means considerable. Population 602. VII.

about 5000. Thirty-five miles north-east of Toulon.

**DRAIN**, *v. a. & n. s.* } Fr. *trainer*; Teut. *DRAIN'AGE*. } *trancer*, part. of verb *drygan*, Sax. to expel; and therefore to dry, according to Mr. Tooke; or from *drehnigean*, to strain, says Mr. Todd. To draw off; to empty of a fluid gradually; to make dry: as a substantive, it means the channel, or course of the water or fluid taken off. Drainage is the act or system of draining.

The fountains *drain* the water from the ground adjacent, and leave but sufficient moisture to breed grass.

In times of dearth it *drained* much coin of the kingdom, to furnish us with corn from foreign parts.

*Id.* to Villiers.

Sinking waters, the firm land to *drain*,  
Filled the capacious deep, and formed the main.

*Rowe common.*

The royal babes a tawny wolf shall *drain*.

*Dryden.*

While cruel Nero only *drains*  
The mortal Spaniard's ebbing veins,  
By study worn, and slack with age,  
How dull, how thoughtless is his rage! *Prior.*  
Had the world lasted from all eternity, these comets  
must have been *drained* of all their fluids. *Cheyne.*  
When wine is to be bottled wash your bottles, but  
do not *drain* them. *Swift's Directions to the Butler.*  
Whilst a foreign war devoured our strength, and  
*drained* our treasures, luxury and expences increased  
at home. *Atterbury.*

That boy was blest,  
Whose infant lips have *drained* a mother's breast.

*Gay.*

By oppression's woes and pains!  
By your sons in servile chains!  
We will *drain* our dearest veins,  
But they shall be—shall be free! *Burns.*

Strike up the dance, the cava bowl fill high,  
*Drain* every drop!—to-morrow we may die.

*Byron.*

In cases which arise from springs, as well as those which are produced by the stagnation of surface water, it will frequently be necessary, in order to effect their *drainage*, to have one or more deep open cuts, brought up in a proper direction from the lowest point at which the water can be discharged.

*Dr. A. Rees.*

**DRAINS**, in the fen countries, are certain large cuts or ditches of twenty or thirty, nay sometimes forty feet wide, carried through the marshy ground to some river or other place, capable of discharging the water out of the fen lands. To clear wet and boggy lands of their superfluous moisture, is an art of the highest importance, not only to the agriculture, but to the health of a country; yet it is only of late years that the principles of this art became well understood, and opened the way for many improvements. Dr. James Anderson of Edinburgh, in his *Essays on Agriculture*, seems to have been the first who treated the subject scientifically; but before quoting his ingenious introductory observations, it may be remarked that land becomes charged with moisture from two causes: 1. From water collected in the higher grounds, and filtrating among the different beds of gravel and other porous materials, forming springs below, and flowing over the surface, or stagnating underneath it. 2. From

rain or water lodging and becoming stagnant on the surface, from the clayey or impervious nature of the soil or superior stratum. The first of these is the cause of bogs, swamps, and morasses, and is the most difficult to remedy. Dr. Anderson says, 'springs are formed in the bowels of the earth, by water percolating through the upper strata where that is of a porous texture, which continues to descend downwards till it meets with a stratum of clay that intercepts it in its course; where, being collected in considerable quantities, it is forced to seek a passage through the porous strata of sand, gravel, or rock, that may be above the clay, following the course of these strata till they approach the surface of the earth, or are interrupted by any obstacle which occasions the water to rise upwards, forming springs, bogs, and the other phenomena of this nature; which, being variously diversified in different circumstances, produce that variety of appearance in this respect that we often meet with. This being the case, we may naturally conclude that an abundant spring need never be expected in any country that is covered to a great depth with sand, without any stratum of clay to force it upwards, as is the case in the sandy deserts of Arabia, and the immeasurable plains of Libya: neither are we to expect abundant springs in any soil that consists of a uniform bed of clay from the surface to a great depth; for it must always be in some porous stratum that the water flows in abundance; and it can be made to flow horizontally in that, only when it is supported by a stratum of clay, or other substance that is equally impermeable by water. Hence the rationale of that rule so universally established in digging for wells, that if you begin with sand, gravel, &c. you need seldom hope to find water till you come to clay; and, if you begin with clay, you can hope for none in abundance till you reach to sand, gravel, or rock. It is necessary that the farmer should attend to this process of nature with care, as his success in draining bogs, and every species of damp and spouting ground, will in a great measure depend upon his thorough knowledge of this,—his acuteness in perceiving in every case the variations that may be occasioned by particular circumstances—and his skill in varying the plan of his operations according to these. As the variety of cases that may occur in this respect is very great, it would be a very tedious task to enumerate the whole, and describe the particular method of treating each; I shall therefore content myself with enumerating a few particular cases, to show in what manner the principles above established may be applied to practice.'

Let fig. 1. Plate DOGS and DRAINS represent a perpendicular section of a part of the earth, in which *AB* is the surface of the ground, beneath which are several strata of porous substances, which allow the water to sink through them till it reaches the line *CD*, that is supposed to represent the upper surface of a solid bed of clay; above which lies a stratum of rock, sand, or gravel. In this case, it is plain, that when the water reaches the bed of clay, and can sink no farther, it must be there accumulated into a body; and seeking for itself a passage, it flows

along the surface of the clay, among the sand or gravel, from *D* towards *C*; till at last it issues forth, at the opening *A*, a spring of pure water. If the quantity of water that is accumulated between *D* and *C* is not very considerable, the stratum of clay approaches near the surface, in that case, the whole of it will issue by the opening at *A*, and the ground will remain dry both above and below it. But if the quantity of water is so great, as to raise it to a considerable height in the bed of sand or gravel, and if that bed of sand is not discontinued before it reaches the surface of the ground, the water, in that case, would not only issue at *A*, but would also ooze out in small streams through every crevice of the ground between *A* and *C*, forming a patch of wet, sandy, or gravelly ground on the side of a declivity, which every attentive farmer must have frequently met with. To drain such ground in this situation is perhaps the most unprofitable task that a farmer can undertake, not only because it is difficult to execute, but also because the soil that is gained is of very little value. However, it is in some cases that patches of this kind are seldom of great extent, although they sometimes run along the whole of the declivity in a horizontal direction to a great length. The only effectual method of draining this kind of ground, is to open a ditch up as high as the highest of the springs at *C*, and to be of such a depth as not only to pass through the whole bed of sand or gravel, but to sink so far into the bed of clay below, as to form a canal therein sufficiently large to carry off the whole of the water. Such a ditch is represented by the dotted lines *ae* and *bf*, at the expense of making a ditch of such a depth as this would suppose, and of keeping it up in repair, is very great, it is but in some cases that this mode of draining is practicable; and never, unless where the declivity happens to be so small, as that a great deal of water is lost for little depth, as would have been the case here if the surface had extended in a straight line to *C* of the dotted line *ad*. But supposing the stratum of clay, after approaching the surface at *A*, continued to keep at a level below ground; and that the soil which it was of a sandy or spongy nature, would allow the water to penetrate it easily; supposing the quantity of water that flows from *D* to *C* was but very inconsiderable, and rising out at the spring *A*, it would not be so great along the surface of the clay among the sand or gravel, so as to keep it so long drenched with water, and of consequence it would be of very little value. Witness, in this case, is usually of much greater value to the farmer: and, as it admits of an easy and ought not to be one moment delayed; a ditch of a very moderate depth opened at *A*, and passing through a part of the stratum of clay, as represented by the dotted lines *Akf*, would carry off the whole of the water, and leave the field as dry as could be desired. Therefore, of very great consequence to the farmer, is the accurate distinction between these two cases, so nearly allied to each other in appearance, as this can be easiest done by boring,

Fig. 1

London: Published by Thomas Egge, 25, Chancery Lane.

J. Smith, sculp.

much ground of this kind ought to provide itself with a set of boring irons, which he would find use for on other occasions. I here enumerate a great variety of cases which might be reduced to the same head with going: but as any attentive reader may, that has been said, be able easily to distinguish, I shall only in general observe, that every soft and porous texture, that lies upon a hard clay, whatever its situation in other may be, will in some measure be subject to disease. And, if it is upon a declivity of considerable length, the undermost parts of the soil be much damaged by it, unless ditches be run up across the declivity, at proper distances from one another, to intercept the water in its descent. It may not likewise be improper to observe, that in cases of this nature, unless the soil is of a very great depth, the marl will always be increased, by raising the surface to a considerable height; as will appear by examining fig. 2; in which the line A B represents the surface of a field of this kind, and C D the surface of the bed of clay. If this field were raised into high ridges, F E F, so that the furrows F E F descended to the surface of the clay, it is plain, that all water that should sink through the middle of the field, would run along the surface of the clay, and come to the sides of the ridge L L L L L, which would thus be kept continually soaked with water. Whereas, if the ground had been level, as in the part of the field from G to H, open furrows H, at moderate distances from each other, the water would immediately reach the clay, and be carried off by the furrows, so as to damage the soil far less than when ridges are high. If the soil is so thin as that it can always touch the clay, the ridges may be made narrow and quite flat, as from H: but if there is a little greater depth of soil, it ought to be raised into ridges of a moderate height, as from H to B, so as to allow the bottom of the furrow to reach the clay: but it is thus necessary where the soil is of any considerable depth. I have seen some industrious farmers, who, having ground in this situation, been at the very great expense of making broad drains in each furrow. But, had they understood the nature of the disease, they would have thought of applying such a remedy; as must appear evident at first sight to who examine the figure. The success was might be expected from such a foolish undertaking. These observations, it is hoped, will be sufficient as to the manner of treating wet, or porous soils. I now proceed to take notice of such as are of a stiff, clayey nature, which are often very different in appearance, and require a different treatment from these. I propose that (in fig. 3) the stratum of sand and gravel D C should be discontinued, as it is, and that the stratum above it should be of a coherent clayey nature. In this case, the water that flowed towards E, being there in on every side, and being accumulated in great quantities, it must at length find a passage for itself in some way; and being strongly upon the upper surface, if any

one part is weaker than the rest, it there would burst forth and form a spring (as suppose at A). But if the texture of every part of this stratum were equally strong, the water would squeeze through many small crannies, and would ooze out in numberless places, as between A and F, so as to occasion that kind of wetness that is known by the name of a spouting clayey soil. The cure, in this case, is much more easily effected than in any of the former; for if a ditch of a considerable size is opened, as at A, towards the lowermost side of the spouting ground, so deep as to penetrate through the upper stratum of clay, and reach to the gravel, the water will rise up through it at first with very great violence, which will gradually decrease as the pressure from the water behind is diminished; and when the whole of the water accumulated in this subterranean reservoir has run off, there being no longer any pressure upon the clay above it, the whole soon becomes as dry as could be desired, and continues so ever afterwards, if the ditch is always kept open. This I speak from experience, having rendered some fields of this kind that were very wet, quite dry by this method of treating them. It will hardly be necessary for me here to put the farmer upon his guard, to be particularly careful in his observations, that he may distinguish between the wetness that is produced from this cause, and that which proceeds from the cause before mentioned; because the treatment that would cure the one would be of no use at all to the other. The attentive observer likewise will readily perceive, that if any field that is wet from this cause admits of being ploughed, it will be in equal danger of being hurt by being raised into high ridges, with the other kind of damp ground before mentioned. For, as the depth of earth above the reservoir would be smaller in the deep furrows than any where else, there would, of consequence, be less resistance to the water in that place, so that it would arise there in greater abundance. And if, in this case, a farmer should dig a drain in each furrow, as a considerable quantity of water would rise into them, in some cases the ground might be improved, or even quite drained thereby, especially if they should have accidentally reached the gravel in any one place; although at an expense much greater than was necessary. I take notice of this circumstance, in some measure to prevent the prejudice, that some inattentive observers might entertain, against what was said before of this method of draining, from their having accidentally seen some fields that may not have been bettered by it.

'Bogs,' continues the doctor, 'are only a variety of this last-mentioned kind of wet ground; and therefore ought, in general, to be drained after the same manner with them. Clay is a substance that strongly resists the entrance of water into it: but when it is long drenched with it, it is, in process of time, in some measure, dissolved thereby, loses its original firmness of texture and consistence, and becomes a sort of semi-fluid mass, which is called a bog; and as these are sometimes covered with a strong scurf of a particular kind of grass, with very matted roots, which is strong enough to bear a

small weight without breaking, although it yields very much, it is in these circumstances called a swaggle. But, whatever be the nature of the bog, it is invariably occasioned by water being forced up through a bed of clay, as just now described, and dissolving or softening, if you will, a part thereof: I say only a part; because whatever may be the depth of the bog or swaggle, it generally has a partition of solid clay between it and the reservoir of water under it, from whence it originally proceeds: for if this were not the case, and the quantity of water were considerable, it would meet with no sufficient resistance from the bog, and would issue through it with violence, and carry the whole semi-fluid mass along with it. But this would more inevitably be the case if there was a crust at the bottom of the bog, and if that crust should ever be broken, especially if the quantity of water under it were very considerable: and as it is probable, that in many cases of this sort, the water slowly dissolves more and more of this under crust, I make no doubt, but that in the revolution of many ages a great many eruptions of this kind may have happened, though not deemed of sufficient importance to have the history of them transmitted to posterity. Of this kind, although formed of a different substance, I consider the flow of the Solway moss, in Northumberland, to have been; which, upon the 16th of November, 1771, burst its former boundaries, and poured forth a prodigious stream of semi-fluid matter, which in a short time covered several hundred acres of very fine arable ground. Nor will any one, who is acquainted with the nature of moss, who knows its resemblance to clay, in its quality of absorbing and retaining water, and its very easy diffusibility therein, be surprised at this; as, from all these properties, it is much better adapted for forming an extensive bog, and therefore in greater danger of producing an extensive devastation by an eruption of the water into it, than those that are formed of any kind of clay whatever. If the bog or swampy ground is upon a declivity, the ditch ought to be carried across the field about the place where the lowest springs arise. But if the surface of the ground is level, or nearly so, as between A and B, fig. 4, and the springs break out in several places, *q q q q*, so as to form soft quagmires, interspersed through the whole of the field, it will be of little consequence in what part the drain is opened; for if it be dug up so deep as to allow the water to rise in it with freedom, it will issue through that opening, and the field will be left perfectly dry. But as it may frequently happen that the stratum of gravel should be at a considerable depth beneath the surface of the earth, and as it may be sometimes even below the level of the place into which the drain must be emptied, it might sometimes be extremely difficult to make a ditch so deep as to reach the bed of sand or gravel. But it is lucky for us that this is not absolutely necessary in the present case; as a drain of two or three feet deep, as at D, will be equally effectual with one that should go to the gravel. All that is necessary in this case, is to sink pits P in the course of the drain, at a moderate distance from

one another, which go so deep as to reach gravel; for, as the water there meets with resistance, it readily flows out at these openings, and is carried off by the drain without being forced up through the earth; so that the ground is entirely dry ever after. I have likewise found the appearance pretty much alike, for the information of the inexperienced, I give a short account of them. If you make your pit in one of these soft quagmires, where the water is found in great abundance, it will meet with very great difficulty in being made; for, as the substance of which it is composed, it will always flow into the hole as fast as it is dug; on which account I would advise, to attempt to make the pit in the solid earth, near it in the solid earth as you can find it. However, if it is pretty firm, and of no great extent, it is sometimes practicable to make the soft bog at the driest time of the year. I have sometimes practised, which gave me opportunity of observing the nature of the bog more perfectly than I otherwise should have done. In the trials of this kind that I have made, the soft quaggy ground has seldom been more than four or five feet deep, below which I have found a stratum of hard tough clay, and sometimes with stone; and so firm, that nothing but a pick-axe could penetrate it; and is comparatively so much drier than the bog above it, an inexperienced operator might be tempted to imagine that this is the bottom of the bog. In digging through this bog, you will frequently meet with small springs of water out in all directions; some of them will fill the tube of a small quill, and others will rise as to be scarcely perceptible; but, regarding these, you must continue to dig without intermission, till you come to the bottom of the reservoir, if I may so call it, which is contained in the rock, gravel, or sand; and you will generally find from two to four feet below the bottom of the swaggle, and which will be in no danger of mistaking when you find, for, if there has been no opening made in the field, as soon as you break through the stratum, the water immediately above the gravel or rock, will burst forth like a torrent; and, on the surface of the bog, rises like a jet d'eau to a considerable height above the bottom of the ditch; and will flow off with great impetuosity for a short time, till the pent up water being drained, the strength of the current to abate; and, at length, it flows gently out like any ordinary stream—allowing it to remain in this state, the earth begins to subside, and gradually becomes firmer and firmer every day; so that, in a few months, those bogs which were so soft as hardly to support the weight of a dog, become so firm, that oxen and horses tread upon them without any danger. At the very wettest season of the year, had a field of this nature, that, by sinking one such pit as I have now described, it was entirely drained to the distance of 100 yards around it in every direction, it is possible that the stratum in which

gy be in some places interrupted, it will be an expedient to make several of these drains in the field is of great extent; always carry the drain forward through the lowermost part of the field, or as near the quag as you can; and sinking a pit wherever you judge it will be most necessary. But, if the gravel is not interrupted, there will be no danger of water at opening any of these drains first, as I have frequently experienced. To prevent these wells from closing up after they are sunk, it is always expedient to fill them up with small stones immediately after they are sunk, which ought to rise to the height of the top of the drain. I have often imagined, that the expense of digging these pits might be saved by boring a hole through this solid stratum with a large wimble made on purpose; but I never experienced this, I cannot say whether or not it would answer the desired end. If the whole field that is to be drained is of one extensive bog, it will require a long time before the whole work can be entirely finished, as it will be impossible to open a drain till one part of it is first drained, and then the solid ground. In a situation of this kind the undertaker, after having opened a drain to carry the water from the lowest part of the bog, must first approach as near to the swampy ground as he can, and there make his first pit; which will carry off the water from the nearest parts of the bog. When this has continued open for some time, and that part of the bog has become so dry as to admit of being worked, let him continue the ditch as far forward through it as the bog is in it will admit of, and there sink another pit, and proceed gradually forward in the same manner; making cross cuts where necessary, till the whole be finished. In this manner, may be the bog or track of spouting ground of this nature rendered dry at a very inconsiderable expense; and, as there can be no other method of draining ground of this sort effectually, I recommend the study of it to the attention of every farmer who may have occasion for it. In the first place be extremely cautious in examining the circumstances of his particular fields, that he may be certain which of the classes above described it may be ranked with; and, when perfectly sure of that, he may proceed with confidence, being morally certain of success. There is, however, one kind of damp ground not yet particularly specified, that I have purposely not taken notice of till this time, as I have not had any opportunity of examining particularly into the nature of it, nor of ascertaining, by experience, what is the most proper method of draining it. The soil I have now particularly in view, consists of a deep strong clay that does not vary its nature even on the surface, but is as hard as manures may have rendered it more soft and tender; the color usually inclines to a reddish cast, and, for the most part, it is situated on the side of some declivity. This bed of clay reaches to a great depth, without any variation, and is intermixed with a considerable quantity of small round stones. Many soils, of the kind now described, are apt to be continually full of water during the winter season;

but when the dry weather of summer sets in, the moisture is diminished, and the surface becomes hard; and it is rent into many large gaps which allow free admission to the sun and air, so as to scorch up almost every plant that is sowed upon it; and, as these soils are usually in themselves naturally fertile when drained, it were to be wished that some method could be discovered, that would be less expensive than what is usually practised with regard to some soils of this kind in Essex; where they make covered drains of two feet and a half deep, running diagonally through the whole field, at the distance of twenty feet from each other.

In the *Georgical Essays*, T. B. Bayley, Esq. of Hope, near Manchester, gives the following directions for making covered drains:—First make the main drains down the slope or fall of the field. When the land is very wet, or has not much fall, there should, in general, be two of these to a statute acre; for the shorter the narrow drains are, the less liable they will be to accidents. The width of the trench for the main drains should be thirty inches at top, but the width at the bottom must be regulated by the nature and size of the materials intended to be used. If the drain is to be made of bricks ten inches long, three inches thick, and four inches in breadth, then the bottom of the drain must be twelve inches; but if the common sale bricks are used, then the bottom must be proportionably contracted. In both cases there must be an interstice of one inch between the bottom brick and the sides of the trench, and the vacuity must be filled up with straw, rushes, or loose mould. For the purpose of making these drains I order my bricks to be moulded ten inches long, four broad, and three thick, which dimensions always make the best drains. The method I pursue in constructing my main drains is as follows: when the ground is soft and spongy, the bottom of the drain is laid with bricks placed across. On these, on each side, two bricks are laid flat, one upon the other, forming a drain six inches high and four broad, which is covered with bricks laid flat. When the bottom of the trench is found to be a firm and solid body, as clay, or marle, the bottom of the drain does not then require being laid with bricks. In that case the sides are formed by placing one brick edgewise, instead of two laid flat. This latter method is much cheaper, and in such land equally durable with the other. When stones are used instead of bricks, the bottom of the drain should be about eight inches in width. And here it will be proper to remark, that, in all cases, the bottom of the main drains must be sunk four inches below the level of the narrow ones, even at the point where the latter fall into them. The main drains should be kept open till the narrow ones are begun from them, after which they may be finished; but before the earth is returned upon the stones or bricks, it will be advisable to throw in straw, rushes, or brush-wood, to increase the freedom of the drain. The small narrow drains should be cut at the distance of sixteen or eighteen feet from each other, and should fall into the main drain at very acute angles, to prevent any stoppage. At the point where they fall

m, and eight or ten inches above it, they should be made firm with brick or stone. These drains should be eighteen inches wide at top, and sixteen at bottom. See plate DRAINS. Fig. 3, represents a field with drains, laid out according to Mr. Bayley's method. The black lines represent the main drains, and the dotted lines represent the narrow drains communicating with the former from all parts of the field.

About the same time that Dr. Anderson had reduced the system of draining to scientific principles in Scotland, Mr. Joseph Elkington, of Princethorpe, in Warwickshire, appears to have made some similar discoveries in England. The priority, indeed, is claimed by Dr. Anderson, but as each party has his merits, and as the public is, doubtless, highly indebted to both, we shall not presume to decide upon this point. The great object of Mr. Elkington's system is the draining of lands rendered wet by waters confined beneath the surface, and attempting to rise in the manner of springs. Among these, bogs or morasses are the chief. Having attempted, a considerable number of years ago, to drain a piece of ground of this kind on his farm at Princethorpe, by making a trench of five feet deep, but without success, he thought it might be of use to know, what kind of strata lay under the trench. Accordingly, he forced an iron crow, of about an inch and a half in diameter, three feet down, and upon taking it out, was agreeably surprised, to find a great quantity of water burst forth, and run down the trench. This led him to think of applying an auger, an instrument fitter for the purpose of boring, which, upon trial, he found equalled his expectations; and, by continuing the same plan with the auger, he at last drained all the wet parts of his farm, which were numerous, and had proved destructive to his sheep, by inducing the rot. When a morass is to be drained, his first object is to ascertain the direction in which the trench is to be dug. The substance of his rules for this, as laid before the Board of Agriculture in 1796, are these: 1. To obtain as much knowledge as possible respecting the strata in the neighbourhood. 2. To direct the trench so as to hit the bottom of the bed, which occasions the mischief, and the particular spot where the main spring lies. 3. If there are various beds through which the water issues, to prefer the stone one for draining the whole; and to make the trench from six to eight yards from the tail of the bed, where the rock ends, because in limestone, and other rocks, the tail, as it is technically termed, is harder than any other part of the rock; but a few yards above it, it is softer, and the water is more accessible. The tail of these beds may often be found jutting out in a point. 4. To direct the trench in a line with the bottom of the hill; as it makes the best separation between the upland and meadow enclosures, where the spring can be best intercepted. The trench, however, must be carried in or near the line of the spring; for, if it diverges to any distance, all chance of reaching the spring by tapping is over, and the labor of digging it probably lost. 5. To make a new trench, rather than to tap the spring in any old brook, or run of water. 6, and lastly, having fixed on the line

of direction, and marked out the trench, at the bottom or lowest level, carrying the gradually up. The fall of the water sand above a few inches in 100 yards. The trench, which must often be used for tapping, must exceed two inches in diameter. Mr. Elkington bored a hole with one, to the depth of five feet, which threw up water equal to three heads in a minute, and completely drained the neighbourhood. In such cases, calculations in draining are unnecessary. In cases, the trench being once made, and then cut off, by tapping, or otherwise, it remains to determine, whether it is to be kept open or covered. Fig. 5 serves to exemplify one of the advantages which result from the arrangement of drains indicated by A B C D. The water of a hill at fig. 6 is furnished with outlets to carry off the water or supply springs at different heights. Thus A is supplied by the lowest at the top of the hill. B and D are supplied by the bed beneath, while by the aid of the trench at C we procure a continuously flowing stream of the water being insulated in its passage by the intermediate strata.

On the drainage of mixed and covered lands of the clayey kind, we have the following observations in Mr. Loudon's *Encyclopædia of Agriculture*:—"The business of draining, he remarks, 'considerably more tedious and difficult than where the superficial and subterranean parts have greater regularity. In such lands, as all the different collections of water are perfectly distinct from each other, by the beds of clay that separate them, evaporation becomes so much increased, or so much in the time of heavy rains, that they quite to the level of the surface of the soil, which they are surrounded; when it gets a free passage, as it would overflow from a bowl or dish, overflows, and the surface of that bed of clay in such a manner to render it so perfectly wet and so unproductive becomes not only annually more scanty, but the soil itself more unproductive. From the sand-beds, however, having no communication with the water, it must evidently require as many drains as there are beds of this kind, in order fully to carry off the water from each of them. A drain is therefore recommended to be cut from the nearest and lowest part of the field to be drained, up to the highest and to a sand-bank in such a line of direction as is possible, to pass through some of the intermediate sand-beds, and prevent the labor and making longer cuts on the sides, which would otherwise be requisite.

Where the different beds of sand are of less extent, and lie together with greater regularity, they can be drained in a more regular manner with less cutting, and of course less expense. Below the layers or beds of clay that lie, in this manner, alternately and nearly parallel to each other, is a body of impervious clay, which keeps the water that is contained in the sand, from being constantly full, renders the soil moist; and in wet seasons runs or tr-

in these cases, the principal under-stratum is rarely above four or five feet beneath the surface; a drain is advised to be cut to the middle of the field, if it is not from both sides; but if it declines, the drain must be made in that direction, so that water will more readily discharge; and unless the field be of great extent, or have more depressions or hollows in it, the drain may be quite sufficient for it, by crossing the different beds that it passes, it must take it off from each of the principal difficulties in draining ground, and which renders it impracticable, is when the direction of the strata, or beds of clay and sand, lie contrary to the declivity of the land, so that one drain will not serve than that of conveying the water after it has passed over the surface, and would naturally stagnate in it, if there was no other.

Where the land lies in this way, frequently the case, it will therefore be necessary to cut the drain in the lowest part, and cut up from it in a slanting direction, following the declivity, which by crossing the strata, or narrow strata of sand, will be of drawing the water from each of the drains in these cases, and ended that, after laying the bottom of a sough, or in the way of a drain, filled some way up by small stones, being applied, the green side down, and them before the mould is filled in. Stones cannot be readily procured, be employed in their place, where it is difficult: the under part of the drain is composed, with stones, so as to form a passage for the conveyance of the water, and sink through the faggots, and for the rendering them more durable; water cannot get freely off, which is the case where there is not an opening of some solid material, it must, by its weight, soon destroy the faggots, and the drain.

The art of draining retentive soils, is manifestly different from that which has been described. Many tracts of level land are the scene of the stagnation of a superabundant water in the upper parts of the surface, which does not rise up into them, or into the springs below. The retentiveness in these cases may, for the most part, be effected without any very heavy labour, from the upper or surface soil, in being constituted of a loose porous material, to the depth of from two to six feet, which has a stiff retentive body beneath it, any water that may come from the surface from heavy rains, or other causes, will filtrate and sink down through the porous body of clay, which is the obstructing body of clay, and from proceeding; the consequence is, that the porous open soil is filled and saturated with water, as to the utility for the purpose of producing grain or grass. Land situated in these cases is frequently said by farmers to be wet-

bottomed. In order to remove this kind of wetness, it seldom requires more than a few drains, made according to the situation and extent of the field, of such a depth as to pass a few inches into the clay, between which, and the under surface of the porous earth above, there will obviously be the greatest stagnation, and consequently, collection of water, especially where it does not become much visible on the surface. In these cases there is not any necessity for having recourse to the use of the boring instrument, as there is no water to be discharged from below. When the field to be drained has only a slight declination, or slope, from the sides towards the middle, one drain cut through the porous superficial materials into the clay, in the lowest part of the ground, may be sufficient to bring off the whole of the water detained in the porous soil. This effect may likewise be greatly promoted, by laying out and forming the ridges so as to accord with the direction of the land, and by the use of the plough or spade in removing obstructions, and deepening the furrows. In such situations, where the drain has been formed in this manner, the water will flow into it through the porous surface materials, as well as if a number of small trenches were cut from it to each side, as is the practice in Essex and some other parts of the country; but which is often an unnecessary labor and expense. The drain made in the hollow may frequently serve as a division of the field, in which case it may be open; but in other circumstances it may be more proper to have it covered. Where a field of this description has more than one hollow in its surface, it will obviously be requisite to have more than one main drain; but when it is nearly level, or only inclines slightly to one side, a trench or drain along the lowest part, and the ridges and furrows formed accordingly, may be sufficient for effecting its drainage. There may, however, be cases, as where a field is large and very flat, in which some side-cuts from the principal drain may be necessary, which must be made a little into the clay, and as narrow as they can be wrought, and then filled up with stones or other suitable materials.

What is called the *Essex method* of draining in ploughed springy lands, where the surface soil is tenacious, is described by Kent, and consists in substituting small under-drains for open furrows; or in some cases having a small under-drain beneath every other or every third furrow. These drains lead to side or fence ditches, where they discharge themselves. For draining of mines, see MINING.

Drains may be conveniently classed, as Mr. Loudon observes, under, 1. Drains of conveyance simply; and 2. Drains of conveyance and collection. The most complete drain of conveyance is a large pipe of metal, masonry, or brickwork: and the most complete collecting drain, one formed with a channel built on the sides, and covered with flat-stones, with a superstratum of round stones or splinters, diminishing to the size of gravel as they rise to the surface, and there covered with the common soil. As the best constructions, however, are not always practicable, the following are a few leading sorts

adapted for different situations. (We are indebted to Mr. Loudon for this selection).

For drains of conveyance, there are the walled or box drain, the barrel drain, the walled or the triangular drain, and the arched drain, fig. 1.

Fig. 1.

Fig. 2.

Drains of collection are formed of stone, brick, gravel, cinders, wood, spray, straw, turf, and earth alone.

The boxed and rubble drain, fig. 2, is a drain of conveyance and collection. The common rubble drain is formed of rough land-stones of any sort, not exceeding six or seven inches in diameter, thrown in the bottom, with smaller ones over, and, if to be had, gravel or ashes at top. On this is laid a thin layer of straw or haum of any kind, and the remainder is filled up with the surface soil.

The brick drain is formed in a great variety of ways, either from common bricks and bats in imitation of the boxed and rubble, or rubble drain; or by the use of bricks made on purpose, of which there are great variety. Draining tiles to be used with effect as collecting drains, should always be covered a foot in depth, or more, with stones or gravel.

The gravel or cinder drain is seldom made deep, though, if the materials be large, they may be made of any size. In general they are used in grass lands; the section of the drain being an acute-angled triangle, and the materials being filled in, the smallest uppermost, nearly to the ground's surface.

The wood drain is of various kinds. A very sufficient and durable construction consists of poles or young fir-trees stripped of their branches and laid in the bottom of the drain lengthways. They are then covered with the branches and spray. Another form is that of filling the drain with faggot-wood, with some straw over. A variety of this mode is formed by first setting in cross stakes to prevent the faggots from sinking; but they are of no great use, and often occasion such drains to fail sooner than common faggot drains, by the greater vacuity they leave after the wood is rotten. In some varieties of this drain the brush-wood is first laid down alongside the drain, and formed by willow, or other ties, into an endless cable of ten or twelve inches in diameter, and then rolled in, which is said to form an excellent drain with the least quantity of materials, and to last a longer time than any of the modes above mentioned. Some cut the brush-wood into lengths of three or four feet, and place them in a sloping direction with the root end of the branch in the bottom of the drain; others throw in the branches at random, with little preparation, and cover them with

spray, straw, or rushes, and finally the surface soil.

The spray drain is generally like the gravel drain, of small size, and formed like it, with an acute angled bottom. In general, the spray is firmly in; though in some cases it is previously formed into a cable, as in the brush-wood drain. Drains of this sort are much in use in grass lands, and when the spray of larch-wood, oak, or ling can be got, they are of great durability. The straw drain, when reeds, rushes, and straw is used, is sometimes made like the gravel drain, by pressing the loose material down, forming a cable; but in general the straw is twisted into ropes as big as a man's leg, with the aid of a machine, and three or more of these are laid in the bottom of a triangular drain, without the protection of three turves.

The turf drain, fig. 3, may be made of any convenient depth, but it must be at least the breadth of a turf at bottom. The drain being dug out as if it were to be filled with stones or any ordinary material; the operator next, with a spade three or four feet wide, digs a narrow channel along its length, clearing it out with the draining soil, and over this the turves, b, are laid without any other preparation, or any thing put over them, but the earth that was excavated. This is found to be a very cheap, and, considering the materials, a surprisingly durable method of draining; answering, in pasture-fields especially, the purposes that the farmer can expect to derive from drains constructed with more labor, and at a much greater expense. They are said to last frequently twenty years and upwards; but the period which it can be supposed they will continue to prove effectual, must depend on the nature of the soil, and the current of water.

The triangular sod drain is thus made: the line of drain is marked out, a sod is cut in the form of a wedge, the grass side being the narrowest, and the sods being from twelve to eighteen inches in length. The drain is then cut to the depth required, but is contracted to a very narrow bottom. The sods are then laid with the grass side downwards, and pressed as far as they will go. As the figure of the drain does not suffer them to go to the bottom, a cavity is left, which serves as a watercourse; the space above is filled with the earth thrown out.

The hollow furrow drain is only used in dry pastures. Wherever the water is apt to stagnate, a deep furrow is turned up with a deep plough. After this, a man with a spade paves the loose soil from the inverted sod, and walks it over the field, or casts it into hollow places. The sod thus paved, and brought to the surface, is restored to its original situation, with the grassy side upwards, as if no furrow had been made. A pipe or tube is thus formed beneath it, two or three feet

Fig. 3.

that deep in the bottom of the furrow, which is sufficient to discharge a considerable quantity of surface water, which readily sinks into it. These furrows, indeed, are easily choked up by any pressure, or by the growth of the roots of the grass; but they are also easily restored, and no surface is lost by means of them.

Pipe drains of turf are sometimes formed where the surface soil is a strong clay, as it is only turves from such a surface that are sufficiently durable. A semicylindrical spade is used to dig the turves, the ground plan of which presents a series of semicircles or half pipes. The drain being dug out to the proper depth, the turf is laid in the bottom, and another being placed over it completes the pipe. The same kind of pipe drain has been formed out of solid beds of clay, and has served for a time to convey water. As collecting drains, of course, they can be of little or no use. This mode of draining appears to have been first practised by Hannab, an ingenious farmer in Wigtonshire. Headed for the purpose of conveying water through running sand, in which only a pipe drain will for a moderate time. After a number of the clay turves were found effective in conveying away the water, and preventing the running away of the sandy sides of the drain.

**DRAKE, n.s.** Swed. *undrake*, from *drake*, a male; or *duckrake*, duck, and Goth. *reke*, a warrior or fighter, says Mr. Thomson; 'from noise it makes,'—Minsheu. The male of a drake; an old piece of ordnance.

Two or three shots, made at them by a couple of drakes, made them stagger. *Clarendon.*

Mourn, sooty coots, and speckled toals,  
Ye nasher herons, watching eels;  
Ye duck and drake, w' airy wheels  
Circling the lake, *Burns.*

**DRAKE**, in ornithology. See **ANAS**.

**DRAKE** (Sir Francis), the renowned English admiral, was the son of Edmund Drake, a sailor, and born near Tavistock, in Devonshire, in 1545. He was brought up under the care of Sir John Hawkins, who was his kinsman; and, at the age of eighteen, was purser of a ship trading to Biscay. At twenty, he made a voyage to Guinea; and, at twenty-two, was made captain of the Judith. In that capacity he was in the harbour of St. John de Ulloa, in the gulf of Mexico, where he behaved most gallantly in the actions under Sir John Hawkins, and returned with him to England with great reputation. He next projected a design against the Spaniards in the West Indies; which he no sooner published, than he had volunteers enough ready to accompany him. In 1570 he made his first expedition with two ships; and in 1571 with one only, in which he returned safe, if not with such advantages as he expected. He made another expedition in 1572, wherein he gained considerable booty. In these expeditions he was much assisted by a nation of Indians, who then were engaged in war with the Spaniards. The prince of these people was named Pedro, to whom Drake presented a cutlass from his side, which he saw the chieftain greatly admired. Pedro, in return, gave him four large wedges of gold; which Drake

threw into the common stock, saying, 'That he thought it but just that such as bore the charge of so uncertain a voyage on his credit, should share the utmost advantage that voyage produced.' Then, embarking his men with all the wealth he had obtained, which was very considerable, he bore away for England, where he arrived in August, 1573. His success in this expedition, joined to his honorable behaviour towards his owners, gained him a high reputation: and the use he made of his riches, a still greater. For, fitting out three stout frigates at his own expense, he sailed with them to Ireland: where, under Walter, earl of Essex, the father of the famous unfortunate earl (see **DEVEREUX**), he served as a volunteer. After the death of his noble patron, he returned into England, where Sir Christopher Hatton introduced him to queen Elizabeth. He now proposed a voyage into the South Seas, through the Straits of Magellan, which was what hitherto no Englishman had ever attempted. The project was well received at court: the queen furnished him with means; and his own fame quickly drew together a sufficient force. The fleet with which he sailed, or this extraordinary undertaking, consisted only of five vessels, small when compared with modern ships, and no more than 164 able men. He sailed on the 13th December, 1577: on the 25th fell in with the coast of Barbary, and on the 29th with Cape Verd. On the 13th March he passed the equinoctial, made the coast of Brasil on the 5th April, and entered the river de la Plata, where he lost the company of two of his ships; but meeting them again, and taking out their provisions, he turned them adrift. (On the 29th May he entered the port of St. Julian's, where he continued two months, for the sake of laying in provisions; on the 20th August he entered the Straits of Magellan, and on the 25th September passed them, having then only his own ship. On the 25th November he came to Macao, which he had appointed for a place of rendezvous in case his ships separated; but captain Winter, his vice-admiral, having repassed the Straits, returned to England. Thence he continued his voyage along the coasts of Chili and Peru, taking all opportunities of seizing Spanish ships, and attacking them on shore, till his men were sated with plunder; and then, coasting America to the height of 46°, he endeavoured to find a passage that way back into our seas, but could not. However, he landed, and called the country New Albion, taking possession of it in the name of queen Elizabeth; and, having careened his ship, set sail from thence, on the 29th September, 1579, for the Moluccas. He is supposed to have chosen this passage round, partly to avoid being attacked by the Spaniards at a disadvantage, and partly from the lateness of the season, whence dangerous storms and hurricanes were dreaded. On the 13th October he fell in with certain islands inhabited by the most barbarous people he had met with in his voyage: on the 4th November he had sight of the Moluccas; and, coming to Ternate, was well received by the king. On the 10th December he made Celebes, where, the 9th January following, his ship unfortunately ran on a rock, from which, how-

## DRAKENSTEIN.

ever, he got off. On the 16th March he arrived at Java Major, and on the 25th, began to think of returning home. He doubled the Cape of Good Hope on the 15th June, having then on board fifty-seven men, and but three casks of water. On the 12th July he passed the line, reached the coast of Guinea on the 16th, and there watered. On the 11th September he made the island of Tercera, and on the 3d November entered the harbour of Plymouth. This voyage round the world was performed in two years and about ten months. Shortly after his arrival, the queen going to Deptford, went on board his ship, where, after dinner, she conferred on him the order of knighthood, and declared her approbation of all he had done. She likewise gave directions for the preservation of his ship, that it might remain a monument of his own and his country's glory. This celebrated ship, which had been laid up many years at Deptford, at length decaying, it was broke up, and a chair, made out of the planks, was presented to the university of Oxford. In 1585 he sailed with a fleet to the West Indies, and took the cities of St. Jago, St. Domingo, Carthagena, and St. Augustin. In 1587 he went to Lisbon with a fleet of thirty sail; and having intelligence of a fleet assembled in the bay of Cadiz, which was to have made part of the Armada, he with great courage entered that port, and burnt there upwards of 10,000 tons of shipping, which he afterwards merrily called 'burning the king of Spain's beard.' In 1588, when the Armada from Spain was approaching our coasts, Sir Francis Drake was appointed vice-admiral under Charles lord Howard of Effingham, high admiral of England, where fortune favored him as remarkably as ever; for he made prize of a very large galleon, commanded by Don Pedro de Valdez, who was reputed the projector of this invasion; and who surrendered, as soon as he learned it was Drake who summoned him. This Don Pedro remained about two years Sir Francis Drake's prisoner in England; and, when he was released, paid him for his own and his captains' freedom, a ransom of £3,500. Drake's soldiers were well recompensed with the plunder of this ship, for they found in it 55,000 ducats of gold, which were divided among them. In 1589 Sir Francis Drake commanded, as admiral, the fleet sent to restore Don Antonio, king of Portugal; the command of the land forces being given to Sir John Norris: but they were hardly got to sea, before the commanders differed, and so the attempt proved abortive. The war with Spain continuing, a more effectual expedition was undertaken by Sir John Hawkins and Sir Francis Drake, against their settlements in the West Indies, than had hitherto been made during the whole course of it: but the commanders here again not agreeing about the plan, this also did not turn out successfully. All difficulties, before these two last expeditions, had given way to the skill and fortune of Sir Francis Drake; which probably was the reason why he did not bear these disappointments so well as he otherwise would have done. A strong sense of them is supposed to have thrown him into a melancholy, which occasioned a bloody flux; and of this he

died on board his own ship, near the island of Nombre de Dios, in the West Indies, on the 28th January, 1595-6. His death was lamented by the whole nation. In the seventh parliament of queen Elizabeth, he was elected burgess for the town of Liskeard, in Tintagel, in the county of Cornwall, and for Plymouth in Devonshire, in the first of the same reign. This town had very great obligations to him: for, in 1487, he began to bring water into it, through the want of which till then, it had been grievously distressed; he performed it by conducting thither a conduit from springs eight miles distant in a straight line, in the manner he brought it, the conduit runs upwards of twenty miles.

DRAKE (James), an English physician and author, born at Cambridge in 1667, and died at that university, where he took his degree. In 1704 he published a pamphlet, entitled *A Memorial of the Church of England*, wherein such offence that a proclamation was issued discovering the author, which obliged him to keep concealed for some time. He was afterwards prosecuted for the publication of a newspaper, entitled *Mercurius Politicus*; and although he was acquitted, it is supposed the vexation threw him into a fever, of which he died in 1707. Besides the above, he published a *System of Anatomy*, 3 vols. 8vo; a translation of Herodotus; a play, called the *Shadlowyer*, &c.

DRAKE, in geography, a harbour of Callao, so called after the celebrated Sir Francis Drake, who discovered and took possession of the peninsula.

DRAKENSTEIN, a district in the interior of the Cape of Good Hope. The division goes by the general name of 'Stellenbosch and Drakenstein' includes a large portion of the territory. See *STELLENBOSCH*; but the Drakenstein is peculiarly applied to two broad and extensive valleys situated about one hundred and forty miles from Cape Town, at the foot of the mountains. They are called the valleys of Great and Little Drakenstein, and are to the east of the district of Stellenbosch, sheltered by lofty mountains, and watered throughout by the Berg and its minor streams. The subdivision Little Drakenstein is enclosed by the large valleys, and the two together supply a large portion of the wine of the Cape. West of the valley is the village of Paarl, surrounded by a fine tract of land, and distinguished by a mass of granite, surmounted with a number of large round stones, like the pearls of a necklace. Mr. Anderson, Captain Cook's surgeon, describes it as at least half a mile in circumference, and appearing in its highest part 'to resemble the dome of St. Paul's church. It is one unintermitting mass, or stone,' he adds, 'if we except the fissures, or rather impressions, not more than two or four feet deep, and a vein which runs near its north end. It is of that sort of stone called by mineralogists *saxum compactum*, and consists chiefly of pieces of mica, quartz, and glimmer, held together by a clayey matrix. But the vein which crosses it, being of the same materials, is much compacter. The

not above a foot broad or thick, and its surface cut into little squares or oblongs, disposed irregularly, which makes it look like some artificial work. But I could not observe whether it penetrated far into the large rock or was only superficial.' Cook's Voyages, vol. v. p. 109. The same gentleman described this remarkable cone, at length, in a letter to Sir Joseph Banks, which is inserted in the Philosophical Transactions, vol. lxxviii. part. I. p. 102, and sent home a specimen of it which induced William Hamilton to suppose it to have been caused by a volcanic explosion. Mr. Barrow considers this a perfectly gratuitous assumption, and describes it as of similar materials with the other mountains of the colony, viz. aggregates of quartz and mica; the first in large irregular masses, and the latter in black lumps resembling basalt, mixed with pieces of felspar, and bound together by a clayey iron ore. The pearl and diamond he speaks of as two distinct central parts of the summit, of which the latter is the highest block, and shaped like a cone. The pearl is accessible on three sides, and rises about 400 feet from its base on the summit of the mountain, where it measures in circumference, according to this writer, a full mile. The sloping northward side, by which it is ascended, is upwards of 1000 feet in length, and nearly covered with species of green lichen. Towards the summit it is split by two deep clefts crossing at right angles, in which grow a number of beautiful plants, and several cryptogamous plants.

On the side of the mountain numerous species of the protea, particularly the mellifera, mingle with the lively green of the wild olive, and the constant and almost endless tribe of heaths for which the colony is so remarkable, and some of which have here the growth and appearance of considerable trees. The fruit of this olive is too small for use, but the wood is close grained, and is said to bear a fine polish. The mellifera yields a saccharine juice in the bottom of its leaves, which is considered as an excellent stomachic by the inhabitants of the district, and is occasionally boiled down with preserves, in the place of sugar. They call it the sugar-tree. The scenery of this spot in the autumn is exquisitely beautiful.

At the north, or upper end of the valley of Drakenstein, are the divisions of Dall Josephat, Waggon-maker's Valley, and Groenberg. The latter being a projecting eminence that bounds the valley northward, and participating in the fruitful character of the surrounding scene. Corn, vines, and fruits adorn its sides,—all of good quality; and the finest peaches and oranges of the colony grow in the two little dales at its feet. Little Drakenstein, the Paarl village, Franche Hook, and the three last subdivisions, northward, embrace all the divisions of this remarkable valley.

The oaks in this valley commonly reach from twenty to thirty feet in height in the stem, and measure from ten to eighteen feet in circumference; many are larger; they appear to grow more freely and naturally in the degree of shelter they here find from the violent winds: the tops are not so bent as in the neighbourhood of Cape

Town, nor is the grain of the wood, when cut, so irregular and twisted. The whole valley is well inhabited, so that few wild animals appear in the day-time; but hyenas, wolves and jackals descend from the mountains at night. Game abounds in the thick shrubbery; particularly the duiker (the diver or plunger) and the griesbock or grizzled deer; nor is the steenbok, once so plentiful as to be supposed to have given name to the neighbouring drosdy, wholly driven from the northern hills. The duiker stands about two feet and a half high, and measures upwards of three feet in length; his color is a dusky brown, and the male has black straight horns, about four feet long, and nearly parallel. The female is without horns. The griesbock is rather smaller, and of a grizzled brown color; in every other respect it is of similar appearance with the duiker. Both these animals commit considerable depredations on the young branches of the vine. Hares are numerous in the valley; common and red-winged partridges (which are as tame as poultry) quails, snipes, widgeons, and other species of wild ducks. In the mountains, both northward and eastward, are found the reebok, and the klip-springer, as he is called, or rock-leaper, the fleetest animal, perhaps, and the most formed for agility, of any in the world. His cloven hoofs are each divided into two segments, and jagged at the edges, so that he will adhere, like an insect, to the smoothest and steepest parts of the rocks. His color is a cinereous gray, and his hair is used as the best stuffing for mattresses, chairs, and saddles. No dog has any chance of keeping up with this animal, but he is easily shot as he leaps from rock to rock. The Paardeberg, or Horse Mountain, and Rick-beck's Casteel or Castle, form a continuation of the Paarl Mountain, northward. Here the zebra, Kolben's 'wild ass,' or horse, formerly abounded; at present neither horses nor cattle are reared here, except for agricultural purposes. See CAPE OF GOOD HOPE.

DRA'MA, n. s. } Fr. drame; Lat. DRAMAT'IC, adj. } drama; Gr. δραμα, a DRAMAT'ICAL, } scene, from δραω, to DRAMAT'ICALLY, adv. } act. A poem representing action, or in DRAMATIST, n. s. } which actions are supposed to be carried on, not related. A dramatist is the author of a drama.

Many rules of imitating nature Aristotle drew from Homer, which he fitted to the drama; furnishing himself also with observation from the theatre, when it flourished under Æschylus, Euripides, and Sophocles. Dryden.

Ignorance and errors are severely reprehended, partly dramatically, partly simply. Id.

I hope to make it appear, that, in the great dramatic poem of nature, is a necessity of introducing a God. Bentley.

The whole theatre resounds with the praises of the great dramatist, and the wonderful art and order of the composition. Burnet's Theory.

There is a kind of drama in the forming of a story, and the manner of conducting and pointing it, is the same as in an epigram. Steele.

To distress them as nothing human ever was distressed, to deliver them as nothing human ever was delivered, is the business of a modern dramatist. Johnson.

In short, his idea is to *dramatise* the penal laws, and to make the stage a court of case to the Old Bailey.

*Sheridan.*

**DRAMA.** The drama is, for the greater part, as Dr. Johnson has defined it, an adaptation of poetry to fictitious representation and dialogue. But it is not confined to any single form that language may have assumed. The works of our greatest dramatist are interspersed occasionally with prose; and the sources of the influence of the dramatic art over our minds lie deep in the constitution of our nature. Neither are the scenic representations of our theatres essential to a just perception of the beauties, or a full resignation of the mind to the power, of this enchanting art. They are but the trappings that occasionally adorn, but often impede its progress. Man, in the lowest stages of civilisation, exhibits rude and barbarous attempts to arrive at the pleasure which the drama is calculated to impart. The inhabitants of China, and even of the islands of the South Sea, secluded from the influence of European example, participate in amusements resembling, in species, those of the theatre: and we observe in the earliest pastimes of children, imitations and representations of the conduct of their elders and superiors. They not only indulge in the mimicry of objects immediately before them, but frame out for themselves fancied similitudes of things, of which they can only have very partial knowledge. They 'pipe and they dance;' they 'mourn and they weep,' in early dramas: thus eagerly going out of themselves towards objects which have acquired a hold on the imagination and the heart. The Hindû theatre is extensive and various. Dramas bearing internal and almost indubitable evidence of being at least 500 years old (if not twice that age), could be adduced in proof of the early excellence of the Hindûs in that species of composition.

But it is to ancient Greece and her rhapsodists, tragedians, and comedians, that we must look, historically, for the origin of this art. The modern distinction between the province of the epic and the dramatic poet, was, in the rise of those pursuits, unknown. In the impassioned recitations of the rhapsodist, in the journeyings and declamations of Homer, they were mingled; while, in the orgies of Bacchus, the historians of the dramatic art are accustomed to trace its first distinct appearance. It was customary, at the feasts of this deity, to sacrifice a he-goat, that animal being supposed to be peculiarly obnoxious to the god, in consequence of the injuries the vine received from its bite. On these occasions, religious hymns were chanted in honor of the festive god, and rustic poets and reciters contended for the prize of victory. The compositions, at first produced on these occasions, were merely lyrical. To relieve the singer, however, and vary the gratification of the audience, interlocutors were soon introduced, who filled up the pauses of the song with short narratives of some heroic event. Thespis and Phrynicus added a little to this idea, by making one entire story occupy, in continuation, all the pauses of the song. In consequence of this improvement, the odes became subordinate, in some degree, to the narration, and

seemed to interrupt it at intervals. Drama, however, was still unknown; and, as far as is considered essential to the drama, *Æschylus* must be given the praise of invention.

This distinguished poet was born, as is generally stated, in the 69th, but on better authority, in the 63d Olympiad. *Bacchus*, it is said, appeared to him in a dream, in his early age, and commanded him to write tragedies. It is far better established that he was a general in the battle of Marathon, fought in the year before Christ 490; and that he was, like the father of the British drama, *Shakespeare*, an actor in his own plays. Before his time the Greek had no regular theatre. The faces of the performers, stained with the lees of wine, they exhibited themselves in the cart of *Thespis*, a kind of war-bank stage. To this succeeded a theatre of wood; and to that, a more permanent building of stone.

But the improvement of the *chorus* in ancient tragedy, was the most important of the alterations which it owed to *Æschylus*. It consisted of hymns sung in honor of *Bacchus*; we have intimated, and constituted, at first a principal part of the performance. It grew, however, diminished in importance, as the character of the drama became developed. *Æschylus* first gave it that peculiar and sanctified form which is so characteristic of the Greek plays. He found it composed of a body of musicians whose lyrical performances were independent of the incidents of the poem. He makes them to sympathize with all that is transpiring on the stage, and, in effect, to be the echo of the feelings of the audience. He divided the chorus, which was formerly sung by a single person, named the *Coryphæus*, who frequently spoke or sung alone, into two or three bands, who addressed and replied to each other. 'By this means,' as Sir Walter Scott observes, 'the two unconnected branches of the Greek choral revels were combined together; and we ought rather to be surprised that *Æschylus* ventured, while accomplishing such a change, to render the hymns sung by the chorus subordinate to the action or dialogue, than that he should take the bolder measure of altogether discarding that which, before his time, was reckoned the principal object of a religious entertainment.'

The ancient tragedy was principally concerned in the development of some great event, enhancing the fortunes of a dynasty, or marking the fate of a nation. Exalted personages, the sport of a luckless destiny, hurled by the gods, or something above the gods, from the heights of their greatness to the depths of wretchedness, gave to the representation a dark and deep interest, hurrying the mind irresistibly to the wildest extremes of mortal condition, surprising the soul with fearful examples of instability in the things on which man reposes with the proudest confidence. The modern drama, with more artificial contrivances and intricacy of plot, shakes the mind with rapid alternations of feeling, sustaining and dissipating its emotions by the anxiety of suspense, the hope of expectation, and the shock of discovery.

entre among the Greeks was probably magnificent conceptions of their ideal stages capable of exhibiting places almost in their real magnific proportions. Neither did their assist of tinsel ornaments, which their amidst a profusion of artificial the genuine productions of the the great events they celebrated beneath the cope of an unclouded the scene was formed to harmon- expense nor labor was spared to representation perfect in its minutest the mask and the buskin, though id to our dramatic style, were the stages of that of Athens. The chief attained was a magnificent ideal

new to the other branch of the art, who flourished about B. C. 450, is of any consideration in comic drama. Philologists and philosophers the derivation of the word *κωμῳδία*, *κωμη*, a 'village,' and have ex- son for this derivation; but they inform us who first introduced or characters, the actors, and the pro- plete here confesses his incapacity: tely suggests the true allusion of *κωμῳδία*, and combats the absurd being derived from *κωμος*, com- revel. *Ὡς κωμῳδός, ἢ ἀπὸ τοῦ γεῖτας ἀλλὰ τῇ κατὰ κωμῶν πλάνῃ, ἢ τῇ εἰσιῶσι.* 'Comedians were a wandering in the *κωμῶν*, or vil- gracefully expelled from the city.' His language would induce us to comic followers of Thespis were a respectable in the origin of the e estimation of many of the legis- alists of modern times, and ill mparison with the more dignified pursuits of the tragedians. Arist- attempt a definition of comedy. 'from the first, he observes, 'for, d not, till a late period, allow a edians, but formerly they were vo- l only conjectures that as the *Iliad* brewed the materials of tragedy (for dlesses that his repasts consisted ants from the banquet of Homer), mer, that the Margites of the bard e the same analogy to comedy. i precise nature of this work, how- k philosopher does not condescend is understood to have been a ludi- cal poem at the expense of some pedagogue. The Greek comedy ew progress, and had originally but pon the public mind, as compared usful efforts of the early tragedians. er shades of human character, the les, the characteristic traits of fri- which the whole structure of comedy at, were not observed, because they ren elicited by circumstances, and a more artificial state of society. idy nor satire could have found ropy nor feelings to work upon in

the earlier ages of the world: the whole inhab- tants of a district were divided mainly into two classes—those of the artisan and the soldier: and the simplicity and necessities of the one, and the bullying insolence of the other, were almost the only topics upon which the old comedy could descant. There was little subdivision of labor, and no subdivision of character, to furnish the Proteus-shapes of the modern comic muse.

In the old comedy of Greece the illustrious statesmen, generals, and public characters of the commonwealth were brought forward on the stage, and held up to ridicule by name before an applauding audience, until it was deservedly su- perseded by what is termed the middle comedy which abolished the chorus, and compelled the poet to substitute for any real personages or characters, in whom he attempted to satirize the vices and follies of the times, disguised or ficti- tious names. This soon gave way in its turn to the new comedy, having for its object the ludi- crous incidents and mortifications of private life. It included also some scenes which call forth pa- thetic emotion, and approached more nearly to the character of tragedy than had been admitted in the ancient comedies of Aristophanes. An agreeable intermediate species of composition was thus introduced, which became the founda- tion of the modern drama. The translations of Menander, in Plautus and Terence, give us the only remaining specimens of the new comedy.

Of the Roman tragedy the works of Seneca are the only existing remains. The alterations, indeed, which the Romans made in the drama- tic art are of little importance to its history. They lessened the theatres; and the orchestra, or, as we should say, the pit of the theatre was no longer left vacant for the occasional occupa- tion of the chorus, but was filled with senators, knights, and the more respectable citizens. The stage was thus brought more near to the eye of the better class of the audience. But an im- portant revolution was effected among this great people in the rank and estimation in which actors were held. 'The ancient Romans,' says Augustus, 'accounting the art of stage-playing and the whole scene infamous, ordained that this sort of men should not only want the honor of other citizens, but also be disfranchised, and thrust out of their tribe by a legal and disgrace- ful censure, which the censors were to execute; because they would not suffer their vulgar sort of people, much less their senators, to be de- famed, disgraced, or defiled with stage-players;' which act of theirs he calls 'an excellent true Roman prudence, to be enumerated among the Romans' praises.' Individual players, however, it is but just to add, rose to high public estima- tion. Cicero called the celebrated Roscius his friend; and Paris, the actor, preserved the life of Statius.

It has been admitted on all hands, that the progress of Christianity was unfavorable to the theatre. The primitive Christians regarded it with a double dislike: first, upon the account of its origin, as connected with heathen superstition; and, secondly, for 'the beastly and abominable license practised in the pantomimes, which, al- though they made no part of the regular drama,

were presented, nevertheless, in the same place, and before the same audience.'—'We avoid your shows and games,' says Tertullian, 'because we doubt the warrant of their origin. They savor of superstition and idolatry; and we dislike the entertainment, as abhorring the heathen religion on which it is founded.' Yet were these exhibitions never formally and legally abolished, even where Christianity became the religion of the state.

The Mysteries of the dark ages, like the orgies of Bacchus, first introduced a species of modern drama, mingled with superstitious rites. 'Whatever name they assumed,' says Sir Walter Scott, they 'were often so unworthy of the Christian religion, on which they were founded, that their being tolerated can be attributed only to the gross ignorance of the laity, and the cunning of the Catholic priesthood, who used them, with other idle and sometimes indecorous solemnities, as one means of amusing the people's minds, and detaining them in contented bondage to their spiritual superiors.' To these succeeded the Moralities, and the Romantic Dramas, cultivated so successfully in the sixteenth century in Spain, and upon the model of which the English drama suddenly arose to comparative perfection in the reigns of queen Elizabeth and James I.

We now, therefore, arrive at the modern distinction between the romantic and the classical drama; and, in the history of our own dramatic productions, these different kinds of composition are most strikingly exemplified.

Shakspeare stands alone and unrivalled among the poets who cultivated the former species. In his hands the art bounded as it were to a sudden and instantaneous perfection;—himself his own legislator and example;—freed from all external influence, and unfettered by any other rules, but those which great minds create for themselves;—and confessedly beyond the reach of imitation, not merely in respect of that poetic genius which carried him into the most sublime and pathless tracks of human thought, but of the form and fabric of his dramas.

The shape and modification of the other class were deduced from the canons of that French criticism which obtained a footing amongst us at the time of the Restoration, and constituted that secondary or reflected Greek tragedy, which, though frequently confounded with the ancient school, is at best but its type or shadow. Primarily, however, it took 'its form and pressure' from the unities, which, originating in a paraphrastic distortion of a passage in Aristotle, have held so despotic an influence over the dramatic writings of France. Its leading attributes are these:—a prologizing development of the story in the shape of a regular narrative recited by a subordinate agent, the immeasurably long speeches of the dialogue, and consequently the absence of rapid and vehement action. Add to this, the predominance of love over the destinies of the personages; a passion, 'according to Dryden, the great apologist of the school,' of such general concernment, that it delights to see its own image in a public entertainment.

Dr. Johnson well remarks upon this subject, 'He that, without diminution of any other excellence, shall preserve all the unities unbroken,

deserves the like applause with the man who shall display all the orders of military in a citadel, without any deduction of strength; but the principal beauty of a drama is to exclude the enemy; and the greatest grace of a play is to copy nature, and mirror the world.

'The necessity of observing the unities of time and place,' says this great writer, 'in the face to Shakspeare, arises from the urgent necessity of making the drama credible. The critics hold it impossible, that an action of many hours; or that the spectator can suppose himself to sit in the theatre, while ambassadors are returning between distant kings, while armies are levied, and towns besieged, while an exile endures and returns, or till he whom they are seeking his mistress, should lament the untimely death of his son. The mind revolts from credulity, and fiction loses its force when it differs from the resemblance of reality.

'From the narrow limitation of time necessarily arises the contraction of place. The spectator, who knows that he saw the first act at Alexandria, cannot suppose that he sees the same at Rome, at a distance to which not the dragon of Medea could, in so short a time, have transported him; he knows with certainty that he has changed his place, and he knows that place cannot change itself; that what was a house must become a plain; that what was Thebes must become Persepolis.

'Such is the triumphant language with which a critic exults over the miseries of an imperfect poet, and exults commonly without reason in reply. It is time, therefore, to tell him, that the authority of Shakspeare, that he assumes as an unquestionable principle a position, that while his breath is forming it into words, his understanding pronounces to be false. It is false, that any representation is instantaneous reality; that any dramatic fable, in its materiality, was ever credible, or, for a single moment, was ever credited. The objection arising from the impossibility of passing the first act at Alexandria, and the next at Rome, does not arise, that when the play opens, the spectator imagines himself at Alexandria, and knows that his walk to the theatre has been a voyage to Egypt, and that he lives in the days of Cleopatra. Surely he that imagines may imagine more. He that can take no time at one time for the palace of the Ptolemies, can take it in half an hour for the promenade of Actium. Delusion, if delusion be admitted, has no certain limitation; if the spectator can be persuaded that his old acquaintance is the elder and Caesar, that a room illuminated by candles is the plain of Pharsalia, or the bed of Graneus, he is in a state of elevation above the reach of reason, or of truth, and, from the help of empty poetry, may despise the common speculations of terrestrial nature. There is no reason why a mind thus wandering in ecstasy should count the clock: or why an hour should not be a century in that calature of the brain which makes the stage a field. The truth is, that (judicious) spectators are always in their own mind, and know, from the first act to the last, what

is only a stage, and that the players are players. They come to hear a certain number of lines recited with just gesture and modulation. The lines relate to some place, and an action must be in some place; different actions that complete a story may be placed very remote from each other; and it is the absurdity of allowing that space to exist first Athens, and then Sicily, which was unknown to be neither Sicily nor Athens, in modern theatre?

By supposition, as place is introduced, time is extended; the time required by the fable is for the most part between the acts; for, much of the action as is represented, the actual poetical duration are the same. If, in the first act, preparations for war against Mithridates are represented to be made in Rome, the end of the war may, without absurdity, be represented in the catastrophe, as happening in Asia; we know that there is neither war, nor preparation for war; we know, that we are neither in Rome nor Pontus; that neither Mithridates nor Lucullus are before us. The drama and its successive imitations of successive actions, and why may not the second imitation represent an action that happened years after the first, if it be so connected with it, that nothing can be supposed to intervene? Time in all modes of existence, most obsequious to imagination; a lapse of years is as easily contracted as a passage of hours. In contemplation we contract the time of real actions, and are willingly permit it to be contracted; we only see their imitation. It will be asked, how the drama moves, if it is not credited? credited with all credit due to a drama. It is acted, whenever it moves, as a just picture of the real original; as representing to the audience what he would himself feel, if he were to do what is there feigned to be suffered or done. The reflection that strikes the heart is that the evils before us are real evils, but they are evils to which we ourselves may be subjected. If there be any fallacy, it is not that we fancy the players, but that we fancy ourselves happy for a moment; but we rather lament the possibility, than suppose the presence of it, as a mother weeps over her babe, when she remembers that death may take it from her. The delight of tragedy proceeds from our consciousness of fiction; if we thought murders and miseries real, they would please no more. Dramatic imitations produce pain or pleasure, not because they are mistaken for realities, but because they bring realities to mind. When the imagination is recreated by a painted landscape, the eye is not supposed capable to give us shade, or the fountains coolness; but we consider how we should be pleased with such fountains play-side us, and such woods waving over us. We are agitated in reading the history of Henry, if no man takes the book for the field of battle. A dramatic exhibition is a book replete with concomitants that increase or diminish the effect. Familiar comedy is often more powerful in the theatre than in the page; imperial dignity is always less. The humor of Petronius may be heightened by grimace; but what

voice or what gesture can hope to add dignity or force to the soliloquy of Cato? A play read affects the mind like a play acted. It is therefore evident, that the action is not supposed to be real, and it follows, that between the acts a shorter or longer time may be allowed to pass, and that no more account of space or duration is to be taken by the auditor of a drama, than by the reader of the narrative, before whom may pass in an hour the life of a hero, or the revolutions of an empire.

We cannot pursue, in detail, the claims of modern dramatists to distinction. Theatrical performances, and consequently theatrical writings, were from religious motives suspended during the life of Cromwell; but at the accession of Charles, the drama re-appeared with a licentiousness that has scarcely been equalled in any other age or country. No species of literature was more admired, or more debased, than this. Milton had, some years before, in his *Comus* and *Sampson Agonistes*, endeavoured to introduce the Grecian model, but his efforts were in vain. The profaneness and nauseous indecency which characterised the dramatical writings of Charles's time had not even the veil of refinement to render them less disgusting. Folly, absurdity, and a dereliction of all the ancient rules of the drama, and even of common sense itself, were visible on every side. From this account little abatement can be made during the remainder of the century.

The celebrated play of the *Rehearsal* produced indeed some effect; but a more considerable time was required, entirely to change the prepossessions of the age. Even Dryden himself, though a writer of great original powers, was infected with a full proportion of the faults of his contemporaries. We must not, however, regard, as barren of dramatical genius, a century which began in the life-time of Beaumont, Fletcher, Jonson, and even Shakspeare himself, and which afterwards gave birth to Otway, Lee, Dryden, and others, whose names are still deservedly celebrated in dramatical literature. But, in the eighteenth century, the drama became more regular in its composition, and less openly impure in its language and sentiments. Collier having collected together a variety of offensive passages from the writings of our dramatic authors, the public, not wholly dead to taste and decency, started with displeasure at the disgusting recital, and having perceived the hideousness of such passages in combination, determined no longer to tolerate them in detail. From this time, not even the genius of Congreve could reconcile them to gross impurity; so that, although much, very much, still remains which modesty can by no means approve, we have never reverted to that open licentiousness which our dramatists were at one time accustomed to display. The taste of the eighteenth century was farther evidenced by the rejection of rhyming plays, and a growing admiration for the works of Shakspeare. Bombast of language was no longer confounded with loftiness of idea, nor a series of puns or quibbles mistaken for the feativity of genuine wit.

Modern dramatic poetry may be considered as comprehending tragedy, comedy, and farce.

These are sufficiently distinguished by their general spirit and strain. While pity and terror, and the other strong passions, form the province of the tragic muse, the chief instrument of comedy and farce is ridicule.

These last two species of composition are indeed so perpetually running into each other, that they can hardly be distinguished: it is true that what is now known by the name of farce, is too much inclined to the extravagance of ridicule; but the most commendable specimens of this kind of entertainment differ in nothing essential from proper comedy.

'Comedy proposes for its object,' says Dr. Blair, 'neither the great sufferings, nor the great crimes of men; but their follies and slighter vices, those parts of their character which raise in beholders a sense of impropriety, which expose them to be censured and laughed at by others, or which render them troublesome in civil society.'

'The subjects of tragedy are not limited to any age or country; but the scene and subject of comedy should always be laid in our own country, and in our own times. The reason is obvious; those decorums of behaviour, those lesser discriminations of character, which afford subject for comedy, change with the differences of countries and times; and can never be so well understood by foreigners as by natives. The comic poet, who aims at correcting improprieties and follies of behaviour, should catch the manners living as they rise. It is not his business to amuse us with a tale of other times; but to give us pictures taken from among ourselves; to satirize reigning and present vices; to exhibit to the age a faithful copy of itself, with its humors, its follies, and its extravagancies.'

'Comedy may be divided into two kinds: comedy of character, and comedy of intrigue. The former is the more valuable species; because it is the business of comedy to exhibit the prevailing manners which mark the character of the age in which the scene is laid: yet there should be always as much intrigue as to give us something to wish and something to fear. The incidents should so succeed one another, as to produce striking situations, and to fix our attention; while they afford at the same time a proper field for the exhibition of character. The action in comedy, though it demands the poet's care in order to render it animated and natural, is a less significant and important part of the performance than the action in tragedy; as in comedy it is what men say, and how they behave, that draws our attention, rather than what they perform or what they suffer. In the management of characters, one of the most common faults of comic writers is the carrying of them too far beyond life. Wherever ridicule is concerned, it is indeed extremely difficult to hit the precise point where true wit ends and buffoonery begins. When the miser in Plautus, searching the person whom he suspects of having stolen his casket, after examining first his right hand, and then his left, cries out, *Ostende etiam tertium*. Show me your third hand, there is no one but must be sensible of the extravagance. Certain degrees of exaggeration are allowed to the comedian, but there are limits set to it by nature and good taste; and supposing the miser to be ever so much engrossed by his jealousy and

his suspicions, it is impossible to connect a man in his wits suspecting another of having more than two hands.' See *POETRY*.

**DRAMMEN**, a town in the government of Christiania, Norway, consisting of two places; Hragernæs and Strömose, the former one on the north and the other on the south of the river Drammer, which here discharges itself into the gulph of that name. A great quantity is here carried on in timber and iron vessels from the interior. The harbour admits only small vessels. Population of the whole place 6000. Twenty miles south-west of Christiania.

**DRANCE**, a river of Switzerland, discharges through the lower Valais, and falls into the Rhone. In June, 1818, a dreadful inundation occurred here, from an accumulation of ice at the mouth of this river in the narrow valley of lake Lemano. The fall of an enormous avalanche, or rather ice, had blocked up the mouth of the valley, and the waters of the Drance were thus forced into the lake, acquiring additional height daily. The expedient was to cut a canal through the ice, to stop the farther accumulation of water. This was accordingly done, and the water, flowing through the channel, fell on some days on the opposite side into the Rhone, forming a magnificent cascade of 16th, however, the accumulated mass was so narrow bounds, and overwhelming that it lay, as far as the bed of the Rhone, over trees, cottages, and cattle, with a great loss of the inhabitants of Champsee and Martigny.

**DRAPE**, *v. n.* Fr. *drap*; low, *la*.

**DRA'PER**, *n. s.* *pus*. To make cloth.

**DRA'PERY**, *n. s.* *per* is he who sells cloth.

**DRA'PER**, *n. s.* *ful* commodity; and cloth-work; and, in a particular sense, cloth-work; hence the cloth itself when made, and the dress made of it. Hence also the art of flowing dress, robes, or stuff. *Drapery* by Spenser as synonymous with *draper*.

Thence she them brought into a study hall,  
Wherein were many tables fair dispos'd,  
And ready dight with drapers' wares,  
Against the vizards should be ministr'd.

It was rare to set prices by statute, and did not proscribe prices, but stated them at a rate, that the clothier might draper as he might afford.

He made statutes for the maintenance of the and the keeping of wools within the realm.

If a piece of cloth in a draper's shop be folded, it will appear of differing colours.

The draper and mercer may measure.

Ports are allowed the same liberty in descriptions and comparisons, as painters in pictures and ornaments.

I could wish, for the sake of my country, that there was such a kind of everlasting law, be made use of by all who live at a certain distance from the town, and that they would agree to fashions as should never be liable to change or innovation.

The Bulls and Frogs had served the law with drapery ware for many years.

*Arbuthnot's History of John Bull*

length, and men, and maids, who

spectacle their eyes before!

series, Julia swooned,  
ing, breathless, by the door,  
drapery scattered on the ground,  
and several footsteps, but no more.

Byron.

(r William), an English general,

He received his education at Eton  
college, Cambridge, after which he  
East Indies, where he rose to the  
el. In 1763 he took Manila, in  
with admiral Cornish; but the fort  
from plunder, on condition of pay-  
of 4,000,000 of dollars, which was  
ged. The commander was, how-  
a knight of the Bath. In 1769 he  
in a controversy with Junius, in de-  
fence of the marquis of Granby. In 1769  
he was appointed lieutenant-governor of Mi-  
chigan that place surrendered to the  
English on the night an accusation against general  
governor, but after his trial general  
demanded by the court to make an  
apology. General Draper died at Bath in

**DRACONIS, adj.** *Δρακονος*. Powerful;  
furious. It is used of a medicine  
of great speed; as jalap, scammony, and  
ergot.

See **DRIVE**.

The navigable river of Germany,  
the former archbishopric of Salz-  
burg, runs south-east through Sti-  
ria, dividing Hungary from Slavonia,  
and enters the Danube at Essek. Gold is some-  
times found in its washings.

See **DRAFT**.

**DRAFT, n. s.**  
**DRAFT, n. s.** } See **DRAW**.  
**DRAFT, n. s.** }

In architecture, or, as it is pro-  
perly, the figure of an intended building  
represented upon paper; wherein are laid down, by  
means of lines, the several divisions and  
the apartments, rooms, doors,  
windows, &c., in their due pro-  
portion, and exceedingly convenient, before a  
design is to be raised, to have draughts  
made of the ground plot, of each floor:  
the plan and fashion of each front, with  
doors, ornaments, &c., in an or-  
derly and upright. Sometimes the several  
parts are taken, and represented in the  
drawing, to show the effect of the whole  
design, is called a scenography, or per-

spective in medicine. See **POTION**.

In trade, called also claff or clough  
draw, is a piece of weighable goods, made by  
the importer, or by the seller to the  
buyer, the weight may hold out when the  
goods are weighed again. The king allows 1 lb.  
draw weighing not less than 1 cwt.,  
draw weighing between 1 and 2 cwt.,  
draw weighing between 2 and 3 cwt.,

4 lbs. from 3 to 10 cwt., 7 lbs. from 10 to 18 cwt.,  
9 lbs. from 18 to 30 or upwards.

**DRAUGHT** is also used sometimes for a bill of  
exchange, and commonly for an order for the  
payment of any sum of money due, &c. The  
person who gives the order is said to draw upon  
the other.

**DRAUGHT Hooks**, large hooks of iron fixed on  
the cheeks of a cannon carriage, two on each side,  
one near the trunnion hole and the other at the  
train, distinguished by the name of fore and hind.  
Large guns have draught hooks near the middle  
transom, to which are fixed the chains that  
serve to keep the shafts of the limbers on a march.  
The fore and hind hooks are used for drawing  
a gun backwards or forwards, by men with  
strong ropes, called draught ropes, fixed to these  
hooks.

**DRAUGHT HORSE**, in farming, a sort of coarse  
made horse, destined for the service of a cart or  
plough.

**DRAW'ING,**

**DRAW'ING-ROOM,**

**DRAW'WELL.**

Sax. dragan; Teut.

*trecken*, from Lat.

*traho*, to pull; i. e.

Gr. *ἄνω*, to do any

thing with violence.

See **DRAW**. To pull

in a particular di-

rection, or with

force sufficient to

overcome resist-

ance: hence to

lengthen, to force

generally, and to wrest or distort: hence also to  
attract, to extract, and to protract; to let fluids  
run; to inspire air; to deduce or derive; to  
trace in lines, or sketch; and, metaphorically,  
to form in writing, or compose; to collect; to  
bring off or away from combat, legal dispute, or  
friendly contest (thus we speak of a 'drawn'  
battle, suit, or game); and, literally or meta-  
phorically, to lead, seduce, entice, or persuade;  
with their consequences, to gain, win, or receive.

Of the various prepositions often added to the  
active verb, to *draw off*, and to *draw up*, seem  
the only idioms: the one is applied to liquors  
drawn through a vent, and often means to empty,  
as in the brew-house; the other, to draw up, is to  
complete in writing, to compose in a formal  
manner. We cannot see the propriety of ex-  
plaining *draw in*, *draw over*, &c., as different  
senses of the verb, any more than draw away,  
*draw aside*, or *draw down*: they are all but dif-  
ferent applications of the same idea. As a neu-  
ter verb, to draw signifies to act as a weight or  
overcoming force, hence as a beast of burden;  
to adhere, contract, come together; advance  
towards; to practise delineation; take a lot, or  
card. As a substantive, 'a draw' is sometimes  
used for the act of drawing, and a lot, or the  
thing drawn. Dr. Johnson says, that to draw re-  
tains through all its varieties of use some shade  
of its original meaning, to pull; and expresses  
'a gradual, continuous, and tenacious action':  
rather, we presume, overcoming force, and what-  
ever time is necessary to make it effectual. Draught  
is the act or habit of drawing; a thing,  
quantity, or number drawn; hence, a quantity  
drunk, a prescribed quantity or dose of medi-

## DRA

**cine**, a drain; and the quantity of water necessary to float a vessel; a representation, a picture. A draught-horse is one that habitually draws carriages; a draught-house, a house in which offal, or what is drawn off from general use, is deposited. A draw-back is what is claimed back or against an account, whether by way of discount, abatement of legal dues, or otherwise. A draw-bridge, one that can be withdrawn at pleasure; drawer is explained in the extract; a drawing-room is one into which company withdraws; and a draw-well, one that is furnished with means for drawing up water.

decks, her guns of mighty strength,  
 might, and warlike in her length. *Id.*

In some similes, men *draw* their comparisons into  
 minute particulars of no importance.

*Felton on the Classics.*

The first conceit tending to a watch, was a *draw-  
 well*: the people of old were wont only to let down a  
 pitcher with a hand-cord, for as much water as they  
 could easily pull up. *Grew.*

People do not care to give alms without some se-  
 curity for their money; and a wooden leg or a wi-  
 thered arm is a sort of *draftment* upon heaven for  
 those who choose to have their money placed to ac-  
 count there. *Nuckensie.*

Folly consists in the *drawing* of false conclusions from  
 just principles, by which it is distinguished from mad-  
 ness, which *draws* just conclusions from false princi-  
 ples. *Locke.*

When he finds the hardships of slavery outweigh  
 the value of life, 'tis in his power, by resisting his  
 master, to *draw* on himself death. *Id.*

Those elucidations have given rise or increase to  
 his doubts, and *drawn* obscurity upon places of scrip-  
 ture. *Id.*

There may be other and different intelligent beings  
 of whose faculties he has as little knowledge, or ap-  
 prehension, as a worm, shut up in one *drawer* of a  
 cabinet, hath of the senses or understanding of a  
 man. *Id.*

The Maltese harden the bodies of their children,  
 by making them go stark naked, without shirt or  
*drawers*, till they are ten years old. *Id.*

I have, in a short *drought*, given a view of our ori-  
 ginal ideas, from whence all the rest are derived. *Id.*

It was the prostitute faith of faithless miscreants  
 that *draw* them in, and deceived them. *South.*

Every *drought*, to him that has quenched his  
 thirst, is but a further quenching of nature; a provi-  
 sion for rheum and diseases. *Id.*

A good inclination is but the first rude *drought* of  
 virtue; but the finishing strokes are from the will;  
 which, if well disposed, will by degrees perfect; if  
 ill disposed, will by the superinduction of ill habits  
 quickly deface it. *Id.*

Majesty in an eclipse, like the sun, *draws* eyes that  
 would not have looked towards it if it had shined out.  
*Suckling.*

Philoclea found her, and to *draw* out more, said  
 she, I have often wondered how such excellencies  
 could be. *Sidney.*

Philoclea intreated Pamela to open her grief; who,  
*drawing* the curtain, that the candle might not com-  
 plain of her blushing, was ready to speak. *Id.*

In private *draw* your poultry, clean your tripe,  
 And from your eels their slimy substance wipe.  
*King.*

A man of fire is a general enemy to all waiters, and  
 makes the *drawers* abroad, and his footmen at home,  
 know he is not to be provoked. *Tatler.*

From the soft assaults of love  
 Poets and painters never are secure:

Can I, untouched, the fair one's passions move,  
 or thou *draw* beauty, and not feel its power?  
*Prior.*

Numbered ill, that lie unseen  
 In the pernicious *drought*: the word obscene,  
 Or harsh, which, once clander'd, must ever fly  
 Irrevocable, the too prompt reply. *Id.*

His sword ne'er fell but on the guilty head;  
 Oppression, tyranny, and power usurped,  
*Draw* all the vengeance of his arm upon 'em.

*Addison*  
 7 li 2

If we make a *drawn* game of it, or procure but moderate advantages, every British heart must tremble.

*Id.*

I shall say nothing of those silent and busy multitudes that are employed within doors in the *drawing* up of writings and conveyances.

*Id.*

Such a *draught* of forces would lessen the number of those that might otherwise be employed.

*Id.*

While near the Lucrine lake, consumed to death, I *draw* the sultry air, and gasp for breath, You taste the cooling breeze.

*Id. on Italy.*

They should keep a watch upon the particular bias in their minds, that it may not *draw* too much.

*Id. Spectator.*

Authors, who have thus *drawn off* the spirits of their thoughts, should lie still for some time, till their minds have gathered fresh strength, and by reading, reflection, and conversation, laid in a new stock of elegancies, sentiments, and images of nature.

*Id. Freeholder.*

Some might be brought into his interests by money; others *drawn over* by fear.

*Id. on the War.*

When the engagement proves unlucky, the way is to *draw off* by degrees, and not to come to an open rupture.

*Collier.*

Sucking and *drawing* the breast dischargeth the milk as fast as it can be generated.

*Wise man on Tumours.*

I opened the tumour by the point of a lancet, with-  
out *drawing* one drop of blood.

*Id. Surgery.*

In poundage and *drawbacks* I lose half my rent; Whatever they give me, I must be content.

*Swift.*

Love is a flame, and therefore we say beauty is attractive, because physicians observe that fire is a great *drawer*.

*Id.*

The report is not unartfully *drawn*, in the spirit of a pleader, who can find the most plausible topics.

*Id.*

They slung up one of their hogsheds, and I drank it off at a *draught*; which I might well do, for it did not hold half a pint.

*Gulliver's Travels.*

Spirits, by distillation, may be *drawn* out of vegetable juices, which shall flame and fume of themselves.

*Cheyne.*

The arrow is now *drawn* to the head.

*Atterbury.*

Why *draw* Marseilles' good bishop purer breath, When nature sickened, and each gale was death?

*Pope.*

Shall Ward *draw* contracts with a statesman's skill?

*Id.*

They random *drawings* from your sheets shall take, And of one beauty many blunders make.

*Id.*

What you heard of the words spoken of you in the *drawing-room* was not true: the sayings of princes are generally as ill related as the sayings of wits.

*Id.*

Delicious wines the attending herald brought; The gold gave lustre to the purple *draught*.

*Id. Odyssey.*

Now, sporting muse, *draw* in the flowing reins; Leave the clear streams awhile for sunny plains.

*Gay.*

Batter a piece of iron out, or as workmen call it, *draw* it out, till it comes to its breadth.

*Moxon.*

With a small vessel one may keep within a mile of the shore, go amongst rocks, and pass over shoals, where a vessel of any *draught* would strike.

*Ellis's Voyage.*

The most occasion that farmers have, is for *draught* horses.

*Mortimer's Husbandry.*

The joiner puts boards into ovens after the batch is *drawn*.

*Id.*

Till rescued from the crowd below,  
No more with pain to move we leave;  
I rise with head clear, to share  
Salubrious *draughts* of purer air.

It is sweet to feel by what *fine-open* the affections are *drawn* together.

The power of *drawing*, modelling, and  
lours, is very properly called the language of  
*So I.*

There is a court jargon, a *chit-chat*, which turns singly upon trifles; and great many words, says little or nothing, fusts instead of what they cannot say, sense instead of what they should not express, proper language of levees, *drawing-rooms*, chambers.

Compliments of congratulation are always taken, and cost one nothing but pen, ink, I consider them as *drawings* upon gold, where the exchange is always greatly in the *drawer*.

As the subtle enemy of mankind takes men gradually into sin, so he usually *draws* degrees into temptation.

Just when our *drawing-rooms* begin to shine, With lights, by clear reflection multiplied, From many a mirror, in which he of Goliath, might have seen his giant self, Whole without stooping, towering erect, My pleasures too begin.

Here, my friend, are the *drafts* of two days I wish to have your opinion on. — By one, I enjoy eight hundred a-year independent of me, and, by the other, the bulk of my fortune.

A bill of exchange is a written order or command of a certain sum of money at an appointed time, and is a mercantile contract in which four things are mostly concerned, viz. 1. The *drawer*, who gives the value. 2. His debtor in a distant place, to whom the bill is drawn, who is called the *drawee*, who is to accept and pay it, &c.

*Dr. Rees's Cyclopædia.*

**DRAWBACK**, in commerce, certain duties of the customs or of the excise, allowed in exportation of some of our own manufactures, or upon certain foreign merchandises, in payment of duty on importation. The merchants importing and exporting are entitled to obtain the drawback on foreign goods, by proving the truth of the officer's certificate of entry, and the due payment of the duties on these may be made by the agent of the importer or company, or by the known agent of any merchant usually employed in the importations and paying his customs. In the case of foreign goods entered outward, if less value be fraudulently shipped out than is expressed in the exporter's certificate, then mentioned, or their value, no drawback is allowed. Foreign goods imported by certificate in order to obtain drawback, not shipped or exported, or re-exported from Great Britain, unless in case of destruction, from perishing, lose the benefit of drawback, and are forfeited, or their value, in vessels, horses, carriages, &c., employed in the landing thereof; and the persons employed in relanding them, or by whose privacy they are landed, or into whose hands they should come, are to forfeit double the amount.

Officers of the customs conniving at any fraud relating to certificate or any penalties, are to forfeit their for six months' imprisonment without mainprize; as are also masters, or agents to the ships employed therein. For the exportation of certificate goods not be delivered up, nor drawn for any goods, till a certificate and seals of the collector or comptroller of the customs be produced, testifying

See CUSTOMS.

RIDGE may be made after several

different ways ; but the most common are made with plyers, twice the length of the gate, and a foot in diameter. The inner square is traversed with a cross, which serves for a counterpoise ; and the chains which hang from the extremities of the plyers, to lift up or let down the bridge, are iron or brass. In navigable rivers it is sometimes necessary to make the middle arch of bridges with two moveable platforms, to be raised occasionally, in order to let the masts and rigging of ships pass through. But this contrivance has fallen into disuse before our modern improvements in the construction of bridges.

## DRAWING.

is the art of representation by picturing the appearances of things surface, by means of lines, shades, formed by various coloring material of drawing, or of delineating the outlines, terminations, and forms of be considered as the basis of painting, greatest importance to every artist; labor lost, when the painter endeavors, by ingenious artifices of color, of form which are fundamentally incoherent. It is the groundwork of sculpture, and is equally architecture.

so called *par excellence*, embraces  
qualities of the art, and demands a  
fine taste, and a well-practised hand.  
Knowledge of pictorial geometry,  
anatomy, proportion, both relative  
and practice. Sir Joshua Reynolds  
said, 'an armour, which upon the  
frontment and a defence; and upon  
the sides, a load.' It leads to  
posturing, and gives what is called  
padding of the chalk or pencil.

polished nation the study of this art has, been held in high esteem:—not only a delightful employment in itself, but from the more important consideration its influence upon the mind and the eye, and directing the intellectual discrimination of dimension, proportion, and order; and we may suppose those who, either from their birth or circumstances, are denied a competent knowledge of the world's wealth, it presents a powerful aspiration after excellence in the art, if it deserve encouragement, rarely failing it. The great masters of all ages, famed for their skill in drawing, in the practice of which they were incessant; nor did they cast off the portraiture the brush, but first made sketches of their intended compositions, then finished drawing of the whole, and more correct drawings of the part;—they then painted the picture all retouched and finished the life.

• greatest artists of ancient times.

Apelles, surnamed *the prince of painters*, is mentioned by ancient writers as the most eminent for the beauty of his drawing. After the revival of the arts in Italy, Michelangiolo Buonarroti appears to have been the most learned and daring, and Raffaele the most correct and graceful. The Roman and Florentine schools, indeed, have excelled all others in this fundamental part of the art: of the former, Raffaele, Guilio Romano, Polydore, and their scholars; and of the latter, Michelangiolo, Leonardo da Vinci, and Andrea del Sarto, have been the most distinguished. In the Bolognese school, the Carraccis, particularly Annibale, whose execution is wonderful, are particularly eminent. In the French school, Poussin, Le Sueur, and Le Brun; and in the English school, omitting living artists, Mortimer, West, Barry, and Gavin Hamilton, demand commendation.

The human figure, as it is the most difficult, should be the first object of the student. To accomplish this, he must begin by acquiring a facile management of his portercyon and crayon, so as to delineate with correctness the effects of the outline, and of the light and shade of the object which he has before him. When these first rudiments of drawing are obtained, and the student can trace, with sufficient correctness, the elementary parts of the figure, as ears, eyes, hands, &c. (plates II. & IV.), he should then apply to the study of the human figure, after the antique, and after nature, in a philosophical manner.

The different styles of drawing or design may be arranged under the heads of *individual nature*, or that of common or familiar forms, with all the imperfections and peculiarities of the individual model; *select nature*, or that wherein the artist has composed or made a selection from the mass of individual models that he has had before him; and, thirdly, the *grand style*, the *grand*, gusto of the Italians, the *beau idéal* of the French, the ideal beauty of the Greeks in which they are so much our masters.

The individual style is that in which the Dutch masters, our great Hogarth and Wilkie, and his school, are so excellent. The select style has been ennobled by Raffaele, and by the Carracci with their eclectic school; and, in the third style, none have surpassed the great sculptors of anti-

quity, particularly those who executed the majestic Apollo Belvedere, and the marvellous works called the Elgin marbles.

The progress of the young artist's studies in drawing or designing, ought to be founded upon a graduated scale. Individual nature, at the commencement of his studies; select, as he proceeds, and, when he attempts originality, idealized according to the precepts of Reynolds, and the practice of Phidias.

**SECT. I.—OF THE PROPER MATERIALS AND INSTRUMENTS FOR DRAWING, AND THE MANNER OF USING THEM.**

The first step towards attaining a proficiency in drawing, is the study of geometry and perspective. Geometry is the science of extension, quantity, or magnitude abstractedly considered, and demands the greatest attention from the scientific artist. Perspective is that branch of optics which teaches how to represent objects on a plain surface, in the manner wherein they appear under the peculiarities which arise from distance and height. A knowledge of these two branches of science may be said to form the fundamental part of drawing; and, when beginning, the learner must furnish himself with proper materials and instruments; such as black lead pencils of different degrees of hardness; crayons of black, white, and red chalk; crow or duck-quill pens; Indian ink or seppia: as also with drawing-boards, rules or straight edges, and compasses; drawing-boards for fastening the paper upon, so that it may not shift, and likewise for straining it, to prevent the colors, or the washes of tint, when laid wet upon the paper, from causing it to swell so as to dry uneven. The simplest of these latter requisites is made of a deal board glued together to its proper width and length, strengthened with a piece rabbeted on at each end, to prevent warping. The paper may be fixed down upon this board with pins, wafers, or sealing wax, or it may be strained with paste or glue in the following manner:—First wet the paper well with a sponge, omitting the edges, which should be turned up about half an inch in width on every side; apply a small quantity of good paste or glue all round on the under side, and press the paper down upon the board with a cloth, rubbing it well with your nail, or the smooth handle of a knife to secure it. In the process of drying, the paper, which had expanded and blistered up much when wet, will contract, and (the edges being fixed immovably) will strain quite flat and tight, and will be much fitter for drawing upon than when loose. But the best drawing boards are made with a frame and a moveable panel, upon which the paper is simply put wet, and then forced into the frame, where it is confined by wedges or keys at the back. This strains equally well, without the trouble of pasting, so that it may be dried at the fire; it also looks better.

The young student must accustom himself to hold the pencil or post-crayon further from the point than he does a pen in writing, which will give him a better command of it, and render his lines or delineations more free and bold.

For Indian ink or seppia drawings, the first

outlines are to be sketched in by the hard pencil, so that any part which is not correct may be easily obliterated by the Indian rubber. The sketch is as correctly done with the pencil as the student's power, he is then to draw the outline with the crow or duck-quill pen in diluted ink or seppia. After this he is to charge the pencil lines, by rubbing on the crumb of stale bread or Indian rubber pigment used for this purpose is either ink, or seppia, which is a pleasant color, and softer in execution. By rubbing up with soft water on a plate, or palette of ware or marble, they may be made of a required degree of strength, and used in or steel pen like common ink.

Having got the outline clear and correct, the next step is to shade the work properly by drawing fine strokes with the pen in which is called hatching, and of which engravings were imitations, or by washing shadows, and softening them into the camel-hair pencils, and tints of Indian seppia. As to the rule and compasses very rarely to be used, except in accurate geometrical drawings, or in measuring portions of figures, after they are drawn, whether they are correct or not; or, in the delineation of fortifications and landscape. Chalks and crayons are made in a similar manner, except that the lines and shades are drawn with the material hatched and softened into one another the same way.

**SECT. II.—OF DRAWING LINES, SQUARES, AND OTHER GEOMETRICAL FIGURES.**

The first practice of a learner should be straight and curved lines, with ease and upwards and downwards, inclined to the right and left, or in any required direction. Lines inclining to the right, or quite horizontal, he must hold his elbow close to his side while writing; when perpendicular, the hand should be removed to about seven inches from the paper, and when inclined to the left, at a very considerable distance, according to the degree of the angle forms. A good practice, illustrating this precept, is for the student to draw a series of equilateral triangles, with a circular line drawn from the apex; and various-formed right angled triangles, with their hypotenuses, bases, and perpendicular sides of various dimensions. He should also learn to draw straight lines, squares, circles, ellipses, and other geometrical figures: for as the alphabet or a list of the letters of a language is an introduction to grammar, so is geometry to drawing.

The practice of drawing these simple figures, till he becomes master of them, will enable him to imitate, with ease and accuracy, many forms both in nature and art, and composed thereof. Four general rules may here be laid down: 1. No student be in a hurry, but always master of one figure before he goes on to the next. 2. He should accustom himself to draw

considerable size, which is the only method requiring a free and bold manner. 3. He should practice drawing till he has gained a tolerable command of his pencil, before he attempts to draw any figure or object of any kind what-so-ever. 4. He should not aim at finishing any single part, before he has sketched faintly, with light strokes of the pencil, the general shape and proportion of the whole figure; correcting it afterwards wherever necessary.

#### SECT. III.—OF DRAWING EYES, EARS, FLOWERS, FRUITS, BIRDS, BEASTS, &c.

The learner should begin with drawing the outlines of eyes, ears, &c., as in plate II. with the hands and parts of faces as in plate III., after the manner of the modes directed in section I. He should next proceed with flowers, fruits, birds, &c., and the like; not only as it will be a more engaging employment to those who do not aim at severe beauties of the art, but as an easier introduction to young ladies, than the drawing of hands and feet, and other parts of the human body, which require not only more care, greater exactitude and nicer judgment. Very good instructions are necessary upon this head. The best thing that a learner can do is, to furnish himself with good prints or drawings by way of copies, and copy them with great care and exactness. If it is the figure of a beast, let him begin with the forehead, and draw the nose, the ears and under jaw, and stop at the throat. He should then return to the top of the head, trace the ears, the neck, and the back; continuing the line till he has given the full shape of the rump and buttock. Then proceed to the head and breast, mark out the legs and feet, and finish the belly. And, lastly, as before directed in sect. I., when the learner has acquired some fluency in the art, let him draw the outline here instructed, and finish it with shadows, or give the proper colors after nature as directed in sect. XII. It would not be amiss, by way of ornament, to add a small sketch of a landscape, appropriate to the country of the animal, either by way of a vignette, or determined by a parallel line like a picture; of these, and other subjects, the learner will find many examples among the plates of this work.

#### SECT. IV.—OF DRAWING LEGS, ARMS, HANDS, FEET, &c.

In the drawing of legs and arms, the learner has very little more to do than to copy exactly the examples of arms given in plate IV., and of legs in plate V. But the actions and positions of the hands are so many and so various, that certain rules can be given for drawing which will universally hold good. Yet, as hands and feet are difficult to draw, it is necessary to bestow some time and pains upon them; carefully imitating their various forms and actions, so as not only to avoid all traces of looseness and imperfection, but to give them life and spirit. To arrive at great care, study, and practice are requisite, particularly in imitating at first, that is before attempting to draw from statues or from nature, the best prints or drawings that can be obtained

of hands and feet; examples of which are given in plates IV. and V. As to mechanical rules for delineating them by lines and measures, they are not only difficult and perplexing to the student, but are also contrary to the practice of the best masters. And here the general rule above mentioned must be applied, which is, to sketch out faintly, with light strokes, the general shape and proportion of the whole hand, with its action and turn; and after considering whether this first sketch be perfect, and altering it wherever it may be amiss, to proceed to the bending of the joints, the knuckles, the veins, and other small particulars, which, when the learner has obtained the whole shape and proportions of the hand or foot, will not only be more easily, but also more perfectly drawn.

#### SECT. V.—OF DELINEATING FACES.

The head is usually divided into four equal parts, namely, 1. from the crown of the head to the top of the forehead. 2. From the top of the forehead to the eye-brows. 3. From the eye-brows to the bottom of the nose. 4. From thence to the bottom of the chin. But this proportion, as may justly be inferred, is not invariable; these features being, in different men, often very different as to length, breadth, and shape. In a handsome well-turned face, however, it is nearly correct. In delineating a perfect face, therefore, the learner's first business must be to sketch slightly an oval or egg-like figure with its broadest hemisphere upwards; then to bisect it with a perpendicular line from the top to the bottom. Through the middle of this line he will draw a diametral one, directly across from one side to the other of the oval. On these two lines all the features of the face are to be delineated as follows: first divide the perpendicular line into four equal parts, the first of which is to be allotted to the hair of the head; the second is from the top of the forehead to the top of the nose between the eye-brows; the third is from thence to the bottom of the nose; and the fourth includes the lips and chin. The diametral line, or the breadth of the face, is always supposed to be the length of five eyes; it must therefore be divided into five equal parts, and the eyes placed upon it so as to leave exactly the length of one eye between them. This is to be understood only of a full front face as in plate I., for if it turn to either side, the distances are to be lessened on that side which turns from you, more or less in proportion. The top of the ear is to rise parallel to the eye-brows, at the end of the diametral line. The nostrils ought not to come further out than the corner of the eye in any face; and the middle of the mouth must always be placed on the perpendicular line. See plate I., DRAWING.

#### SECT. VI.—OF DRAWING HUMAN FIGURES.

When the student is tolerably perfect in drawing faces, heads, hands and feet, he may next attempt to draw the human figure at full length. He should begin by sketching the head; then draw a perpendicular line from the bottom of the head seven times its length, or as many heads as his figure is high from which he is drawing. For in general the length of the head is about one-seventh

part of the length of the figure. The best-proportioned figures of the ancients are seven heads and three quarters in height, but they vary as required by the different characteristics of the figure. If, therefore, the figure stands upright, as fig. A, plate VI., draw a perpendicular line from the top of the head to the heel, which must be divided into two equal parts. The bottom of the belly is exactly the centre of the figure. Then divide the lower part into two equal parts again; the middle of which is to be the middle of the knee.

The method of delineating the upper part of the figure is as follows:—Take off with the compasses the length of the face, which is about three-fourths of the length of the head; then set off the length of another face from the pit of the throat to the pit of the stomach; thence to the navel is another face in length, and thence to the lower rim of the belly is a third.

The entire line must then be divided into seven equal parts: against the end of the first division is the situation of the breasts; the second is the place of the navel; at the third mark out the privities; the fourth comes in the middle of the thigh; the fifth to the lower part of the knee; the sixth to the lower part of the calf; and the seventh to the bottom of the heel; the heel of the leg which supports the body being always under the pit of the throat.

As the essence of all good drawing consists in making a correct sketch at first, the student must be very accurate and careful in this stage of his business, rubbing out and sketching again till he is right in all the bearings and proportions; and finishing no one part perfectly till he finds the general sketch and character of the figure complete and good; and when it is all in, correctly to his mind, he may then proceed to the finishing of one part after another, with all the fidelity in his power.

Some artists, when they have a statue to copy, begin with the head, which they finish, and then proceed in the same manner to the other parts of the figure, perfecting as they go on: but this manner is generally unsuccessful; for, if they make the head in the least too large or too small, the consequence is a manifest disproportion between all the parts, occasioned by their not having sketched the whole proportionably at first. Let the more advanced student therefore remember that, in whatever he intends to draw, he should first sketch its several parts, measuring the distances and proportions between each with his finger or his pencil, without using the compasses, observing the precept of *Du Piles* 'to bear the compass in his eye,' and then to judge of its general effect by the eye which by degrees will be able to estimate truth and proportion, and will become his principal and best guide. Let him also observe, as a general rule, invariably to begin with the right hand side of the piece he is copying; for thus he will always have what he has done before his eyes, and the rest will follow more naturally and with greater ease. Whereas if he begin with the left side of the figure, his hand and arm will cover what he does first, and deprive him of the sight of it; by which means he will not be able to proceed with so much ease, pleasure, or certainty.

When these more mechanical parts are acquired, and their real measurements become familiar, the student may proceed in drawing the order and manner of drawing the figure, as follows:—First he should draw the head; then the shoulders in their exactness in relation to the head; then draw the trunk of the body, beginning with the armpits, and the arms for an after consideration, and then all the beautiful undulations which form the outline of the human body, down the back on both sides; observing carefully the exactness of the waist. Then he should draw the legs upon which the body stands, and afterwards the other which is in repose: then the arms, and of all the hands. He must carefully notice the bowings and bendings that are in the making the part which is opposite to the leg, bowing inwards correspond to its antagonist swelling outwards.

For instance: if one side of the body bends, the other must naturally swell out to be answerable to it: if the back bend in, the head must swell out; if the knee bend out, the leg must bend in, and so on of every other part of the body. In a word, he must endeavour to make the parts of the figure with truth, and in proportion; not one arm or one leg bigger than the other; nor broad Herculean trunks with a weak and slender waist; nor great bony arms with thick and puffy legs; but serving an harmonious agreement and union amongst all the members, and consequently beautiful symmetry throughout the whole. When these rudiments of drawing the figure are thus acquired, and the student can draw with sufficient correctness, he must apply himself to its study after the manner of nature in a philosophical manner; studying *PHYSIOLOGY* and *ANATOMY* as his surest guides. See those articles.

In copying after the antique, which should precede and always accompany that of drawing from nature, the following statues and sculptures among the master-pieces of ancient art, which the student's attention is particularly directed to, are subjects for his studies in chalk drawing:—The sign: namely, first of all the remains of ancient art, those incomparable works known by the name of the *Elgin marbles*. Of these the most celebrated are the *Theseus* or *Hercules*, the *Ilissus*, the *Cupid*, and the wonderful fragment of the head and shoulders of *Neptune*, standing piece among the naked ones: the coloured ones are *Bacchus*, the *Fates*, the *Victory*, the *Chloris*, and the *Panathenæan procession*. The figures are dressed and every one of them—from the toes to the top of the head—has attained to the highest degrees and kinds of perfection in art. They were for more than 700 years the admiration of the ancient world, and, in the time of Rome, were regarded as inimitable for their grace and beauty.

The torso of the *Belvedere*, commonly called the torso of *Michel Angelo*, as being a considerable favorite with that great master, is another beautiful study for the young artist. It is also the *Farnese Hercules*, which is a wonderful master-piece of art. The *Apollo Belvedere*

of ancient statues, and presents but for the pencil. The Laocöon and the Medicean Venus are of another character; the Medicean is a perfect model of grace, elegance, and sweetness, the perfection of the female form. The Belvedere is a magnificent male youthful beauty, and the artists are remarkable for their anatomical correctness.

He has mastered these, and imitates with their beauties and proportions; drawing after nature, or from a model; undertaking a course of anatomical drawing, and an occasional study of the beauties of the antique, to avoid mannerism and individuality.

#### OF THE PROPORTIONS AND MEASURES OF THE HUMAN BODY.

The middle part, between the extremities and feet of a well-proportioned man, is in the navel, but that of an average man is in the pubis; and the practice of di-

viding the measures of children into four, five, and six parts, of which one is given to the head, is made use of in the way of proportion both by painters and sculptors.

A child of two years of age is in general about five heads high, but, of four or five years old, nearly six; about the fifteenth or sixteenth year, seven heads are the proportion or measure, and the centre declines to the upper part of the pubis. Hence it appears that, as the growth of the body advances, there is a gradual approach to the proportion of an adult of nearly eight heads in the whole height; of which, as before mentioned, the head itself makes one.

Upon these principles the following table is constructed, exhibiting the proportions of a strong, and of a graceful man, and of a fine woman, as given by the ancients, measured from the originals at Rome, and published by J. J. Volpato and Raffaele Morghen. It is found in Elmes's Dictionary of the Fine Arts. The models are, the Farnese Hercules, the Belvedere Apollo, and the Medicean Venus, which may be classed as the Doric, the Ionic, and the Corinthian orders of human beauty.

The entire proportions of these celebrated statues are, in round numbers; the Hercules seven heads, three parts, seven minutes (four parts being equal to one head, and twelve minutes equal to one part). The Apollo seven heads, three parts, six minutes; and the Venus seven heads, three parts. The other most admired statues differ a little from these proportions—the Laocöon measuring (if erect) seven heads, two parts, three minutes; the Pyramus seven heads, two parts; the Antinous seven heads, two parts; the Grecian shepherdess seven heads, three parts, six minutes; and the Mirmillo eight heads; but all their various proportions are harmonious and agreeable, and in keeping with the characters of the figures they represent.

It is a leading principle, in which every person who is conversant in the arts of design agrees, that, without a perfect knowledge of the proportions of the human figure, nothing can be produced but absurdity and extravagance; and it is also universally admitted, that the ancient Greek and Roman sculptors attained the highest success in producing unexceptionable models.

The greatest modern artists, who have examined these antique statues with attention, admit, that several of the ancient sculptors have, in some degree, surpassed nature, no living man having been found so perfect in every part as some of their figures are. The opportunities for acquiring excellence, which they possessed, were indeed great: Greece abounded with models of beauty, strength, and elegance; and Rome being mistress of the world, every thing beautiful, rich, or curious was brought to it, from all parts. The motives which inspired them and their patrons were also powerful. Religion, glory, and interest, all united in their aid. They considered it a kind of religious duty to give to the figures of their gods so much beauty and grandeur, as to attract at once the love and veneration of the people. Their own glory was also concerned, particular honors being conferred on those who succeeded; and for their fortune they had no farther care to take of that, after arriving at a certain degree of celebrity.

#### SECT. VIII.—OF THE ATTITUDES OF THE HUMAN FIGURE.

If an artist be required to represent a powerful athletic figure, such as a Hercules or a Sampson, in a state of vigorous action, he must pay particular attention to the parts or limbs which are principally exerted in such action. If the figure be standing, the foot must be placed in a right line or perpendicular to the trunk or bulk of the body, so that the centre of

gravity may be placed in equilibrio. The centre or centre is determined by the heel; or, the figure be on tiptoe, then the ball of the great toe in the centre. The muscles of the leg, which supports the body must be swelled, and the tendons drawn more to an extension; the toe of the other leg, which is only so placed as to receive the weight of the body like a buttress, a prop, towards that way to which the statue inclines it.

For example, suppose Hercules is to be represented, aiming a blow with his club, at something before him, towards his left side. The right leg must be placed so as to receive the whole weight of his body, and the left foot touching the ground with the toes. In this position the external muscles of the right leg must be strongly marked; while those of the left leg must be represented more flaccid, and in repose. But, as the foot is extended, the muscles which compose the calf of the leg are extended, and those of the right are compressed and relaxed. For if the leg or tibia is extended, then the tending muscles are most swelled; but if it is bent, then the bending muscles and their tendons appear most plainly.

The like may be observed of the motion of the whole figure in general, if it be represented in vigorous action. The Laocöon furnishes an example of this muscular appearance being carried through the whole figure; while in the Antinous, the Apollo, the youthful Bacchus, and other figures where no energetic action is expressed, the muscles are expressed but faintly, as they appear through the skin in nature.

The clavicles, or collar bones, and the neck in general, do not show themselves so strongly in the female as in the other sex, nor in action as in adults. Nor will any action in which the female uses her utmost strength occasion risings or indications of the muscles as they do in the stronger sex. The great quantity of fat under the skin of females so clothes their delicate muscles as to prevent such a naked appearance.

#### SECT. IX.—OF THE EFFECTS OF THE EXTENSION OF THE MUSCLES.

The most obvious effects of the extension of those muscles which chiefly demand the attention of the artist are the following.

If either of the mastoid muscles (see the plates of muscles in Anatomy,) act, the head is inclined to the contrarieside, and the muscle which produces that action appears very plainly through the skin.

If the arms be raised, the deltoid muscles placed on the shoulders, which perform the

tion, well, and make the extremities of the scapulae of the shoulder blades, called the tops of the shoulders, appear indented or hollow. The shoulder blades following the elevation of the arms, their bases incline at that time obliquely upwards. If the arms be drawn down, put forward, or pulled backwards, the shoulder-blades necessarily vary their positions accordingly. These particulars can only be learned by an attentive study of anatomy and of the living model; by which means the student becoming acquainted with the circumstances which attend every action he will be able to form an idea how they ought to be expressed.

When the cubit or fore-arm is bent, the biceps of its belly very much raised, as shown in the left arm. The like may be observed of the triceps when the arm is extended, as shown in the right arm.

The straight muscles of the abdomen appear very strong when arising from a recumbent posture. Those parts of the great serratus muscle which are received in the beginnings of the oblique descending muscle immediately below, are very much swelled when the shoulder on the side is brought forwards; the serratus muscle then being in action in drawing the scapula forwards.

The long extending muscles of the trunk alternate in walking. If the right leg bears the weight of the body, and the left is advancing on tiptoe, the last-mentioned muscles of the back, on the left side, will be tumefied on the other side about the region of the loins, and so on the other side.

The trochanters, or outward and uppermost ends of the thigh bones, (see the skeleton in the plate of Anatomy,) vary in their positions in such a manner as that no precise observations can explain their several appearances; but a careful study of the living model, placed in action, must be carefully attended to. If either thigh be extended, as when the whole weight of the body rests on that side, the glutæus or buttock-muscle presents a very different appearance from what it offers at another time, or when in repose; but if the thigh be drawn backwards, that muscle becomes still more tumefied.

When the whole leg is drawn upwards and forwards, and at the same time the foot is inclined inwards, the upper part of the sartorius muscle appears, rising very strong. In other positions of the thigh that muscle makes a furrowing appearance in its whole progress.

If a man be on tiptoe, the extending muscles of the leg, which are situated on the fore-part of the thigh and those of the foot, which compose the calf of the leg, appears very strongly, and the long peroneus makes a considerable indentation or furrowing at that time in its progress on the outside of the leg. Many other remarks might be made on this subject; but an attentive study of nature will render them unnecessary. Indeed we beg leave to refer the reader for further illustration, to the plates and article ANATOMY.

#### SECT. X.—OF THE EFFECTS OF THE PASSIONS IN GENERAL.

When the student has thus made himself master of the various attitudes and muscular

exertions of the human body, it will be necessary for him next to study the effect of the passions upon the limbs and features. The passions, says Le Brun, are motions of the soul, either upon her pursuing what she judges to be for her good, or shunning what she thinks hurtful; and commonly, whatever causes emotions of passion in the soul, creates also some action in the body. It is therefore necessary for a painter to know which are the different passions of the soul, and how to delineate them.

Le Brun has been extremely happy in delineating many of the passions, and the young artist cannot study any thing better than the examples which he has left us of them; and of which we have given a copy in plate VI. However, as De Piles justly observes, it is absurd, as well as impossible, to pretend to give such particular demonstrations of them, as to fix their expression to certain strokes, which the painter should be obliged to use as essential and invariable rules. This, he very properly says, would be depriving the art of that excellent variety of expression which has no other principle than diversity of imagination, the extent of which is infinite. The same passion may be finely expressed several ways, each yielding more or less pleasure in proportion to the painter's understanding and the spectators' discernment.

Although every part of the face contributes towards expressing the sentiments of the heart, yet the eye-brow is the principal seat of expression, and that wherein the passions principally indicate themselves. It is certain, says Le Brun, that the pupil of the eye, by its fire and motion, very well shows the agitation of the soul, but then it does not express the kind or nature of such an agitation; whereas the motion of the eye-brow differs according as the passions change their nature. To express a simple passion, the motion is simple; to express a mixed passion, the motion is compound: if the passion be gentle, the motion is gentle; and if it be violent, the motion is so too.

We may observe farther, says he, that there are two kinds of elevation in the eye-brows: one, in which the eye-brows rise up in the middle—this elevation expresses agreeable sensations, and it is to be observed that then the mouth rises at the corners: the other, in which the eye-brows rise up at the ends, and fall in the middle; this motion indicates bodily pain, and then the mouth falls at the corners. In laughter, all the parts agree; for the eye-brows, which fall towards the middle of the fore-head, make the nose, the mouth, and the eyes follow the same motion. In weeping, the motions are compound and contrary; for the eye-brows fall towards the nose and over the eyes, and the mouth rises that way. It is to be observed also, that the mouth is the part of the face which more particularly expresses the emotions of the heart: for when the heart complains, the mouth falls at the corners; when it is at ease, the corners of the mouth are elevated, and when it has an aversion, the mouth is protruded and rises in the middle.

'The head,' says De Piles, 'contributes more to the expression of the passions, than all the

other parts of the body put together. Those separately can only show some few passions, but the head expresses them all. Some, however, are more peculiarly expressed by it than others: humility, by hanging it down; arrogance, by lifting it up; languor, by inclining it on one side; and obstinacy, when, with a still and resolute air, it stands upright, fixed, and stiff between the two shoulders. The head also best shows our supplications, threats, mildness, pride, love, hatred, joy, and grief. The whole face and every feature contribute something; especially the eyes, which, as Cicero says, are the windows of the soul. The passions which they more particularly discover are pleasure, languishing, scorn, severity, mildness, admiration, and anger; to which we may add joy and grief, if they did not proceed more particularly from the eye-brows and mouth: but when these two passions fall in also with the language of the eyes, the harmony will be wonderful.

But though the passions of the soul are most visible in the lines and features of the face, they often require the assistance also of the other parts of the body. Without the hands, for instance, all action is weak and imperfect; motions, which are almost infinite, create numberless expressions: it is by them that we desire, hope, promise, call, send back; they are the expressive instruments of threatening, prayer, horror, and praise; by them we approve, condemn, refuse, admit, fear, ask; express our joy and grief, our doubts, regrets, pains, and admiration. In a word, it may be said, as they are the language of the dumb, that they contribute not a little to speak a language common to all nations, which is the language of painting. But to say how these parts must be disposed for expressing the various passions is impossible, nor can any exact rules be given for it, both because the task would be infinite, and because every one must be guided in this by his own genius and the particular turn of his own studies.

#### SECT. XI.—OF THE PARTICULAR EFFECTS OF THE DIFFERENT PASSIONS ON THE FEATURES.

Notwithstanding the justice of the preceding observations of De Piles, yet Le Brun has given such an accurate description of the particular effects of the passions on the human features, as must be of essential service to all who wish to attain proficiency in any of the arts of design. We therefore subjoin it, not only as an illustration of his drawings, copied in plate VI. but as containing a set of general rules to the student for depicting the various passions of human nature.

1. *Attention.*—The effects of attention are to make the eye-brows sink, and approach the sides of the nose; to turn the eye-balls towards the object that causes it; to open the mouth, and especially the upper part; to decline the head a little, and to fix it without any other remarkable alteration. See plate VI, 1.

2. *Admiration.*—Admiration causes but little agitation in the mind, and therefore alters but very little the muscles of the face. Nevertheless the eye-brows rise, the eyes open a little more than ordinary; the eye-balls, placed equally be-

tween the eye-lids, appear fixed upon the object; the mouth half opens, but occasionally an occasional alteration in the cheeks. Ibid. 2.

3. *Admiration combined with astonishment.*—The motions that accompany this mixed emotion are scarcely different from those of admiration; except, that they are more open and more strongly marked. The eye-brows rise more elevated, the eyes more open, the eyelids removed farther from the lower eyelid, and are steadily fixed: the mouth more open, and the muscles in stronger action.

4. *Veneration.*—Admiration begets external esteem, in a high degree, produces veneration, which, when it has for its object something far or beyond our comprehension, occasions a desire to decline, and the eye-brows to bend downward. The eyes become almost closed as fixed, and the mouth is shut. These motions are gentle, and produce but little alteration in the other parts of the face. Ibid. 3.

5. *Rapture.*—Although rapture has occasioned the same object as veneration, only views in a different manner, yet its motions and characteristics are different. The head becomes turned to the left side, the eye-balls and eyelids are directed up; the mouth half opens, and the corners are also a little turned up; while the other parts remain in the natural state. Ibid. 4.

6. *Desire.*—This passion brings the organs together, and protruded towards the eyes, the eyes are more open than ordinary. The eyelids are inflamed, and place themselves in the corners of the eyes. The nostrils rise up, and contract themselves towards the eyes; the mouth opens as the spirits, being in motion, give a lively pink color to the whole countenance. Ibid. 5.

7. *Joy.*—Very little alteration is perceived in the faces of those who feel within themselves the sweetness of this passion, or of joy born of tranquillity. The forehead is smooth and open; the eye-brows without motion, elevated a little in the middle; the eye pretty open, and with a softening air; the eye-balls lively and shining; the corners of the mouth turned up a little, the complexion lively, and the cheeks and lips rosy. Ibid. 6.

8. *Laughter.*—That kind of laughter which is produced by joy mixed with surprise, causes the eye-brows rise towards the middle, and bend towards the nose; the eyes become almost shut, and are sometimes wet with tears, which cause no alteration in the face. The mouth, wide open, shows the teeth; the corners of the mouth rise back, cause a wrinkle in the cheeks, which rise so as to partially close the eyes; the nostrils rise, and all the face is of a red color. Ibid. 7.

9. *Acute Pain.*—Acute pain occasions the eye-brows to approach one another, and to turn towards the middle; the eye-balls are crowded under the eye-brows, the nostrils rise and contract the cheeks; the mouth half opens and is turned back, and all the muscles of the face are agitated in proportion to the violence of the pain. Ibid. 8.

10. *Simple Bodily Pain.*—This degree of suffering produces proportionably the same motions as the last, but in a less violent degree. The eye-balls do not approach so close, nor rise so much;

to be fixed upon some object; but the wrinkles in the cheeks hide; the lips are farther apart side, and the mouth is half

The dejection which is projection of the mind, makes the towards the middle of the forehead towards the cheeks. The eye disturbed, the white of the eye lid, the eye-lids are drawn down lid. All about the eyes becomes lid are drawn downwards, the open, its corners being drawn carelessly droops on one of the lid becomes of a heavy color, and lid. 9.

The alterations occasioned in expression by weeping are very eye-brows sink down towards the forehead; the eyes are all are wet and drawn downwards lids. The nostrils swell, the lid of the forehead appear, the lid and the sides thereof are drawn wrinkles on the cheeks: the under presses the upper one; all the lid and contracted, and its lid about the eye-brows, the lid and the cheeks. Ibid. 10.

10.—That lively attention to the liders, which is called compassion, lidows to sink towards the middle lid the eye-balls to be fixed upon lid attention; the sides of the nostrils lid to be a little elevated, forming lid cheeks; the mouth to be open; lid be raised and thrust forwards; lid all the parts of the face to be lid dered towards the object which lident. Ibid. 11.

The motions of this feeling are lively lid forehead becomes wrinkled, the lid sides of the nose next the nose sunk lid liders much risen. The eyes are lid lid the eye-balls in the middle: lid lid are drawn towards the eyes, lid lid in the cheeks. The mouth lid lid are drawn down, and the under lid beyond the upper. Ibid. 12.

A despised object sometimes ex-lid then the eye-brows become knit, lid lidly more than in the last instance, lid lid at the bottom of the eyes, lid lid by the lower eye-lids: the mouth lid lid closer in the middle than in the lid lid drawn backwards, make lid lid cheeks; the face becomes pale, lid lid whilst the muscles and veins are lid lid. Ibid. 13.

13. *Fright*.—The violence of these lid lid are not synonymous, although lid lid classed them, as the former may lid lid certainty and durable, while the lid lid and often evanescent, alter all the lid lid the face. The eye-brows rise in lid lid muscles are strongly developed, lid lid against each other, and depressed lid lid, which is drawn up as well as

the nostrils. The eyes are very open, the upper eye-lid hidden by the eye-brow, the white of the eye encompassed with red, the eye-balls fixed toward the lower part of the eye; the lower part of the eye-lids swell and become livid, the muscles of the nose and cheeks enlarge, and the latter terminate in a point towards the sides of the nostrils. The mouth is very open, and its corners become very apparent; the muscles and veins of the neck stretch; the hair stands on end; the color of the face, that is, of the end of the nose, the lips, the ears, and round the eyes, becomes pale and livid; and all the muscles appear strongly marked. Ibid. 14.

17. *Anger*.—The effects of this passion show its nature. The eyes become red and inflamed; the eye-balls staring and sparkling; the eye-brows sometimes elevated, and at others depressed equally; the forehead much wrinkled, as also the space between the eyes. The nostrils open and enlarged; the lips compress, the under one rising over the upper, slightly opens the corners of the mouth, and gives the appearance of a cruel and disdainful grin. Ibid. 15.

18. *Hatred, or Jealousy*.—The expression of the two passions is so very similar that Le Brun classes them together. They wrinkle the forehead, and the eye-brows become depressed and knit; the eye-balls are half hidden under the eye-brows, and turn towards the object of hatred, appearing fiery and animated; the nostrils are pale, open, more marked than ordinary, and drawn backward so as to cause wrinkles upon the cheeks; the lips are so compressed as to show that the teeth are firmly closed; the corners of the mouth are drawn back, and much sunk; the color of the face becomes partly inflamed and partly yellowish, and the lips pale or livid. Ibid. 16.

19. *Despair*.—As despair is extreme, so are its expressions. The forehead becomes wrinkled from the top to the bottom; the eye-brows bend down over the eyes, and press each other on the sides of the nose; the eyes become fiery in their expression and full of blood; the eye-balls are disturbed, and concealed beneath the eye-brows, sparkling and wandering. The eye-lids are swollen and livid, the nostrils large, open and raised. The end of the nose turns down, the muscles, tendons, and veins, become swollen and stretched. The upper part of the cheeks becomes large; the muscles protrude; the mouth drawn backwards is more open at the sides than in the middle; the lower lip swells and turns outwards. The sufferers gnash their teeth, foam and bite their lips, which are pale, as is the rest of the face; the hair becomes straight and stands on end. Ibid. 17.

To these rules the student will do well to add Charles Bell's *Anatomy of Expression*, published expressly for artists upon the same subject; and, as has been so often insisted on, to pursue an attentive study of nature.

#### SECT. XII.—OF THE DISTRIBUTION OF LIGHT AND SHADE.

After the student has made himself master, in a tolerable degree, of drawing figures correctly in outline, his next endeavour should

be to shade them properly. It is this portion of the art which gives the desired effect of substance, form, distance, and distinction, to whatever bodies he endeavours to represent, whether animate, or inanimate.

The best rule for performing this is, to consider from what point, and in what direction, the light falls upon the objects which he proposes to delineate; and to make all his lights and shades fall according to that direction throughout the whole work. That part of the object must be lightest which has the light most directly opposed to it. If the light falls obliquely upon the picture, he must make that side which is opposite to the cause the lightest, and that side which is farthest from it the darkest. If he be drawing the figure of a man, and the light is placed above the head, then the top of the head will of course be the lightest, the shoulders will have the next degree of light, and the lower parts be less illumined as they are removed from the cause. That portion of the object, whether the figure be naked or dressed, or whether it be a building which stands farthest out or nearest to the eye, must be made lightest, because it is nearest to the light; which loses so much of its brightness by how much any part of the object recedes; because those parts which project, hinder the lustre and full brightness of the light from striking on the receding parts.

Titian used to say, that he knew no better rule for the distribution of light and shadow, or, as the Italian critics call this department of the art, *chiaro-scuro*, than the observations that may be drawn from the lights, shadows, and reflexes of a bunch of grapes. Satins and silks, and all other shining stuffs, have certain glancing reflections, exceedingly bright where the light falls strongest. The like is seen in armour, brass pots, or any other glittering metal, where a sudden brightness appears in the centre of the light, which discovers the shining nature of the body depicted. The principal light should be thrown on the principal figure, and an equal balance must be kept between the lights and shades throughout the whole.

The outlines must be faint and almost imperceptible in such parts as receive the light; but where the shades fall the outline may be stronger, but must never be too evident, as there is no such thing as outline in nature. Another effect of nature to be observed is, that as vision becomes weaker by distance, so must the objects appear more or less defined according to the places which they occupy in the picture; those which are very distant, faint and undefined; those which are nearer, and in the foreground, clear, strong, and accurately defined.

However, so much of this important portion of the art depends upon the artist's own feelings and perceptions, that better directions for its acquirement cannot be given, than to study with attention the works of those masters who are reckoned the most successful in its uses, and to follow them and their mistress—nature, as guides.

#### SECT. XIII.—OF DRAPERY.

Drapery is the art of clothing figures, and disposing the drapery or clothing properly

and elegantly upon them. In the department of the art many things are necessary to be observed. 1. The eye must keep its station in doubt as to the object before it; but the shape and proportion of the limb, or portion of the figure, which is covered by the drapery, must appear to be beneath it; or at least so far as and probability will permit. This is so much a consideration, that the best artists draw a naked figure first, and throw the drapery upon about it afterwards. 2. The drapery must not be too loose about the figure, but should be so round and adhere to it, that the latter may seem unencumbered and have a free motion. 3. The draperies which cover those parts which are exposed to great light, must not be so much shaded as to seem to pierce them, lest by the great darkness of their shades, the limbs will look as if they were broken. 4. The garments must be drawn first, and then divided into ones; and great care must be taken that they not cross one another improperly. 5. Folds in general should be large and few; this must be guided, however, by the quality and quantity of the stuffs of which the drapery is composed. The quality of the persons depicted must also be considered in their drapery; if ancient republicans, orators, or philosophers, their robes should be large and ample; if clowns, countrymen, slaves, short and of coarse materials; if goddesses, nymphs, light and soft. 6. The garments must be adapted to the body, whose motions they should follow, and the closer the garment is to the body the narrower and smaller must be the folds. 7. Well-imagined folds give appearance of motion to the principal limb, which seems to stir forcibly upon them, and makes them more stirring as the action is more or less violent. 8. An artful complication of folds in a small manner greatly assists the effects of *chiaro-scuro*. 9. All folds consist of two shades and reflexes, which may be turned with the garment upon the shadowing the nearer side deeply and the other more faintly. 10. The shades in silk and fur are very thick and small, requiring little light and a light shadow. 11. Observe the action of the air or wind, in order to draw the loose part all flying one way; and draw the part of the garment which adheres closest to the body before you draw the looser part which flies from it: lest by drawing the looser part first, you should mistake the position of the figure, and thereby place it wrong. 12. Rich ornaments, when judiciously and sparingly used, sometimes contribute to the beauty of drapery; but such ornaments are below the dignity of heroic figures, whose grandeur should be derived from their characteristic forms and expressions, rather of countenance, attitude, or action, than from the earthly vanity of rich and glittering ornaments. 13. Light and loose draperies are proper only to figures in rest, motion, or blown upon by the wind. But in all places, and free from violent action, draperies should be large and flowing; that is, in contrast, and the fall of their folds, they should bear the appearance of grace and dignity. — further under *PAINTING*.

#### IV.—OF DRAWING LANDSCAPES, BUILDINGS, &c.

all the branches of art, this is the most useful and necessary; because it is every man may have occasion for at one or another. To be able, on the spot, to take the sketch of a fine building, a relic of antiquity, or a beautiful prospect, any curious production of art, or uncomeliness in nature, is not only a desirable accomplishment, but an agreeable and useful talent. Rocks, mountains, fields, woods, cataracts, cities, towns, castles, houses, ruins, or whatsoever else may present itself to view on our journeys or travels, in our own or foreign countries, may be thus brought home and preserved for future use either in conversation. On this part, therefore, more than ordinary pains should be bestowed.

Drawing consists in measuring visible objects accurately with the eye. In order to facilitate this operation, the student should fancy, in his mind, that the subject he is delineating is divided into squares of imaginary lines. We may draw imaginary lines, because though engravers there, who copy with great exactness, both their copy and the original into an equal number of squares, yet this is a method not to be recommended; since it imposes shackles on the learner, from which he will find it difficult to emancipate himself, particularly when he is to draw from nature, where such artificial aids will not avail him.

When colors are used in drawing, they should be employed with caution and judgment; it being

disgusting to see colored or tinted drawings, wherein the reds, greens, and blues are laid on without regard to truth or harmony. It may be urged, by those who execute them, that nothing is greener than grass, nor bluer than the sky; but it should be considered, that nature employs such a multitude of little shadows, and such an endless variety of different tints, intermixed with her broadest colors, that the harshness of the original hue, or local tint, is thereby corrected, and the effect of the whole very different from a raw and unbroken color laid upon white paper.

Though the artist should have recourse to the study of nature, in preference to that of a master, for a knowledge of coloring, yet it requires some judgment to know what part of nature is to be studied, and what to be avoided; in short, selection is necessary. The student, in coloring, should examine with attention, that of old walls, broken and stained by time and weather; old thatch, old tiles, rotten wood;—in short, all objects which are covered with moss, stains, and tints of various kinds; wherein he will find all the principles of the picturesque and agreeable in coloring. Such things as these should be copied with every possible care, and all objects of a decided uniform color should be as carefully avoided. This has ever been the practice of all the great masters who have excelled in this delightful part of the art; and examples of drawing landscapes from nature according to the foregoing precepts have been often given.

To conclude, in order to attain any considerable proficiency in this sort of drawing, a knowledge of PERSPECTIVE is absolutely necessary. See that article.

**DRAWING SLATE**, in mineralogy, black chalk. It is grayish black. Massive. Lustre of the surface fracture, glimmering; of the cross fracture, dull. Fracture of the former slaty, of the latter earthy. Opaque. Streak same color as the mineral. Very soft. Sectile. Easily fractured. It adheres slightly to the tongue. Specific gravity 2.11. It is infusible. Its constituents are silica 64.96, alumina 11, carbon 11, water 10.75. It occurs in beds, in primitive and transition clay-slate, also in secondary formations. It is found in the coal formation of England, and in most countries. It is used in writing.

**DRAWL**, v. n. From draw. To utter any thing in a slow, driveling way. To mount the clerks, and in one lazy tone to turn the long heavy page drawl on. *Pope.*

To see him launched into the world at large; to see him, caputiously droning o'er his charge, between his pillow, and his weekly drawl, short, too long, the price he pays for all. *Granger.*

**DRAWL**, n. s. Then, I suppose, it must have been in some single's dravelling manner of reading it to me. *Sheridan.*

**DRAW**, n. s. Sax. *dræg*, of the same origin as *DRAW*, which see. The car on which beer is conveyed; the horse attached, and the driver.

A brace of draymen bid God speed him well.

And had the tribute of his supple knee. *Shakespeare.*  
Have not coblers, draymen, and mechanicks governed as well as preached? Nay, have not they by preaching come to govern? *South.*

This truth is illustrated by a discourse on the nature of the elephant and the drayhorse. *Tatler.*

Let him be brought into the field of election upon his draycart, and I will meet him there in a triumphant chariot. *Addison.*

When drays bound high, then never cross behind Where bubbling yeast is blown by gusts of wind. *Gay.*

The drayplough is the best plough in winter for miry clays. *Mortimer's Husbandry.*

I know too that, if stopped upon my route, Where the green alleys windingly apace, Reeling with grapes red waggons choke the way,— In England 't would be dung, dust, or a dray. *Byron.*

**DRAYTON** (Michael), an eminent English poet, born of an ancient family in Warwickshire in 1563. His propensity to poetry was extremely strong from his infancy; and we find most of his principal poems published by the time he was about thirty years of age.—It appears, from his poem of *Moses's Birth and Miracles*, that he saw at Dover the famous Spanish armada, and it is not improbable that he was engaged in some military employment there. He was patronised by several persons of consequence: particularly by Sir Henry Goodere, Sir Walter Aston,

and the countess of Bedford; to the first of whom he owns himself indebted for a great part of his education, and by the second he was for many years supported. His poems are very numerous and elegant; the most celebrated one is the *Poly-Albion*, a chorographical description of England, with its commodities, antiquities, and curiosities, in metre of twelve syllables; which he dedicated to prince Henry, by whose encouragement it was written; and, whatever may be thought of the poetry, his descriptions are allowed to be exact. He died in 1631; and was interred in Westminster Abbey among the poets, where his bust is to be seen with an epitaph by Ben Jonson.

DRAYTON (William Henry), a statesman of the American revolution, and an able political writer, was born in South Carolina, in September 1742. In 1753 he went to England, and was placed in Westminster school; thence he removed, in 1761, to Oxford, where he continued nearly three years, when he returned to South Carolina. In 1771 he was appointed, by the British government, privy counsellor for the province, and became conspicuous by his defence of the rights of his country against the encroachments and irregularities of the crown officers and judges. In 1774 he accepted the office of an assistant judge of the province. When the continental congress was about to sit at Philadelphia, he wrote and published a pamphlet under the signature of Freeman—a production, of which Ramsay, in his *History of South Carolina*, observes, that ‘it substantially chalked out the line of conduct adopted by the congress.’ The lieutenant-governor suspended him from his place in the king’s council, in consequence of his representation of American grievances, and the ‘bill of American rights,’ which he submitted to the congress in his pamphlet. As soon as the revolution began he became an efficient leader, and, in 1775, was chosen president of the provincial congress. In March of the following year he was elected chief justice of the colony, in which character he delivered to the grand jury political charges of the most energetic character. He published, besides, a pamphlet, refuting the suggestions in favor of lord Howe’s plan of a reconciliation with the mother country. Independence—unqualified independence—was his constant advice. In the year 1777 Mr. Drayton was invested with full powers, as president of South Carolina, and, early in the following year, was elected a delegate to the continental congress. In this body he took a prominent part. His speeches and writings against the propositions of the three British commissioners were particularly celebrated. The congress employed him on various important missions. The censure which he pronounced upon major-general Charles Lee’s conduct at the battle of Monmouth, caused that officer to challenge him. The reasons which he assigned for declining the duel are such as became a true patriot and honorable man. Mr. Drayton continued in congress until September, 1779, when he died suddenly at Philadelphia, in the thirty-sixth year of his age. His political resolution and sagacity, his literary attainments, his domestic virtues, and his polished manners, rendered him

valuable to his country, and dear to his associates. He left behind a considerable number of historical materials, which his only son, Drayton, revised and digested, and printed at Charleston, in 1821, in two octavo volumes under the title of *Memoirs of the American revolution*, from its commencement to 1776, inclusive, as relating to the state of Carolina, and occasionally referring to that of North Carolina and Georgia.

DRAZZEL, *n. s.* Perhaps corrupted from *drossel*, the scum or dross of human life from Fr. *drosselle*, a whore. A low, worthless wretch.

As the devil uses witches,  
To be their cully for a space,  
That, when the time’s expired, the  
For ever may become his vassal.

DREAD, <i>n. s., v. a. &amp; v. n.</i>	Sax. <i>drædan</i>
DREAD’ER, <i>n. s.</i>	Goth. <i>drædan</i>
DREAD’FUL, <i>adj.</i>	tot. <i>drædan</i>
DREAD’FULLY, <i>adv.</i>	Todd. <i>drædan</i>
DREAD’FULNESS, <i>n. s.</i>	from <i>drædan</i>
DREAD’LESS, <i>adj.</i>	Goth. <i>drædan</i>
DREAD’LESSNESS, <i>n. s.</i>	ness

fear, terror, awe; the cause of fear. It seems to be derived from the noun, and fear in a great degree; to be in fear: he is one who lives in habitual dread or terrible: dreadful, without fear or the derivatives correspond in meaning.

And Zacarye sayge was afayed: and upon him.

And the angle sayde to him, Zacarye: not: for thy prayer is herd.

Not scrvinge at ight as pleeynge to the symplenesse of herie dredinge the Lord.

The fear of you, and the dread of you upon every beast of the earth.

How dreadful is this place!

Let him be your dread.

Quod he, to Athens right now wol I  
Ne for no drede of deth shall I not spare  
To see my lady, that I love and serve  
In hire presence I rekke not to sterne.

Chaucer. *Can.*

Right, faithful, true he was in deed and  
But of his cheere did seeme too solitarie  
Yet nothing did he dread, but ever was

Spenser. *Yarrow.*

Think’st thou that duty shall have freedom  
When power to flattery bows? To plainness  
Is bound, when majesty to folly falls.

Shakespeare. *Ham.*

It cannot be, but thou hast murdered:  
So should a murderer look, so dreads

Shakespeare. *Ham.*

The wicked heart never fears God, but in  
or shaking the earth, or raining fire from  
the good can dread him in his very  
loving deliverances and blessings dread  
awfulness.

Hyp. *Ham.*

Terrour seized the rebel host,  
When, coming towards them, so dread  
The bottom of the mountains appeared

From this descent  
Celestial virtues rising will appear  
More glorious and more dread than from

attraction! while behind thee gapes  
 a visible gulf where Ashur lies  
 forgotten.

*Id. on Luxury.*

l, v. n., v. d. & n. s. } Sax. drom;  
 (u, n. s. } Goth. *drauma*;  
 less, adj. } Belg. *droom*;

s, from Lat. *dormio*; Heb. *דָּרַם*, to  
 have a representation or imagina-  
 tion in sleep: hence, to imagine gene-  
 rally vaguely or idly: as an active verb,  
 dream. Dreamer has formerly meant  
 father or master of dreams: dreamless is  
 without dreams. Dr. Johnson ob-  
 serves word is derived by Meric Casaubon,  
 ingenious than truth, from *δραμα* the  
 comedy of life; dreams being, as plays  
 representation of something which does  
 happen. This conceit Junius has en-  
 lightened an epigram:

ὁ βροχὸς καὶ πῦρ ἔστιν ἢ παθεὶ πάλαιον,  
 ἢ μεταθεῖς, ἢ φῶρε τὰς ὕπνους.

his dreamer (Marg. *master of dreams*)  
*Gen. xxvii. 19.*

these things be no *dreams* ne japes, to  
 agree, it is lyfelych mete for children of  
 as they me beviden when I pilgreamed out  
 in wintere. *Chaucer.*

eat our meat in fear, and sleep  
 affliction of those terrible *dreams*  
 take us nightly. *Shakespeare. Macbeth.*

I long dreamed of such a kind of man,  
 now awake, I do despise my dream.  
*Shakespeare.*

we know little they are sons to the king,  
 these *dreams* that they are alive. *Id.*

Sometimes he angers me  
 king of the moldwarp and the ant,  
 or Merlin, and his prophecies. *Id.*

ages of Mount Atlas, in Barbary, were re-  
 ceived both nameless and *dreamless*.

*Camden's Remains.*

fast heart! and, dearer image! stay;  
 joys at best are *dreams* enough;  
 to stay here you pass too fast away,  
 the first life's taper is a snuff. *Donne.*

but once, and *dreams* of burglary.  
*Bp. Hall's Satires, iv. 8.*

The Macedon, by Jove's decree,  
 ought to dream an herb for Ptolemy.

*Dryden.*

as they fearful precipices tread;  
 wrecked, labour to some distant shore. *Id.*

does Anthony dream out his hours,  
 expects not fortune for a noble day! *Id.*

dreamer pleases to try whether the glowing  
 glass furnace be barely a wandering imagi-  
 nation; drowsy man's fancy, by putting his head  
 may perhaps be awakened into a certainty.  
*Locke.*

is the having of ideas, whilst the out-  
 ward are stopped, not suggested by any external  
 known occasion, nor under the rule or con-  
 trol of understanding. *Id.*

go on in a constant course of reading, but  
 not. *Id.*

and that I was conveyed into a wide and  
 plain. *Tutler.*

GL VII

The man of sense his meat devours,  
 But only smells the peel and flowers,  
 And he must be an idle dreamer,  
 Who leaves the pie and gnaws the streamer.

*Prior.*

He never dreamed of the deluge, nor thought that  
 first orb more than a transient crust.

*Burnet's Theory.*

Her midnights once at cards and hazard fled,  
 Which now, alas! she dreams away in bed,  
 And round her wait shocks, monkeys, and mockaws  
 To fill the place of fops and perjured beaux. *Gay.*

Life, like their bibles, coolly men turn o'er,  
 Hence unexperienced children of threescore,  
 True all men think of course, as all men dream;  
 And if they slightly think, 'tis much the same.

*Young.*

If we can sleep without dreaming, it is well that  
 painful dreams are avoided. If, while we sleep, we  
 can have any pleasing dreams, it is, as the French  
 say, tant gague, so much added to the pleasure of  
 life. *Franklin.*

With woo I nightly vigils keep,  
 Beneath thy wan unwarming beam;  
 And mourn, in lamentation deep,

How life and love are all a dream. *Burns.*

It may therefore, perhaps be fairly said, that, in  
 respect of any supposed tendency to scepticism, the  
 evidence of history is full as strong against natural  
 philosophy as against metaphysics; yet who ever  
 dreamed of proscribing the natural sciences?

*Bowdler.*

He came—oh Hope! he hastened to my coat;  
 I saw, and almost dreamed him at my feet,  
 Close by my side a gay attendant slave;  
 The glance, which thousands sought, to none he gave.

*Dr. T. Brown.*

Tell me no more of fancy's gleam,  
 No, father, no, 'twas not a dream;  
 Alas! the dreamer first must sleep,  
 I only watched, and wished to weep;  
 But could not, for my burning brow  
 Throbbed to the very brain as now.

*Byron. The Giaour.*

DREAMS have been defined as those thoughts  
 of which we are conscious, and those imaginary  
 transactions in which we fancy ourselves engaged,  
 when in the state of sleep. Scarcely any part of  
 nature is less open to our observation than the  
 human mind in this state. The dreamer himself  
 cannot observe the manner in which dreams arise  
 or disappear. When he awakes he has in general  
 but a confused recollection of the circumstances  
 of his dreams. Were we to watch over him with  
 the most vigilant attention, we could not perceive  
 what emotions are excited in his mind, or what  
 thoughts pass through it, during his sleep. But  
 though we could ascertain these phenomena, many  
 other difficulties would still remain. What parts  
 of a human being are active, what dormant, when  
 he dreams? Why does he not always dream while  
 asleep? Or why dreams he at all? Do any cir-  
 cumstances in our constitution, situation, and  
 peculiar character, determine the nature of our  
 dreams?

Without pretending to solve the above ques-  
 tions, we shall here give a brief view of those facts  
 which have been ascertained concerning dreams.  
 1. In dreaming we are not conscious of being  
 asleep. This is well known from a thousand cir-  
 cumstances. When awake, we often recollect our  
 dreams; and we remember on such occasions,

2 I

that, while those dreams were passing through our minds, it never occurred to us that we were separated by sleep from the active world; except in those cases where we have a kind of double dream; i. e. when, after dreaming for some time, we dream that we have awaked from sleep, and told our dream. But during this second dream, and rehearsal of our former one, we are fully persuaded that we are awake, till, by awaking in reality, we are convinced that we were asleep all the time. We are also often observed to act and talk in dreaming, as if we were busily engaged in the intercourse of social life.

2. In dreaming we do not consider ourselves as witnessing or bearing a part in a fictitious scene; we seem not to be in a similar situation with the actors in a dramatic performance, or the spectators before whom they exhibit, but engaged in the business of real life. All the varieties of thought, that pass through our minds when awake, may also occur in dreams; all the images which imagination presents, in the former state, she is also able to call up in the latter; all the same emotions may be excited, and we are often actuated by equal violence of passion; none of the transactions, in which we are capable of engaging while awake, is impossible in dreams; in short, our range of action and observation is equally wide in the one state as in the other; nay often more so; for we may dream of flying, walking upon waters, and performing actions which we cannot perform when awake. 3. It is said that all men are not liable to dream. Dr. Beattie, in a very pleasing essay on this subject, relates, that he knew a gentleman who never dreamed except when his health was in a disordered state; and Locke mentions, that a person of his acquaintance was a stranger to dreaming till the twenty-sixth year of his age; when he began to dream in consequence of having a fever. These instances, however, are too few; and, besides, it does not appear that those persons had always attended, with the care of a philosopher making an experiment, to the circumstances of their sleep. They might dream, but not recollect their dreams on awaking; and they might both dream, and recollect their dreams immediately upon awaking, yet afterwards suffer them to slip out of their memory. But though it is by no means certain that any of the human race are, through the whole of life, absolute strangers to dreaming, yet it is well known that all men are not equally liable to dream. The same person dreams more or less at different times; and, as one person may be more exposed than another to those circumstances which promote this exercise of fancy, one person may therefore dream much oftener than another. The same diversity will naturally take place in this as in other accidents to which mankind are in general liable. 4. Though in dreams imagination appears to be free from all restraint, and indulges in the most wanton freaks, yet it is agreed that the imaginary transactions of the dreamer, if in health, generally bear some relation to his particular character in the world, his habits of action, and the circumstances of his life. The lover dreams of his mistress; the miser of his money; the philosopher renews his scientific researches in sleep with the same assiduity as when awake; and the merchant

tries to balance his books, and compute the profit of an adventure, when slumbering on his bed. And not only do the general circumstances of a person's life influence his dreams, but his passions and habits are nearly the same when asleep as when awake. A person whose habits are virtuous does not in his dream indulge in a series of crimes; nor are the vicious passions when they pass into this imaginary world. The choleric man finds himself offended by slight provocations in his dreams, as well as in waking. The temperate man indulges in the same intercourse with the world, and a good time continues pacific in sleep. 5. The evidence that a person's dreams is influenced by his circumstances when awake in a still more remarkable manner. Certain dreams usually arise in the mind after a person has been in certain situations. Dr. Beattie relates, that he once dreamed of riding thirty miles in a high wind, passed over the succeeding night in dreams beyond description terrible. The state of a person's health, in the manner in which the vital functions are carried on, have a considerable influence in determining the character of dreams. After a person has eaten a meal, or after eating of an unusual sort of food, a person has dreams of a certain nature. In dreaming, the mind for the most part carries on no intercourse through the senses with the external objects. Touch a person gently when he is asleep, he feels not the impression. You may strike him by a smart blow; but, when the pain is not sufficiently violent, he remains insensible to it. We speak softly beside a person asleep, without fearing that he will overhear us. His eyes are shut; and even though light should be on the eye-ball, yet still his powers of vision are so weakened, that he is not awakened to active exertion, unless the light be so strong as to rouse him from sleep. His hearing is also insensible both to sweet and to disagreeable sounds. It is not easy to try whether his organs of smell retain their activity, without awaking him. From analogy, it may be presumed that the organs of taste are inactive. With respect to the circumstances here enumerated, it is indifferent whether a person be dreaming or buried in deep sleep. There is one remarkable fact concerning dreaming which may seem to contradict what has been here asserted. In dreams we are liable to attend to speak aloud in consequence of the suppression of imagination, but some persons even go so far as to walk about and engage in little enterprises without awaking. Now, as we are in this state so active, it seems that we cannot be then conscious of the presence of surrounding objects. The sleep-walker is really sensible, in a certain degree, of the presence of the objects around him; but he does not attend to them with the same circumstances, nor do they excite in him the same emotions as if he were awake. He has been seen to totter on the brink of a precipice; and, in consequence of being free from fear, he is not awakened in such a situation unless suddenly roused. This is one of the most inexplicable phenomena of dreaming. There is another fact not so consonant with what has been above stated. It is said that, in sleep, a person may hear the noise of a cataract in the neighbourhood, or regular strokes with a hammer, at any time

insufficiently loud, and continued uninterrupted from before the time of his falling asleep. It is affirmed that he awakes on the sudden on account of the noise. This fact is asserted on all evidence: it is curious. Even when we are deeply intent on study, or closely occupied in business, the sound of a clock striking in our neighbourhood, or the beating of a drum, escape us unnoticed; and it is therefore the surprising that we should thus continue to be sensible to sounds when asleep. 7. Not only do the general character, habits of life, and the state of health, influence his dreams; but those particular circumstances in which he has been most deeply interested during the preceding day, and the views which have arisen most frequently to his imagination, very often afford the subjects of his dreams.

When one looks forward with anxious expectation towards any future event, he is likely to be affected either of the disappointment or the gratification of his wishes. If engaged through the ardour of business or amusements which he is exceedingly agreeable, or in a way in which he is extremely unhappy, either his happiness or his misery is likely to be renewed in his dreams. 8. Though dreams have been recorded in almost all nations, at least in some parts of their history, as prophetic of future events, yet it does not appear that this popular belief has been established on good grounds. The Bible, indeed, teaches us to believe that the same Being may operate through this medium, and actually has operated on the human mind; as he did to Abimelech, Gen. xx. 18; to Joseph, Matt. i. 20, and ii. 19, 22; to the dreams of Joseph and Pharaoh; of his chief butler and baker; of Nebuchadnezzar and the three youths; Daniel, &c., are also decisive on this point. Yet it is perfect folly to confound such dreams with those which the priests of heathen nations, or the vulgar among us, have considered as prophetic. We are too easily imposed upon by our own ignorance, and our imposture adopts to impose upon others.

We cannot trace any certain connexion between our dreams and those events to which they are supposed to be prophetic. The plausibility of the vulgar pretends that they are so. And we cannot, therefore, join with the vulgar and the superstitious in believing them infallible or infallible. 9. It appears that animals are also capable of dreaming. The dog is observed to start suddenly up in his sleep in a manner which cannot be accounted for in any other way than by supposing that he is roused by an impulse received in a dream. The same is observable of other brutes. That they dream, is not an idea inconsistent with what we know of their economy and manners. We may, therefore, consider it as a certain truth that many, if not all, of the animals are liable to dream, as well as man. It appears, then, that in dreams we are not conscious of being asleep; that in dreaming, his dreams seem realities: though it be uncertain whether mankind are liable to dreams, yet it is well known that they are not all equally liable to dream: that the nature of a person's dreams depends in

some measure on his habits of action, and on the circumstances of his life: that the state of the health too, and the manner in which the vital functions are carried on, have a powerful influence in determining the character of a person's dreams: that in sleep, and in dreaming, the senses are either absolutely inactive or nearly so: that such concerns as we have been very deeply interested in during the preceding day, are very likely to return upon our minds in dreams in the hours of rest: that dreams may be rendered prophetic of future events; and therefore, wherever we have such evidence of their having been prophetic as we would accept on any other occasion, we cannot reasonably reject the fact as absurd; but that they do not appear to have been actually such, in those numerous instances in which the superstition of nations, ignorant of true religion, has represented them as referring to futurity, nor in those instances in which they are viewed in the same light by many among ourselves. and, lastly, that dreaming is not a phenomenon peculiar to human nature, but common to mankind with the brutes.

We know of no other facts, that have been ascertained concerning dreaming, besides the above. But we are by no means sufficiently acquainted with this important phenomenon in the history of mind. We cannot tell by what laws of our constitution we are thus liable to be so frequently engaged in imaginary transactions, nor what are the particular means by which the delusion is accomplished. The delusion is indeed remarkably strong. One will sometimes fancy that he reads a book, and actually enter into the nature of the imaginary composition before him, and even remember, after he awakes, what he then knows, that he only fancied himself reading. Another will sometimes dream that he is at church, and hears a sermon delivered, which he would be incapable of composing when awake. Can this be delusion? If delusion, how, or for what purpose, is it produced? The mind, it would appear, does not, in sleep, become inactive like the body; or at least is not always inactive while we are asleep. When we do not dream, the mind must either be inactive, or the connexion between the mind and the body must be considered as in some manner suspended: and when we dream, the mind, though it probably acts in concert with the body, yet does not act in the same manner as when we are awake. It seems to be clouded or bewildered, in consequence of being deprived for a time of the service of the senses. Imagination becomes more active and more capricious; and all the other powers, especially judgment and memory, become disordered and irregular in their operations.

Various theories have been proposed to explain what appears most inexplicable in dreaming. The ingenious Mr. Baxter, in his treatise on the Immateriality of the Human Soul, endeavours to prove that dreams are produced by the agency of some spiritual beings, who either amuse or employ themselves seriously in engaging mankind in all those imaginary transactions with which they are employed in dreaming. This theory, however, is far from being plausible. It leads us entirely beyond the limits of our know-

ledge. It requires us to believe without evidence. It is unsupported by any analogy. It creates difficulties still more inexplicable than those which it has been proposed to remove. Till it appear that our dreams cannot possibly be produced without the interference of other spiritual agents, possessing such influence over our minds as to deceive us with fancied joys, and involve us in imaginary afflictions, we cannot reasonably refer them to such a cause. Besides, from the facts which have been stated as well known concerning dreams, it appears that their nature depends both on the state of the human body and on that of the mind. But were they owing to the agency of other spiritual beings, how could they be influenced by the state of the body? Wolfius, and after him M. Formey, have supposed, that dreams never arise in the mind, except in consequence of some of the organs of sensation having been previously excited. Either the ear or the eye, or the organs of touching, tasting, or smelling, communicate information somehow, in a tacit, secret manner; and thus partly rouse its faculties from the lethargy in which they are buried in sleep, and engage them in a series of confused and imperfect exertions. But what passes in dreams is often so very different from all that we do when awake, that it is impossible for the dreamer himself to distinguish whether his powers of sensation perform any part on the occasion. It is not necessary that imagination be always excited by sensation. Fancy, even when we are awake, often wanders from the present scene. Absence of mind is incident to the studious: the poet and the mathematician often forget where they are. We cannot discover from any thing that a person in dreaming displays to the observation of others, that his organs of sensation take a part in the imaginary transactions in which he is employed. In those instances, indeed, in which persons asleep are said to hear sounds, the sounds which they hear are also said to influence, in some manner, the nature of their dreams. But such instances are singular. Since it then appears, that the person who dreams is himself incapable of distinguishing, either during his dreams or by recollection when awake, whether any new impressions are communicated to him in that state by his organs of sensation; that even by watching over him, and comparing our observations of his circumstances and emotions, in his dreams, with what he recollects of them after awaking, we cannot, except in one or two singular instances, ascertain this fact; and that the mind is not incapable of acting while the organs of sensation are at rest, and on many occasions refuses to listen to the information which they convey; we may conclude, that the theory is groundless. Other physiologists tell us, that the mind, when we dream, is in a state of delirium. Sleep, they say, is attended with what is called a collapse of the brain; during which either the whole or a part of the nerves of which it consists, are in a state in which they cannot carry on the usual intercourse between the mind and the organs of sensation. When the whole of the brain is in this state, we become entirely unconscious of existence and the mind sinks into inactivity; when

only a part of the brain is collapsed, we are neither asleep nor awake, but in a sort of state between the two. This theory, like the former, supposes the mind incapable of acting without the help of sensation: it supposes that we know the nature of a state, of which we cannot obtain the phenomena; it also contradicts the fact, in representing dreams as confused images of things around us, not fanciful creations of things not existing together in nature, but as a baseless fabric. In the second edition of the Encyclopædia Britannica, a theory is given from any of the foregoing was advanced. It was observed, that the nervous fluid, when it is supposed to be secreted from the blood by the brain, appears to be likewise absorbed from the blood by the extremities of the nerves. It was argued, that, as this fluid was considered as the principle of sensibility, therefore, in all cases in which a sufficient supply of it was not absorbed in the blood by the extremities of the nerves, some parts of the body to which those nerves were distributed must be, in some degree, deprived of sensation. From these positions it was inferred, that, as impressions of external objects communicated a certain motion from the extremities of the nerves to the brain, so they continued awake; and that, when there was a deficiency of this vital fluid in the extremities of the nerves, or when from any other cause it failed to communicate to the brain the peculiar sensations alluded to, we must naturally fall asleep, and become insensible of our existence. It was concluded, that, in sleep, the nervous fluid between the extreme parts of the nerves and the brain either be at rest, or be deficient, or be passed by some means from passing into the brain. It was concluded, that whenever irregular motions of this fluid were occasioned by any cause, dreaming was produced. Thus we might be deceived with regard to the operation of the senses; so as to fancy that we saw things not actually before us: that we heard sounds that we taste, feel, smell, &c. The instances of visions which will sometimes arise, when we were swim before us when awake, the ears when the eyes be shut; the tinnitus aurium, which is a symptom in nervous diseases; and the tingling feelings in the case of the amputated limb, are produced in proof of this theory, and applied to confirm it.

Plausible as the above theory at first may appear, it is not satisfactory. It is much founded on supposition. The nature of the nervous fluid is but imperfectly known, and even its existence is not fully ascertained. All theories founded upon it must, therefore, be at best uncertain. Besides the supposition made in this theory, of a partial privation of sensation, and efficiency of the vital fluid necessary to produce sleep, seem to infer that sleep is not consistent with a state of perfect health, which every body knows is contrary to fact. The Brunonian system of medicine appears to offer rather a more satisfactory solution of the phenomena and causes of sleep, by ascribing it to the exhaustion of the excitability by the powers. But, without trusting entirely to the

theses of either system, we are persuaded, a  
 y of dreaming, if not perfectly satisfactory,  
 is less exceptionable than any of the above,  
 he drawn from merely attending to a simple  
 that frequently takes place when we are  
 te. Every person must have observed, that  
 alone, and while his attention is not called  
 y particular subject, either by study, con-  
 sition, manual labor, sudden noise, or the  
 as around him, a kind of involuntary mo-  
 so to speak, will take place in his ideas;  
 that, if he makes no voluntary exertion of  
 to fix his attention upon one idea more  
 another, a rapid succession of very different  
 y, some old and some recent, will occur in  
 ouse of a few minutes. Every person,  
 attends church regularly, or who has at-  
 ted the lectures of an unentertaining public  
 ker, must be sensible, that such involuntary  
 os of his ideas have often taken place,  
 either through the fault of the speaker, or  
 of the hearer, his attention has not been  
 gently fixed upon what was spoken. A  
 much addicted to study, and to the habit  
 ing his ideas constantly upon one subject  
 other, may, perhaps, be less sensible of the  
 luntary motion we here allude to, than  
 e; but let such a studious person be placed  
 company where a trifling conversation is  
 on, and he will soon find himself in the  
 ion here described. A current of ideas will  
 lly intrude upon his mind, and carry off  
 tion from the trifles in which those around  
 are engaged; and thus subject him to what  
 mmonly called absence of mind. And it  
 also be admitted that the most studious, as  
 as the most thoughtless, will sometimes find  
 es of a long forgotten fact, sentiment, or  
 stance, suddenly recurring to their minds,  
 out any seeming cause. The inference we  
 dd draw from all these facts, to our present  
 ect, is, that during sleep, a similar involun-  
 motion, or current of ideas, takes place;  
 but, in consequence of the fatigue occasioned  
 the labors of the day (no matter whether these  
 are by exhausting the excitability, or by oc-  
 casioning a deficiency of the nervous fluid), the  
 chief powers of the mind—the will, the  
 ment, and the memory, are rendered in a  
 considerable degree inactive; at least, in so far,  
 as the will has no power over these faculties,  
 as the imagination, rendered more active, as  
 would seem, by being freed from the control  
 both the will and the judgment, gives every  
 idea that occurs a visionary form; and thus  
 has a fresh and rapid succession of various  
 es, according to the unlimited current of  
 controlled ideas that succeed each other. How  
 happens, perhaps, the human faculties will  
 be able to comprehend or explain; at least,  
 they shall be capable of explaining the condi-  
 tion by which the soul and body are united,  
 indeed, mankind shall ever attain to such a  
 eed of perfection in physiology. But that  
 ents take their rise chiefly, if not solely, from  
 ment succession of ideas, dressed into form  
 the imagination, uncontrolled by the will or  
 judgment, appears to us to be an undoubted  
 y, though hitherto it would seem little, if at

all, attended to. And it appears to be a suffi-  
 cient confirmation of this theory, that persons in  
 good health, and engaged in active employments,  
 most commonly dream of those matters wherein  
 they are daily occupied; the uniform current of  
 their ideas when awake, seldom taking any other  
 direction during sleep; whereas, persons in a  
 bad habit of body, or weak state of mind, and  
 those who take little exercise, or who are not  
 engaged in active business, have generally wild  
 and extravagant dreams, and sometimes very  
 disagreeable ones, of monsters, mad dogs, devils,  
 deep pits, houses on fire, stormy oceans, and the  
 like. In a word, when we consider the opera-  
 tions of our minds when awake, particularly of  
 that active faculty, the imagination, how readily  
 upon hearing, reading, or speaking of any person,  
 place, action, or circumstance, it forms an idea  
 in the mind of such person, place, &c., though,  
 perhaps, many years have elapsed since we saw  
 them, or even though we have never seen them,  
 we need not be surprised, that the same active  
 faculty should be able, when uncontrolled by the  
 will and judgment, and but partially assisted by  
 the memory, to raise up a series of images in  
 succession, and thus to create an ideal world, and  
 various ideal transactions in the mind.

The late Mr. Rennell, of Kensington, consi-  
 ders dreams to afford satisfactory proof that the  
 mind can act without the intervention of the  
 brain: upon this it has been well remarked, that  
 we have not as yet sufficient data from which to  
 estimate the degree of dependence of the former  
 upon the latter, still we have no facts founded  
 upon our present state of being, which can estab-  
 lish the total independence which he supposes.  
 The proximate cause of sleep is undoubtedly  
 corporeal, and, perhaps, consists in a certain  
 inaptitude of the brain to receive the usual im-  
 pulses of its immaterial tenant. When this in-  
 eptitude amounts to complete quiescence, the  
 soul cannot display itself, because the instrument  
 of its operations is in a state of repose. In such  
 circumstances the sleep is profound, and no  
 dreams take place. This repose or quiescence  
 of the brain may be increased to absolute torpor  
 for a season, as is seen in the hybernation of ani-  
 mals, and in those rare cases in the human spe-  
 cies, where persons have remained for several  
 hours, or even days, in a trance. When this  
 torpor of the cerebral system abates, the immat-  
 erial principal is again enabled to resume its  
 operations, owing to the renewed capabilities of  
 the instrument. Thus, as the cause of sleep is  
 corporeal, there are strong grounds for presu-  
 ming that the cause of dreams is corporeal also.  
 They occur oftener when there is any irritation  
 of the system in general, or of the brain in par-  
 ticular, hindering the complete repose of that  
 part. When this irritation is great, as in general  
 fever, accompanied with increased action of the  
 blood-vessels within the head, sleep is often en-  
 tirely prevented; or if it does take place, it is  
 disturbed with frightful illusions. What is the  
 precise state of the soul at such times, is a dis-  
 puted point amongst metaphysicians. Perhaps,  
 on so dark a subject, it may be allowable to ha-  
 zard a conjecture, that the operations of the  
 immaterial being are modified by the simi-

quiescence of the material organ, and that this want of correspondence between the agent and the instrument is the cause of the wild imaginations and false judgments that distinguish our dreams from our waking thoughts. Dreams, therefore, instead of proving the contrary, rather tend to show that the dependence of the immaterial upon the material part is perpetual and without exception, during the continuance of man's existence upon earth.

In whatever way we attempt to account for the manner, in which our powers of mind and body perform their functions in dreaming, we can, at least, apply to useful purposes the imperfect knowledge which we have been able to acquire concerning this series of phenomena. Our dreams are affected by the state of our health, by the manner in which we have passed the preceding day, by our general habits of life, by the hopes which we most fondly indulge, and the fears which prevail most over our fortitude when awake. From recollecting our dreams, therefore, we may learn to correct many improprieties in our conduct; to refrain from bodily exercises, or from meals and drinks that have unfavorable effects on our constitution; to resist, in due time, evil habits that are stealing upon us; and to guard against hopes and fears which detach us from our proper concerns, and unfit us for the duties of life. Instead of thinking what our dreams may forebode, we may, with much better reason, reflect by what they have been occasioned, and look back to those circumstances in our past life, to which they are owing. The sleep of innocence and health is sound and refreshing; their dreams delightful and pleasing. A disordered body, and a polluted or perturbed mind, are haunted in sleep with frightful, impure, and displeasing dreams. The reader who is disposed to speculate farther on this subject, may consult Dr. Beattie's *Essays*, Hartley on *Man*, and the principal writers on physiology. We may add, some very beautiful fables have been written both by ancients and moderns in the form of dreams. The *Somnium Scipionis* is one of the finest of Cicero's compositions. In the periodical publications, which have diffused so much elegant and useful knowledge through Great Britain, the *Tatlers*, *Spectators*, *Guardians*, &c., we find a number of excellent dreams. Addison excelled in this way of writing. The public are now less partial to this species of composition than formerly. Dr. Beattie, in his valuable *Essay on Dreaming*, quotes a very fine one from the *Tatler*, and gives it due praise.

DREAR, *adj.* & *n. s.* } Sax. dreorig; Belg.

DREAR'HEAD, *n. s.* } rygga, to lament. All  
DREAR'IMENT, } the substantives signify  
DREAR'INESS, } sorrow, united with  
fear: drear and dreary are, dismal; mournful; fearful.

The ill-faced owl, death's dreadful messenger;  
The hoarse night raven, trumpet of doleful drear.

Spenser.

The messengers of death, the ghastly owl,  
With dreary shrieks did also yell,  
And hungry wolves continually did howl  
At her abhorred face, so horrid and so foul.

Id. *Fuero* Queene.

But the good knight

Full of sad fears and ghastly drear,  
When all this speech the living tree had o'er,  
The bleeding bough did thrust into the ground.  
Spenser. *Fuero*

In urns and altars round,  
A drear and dying sound  
Affrights the flames at their service quair,  
Obscure they went through dreary chambers,  
Along the vast dominions of the dead.  
Towns, forests, herds, and men perished,  
drowned,  
With one great death deform the dreary ground.

So with his dread Caduceus Hermes led  
From the dark regions of the unknown  
Or drove in silent shoals the hanging train  
To night's dull shore, and Pluto's dreary throne.

It struck even the besiegers' ear  
With something ominous and drear,  
An undefined and sudden thrill,  
Which makes the heart a moment

O luxury!

Bane of elated life, of affluent state,  
What dreary change, what ruin, is not thine?

DREDGE, *v. a.* & *n. s.* } Sax. drag  
DREDGER, *n. s.* } drag, of drag

(or of dregs?) this word is a corruption of *drag*, which is a particular kind of net: the dredger is one who uses such a net; it is a hoop from its net-like top, a box for flour on meat, or amongst pastry; called dredging-box.

For oysters they have a peculiar dredge, a strong net, fastened to three spalls of iron, and at the boat's stern, gathering whatsoever is lying in the bottom.

The oysters dredged in the Lynce find a ready acceptance.

DREDGING, in civil engineering, is the removing mud, silt, or other deposit from the bed of rivers, canals, harbours, &c., and is accomplished by various tools and descriptions of machinery.

The common dredging-boat or barge is manned by two or more men, by whom the gunwale ballast is taken up in a leather bag, the end of which is extended by an iron hoop, to a pole, of sufficient length to reach the bottom: in the small way, two men are employed to work each pole. The barge being moored, one of the men takes his station at the stern, the other at the head, having hold of a rope, tied fast to the end of the leather bag. The man at the head puts the pole and bag down, over the side, to the bottom, in an inclined position, the hoop being furthest from the man in the barge, and having a rope, one end of which is fast to the gunwale of the barge, he turns twice or thrice round the pole, and then it is tight: the man in the head now pulls the rope fast to the hoop, and draws the hoop along the ground, the other allowing it to slip through the rope as it approaches the vertical position, at the same time causing friction, that the hoop digs into the mud, the leather bag receiving whatsoever passes the

Fig. 2

low assist in getting a bag into the trundle O. When the men are employed; and, to a windlass, with wheel-work,

A chain or rope is brought to the spoon, through a block and a small crane for bearing the contents to the side of the boat, over the gunwale to be emptied. The base rope is led upon deck by the proper direction for the chain. From two to four men, the apparatus, lift from twenty fathoms, from a depth of from two fathoms, when the ground is favourable, the convicts at Woolwich have been long employed to dredging, or dredging.

The dredging-machine, whether worked by the steam-engine, is a great improvement on the above. The frame-work consists of timber, supported on a platform of wood; on these the machine is placed upon iron rollers fixed to the empty buckets, attached to an endless chain, form a curve in the bottom; as they respectively descend to excavate or scoop up from the ground. The operation of raising the frame once the work is done, distinct from the steam-engine, is now also accomplished from it.

**MACHINES, AA, fig. 1,** is bolted to the starboard gunwale. A large horizontal beam BB, the frame is fixed up in the plan at D, fig. 2, and the end of the beam is bolted to an upright post bolted to the gunwale; the starboard end of the beam is over the vessel's side, and has a bracket fastened to it, to support one end of the long frame EE, composed of two plates bolted together: the other end of the frame is supported by pulleys *a, a*; from the stern, the upper ends of the frame EE have brackets bolted to them, which are perforated to receive two short tubes fastened to the iron bracket on the beam B, and the other to a frame A; these tubes act as guides for the pulleys *a, a*: they also form an iron axis, on which a trundle O is fixed, containing four similar trundles P is placed at the end of the frame EE, and two endless chains, as is seen in the plan, run round the buckets, bring the buckets up to the beams of the frame to the rollers *d, d*, and buckets as they roll up. The rollers are also placed on each of the chains to keep the chains in their places, so they may not get off to one side. The ballast is conveyed to the chains by

means of a cast iron wheel at G in the plan, wedged on the end of the axis of the upper trundle O. The wheel is cast hollow, like a very short cylinder, and has several screws tapped through its rim, pointing to the centre, and pressing upon the circumference of another wheel enclosed within the hollow of the first, that it may slip round in the other, where any power greater than the friction of the screw is applied; the internal wheel is wedged on the same shaft with a large cog-wheel *f*, turned by the small cog-wheel *g*, on the axis of the steam-engine. The steam-engine is one of that kind called high pressure, working by the expansive force of the steam only, without condensation; *h* is the boiler containing the fire-place and cylinder within it; *i* is one of the connecting rods, and *l* the fly wheel on the other end of the same shaft as the wheel *g*. The pulleys *a*, which suspend the chain frame, are reeved with an iron chain, the tackle fall of which passes down through the ship's deck, and is coiled on a roller *m* in the plan, and represented by a circle in the elevation: on the end of the roller is a cog-wheel *p*, turned by the engine wheel *g*: the bearing of this wheel is fixed upon a lever, one end of which comes near that part of the steam-engine, where the cock, which regulates the velocity of the engine, is placed; so that one man can command both lever and cock, and, by depressing that end of the lever, cause the wheel *p* to gear with *g*, and consequently be turned thereby, and wind up the chain of the pulleys; *g* is a strong curved iron bar bolted to the vessel's side and gunwale, passing through an eye bolted to the frame E, to keep the frame to the vessel's side, that the tide or other accident may not carry it away.

A hopper or trough is suspended beneath the wheel *o*, by ropes from the beam B, into which the buckets *b, b, b*, empty the ballast they bring from the bottom; the hopper conveys it into a barge brought beneath it; this hopper is not shown in the plate, as it would tend to confuse parts already not very distinct. The motion of the whole machine is regulated by one man. The vessel being moored fast, the engine is started, and turns the chain of buckets: the engine tender now puts his foot upon a lever, disengages the wheel *p* from *g*, and by another takes off a gripe which embraced the roller *m*. This allows the end E of the frame to descend, until the buckets on the lower half of the chain drag on the ground, as shown in fig. 1, when he stops the further descent by the gripe, the buckets are filled in succession at the lower end of the frame, and brought up to the top, where they deliver their contents into the hopper before-mentioned: as they take away the ballast from the bottom, the engine tender lets the frame E down lower by means of the gripe lever, and keeps it at such a height that the buckets come up nearly full; if at any time the buckets get such deep hold as to endanger the breaking of the chain or stopping the engine, the coupling-box at G before-described, suffers the steam-engine to turn without moving the chain of buckets, and the engine tender, pressing his foot upon the lever which brings the wheel *p* to gear with *g*, causes the roller *m* to be turned by the engine, and raise up the frame E, until

the buckets take into the ground the proper depth, that the friction of the coupling-box at G will turn the chain without slipping in any considerable degree. The steam-engine here described is of six-horse power, and will load a small barge with ballast in an hour and a half. Generally the excavated matters are required as ballast for shipping. Those of the Thames are sold to the colliers of Shield and Newcastle, at the rate of about a shilling per ton, and the ballast hills of those places are said to consist of these matters principally. They are also used for embanking and filling up behind piers, and those taken from the London docks are carried to the Osier Forelands on the banks of the river Lea, where they have already formed a valuable frontage for building. When dry they have also been used as brick-earth. When these matters are required to be transported by water to a distance, the receiving boat is made with two holds sloping towards the keel or bottom, for the purpose of lessening the width of the discharging apertures, which are shut with hatches, or hinged doors. These opening outwards, the pressure of the water prevents them from being opened until the time of arrival at the proper place; when chains attached to ring-bolts force them apart, and the whole contents of the boat escape.

The *Scouring or Dredging Basin* is a watertight compartment of a harbour, furnished with sluices, and designed to contain a quantity of tidal or river water, to be run off at pleasure. Where the command of head-water is sufficient, this is found the most effectual of all modes of disposing of loosened stuff. Most modern engineers have therefore included a scouring basin in their designs for tide harbours. The late Mr. Rennie reported that 400,000 tons of mud were annually discharged by the sewers of London into the river Thames. See *HARBOUR*.

**DREGS**, *n. s.* } Goth. *dregg*; Teut. *trus-*  
*DREG'GISH*, *adj.* } *cen*; Lat. *fuccus*; Gr. *ρφο*,  
*DREG'GY*, *adj.* } *ρρνος*, refuse. (Used by  
 Shakespeare in the singular, see below.) The  
 sediments or lees of liquors; offal; refuse of any  
 kind: *dreggy* is, containing dregs.

**TROT.** — What makes this pretty abruption?  
 What too curious dreg espies my sweet lady in the  
 fountain of our love?

**CRES.** More dregs than water, if my fears have  
 eyes. *Shakespeare. Troilus and Cressida.*

The king by this journey purged a little the dregs  
 and leaven of the northern people, that were before  
 in no good affections towards him. *Bacon.*

Fain would we make him author of the wine,  
 If for the dregs we would some other blame.

Ripe grapes being moderately pressed, their juice  
 may, without much dreggy matter, be squeezed out.  
*Davies.*

To give a strong taste to this dreggy liquor, they  
 fling in an incredible deal of broom or hops, whereby  
 small beer is rendered equal in mischief to strong.  
*Boyle.*

Heaven's favourite thou, for better fates designed  
 Than we, the dregs and rubbish of mankind.  
*Harvey on Consumption.*

What diffidence we must be under whether God  
 will regard our sacrifice, when we have nothing to  
 offer him but the dregs and refuse of life, the days of  
*Dryden.*

loathing and satiety, and the years in which we live  
 no pleasure. *Laps.*

Such run on poets, in a raging vein,  
 Even to the dregs and squeezings of the brain.  
*For.*

This the chalice of the fornications of rapine, war,  
 and oppression, which was held out by the popish  
 eastern harlot; which so many of the people, even  
 of the nobles of the land, had drained to the  
 dregs. *Dus.*

The body of your work is a composition of mud  
 and sediments, like a bad tavern's worst wine.  
*Stanh.*

His had been quaffed too quickly, and he found  
 The dregs were wormwood; but he filled again.  
 And from a purer fount, on holier ground,  
 And deemed its spring perpetual; but in vain.  
 Still round him clung invisibly a chain  
 Which galled for ever. *Apes.*

**DREIN**, *v. n.* See **DRAIN**. To engage in the  
 same with drain; spelt differently perhaps for  
 chance.

She is the sluice of her lady's secrets: to see  
 ting her mill a-going, and I can drown her in  
 all. *Crozier.*

'Tis dreined and emptied of its poison wine.  
 A cordial draught. *Stanh.*

**DRELINCOURT** (Charles), a minister  
 of the reformed church at Paris, was born in 1595.  
 He is best known in England by his  
 Consolations against the Fears of Death, which  
 was translated, and has been often printed.  
 His third son, professor of physic at Leyden, was  
 physician to the prince and princess of Orange  
 before their accession to the crown of England.  
 He died in 1660.

**DRENCH**, *v. a. & n. s.* } *Saxo. dren-*  
**DRENCH'EN.** } *Goth. drenan.*  
 immerse, moisten. To soak; steep; saturate with  
 moisture; physic abundantly or violently; to  
 substantives corresponding. A drench has been  
 defined, 'physic for a brute.'

And he seide, come thou and Peter shalt see  
 fro the boot and wakide on the waters to see  
 Jhesus, But he sigh the wynd strong, and we are  
 and whanne he biganne to drenchen, he creide an  
 lord make me saaf. *Wyclif. Mark.*

Our garments being as they were drenched in the  
 sea, hold notwithstanding their freshness and coolness.  
*Stanh.*

In swinish sleep  
 Their drenched natures lie, as in a death.  
*Sh. Hamlet.*

Harry, says she, how many hast thou killed since?  
 Give my roan horse a drench, says he; and return  
 fourteen, an hour after. *Sh. Henry 1st.*

Their counsels are more like a drench that is  
 poured down, than a draught which one would  
 drink if I liked it. *Apes.*

Let such bethink them, if the sleep drench  
 Of that forgetful lake benumb not still.  
 That in our proper motion we are dead.  
 To-day deep thoughts learn with one to dream  
 In mirth, that after no repenting dream.  
*Sh. Hamlet.*

Now dam the ditches, and the ditches  
 Their moisture has already drenched the plain.  
*Sh. Henry 1st.*

A drench of wine has with success been used  
 And through a horn the generous juice is  
 poured. *Sh. Henry 1st.*

his! has mutual batree *drenched*  
a native blood. *Philips.*

or cattle are infected, speedily let both  
feed, and *drench* them.

*Mortimer's Husbandry.*  
fleece, which, *drenched* with dew he

none refreshed the herbs around,  
resent the Church, endowed  
gifts, to Heathens not allowed.

*Cooper.*  
we cast up upon that great book  
The Family Receipt Book;  
th she rules in all her courses,  
ewing figs to *drenching* horses.

*Sheridan.*  
neglected on the lonesome plain,  
or Edwin never knew your lore,  
against the winter's *drenching* rain,  
th snow, the cottage shut the door.

*Beattie.*  
Then she wrung  
her long *drenched* by every storm.

*Byron.*  
half. Probably corrupted from  
make a proverbial rhyme to *brent*

, quoth he, when I the present see  
to be *drent* than *brent*?

*Færia Queens.*  
N, a handsome city of Germany,  
Saxony, is situated on both sides  
at the influx of the Weisseritz.  
a third division, lying on the Weis-  
Frederickstadt. It is approached  
ry direction by delightful avenues,  
gh a rich and fertile country, and  
gentle acclivities. On entering the  
ble bridge across the Elbe first  
e of the spectator. It is built en-  
stone, and is about 550 paces in  
ting of nineteen arches. A delight-  
preads on every side. The streets  
are clean, broad, and well paved.  
Its public buildings are eleven  
arches, two Catholic, and one Cal-  
ore recent of the Catholic churches,  
middle of the eighteenth century, is  
test ecclesiastical edifices in Ger-  
a flat roof cased with copper, and  
feet in height. But the late elec-  
e royal palace, is both an extensive  
the fine arts, which the traveller  
omit to explore, and a magnificent,  
lar structure. It has a tower 355  
and a number of remarkable apart-  
ularly the well known green vault,  
eight rooms, paved with marble,  
eg numerous statues, ivory work,  
vases, and precious stones. Before  
750 this collection was almost un-  
gustus II. and his preceding elec-  
to the fine arts an object of their  
torage; and to him this city is in-  
post of its modern improvements.  
lace is the chancery, and a large  
staining a valuable collection of  
the house of assembly for the diet  
e an elegant building, as well as

the palaces called after the princes Anthony and  
Maximilian. In the suburbs are the Zwinger gar-  
dens, a promenade containing a valuable cabinet of  
natural history. The arsenal has a curious collection  
of early fire-arms. The castle, formerly belonging  
to the counts of Brühl, is the great dépôt of the  
porcelain manufactures. Another remarkable  
edifice is the Dutch and Japanese palace, a  
square building, rising amidst groves and  
thickets, and containing the royal library, said to  
consist of 150,000 volumes, some valuable sta-  
tues, and a beautiful collection of porcelain.

Here is a military school, and an academy for  
cadets of noble family. The charitable insti-  
tutions, particularly the house of industry, are  
said to be well regulated. It finds employment  
for more than 3000 individuals. The manufac-  
tures are those of lace, jewellery, porcelain, ear-  
thenware, mirrors, tapestry, and plaited straw.  
There are several public gardens outside of the  
city, of which the largest, the royal garden, is  
occasionally enlivened with concerts. There is  
also in this neighbourhood a romantic spot,  
called the Planische Grund, a valley formed by  
steep rocks of granite, and watered by the Weis-  
seritz. Vineyards extend along a hill in the  
direction of the castle of Pillnitz, the summer  
residence of the royal family, and remarkable  
for the coalition of 1792. In 1755 the popula-  
tion of Dresden was 63,000; in 1788, 53,000;  
in 1801, 48,000; in 1811, 45,000. This de-  
crease is ascribed to the alarms and actual cala-  
mities to which Dresden has been exposed in  
the late wars of the continent; and, indeed,  
ever since Prussia ventured to cope with Austria.  
It was taken by the Prussians in 1745, and again in  
1756; when it became the scene of war and of ex-  
treme distress. August 26th and 27th, 1813, the  
combined Austrian and Russian army advanced  
in great force from the Bohemian frontier, and  
attacked this city, but were obliged to retire.  
Dresden remained in the possession of the French  
until the scene of war was transferred to the  
neighbourhood of Leipzig; and the decisive  
battles in that situation obliged Buonaparte to  
evacuate Germany. Marshal St. Cyr was  
blockaded in it, and obliged to capitulate on the  
6th of November, 1813.

Dresden was stripped of its walls in 1810 to  
repair the fortifications of Torgau. Since the  
peace it has been rapidly improving, and the  
population is now taken at 60,000. It is  
situated 100 miles south-west of Berlin.

DRESS, *v. a., v. n. & n. s.* *Fr. dresser;*  
DRESS'ER, *n. s.* *Ital. drizzare;*  
DRESS'ING, *Teuton. diruer;*  
DRESS'ING-ROOM, *from Lat. dirigo;*  
DREST, *part.* *Gr. δρῆσαι, to*  
make ready. To clothe; robe; adorn. Hence  
to cover a wound with medicaments; to rectify;  
adjust and prepare, generally: used also in a  
particular sense for the trimming, currying, and  
rubbing horses, as well as breaking them in;  
and for preparing food for the table. As a neuter  
verb, it means to pay particular attention to dress;  
and among soldiers, to keep in line. As a sub-  
stantive, it is synonymous with clothes, attire;  
and sometimes means skill; exactness in putting  
on dress. Dressing is synonymous with dress:

a dresser is one employed in dressing; and a useful kitchen-board on which food is dressed.

To give light to them that sit in darkness, and in shadow of death, to *dress* our feet into the ways of peace. *Wiclif.*

When he *dresses* the lamps, he shall burn incense. *Rodas xxx.*

Said he unto the *dresser* of his vineyard, Behold, these three years I come seeking fruit on this fig-tree, and find none. *Luke.*

Enforced to slepe, and for to take some rest  
And to lye downe as soone as I my *dreeste*  
At Harwyche porte slumbryng as I laye  
In myne hostes house called *powres* keye. *Skelton.*

'Tis burnt, and so is all the meat.  
What dogs are these! Where is the rascal cook?  
How durst you, villains! bring it from the *dresser*,  
And serve it thus to me that love it not? *Shakespeare.*

Adam! well may we labour still to *dress*  
This garden; still to tend plant, herb, and flower. *Milton.*

Where was a fine room in the middle of the house,  
handsomely *dressed up*, for the commissioners to sit in. *Clarendon.*

Our infirmities are so many, that we are forced to  
*dress* and tend horses and asses, that they may help  
our needs. *Taylor.*

The first request  
He made was, like his brothers to be *dressed*;  
And, as his birth required, above the rest. *Dryden.*

A steed  
Well mouthed, well managed, which himself did  
*dress*;  
His aid in war, his ornament in peace. *Id.*

Few admired the native red and white,  
Till poets *dressed* them up to charm the sight. *Id.*

Thus the voluptuous youth, bred up to *dress*  
For his fat grandsire some delicious mess,  
In feeding high his tutor will surpass,  
An heir apparent of the gourmand race. *Id.*

She hurries all her hand-maids to the task;  
Her head alone will twenty *dressers* ask. *Id. Juvenal.*

A maple *dresser* in her hall she had,  
On which full many a slender meal she made. *Id.*

The mind loses its natural relish of real truth, and  
is reconciled insensibly to anything that can be  
*dressed up* into any faint appearance of it. *Locke.*

When you take down dishes, tip a dozen upon the  
*dresser*. *Suiff's Directions to the Cook.*

Latin books might be found every day in his  
*dressing-room*, if it were carefully searched. *Swift.*

Lollia Paulina wore, in jewels, when *dressed out*,  
the value of three hundred twenty-two thousand nine  
hundred and sixteen pounds thirteen shillings and  
four-pence. *Arbuthnot.*

In time of my sickness another surgeon *dressed*  
her. *Wiseman.*

The second day after we took off the *dressings*, and  
found an eschar made by the cathartic. *Id. on Tumours.*

Full *dress* creates dignity, augments consciousness,  
and keeps at distance an encroacher. *Clarkson.*

A robe obscene was o'er his shoulders thrown,  
A *dress* by fates and furies worn alone. *Pope's Stat.*

The men of pleasure, *dress*, and gallantry. *Pope.*  
When you *dress* your young hops, cut away roots or  
sprigs. *Mortimer's Husbandry.*

A lady of genius will give a genteel air to her  
whole *dress* by a well-fancied suit of knots, as a judi-

cious writer gives a spirit to a whole *dress* by a  
single expression. *Ca.*

*Dress* drains our cellar dry,  
And keeps our larder lean; puts out our fire,  
And introduces hunger, frost, and war.  
Where peace and hospitality might reign. *Comus.*

And dear to love, to memory dear,  
It brightens through the starting tear;  
Like the glad bow, by fancy *drawn*,  
That beams on evening's watery *draw*. *Bonnie*  
oldiers *dress* by one another in *draws*. *Ca.*  
collectively *dresses* by some given object. *James's Military Dictionary.*

*DRESSING*, in surgery. See *SURGICAL*.

*DRESSING OF MEAT*, by means of open  
fire, is intended to loosen the compact texture  
of the flesh, and dispose it for digestion  
and digestion in the stomach. The operations  
are roasting, boiling, and stewing. In  
roasting, it is observed, meat will bear a  
greater and longer heat than either in boiling  
or stewing; and in boiling, greater and longer  
in stewing. Roasting being performed in  
open air, as the parts begin externally to  
they extend and dilate, and so gradually  
part of the rarefied included air, by which  
the internal succussions, on which the  
depends, are much weakened and abated. Roast-  
ing being performed in water, the pressure is  
greater, and consequently the succussions  
up the weight are proportionably more  
which means the coction is hastened. So  
in this way there are great differences, but  
greater the weight of water the sooner the  
business done. In stewing, though the heat is  
much less than what is employed in the  
methods, the operation is much more  
because performed in a close vessel, and so  
which means the succussions are often re-  
peated, and more strongly reverberated. Hence  
the force of Papin's digester. Young  
Cheyne observes, draws more of the rarest  
juices from the meat, and leaves it less moist,  
but lighter, and easier of digestion; roasting,  
the other hand, leaves it fuller of the starchy  
tritive juices, but harder to digest, and so  
more dilution. Dr. Brown insists, that meat  
is more easily digested, and every way  
for a weak stomach than boiled. Strong  
grown animal food should be boiled, and  
young and tender roasted.

*DREVET* (Peter), the elder and younger  
eminent French engravers. The father  
but was surpassed by his son, who was  
of the Royal Academy of painting and  
sculpture. His portraits are neat and elegant  
labored to the last degree. He particularly  
excels in representing lace, silk, fur, velvet, and  
other ornamental parts of dress. His  
prints, in point of neatness and execution,  
manship, are scarcely to be equalled. His  
representation of Christ in the Temple, is  
the best of these. The following are  
valued: the Meeting of Abraham's Servants  
Rebecca at the Well; and Abraham, with Isaac  
on the Altar, dated 1707; both large  
plates from A. Coypel. Among his  
the following are held in the highest esteem.  
M. Bossuet, bishop of Meaux, a whole

and Samuel Bernard, a whole-  
a chair.

town of France, in the depart-  
re and Loire, and ci-devant pro-  
v. It is remarkable for its anti-  
taken by Henry II. of England  
by Henry V. in 1421. It is  
e for a battle fought in the  
December, 1562, between the  
stants. Some derive its name  
d. It has two churches, St. Ste-  
re Dame, or the great church,  
uilt. It has a cloth manufacture,  
the river Blaise, at the foot of a  
five miles west by south of Paris.

heap o' leaves an' stibble,  
mony a weary nibble  
turned out, for a' thy trouble,

But house or hald,  
winter's sleety *dribble*,

An' cranreuch could! *Burns.*

v. a. & v. n. From drive. Impulse;  
ince or tendency; violent course;  
rft or violent shower, and a heap  
y matter thrown together, or at  
verb is derived from the substan-  
to draw; impel along; or throw

nk, half rent with rugged rift,  
he rocks, and fall with fearful *drift*.

*Faerie Queene.*

under from the south  
bift of bullets on this town.

*Shakespeare.*

ape, upon the waters swam,  
which rudely cut within,  
first a floating trough became,  
let passage did begin.

*Dryden.*

under the *drift* of any passion, will  
impulse of it till something interpose,  
it impulse, turn him another way.

*South.*

ft of his hook being to prove, that  
possible to be false, he opposes no-  
*Tillotson.*

The *drift* of the pamphlet is to stir up our compas-  
sion towards the rebels.

*Addison.*

This, by the stile, the manner, and the *drift*,  
'Twas thought could be the work of none but Swift.

*Swift.*

The ready racers stand;

Swift as on wings of wind upborne they fly,

And *drifts* of rising dust involve the sky.

*Pope's Odyssey.*

Snow, no larger than so many grains of sand,  
*drifted* with the wind in clouds from every plain.

*Ellis's Voyage.*

He wanders on

From hill to dale, still more and more astray,  
Impatient bounding through the *drifted* heaps.

*Thomson.*

'Prince, to these walls give access free

At all times for my friends and me.'

Phrygia full well perceived her *drift*

Yet nobly rais'd his gift.

*Sheridan.*

DRIFT, in navigation, the angle which the  
line of a ship's motion makes with the nearest  
meridian, when she drives with her side to the  
wind and waves, and is not governed by the  
power of the helm; it also implies the distance  
which the ship drives on that line. A ship's  
way is only called drift in a storm; and then  
when it blows so vehemently as to prevent her  
from carrying any sail, or at least restrains her to  
such a portion of sail as may be necessary to  
keep her sufficiently inclined to one side, that  
she may not be dismasted by her violent labor-  
ing, produced by the turbulence of the sea.

DRIFT-SAIL, a sail used under water, veered  
out right a-head by sheets, as other sails are. It  
serves to keep the ship's head right upon the sea  
in a storm, and to hinder her driving too fast in  
a current.

DRILL, v. a., v. n., & n. s. Germ. and Dutch  
*drillen*; Sax. *dirhan*, of the verb *thregian*, to turn;  
from *durgh* or *turgh*, through. To pierce or bore;  
hence to drain: as a neuter verb, it means to  
flow gently, trickle; and hence, probably, to  
cause so to flow; to conduct; to train. Drill is  
used substantively for a boring instrument; a  
dribbling brook; military exercise; and a kind of  
monkey.

Springs through the pleasant meadows pour their  
*drills*,

Which snake-like glide between the bordering hills.

*Sandys.*

My body through and through he *drilled*,

And Whacum by my side lay killed.

*Hudibras.*

The foe appeared drawn up and *drilled*,

Ready to charge them in the field.

*Id.*

The way of tempering steel to make gravers, *drills*,  
and mechanical instruments, we have taught artificers.

*Boyle.*

Shall the difference of hair be a mark of a different  
internal species constitution between a changeling  
and a *drill*, when they agree in shape and want of  
reason?

*Locke.*

When by such insinuations they have once got  
within him, and are able to *drill* him on from one  
lewdness to another, by the same arts they corrupt  
and squeeze him.

*South.*

She has bubbled him out of his youth: she *drilled*-  
him on to five-and-fifty, and she will drop him in his  
old age.

*Addison.*

*Drills* are used for the making such holes as punches will not serve for; as a piece of work that hath already its shape, and must have an hole made in it.

*Moron.*

When a hole is *drilled* in a piece of metal, they hold the drill-bow in their right hand; but, when they turn small work, they hold the drill-bow in their left hand.

*Id.*

Tell, what could *drill* and perforate the poles,  
And to the' attractive rays adapt their holes?

*Blackmore.*

*Drilled* through the sandy stratum every way,  
The waters with the sandy stratum rise.

*Thomson.*

Some *drill* and bore

The solid earth, and from the strata there  
Extract a register, by which we learn,  
That he who made it, and revealed its date  
To Moses, was mistaken in its age.

*Cowper.*

**DRILL-SOWING**, a method of sowing grain or seed of any kind, so that it may all be at a proper depth in the earth, which is necessary to its producing healthful and vigorous plants. For this purpose a variety of drill ploughs have been invented and recommended; but from the expense attending the purchase, and the extreme complication of their structure, there is no instrument of this kind, as yet discovered, that has been brought into general use. This method, however, is greatly recommended in the *Georgical Essays*. See **HUSBANDRY**.

**DRINK**, *v. a., v. n., & n. s.*

**DRINK'ABLE**, *adj.*

**DRINK'ER**, *n. s.*

**DRINK'MONEY**,

**DRUNK**, *adj.*

**DRUNK'ARD**, *n. s.*

**DRUNK'ER**, *adj.*

**DRUNK'ENLY**, *adv.*

**DRUNK'ENNESS**, *n. s.*

*Gothic drecca; Sax. drencan; Teut. and Belg. trincken, perhaps from the sound of drinking from a cup.—Minshew. To swallow liquid; quench thirst: hence to feast; guzzle habitually; salute in drinking. As an active verb, it means to swallow; suck up; absorb; to act upon by drinking; and is used with the intensive particles off, up, and in: drink is liquid of any kind. Drinkable is proper or agreeable to drink: drinker is applied both to him who moderately as well as him who excessively drinks: drink-money, is money given to procure, or instead of, drink: drunk, and drunken, are the regular participial adjectives of drink: drunkard is one who habitually drinks to excess; and drunkenly, drunkenness, the corresponding adverb and substantive.*

For Jon cam neither etynge ne drynhynge, and thei seyen he bath a devil. The son of man cam etynge and drynhynge; and thei seyen lo a man a gloutoun and a drynhere of wyn, and a frend of puppleanes and of synful men.

*Wiclif. Mat. xi.*

And nyle ghe be drunken of wyn in which is lecherie, but be ghe fillid with the hooli goost.

*Wiclif. Effensis v.*

She said, drink, and I will give thy camels drink also; so I drank, and she made the camels drink also.

*Gen. xxiv. 46.*

Benhadad was drinking himself drunk in the pavilions.

*1 Kings.*

Withouten lake mete never was his hous  
Of fish and flesh, and that so plenteous  
It snowed in his hous of mete and drinke  
Of alle dainties that men coude thinke.

*Chaucer. Prolog. to Cant. Tales.*

Thou livest in bliss  
That earthly passion never unites;  
Where, from the purest spring,  
The sacred nectar sweet  
Is thy continual drink.

*Spenser. The Faerie Queene.*

Passion is the drunkenness of the soul, and therefore in its present workings not commendable.

Come, we have a hot venison pasty in the kitchen, gentlemen, I hope we shall drink down all.

I take your princely word for these words—  
I gave it you, and will maintain my word  
And thereupon I drink unto your grace.

My ears have yet not drunk a hundred  
Of that tongue's uttering, yet I know the sound.

Then let the earth be drunken with thy blood.

We will give you rare and sleepy drams.

*Id. Macbeth.*

We came to fight you.—For my part, it is turned to a drinking. *Id. Antony and Cleopatra.*

Done in a state of inebriation.

When your carter, or your waiting woman, have done a drunken slaughter, and defiled the precious image of our dear Redeemer, you straight are on your knees for pardon.

My blood already, like the pelican,

Heat thou tapt out, and drunkenly

Some blood drawn on me would taste

Of my more fierce endeavour. I've

Do more than this in sport. *Id. Hamlet.*

It were good for those that have made  
are great drinkers, to take some of the  
rosemary, and frankincense, about the  
mouth.

*Drunken* men imagine every thing they imagine that things come upon them not well things afar off; those things in near hand, they see out of their place, as they see things double.

When God made choice

His mighty champion, strong above

Whose drink was only from the liquid

O madness, to think use of strongest

And strongest drinks, our chief support

*Drunkenness* is the way to all bestial sins.

*Ap. Hall's Collection.*

Cannot be that wisely declines valour  
ice for fear of falling, though possibly  
him sooner to his journey's end, as  
drinking more wine than is necessary, for  
drunk, and the ill consequences thereof.

*Lat.*

Every going off from our natural temper, and our usual severity of behaviour, of drunkenness.

*Taylor's Rule of Life.*

The body being reduced nearer unto emptied, he cometh more porous, and is eth in water.

*Brevius Vita.*

This was the morn when issuing in the  
Drawn up in rank and file, they stood  
Of seeming arms to make a short essay  
Then hasten to be drunk, the business of

On the other side, let a drunkenard see  
decays, his estate wastes, his discretion, and  
the want of all things, even of his talk  
tends him in the course he follows.

and debauched person is the object of contempt. *South.*

Is another a cup of poison, a thing as bad; but at the same time he tells him so, and so he *drinks* it off, and dies.

*Id.*  
In his health and his strength in his life, he all his *drunken* trophies, at length himself too. *Id.*

I conclude that man *drunk*, who takes ought sober. *Spectator.*

I should for honour take broken quarrels of a rake. *Swift.*

Let acts of gods, and heroes old, be bards in hall and bower have told, to the lyre, your voice employ; and e'er will *drink* with silent joy.

*Pope.*  
Delicious poison from thy eye. *Id.*

Thy sweeping skirt too near the wall; thy sleeve will *drink* the coloured oil.

*Gay.*  
Austere wines are apt to occasion *Arbutnot on Aliments.*

As were always asking for drink-money. *Arbutnot.*

Romans trained up their children to be, by bringing a drunken man into the world. *Watts on the Mind.*

Necessary to be *drunk* one's self, to relish drunkenness. Do we not judge of the dialogue between Iago and Cassio (sent in its kind), when we are quite wit, by whatever means it is produced; will appear so at all times. I admit are raised by *drinking*, as by the communion of any pleasure: cock-fighting or all raise the spirits of a company, as though surely they will not improve unless admit, that there are some sluggish approved by *drinking*, as there are fruits good till they are rotten: there are such are meddles. *Johnson.*

No eyes how *drink* this sight of loveliness; sole in this sweet solitude, the Spirit of the place divide of these waters. *Byron.*

Would that I had died monster's victim I had been! its midnight violence betide, fit of drunkenness or spleen? *Id.*

An essential part of our ordinary food. See Food. The general is, to supply fluid; facilitate solution to assist the evacuation of the aliment; promote the progress of the aliment in the intestines; for, by the contraction of longitudinal fibres of the stomach, (drawn up, and nothing but fluid left), by its bulk, makes a hurried passage through the intestines, and so determines excretion by stool, as less than determined by the lacteals. Hence, a large common water has been found purer ceteris paribus, that aliment which is mixed with the largest proportion of water, the largest evacuation by stool. It has arisen, about where the fermentation of the aliment is first remarkably

collected. It is commonly thought to be in the great gut; but, undoubtedly, it often begins in the ileum, especially when the drink is in a small proportion, and when the progress of the aliment is slow; for when the contents of the guts are very fluid, they are quickly pushed on, and reach the great guts before they deposit their feculency. Another effect of drink is, to facilitate the mixture of the lymph, reffluent from every part of the system, with the chyle. In the blood-vessels, where all must be kept fluid in order to proper mixture, drink increases the fluidity, and gives tension, by its bulk. Hence, drink contributes to sanguification, as sometimes food gives too dense a nutriment to be acted upon by the solids; and hence, also, drink promotes the secretions. These are the effects of drink in general; but the more liquid the food is, it is the sooner evacuated, and less nourishment is extracted. Hence, drink is, in some degree, opposed to nourishment; and so, ceteris paribus, those who use least drink are most nourished. All these effects may be produced by simple water; and it is said, that other liquors are fit for drink in proportion to the water they contain. Water, however, when used as drink, is most commonly impregnated with vegetable and farinaceous substances, which thus both operate as drink and contribute to nourishment. Sometimes we impregnate water with the subacid fruits; and thus it acquires other qualities, of considerable use in the animal economy. All drinks may be reduced to two heads: first, pure water, or where the additional substance gives no additional virtue; second, fermented liquors. The latter have not only the qualities of the first, but also qualities peculiar to themselves. Fermented liquors are more or less poignant to the taste, and better calculated to quench thirst. They are peculiarly adapted for stimulating the mouth, fauces, and stomach, to throw out the saliva and gastric liquor. By their acscency they are fitted for some beneficial purposes in certain states of the system; by their fluidity they dilate viscid food; though in this respect they answer no better than common water. Carried into the blood-vessels, in so far as they retain any saline property, they stimulate the excretories, and promote urine and sweat. Many physicians, in treating of fermented liquors, have rejected their nutritious virtues, which certainly ought to be taken into the account, though, by expediting the evacuation by stool, they cause less of the nutritious parts of the aliment to be taken up, and, by stimulating the excretories, make these nutritious parts to rest for a shorter time in the system. All these and many other effects arise from fermented liquors. Their acscency sometimes promotes the disease of acscency, by increasing that of vegetables, acting as a ferment, and so producing flatulency, purging, cholera, &c. So that, with vegetable aliment, as little drink is necessary, the most innocent is pure water; and it is only with animal food that fermented liquors are necessary. In warmer climates, fermented liquors would seem requisite to obviate alkalescency and heat. But it should be considered, that, though fermented liquors contain an acid, yet they also contain al-

sons ben of the word, and of names of  
the glossif, I will not be domesman  
is, and he *drive* him from the doom place.

*Id. Dedis. 18.*

Richman told, saying, the *driving* is like  
Jehu, the son of Nimshi, for he *driveth*  
Bible, 2 Kings ix. 20.  
is *driven* forth from among men.

*Job xxi. 5.*

He measured the earth: he beheld, and  
the nations.

*Hab. iii. 6.*

He benches he *drove* away the cat,  
tous his potent and his bat,  
scrip, and set himself adoun.

A Spaniard is unacquainted with our northern  
*drovers*.

*Brown.*

Authors *drive* at these, as the highest elegancies,  
which are but the frigidities of wit.

*Id. Vulgar Errors.*

He taught the gospel rather than the law,

And forced himself to *drive*, but loved to draw.

*Dryden*

Love, fixt to one, still safe at anchor rides,

And dares the fury of the winds and tides;

But losing once that hold, to the wide ocean born,

It *drives* away at will, to every wave a scorn.

*Id.*

Fierce Horcas *drove* against his flying sails,

And rent the sheets.

*Id. Rucid.*

Perithous' dart *drove* on, and nailed him to the  
wood.

*Dryden.*

Your Pasimond a lawless bargain *drove*,

The parent could not sell the daughter's love.

*Id.*

Fate has *driven* 'em all

Into the net.

*Id. Non Sebastian.*

Not the fierce *driver* with more fury lends

The sounding lash, and, ere the stroke descends,

Low to the wheels his pliant body bends.

*Id. Virgil.*

But if to fame alone thou dost pretend,

The miser will his empty palace lend,

Set wide with doors, adorned with plated brass,

Where *droves*, as at a city-gate, may pass.

*Id. Juvenal.*

The *drover*, who his fellow *drover* meets

In narrow passages of winding streets.

*Id.*

The wolves scampered away, however, as hard as  
they could *drive*.

*L'Estrange.*

The one 's in the plot, let him be never so inno-  
cent; and the other is as white as the *driven* snow, let  
him be never so criminal.

*Id.*

He, *driven* to dismount, threatened, if I did not the  
like, to do as much for my horse as fortune had done  
for his.

*Sidney.*

It is better to marry than to burn, says St. Paul;  
where we may see what *drives* men into a conjugal  
life: a little burning pushes us more powerfully than  
greater pleasures in prospect.

*Locke.*

The multitude or common rout, like a drove of  
sheep, or an herd of oxen, may be managed by any  
noise or cry which their *driver* shall accustom them to.

*South.*

There find a herd of heifers, wandering o'er  
The neighbouring hill, and *drive* 'em to the shore.

*Addison.*

We have done our work, and are come within view  
of the end that we have been *driving* at.

*Id. on the War.*

To *drive* the argument farther, let us inquire into  
the obvious designs of this divine architect.

*Chrysos's Philo. Principles.*

The trade of life cannot be *driven* without partners.

*Collier.*

The design of these orators was to *drive* some pas-  
sicular point, either the commendation or acquittal.

*Suett.*

He builds a bridge, who never *drove* a pile.

*Pope*

Thick as autumnal leaves, or *driving* sand,

The moving squadrons blacken all the strand.

*Id. Hud.*

The foe rushed furious as he pants for breath,  
And through his navel drove the pointed death. *Id.*  
Or when the country floats with sudden rains,  
Or driving mists deface the moistened plains,  
In vain his toils the unskilful fowler tries,  
While in thick woods the feeding partridge lies.

*Gay.*

First joyless rains obscure  
Drive thro' the mingling skies with vapour foul,  
Dash on the mountain's brow, and shake the woods  
That grumbling wave below. *Thomson.*  
Of plain sound sense life's current coin is made;  
With that we drive the most substantial trade.

*Young.*

He that by the plough would thrive,  
Himself must either hold or drive. *Franklin.*

May He who gives the rain to pour,  
And wings the blast to blow,  
Protect thee from the driving shower,  
The bitter frost and snow! *Burns.*

DRIVING, among sportsmen, a method of taking pheasant pouts. The sportsman having found out the haunts of these birds, and fixed his nets there, he calls upon them together by a pheasant call, imitating the voice of the dam; after this he makes a noise with his driver, which will make them run a little way forward in a cluster; and this he repeats till he has made sure of them, by driving them into his nets.

DRIVING, in metallurgy, is said of silver, when, in the operation of refining, the lead being burnt away, the remaining copper rises upon its surface in red fiery bubbles.

DRIVING, in the sea language, is said of a ship, when an anchor being let fall will not hold her fast, nor prevent her falling away with the wind or tide. The best help in this case is to let fall more anchors, or to veer out more cable; for the more cable she has out, the safer she rides. When a ship is a-bull or a-try, they say she drives to leeward.

DRIV'EL, *v. n. & n. s.* } *Goth. drafla*; *Icel.*

DRIV'ELLER, *n. s.* } *drafu*, to talk wildly;  
whence Teut. *ravelen*, to dote. To be weak;  
foolish: hence to slaver like a child or idiot.  
The substantive, driv'el, saliva, is derived from  
the verb. A driveller is a dastard; fool; idiot.

This *driveling* love is like a great natural, that runs  
lolling up and down to hide his bauble.

*Shakespeare. Romeo and Juliet.*

No man could spit from him, but would be forced  
to driv'el like some paralytick, or a fool. *Grew.*

Besides the' eternal driv'el, that supplies  
The dropping beard, from nostrils, mouth, and eyes.

*Dryden.*

I hate to see a brave bold fellow sotted,  
Made sour and senseless, turned to whey, by love  
A driveling hero, fit for a romance. *Id.*

What fool am I, to mingle that driv'el's speeches  
among my noble thoughts. *Sidney.*

I met with this Chremes, a driveling old fellow,  
lean, shaking both of head and hands, already half  
earth, and yet then most greedy of earth. *Id.*

I have heard the arrantest drivellers commended for  
their shrewdness, even by men of tolerable judgment.

*Swift.*

All pay themselves the compliment to think  
They, one day, shall not driv'el: and their pride  
On this reversion takes up ready praise. *Thomson.*

In life's last scene what prodigies surprise,  
Fears of the brave, and follies of the wise!

From Marlborough's eyes the stream of life  
And Swift expires a driveller and a hero.  
*Johnson. Vanity of Honour.*

Ye writers of what none with safety  
Footing it in the dance that fancy leads,  
Ye novelists, who mar what ye would mend,  
Sniveling and driveling folly without end.

DRIVERS, among sportsmen, a driving pheasant pouts, consisting of strong ozier wands, such as the hazel, use, set in a handle, and twisted or bent into small ozers in two or three places. The instrument the sportsman drives the pouts into his nets.

DRIZZLE, *v. a. & v. n.* } *Goth.*

DRIZZLY, *adj.* } *Germ. drizeln.*

Lat. *ros*; Gr. *ερσοος*, dew. To shed  
small drops: drizzily is shredding small.

And drizzling drops, that often do  
The finest flint doth in continuance show.

Her heart did melt in great compassure  
And drizzling tears did shed for pure amour.

*Farmer.*

When the sun sets, the air doth drizzle.

This day will pour down  
If I conjecture aught, no drizzling shower  
But rattling storm of arrows harbed round.

This during winter's drizzly reign be  
Till the new ram receives the created rain.

*Dryden.*

The neighbouring mountains, by reason  
height, are more exposed to the dew than  
rains than any of the adjacent parts.

*Adrian.*

But if perchance on some dull driveling  
A thought intrude, that says, or seems to say  
If thus the' important cause is to be tried,  
Suppose the beam should dip on the wrong side,  
I soon recover from these needless fears,  
And God is merciful—sets all to right.

DROGDEN CHANNEL, a channel between the islands of Amak and Saltholm, and a safe passage for ships of the line into the bay of Copenhagen. It is about five miles in length, and opposite the road of Copenhagen, and consisting of two channels, divided by a narrow isthmus. The inner, which is called Kotegeddy (a passage), is commanded by the city of Copenhagen, and was the scene of the battle of 2d of April, 1801, between the Danish and British fleets.

DROGHEDA, anciently called Tinnahinch, a post, market, and fair town in Ireland, twenty-nine miles from Dublin. It is situated on the river Boyne, the natural boundary between the counties of Meath and Louth, and is the county of the town of Drogheda; it is governed by a recorder, a mayor, two sheriffs, two aldermen, the sheriffs' peers, and four representatives from the guilds. Drogheda is formerly a town of much consideration, and the privilege of coinage was once granted in the reign of Edward IV. an act of the Irish parliament, for the foundation of a university here, with like privileges, which act remains still unrepealed.

place was besieged by the rebels, but after being considerably, was at length gallantly led by Sir Henry Trehbourne. Cromwell's forces stormed and captured it, and left an lasting remembrance of his sanguinary character here, in the massacre of its unarmed inhabitants: St. Lawrence's gate and tower are chief remains of the ancient fortifications. Four miles from Drogheda, on the river Boyne, is the passage of Oldbridge, celebrated for the scene of the memorable engagement between William III. and James II. in 1690, by which the battle of the Boyne. A hand-cannon is erected on the spot.

Drogheda returns one member to the imperial parliament. The principal public buildings are, a very elegant structure: the churches of St. Peter's and St. Mary's; five Roman Catholic chapels, and two meeting-houses. There are also large assembly-rooms, and a reading-room. The gaol is a fine building, lately erected at an expense of £12,000. There is an infantry barracks in the town, and a fine one on a hill called Millmount, on the south side of the river. The principal trade of Drogheda consists in the sale of dowlas, from six to thirty inches wide: sheeting of a superior quality was once the staple, but it has lost its reputation of manufacturing the best of that article. Much corn is exported, and coal imported, which latter is conveyed by means of the Boyne navigation to Drogheda, whence the interior of Meath is conveyed. The harbour of Drogheda is in need of much improvement: the great objection to the navigation is a bank called the Red Bed; by cutting through this, which can be done for a small sum, four feet water can be gained over the bar and up to the town.

There is but one bridge in Drogheda, and this is dangerously narrow. Amongst the public institutions are the classical school (one of high character), founded by Sir Erasmus Smith; the blue school, supported by the corporation; an almshouse, affording shelter and support to twenty-four widows; an asylum for thirty-six clergymen's widows, to each of whom £25 annually are allowed: this is supported by bequests of primates Marsh and Bolter. There are many other valuable charities and institutions in this town. The export trade is highly flourishing, and to the establishment of the harbour improvement above-mentioned only need to be added, to make it the medium of communication to the midland counties.

**DROLL**, *n. s. & v. n.* A contraction of drivelling. a sluggard: hence to work sluggishly; to droll.

Let such vile vassals, born to base vocation,  
Ledge in the world, and for their living droll,  
Which have no wit to live withouten toyle.

*Spenser.*

Ames does contract and narrow our faculties,  
So we can apprehend only those things in which  
we converse; the drolling peasant scarce thinks  
of any world beyond the neighbouring markets.

*Government of the Tongue.*

VOL. VII.

**DROITWICH**, a town of England, in the county of Worcester, containing three churches, and about 400 houses. It is noted for excellent white salt, made from the salt-springs in its neighbourhood; amounting to about 700,000 bushels a year. This town, anciently called Diertwich, from its wet dirty appearance, is seated on the navigable river Salwarp. It appears to have been a populous place in the reign of William the Conqueror, and has always been particularly celebrated for its immense salt-springs, whereof mention is made in Domesday-Book. A canal has been made from this town to the Severn, about three miles from Worcester, for the purpose of conveying the salt. It has a weekly market on Friday, and sends one member to parliament. The right of election is in two bailiffs, the recorder, and eleven burgesses, who are styled the corporation of the salt-springs of Droitwich. The bailiffs are the returning officers, and justices of the quorum: the recorder is also a justice of the peace. It is seven miles E. N. E. of Worcester, and 118 W. N. W. of London.

**DROLL**, *n. s., v. n., v. a. & adj.* Fr. *drôle*;

**DROL'LER**, *n. s.*

**DROL'LERY**,

**DROL'LINO**,

**DROLL'HOUSE**.

Arin. *drew*.  
A jester; buffoon: hence to play the buffoon, or jester; to cheat; trick: and, as an adjective, ridiculous; odd.

There is nothing so disagreeable in works of humour, as an insipid, unsupported vivacity, the very barks of drollery, bottled small beer, a man out-riding his horse, lewdness and impotence, a fiery actor in a phlegmatic scene, an illiterate and stupid preacher discoursing upon Urim and Thummim, and beating the pulpit cushion in such a manner, as though he would make the dust and the truth fly out of it at once.

*Shenstone.*

He is making an experiment by another sort of economies, and sets the apes and drollers upon it.

*Glauville.*

Such august designs as inspire your inquiries, used to be decided by drolling fantasticks, that have only wit enough to make others and themselves ridiculous.

*Id.*

As he was running home in all haste, a droll takes him up by the way.

*L'Esrange.*

Men that will not be reasoned into their senses, may yet be laughed or drolled into them.

*Id.*

Let virtuosos insult and despise on, yet they never shall be able to droll away nature.

*South.*

The vulgar may swallow any sordid jest; any mere drollery or buffoonery; but it must be a finer and truer wit which takes with men of sense and good breeding.

*Shaftesbury.*

Italy may have the preference of all other nations for history painting; Holland for drolls and a neat finished manner of working; France for gay, jaunty, fluttering pictures; and England for portraits.

*Spectator.*

Democritus, dear droll! revisit earth,  
And with our follies glut thy heightened mirth.

*Prior.*

Some as justly fame extols,

For lofty lines in Smithfield drolls.

*Swift.*

They hang between heaven and hell, borrow the christian's faith, and the atheist's drollery upon it.

*Government of the Tongue.*

2 E

Should the senate-house, where all our lawgivers assemble, be used for a theatre or *droll-house*, or for idle puppet shows? *Watts.*

**DROME**, a river of France, in Dauphiny, which rises near the entrance of the Val de Drome, on the borders of the department of the Upper Alps, and which, rapidly traversing the department of its own name from east to west, falls into the Rhone between Montelimar and Valence. It is partially navigable.

**DROME**, a department of France, so named from the foregoing river, comprehends the south-west part of Lower Dauphiny, and is bounded by the departments of the Isere, Upper Alps, Lower Alps, and Vaucluse: the Rhone bounds it on the west. It contains a population of 253,500, among whom there are 34,000 Protestants. The country is high, full of mountains and valleys, and is watered by the Rhone, the Isere, the Drome, and several inferior rivers. In the valley of the Rhone, the mulberry, the almond, the chestnut, walnut, and in some places the olive, are found to thrive; and though the climate is cold, wine is a staple production, particularly the kinds called *Hermitage* and *Vin de Nyons*. Corn is imported yearly to a considerable amount. The stock of cattle is not considerable, the pasturages being for the most part appropriated to the herds of Provence. Wood is in abundance. The manufactures are in the larger towns are linen, woollen, and cotton works. The exports consist of wine, silk, olive and nut oil, and almonds.

**DROMEDARY**, *n.* Fr. *dromadaire*; Ital. Span. and Port. *dromedario*; Lat. *dromedarius*; Gr. *δρομας*, from *δρομος*, a course, on account of the swiftness of its course. An animal of the *CAMELUS* species, which see.

Straw for the horses and *dromedaries* brought they unto the place. *1 Kings.*

Mules, after these camels and *dromedaries*,  
And waggons fraught with utensils of war.

*Milton.*

A sort of camel so called from its swiftness, because it is said to travel a hundred miles a-day. *Dromedaries* are smaller than common camels, slenderer, and more nimble. *Culmet.*

Or let me have the long

And patient swiftness of the desert-ship:

The helmless *dromedary*;—and I'll bear

Thy fiendish sarcasm with a saintly patience.

*Byron.*

**DROMORE**, a town of Ireland, in the county of Down. It is a very ancient town, and the seat of a bishopric. The see was founded by St. Colman in the sixth century. It was refounded by king James I., who, by his charters (preserved in the rolls office), granted it very great privileges. Among other marks of royal favor, he distinguished the bishops of this see by the style of 'A. B., by Divine Providence bishop of Dromore;' whereas all other bishops in Ireland, except those of Meath and Kildare, are styled 'by Divine Permission.' Dromore lies seventeen miles east of Armagh, and fifteen south-west of Belfast.

**DRONE**, *n. s. & v. n.* } Belgic *droomigh*,  
Dron'ish, *adj.* } (sleepy).—*Minsheu.*

DRONE-PIPE. } Sax. *drane* of drygan,  
to expel.—*H. Tooke.* Serenius says, of Sax.

*droen*, to murmur. The bee which makes no honey and only murmurs: hence also a murmuring noise; an idler; a sluggard. To *drone* is to live idly; to make a low humming noise; to be idle, lazy, sluggish.

There is a great number of noblemen among us that are themselves as idle as *drones*; that abuse other men's labour, on the labour of those whom, to raise their revenues, they pass to the point.

*St. J. B.*

The sad-eyed justice, with his curly hair,

Delivering o'er to executors pale

The lazy yawning *drone*. *Shakespeare. Henry 4.*

Sit idle on the household hearth,

A burdensome *drone*, to visitants a gaze. *Van.*

What have I lost by my forefather's fault

Why was I not the twentieth by descent

From a long restive race of *droning* kings? *Dryden.*

Melfoil and honeysuckles pound,

With these alluring savours strew the ground,

And mix with tinkling brass the cymbal's sound. *A.*

All, with united force, combine to drive

The lazy *drone* from the laborious hive. *Id. Tem.*

Luxurious kings are to their people lost,

They live, like *drones*, upon the public's cost. *Id. Antagon.*

It is my misfortune to be married to a *drone* who lives upon what I get, without bringing any addition to the common stock. *Johnson.*

The *dronish* monks, the scorn and shame of the hood,

Rouse and prepare once more to take possession  
To nestle in their ancient hives again. *Johnson.*

Here while his canting *drone-pipe* seemed

The mystic figures of her hand,

He tipples palmistry, and dines

On all her fortune-telling lines. *Johnson.*

You speak with life, in hopes to extenuate

Your elevated voice goes through the brass.

You fall at once into a lower key.

That's worse—the *drone-pipe* of an humble bee. *Johnson.*

Cobwebs for little flies are spread,

And laws for little folks are made;

But if an insect of renown,

Hornet or beetle, wasp or *drone*,

Be caught in quest of sport or plunder,

The flimsy fetter flies in sunder. *Johnson.*

**DRONTHEIM**, a town and province of Germany, formerly the capital, and the residence of the kings, situated on a point of the North Sea. It is nearly surrounded by mountains; and has a well-frequented sea-port, which however is not capable of receiving large vessels, on account of the narrowness of the entrance of the harbour. It is still a bishop's see, is enclosed by a wall, and defended by a castle by no means strong. The houses are mostly of wood. Near it are mines of gold and silver. The principal exports are wool, timber, copper, iron, pitch, tar, stock-fish, dross, pot-ash, &c. In exchange, they receive all import spices, wines, salt, brandy, corn, flour, cloth, &c. It is 270 miles north-west of Stockholm. Long. 11° 9' E., lat. 63° 26' N. The province of Dronthheim is the most northern of the four grand bailiages or dioceses of the country, and situated on the west coast, between

terhaus, the Swedish frontier, and in its widest extent it comprises mentioned province and Finnmarch. Proper includes eighty-six parishes, or towns of Drontheim, Rorans, d, and Molde. The population of has received a marked increase last half century; in 1769 it was 1 in 1814, 138,000: including Norrmarmark, the number in 1801 was though full of mountains, and little cultivation, the progress of rural been of late years very consider-

v. n. Dut. *droef* (sorrow; Sax. *diupa*, from *drop*, almost a cognate languish; bend in sorrow; sink; ards.

v, with struggling spent;  
ghts are on my sorrows bent. *Sandys*.  
eg the dishonour of his mother,  
declined, *drooped*, took it deeply;  
nd fixed the shame on 't in himself.

*Shakespeare.*

emith doth depend upon  
dous star; whose influence  
I not, but omit, my fortunes  
if *droop*. *Id. Tempest.*

In thy side henceforth must stray.  
day's work lies; though now enjoin'd  
I day *droop*. *Milton's Paradise Lost.*

His head, though gay,  
rple, azure, or specked with gold,  
f, unsustained. *Id.*  
but *droop* in absence of the sun,  
their sweets! and mine, alas! is gone.  
*Dryden.*

gious rage to cruel exile drove  
of beauty and the court of love,  
*drooped* with their forsaken arts. *Id.*  
mpulse from heaven Tyrtæus sung,  
ldiers a new courage sprung.

*Roscommon.*

ate the soldiers' *drooping* courage  
of freedom and contempt of life.  
*Addison's Cato.*

ten days before he died, and observed  
much to *droop* and languish. *Swift.*  
wed bosom hung her *drooping* head,  
ough she raised, and this she said.  
*Pope.*

et sighs the virgin lily *droops*.  
a conslips hang their tawny cups.  
*Darwin.*

Don Jerome, you promised her forgive-  
the poor creature *droops*!  
m, indeed! Why, gad take me, this is  
—but where's my daughter, where's  
*Sheridan.*

he cared how sped the bower,  
e marked the *drooping* flower,  
during through the bushy brake,  
bewildered accents spake. *Id.*

ere me the Gladiator lie:  
pon his hand—his manly brow  
e death, but conquers agony.  
ayed head sinks gradually low—  
h his side the last drops, ebbing slow  
nd gash, fall heavy. *Byron.*

The winds were pillowed on the waves,  
The banners *drooped* along their staves,  
And, as they fell around them farling,  
Above them shone the crescent curling. *Id.*

DROP, v. a., v. n. & n. s. } Goth. *droppa*;  
DROPT'LET, } Saxon *dropian*;  
DROPT'ING, n. s. } Germ. and Dutch  
*dropten*; Swed. and Dan. *dryppe*. To let fall in  
small particles; hence let go; quit; speak cas-  
sually; intermit; suffer to vanish or expire: as  
a neuter verb, to fall in drops; hence to fall ge-  
nerally; to come casually; to sink, die. Drop-  
let is a diminutive of drop.

His heavens shall *drop* down dew.

*Deut. xxxiii 28.*

The heavens *dropped* at the presence of God.

*Psaln lxviii 8.*

*Drop* not thy word against the house of Isaac.

*Amos.*

It was your presumptuous,  
That in the dolo of blows your son might *drop*.

*Shakespeare.*

The quality of mercy is not strained;  
It *droppeth* as the gentle rain from heaven  
Upon the place beneath.

*Id. Merchant of Venice.*

Meet we the med'cine of our country's weal,  
And with him pour we, in our country's purge,  
Each drop of us. *Id. Mucheto.*

Though I could

With barefaced power sweep him from my sight,  
And bid my will avouch it; yet I must not,  
For certain friends that are both his and mine,  
Whose loves I may not *drop*. *Id.*

Thou abhorrest in us our human griefs,  
Scorned our brine's flow, and those our *droplets*, which  
From niggard nature fall. *Id. Timon.*

Thrifty wench scrapes kitchen-stuff,  
And barrelling the *droppings* and the snuff  
Of wasting candles. *Donne.*

Nothing, says Seneca, so soon reconciles us to  
the thoughts of our own death, as the prospect of  
one friend after another *dropping* round us.

*Digby to Pope.*

So mayest thou live, till, like ripe fruit, thou *drop*  
Into thy mother's lap; or be with ease  
Gathered, not harshly plucked. *Milton.*

Or sporting, with quick glance,  
Shew to the sun their waved coats, *dropped* with gold.  
*Id.*

So thick a *drop* serene hath quenched their orbs,  
Or dim suffusion veiled! *Id. Paradise Lost.*

Admiring in the gloomy shade,  
Those little *drops* of light. *Waller.*

Whereas Aristotle tells us, that if a *drop* of wine  
be put into ten thousand measures of water, the wine,  
being overpowered by so vast a quantity of water, will  
be turned into it; he speaks very improbably. *Boyle.*

One only hag remained:  
Propped on her trusty staff, not half upright,  
And *drooped* an awkward courtesy to the knight.  
*Dryden.*

Either you come not here, or, as you grace  
Some old acquaintance, *drop* into the place,  
Careless and quailish, with a yawning face. *Id.*

Beneath a rock he sighed alone,  
And cold Lycæus wept from every *dropping* stone.  
*Id.*

Had I but known that Senebo was his father,  
I would have poured a deluge of my blood  
To save one *drop* of his. *Id. Spanish Friar.*

I have beat the hoof till I have worn out these shoes  
in your service, and not one penny left me to buy  
more; so that you must even excuse me if I drop you  
here.

*L'Estrange.*

The thoughts that come often unsought, and, as it  
were, drop into the mind, are commonly the most va-  
luable of any we have, and therefore should be se-  
cured, because they seldom return again.

*Locke.*

St. Paul's epistles contain nothing but points of  
Christian instruction, amongst which he seldom fails  
to drop in the great and distinguishing doctrines of  
our holy religion.

*Id.*

Repentance hath a purifying power, and every tear  
is of a cleansing virtue; but these penitential clouds  
must be still kept dropping, one shower will not suffice;  
for repentance is not one single action but a course.

*South.*

He could never make any figure in company, but by  
giving disturbance at his entry: and therefore takes  
care to drop in when he thinks you are just seated.

*Spectator, No. 448.*

Thus was the fame of our Saviour perpetuated by  
such records as would preserve the traditionary account  
of him to after-ages; and rectify it, if, by passing  
through several generations, it might drop any part  
that was material.

*Addison.*

Virgil's friends thought fit to let drop this incident of  
Helen.

*Id. Travels.*

In every revolution, approaching nearer and nearer  
to the sun, this comet must at last drop into the sun's  
body.

*Cheyne.*

Where the act is unmanly or immoral, we ought to  
drop our hopes, or rather never entertain them.

*Collier on Despair.*

After having given this judgment in its favour, they  
suddenly drop the pursuit.

*Sharp's Surgery.*

Philosophers conjecture that you dropped from the  
moon, or one of the stars.

*Gulliver's Travels.*

St. John himself will scarce forbear

To bite his pen and drop a tear.

*Swift.*

Opinions, like fashions, always descend from those  
of quality to the middle sort, and thence to the vulgar,  
where they are dropped and vanish.

*Id.*

The drops to thee, Brilliante, we consign;

And, Musementilla, let the watch be thine.

*Pope.*

I heard of threats occasioned by my verses: I sent  
to acquaint them where I was to be found, and so it  
dropped.

*Id.*

Strain out the last dull droppings of your sense,  
And rhyme with all the rage of impotence.

*Id.*

The most affluent may be stript of all, and find his  
worldly comforts like so many withered leaves dropping  
from him.

*Sterna.*

Those who have assumed visible shapes for a season,  
can hardly be reckoned among this order of com-  
pounded beings; because they drop their bodies, and  
divest themselves of those visible shapes.

*Watts's Logic.*

Constancy in friendships, attachments, and familia-  
rities, is commendable, and is requisite to support  
trust and good correspondence in society. But in  
places of general, though casual concourse, where the  
pursuit of health and pleasure brings people promiscu-  
ously together, public convenience has dispensed  
with this maxim; and custom there promotes an un-  
reserved conversation for the time, by indulging the  
privilege of dropping afterwards every indifferent ac-  
quaintance without breach of civility or good manners.

*Hume.*

Evening now from purple wings  
Sheds the grateful gifts she brings;  
Brilliant drops bedeck the mead,  
Cooling breezes shake the reed.

*Johnson, Ode to Evening.*

Shrouded Nile,

Eridanus, and Tiber with his sons,  
And palmy Euphrates: they with bosoms  
Hang o'er their urns, and mourning  
The plaintive-echoing ruins pour their tears.

Drops, in meteorology, small spheres  
which the particles of fluids spontaneously  
themselves into when let fall from air.  
This spherical figure, the Newtonian  
phers demonstrate to be the effect of  
attraction; for, considering that the  
force of one single particle of a fluid  
exerted to an equal distance, it may  
that other fluid particles are on every  
to it, and will therefore take their pre-  
equal distance from it, and consequently  
round superficies.

DROPSY,

DROPSICAL, adj.

DROPSIED, adj.

*Fr. hydropisie.*

*Port. dropsea.*

*Lat. hydrops.*

from *utrop*, water. A disease which  
water in different parts of the body.

Where great addition swells, and water  
It is a dropried honour: good alone

Is good. *Shakespeare. All's Well that*

There note they the ship's sickness,  
Shaked with an ague, and the hold and  
With a salt droprie clogged.

Revenge, that thrifty droprie of our  
Which makes us covet that which harm  
Is not alone sweet, but partakes of pain.

The diet of nephritick and dropried  
to be such as is opposite to, and subdu-  
cent nature of the salts in the serum of the  
*Arbushaet*

A tendency to these diseases is certainly  
though perhaps not the diseases them-  
less quantity of ale, cyder, wine, or spirits,  
the gout and droprie in those constitutions  
rents have been intemperate in the  
quors; as I have more than once had  
observe.

She likewise hinted that a certain widow  
street had got rid of her droprie, and  
shape in a most surprising manner.

Dropsy (*utropia*), a collection of fluid  
in the cellular membrane, the various  
cavities of the body. For the general  
of this disease, see HYDROPS; for drop-  
belly, see ASCITES; for dropsy of the  
DROCFPHALUS; for dropsy of the  
THORAX; for dropsy of the skin,  
for dropsy of the testicle, HYDRO-  
TIC.

DROSERA, *ros solis*, or sun-dew,  
a genus of the pentagynia order, and  
class of plants; natural order tou-  
nales: cal. quinquefid, petals five:  
cular, and quinquevalved at top:  
numerous. Species eleven, which  
rally in boggy places, in many par-  
dom. They are named sun-dew for  
striking circumstance in their appa-  
leaves, which are circular, are fringed  
supporting small drops or globules  
liquor like dew, which continue the  
test part of the day, and in the full  
to the sun. The whole plant is ef-  
ciently caustic to erode the skin, &c.

What succour can I hope the muse will send,  
Whose drowsiness hath wronged the muse's friend?  
*Crazshaw.*

While thus she rested, on her arm reclined,  
The hoary willows waving with the wind,  
And feathered quires that warbled in the shade,  
And purling streams that through the meadow strayed,  
In drowsy murmurs lulled the gentle maid. *Addison.*

A sensation of drowsiness, oppression, and lassitude, are signs of a plentiful meal in young people.

Those inadvertencies, a body would think, even our author, with all his drowsy reasoning, could never have been capable of.  
*Atterbury.*

The flowers, called out of their beds,  
Start and raise up their drowsy heads.

Now while the drowsy world lies lost in sleep,  
Let me associate with the serious night,  
And contemplation, her sedate compeer.  
*Thomson.*

Amidst the drowsy charms of dull delight,  
Year chases year with unremitted flight,  
Till want now following, fraudulent and slow,  
Shall spring to seize thee like an ambushed foe.

*Dr. Johnson's Poems.*

A dull rotation, never at a stay,  
Yesterday's face, twin image of to-day;  
While conversation, an exhausted stock,  
Grows drowsy as the clicking of a clock.

*Cooper.*

The drowsy dungeon-clock had numbered two,  
And Wallace tower had sworn the fact was true:  
The tide-swollen Frith, with sullen sounding roar,  
Through the still night dashed hoarse along the shore.

*Burns.*

DRUB, *v. a. & n. s.* } Dan. *druber*, to kill;  
DRUB'ING, *n. s.* } Swed. *drabba*; Island.  
*drubba*, to fight. To beat soundly; to give blows;  
also, the beating given, for which a drubbing is  
the common substantive of low conversation.

He that is valiant, and dares fight,  
Though drubbed, can lose no honour by it.

*Hudibras.*

The blows and drubs I have received  
Have bruised my body, and bereaved  
My limbs of strength.

*Id.*

The little thief had been soundly drubbed with a  
good honest cudgel.  
*L'Estrange.*  
Though the bread be not mine, yet, if it had been  
less than weight, I should have been drubbed.

*Loche.*

By setting an unfortunate mark on their followers,  
they have exposed them to innumerable drubs and  
contusions.

*Addison.*

In the rude state of society, prior to the existence  
of laws, if one man gave another ill language, the  
affronted person might return it by a box on the ear;  
and if repeated, by a good drubbing.

*Franklin.*

DRUDGE, *v. n.* } Sax. *dreogan*; Dutch  
DRUDGE'ER *n. s.* } *dragen*; perhaps from  
DRUDGE'RY, } *drag*, which see. To  
DRUDGE'INGLY, *adv.* } labor in heavy or servile  
DRUG, *n. s.* } work: a drudger is he  
who thus labors, and drudgery the work done.  
Shakspeare has drugge for drudge in his first fol.  
edit. See the passage given below from Timon  
of Athens.

My old dame will be undone for one to do her hus-  
bandry and her drudgery.

*Shakspeare.*

To conclude, this drudge of the devil, this diviner,  
said claim to me.

*Id. Comedy of Errors.*

We from his first oath proceeded  
Through sweet degrees that this brief notice  
To such as may the passive drudge of it  
Freely command.

*Id. Timon.*

Those whom the Egyptians honoured  
now they contemn as drudges.

*Bp. Hall. Comedy.*

A high spirited man is above the vulgar  
drudgery, and cannot pull down his thrusting  
business of life.

He sits above and laughs the while,  
At thee, ordained his drudge, to execute  
Whate'er his wrath shall bid.

*Milton's Poems.*

And to cracked fiddle, and beane  
In merriment, did drudge and labour.

It is not poetry, that makes men poor:  
For few do write, that were not so before.  
And those that have writ best, had rather  
Had ne'er been seized with a poetic rage:  
Had loved their ease too well, to take the  
To undergo that drudgery of brains;  
Advantages obtained by industry, drudgery  
losophy, can never be expected from drudgery  
rance.

The hard master makes men serve him  
who rewards his drudges and slaves with  
shame, and sorrow, and misery.

The poor sleep little: we must learn to  
Our labours late, and early every morning  
Midst winter frosts; then, clad and fed  
Rise to our toils, and drudge away the day.  
To thee that drudgery of power I give:  
Cares be thy lot: reign though, and let

Paradise was a place of bliss, as well as  
lity, without drudgery, and without sorrow.  
Were there not instruments for drudgery  
offices of drudgery? Were there not people  
orders, as well as others to give and execute

You do not know the heavy grievance  
The toils, the labours, weary drudgery  
Which they impose.

*Southey.*

He does now all the meanest and trifling  
himself drudgingly, without making use of  
or subordinate minister.

*Ray on the*

What is an age, in dull renown  
One little single hour of love is more.  
Even Drudgery himself,  
As at the car he sweats, or dizzy  
The palace stone, looks gay.

*Thomson.*

It is now handled by every dirty creature  
demned to do her drudgery.

*Saunders's Meditations on a*

A man of wit is not incapable of  
above it. A sprightly generous horse  
a pack-saddle as well as an ass, but  
to be put to the drudgery.

I knew that the work in which I  
usually considered as drudgery for the blame  
per toil of artless industry.

*Johnson. Pious*

But I am bankrupt now; and do  
To drudge, in decent dry, on others  
Bards, I acknowledge, of unequalled  
But what is commentators' happiest prize

The poor, inured to drudgery and  
Act without aim, think little, and feel  
And no where, but in feigned Arcadian  
Taste happiness, or know what pleasure

like ye, that sle as you and I,  
sledge and drive through wet and dry.  
ever-ceasing toil. Burns.

GING-BOX. See DREGG-BOX.  
n. s. & v. s. } Fr. *drogue*; Span.  
tr, n. s. } and Ital. *droga*; prob-  
ably from Sax. *drug*;  
Fr. *royne*, dry; drugs  
signifying dry medicines: and hence  
dried up or worthless. Drugget is a  
non kind of stuff: druggist and drug-  
tr of drugs.

drugs I have; but Mantua's law  
to any he that utters them. Shakespeare.  
The surfeited grooms

for charge with snores.—I've *drugged* their  
sins,  
and nature do contend about them. Id.  
to people, the good physician prescribes  
wholesome medicines; not removing the  
out of their bodies into their purses, nor  
to the East Indies for *drugs* which they  
utter out of their gardens. Fuller.

Of they assayed,  
(thirst constraining; *drugged* as oft  
deest diarrheah, writhed their jaws  
and cinders filled. Milton's *Paradise Lost*.

A fleet descried  
in clouds, by equinoctial winds  
g from Bengal, or the isles  
and Tidore, whence merchants bring  
*drugs*. Id.  
trocs of *drugs* and plants, the mistake in a  
danger life.

Baker's *Reflections on Learning*.  
nitre we bought at the druggin's. Boyle.  
oil of turpentine I bought at the druggin's. Id.

Each noble vice  
Shall bear a price  
And virtue shall a *drug* become.  
An empty name,  
Was all her fame,  
But now she shall be dumb.

Dryden's *Albion*.  
its drest, of thirteen pence a-yard,  
son amidst his Persian guard. Swift.  
the clergy below their apothecaries, the  
of the soul below the druggers of the body. Atterbury.

(physick's noble art to gain,  
id plants explored, alas! in vain. Smith.  
eden mixed a mirth-inspiring bowl,  
with *drugs* of sov'reign use, to assuage  
bosom of tumultuous rage.

Pope's *Odyssey*.  
e' important budget! ushered in  
heart-shaking music, who can say  
is tidings? have our troops awaked?  
still, as if with opium *drugged*,  
e murmurs of the Atlantic wave!

Cooper.  
Hed some druggists and physicians,  
to prove her loving lord was mad.  
and some lucid intermissions,  
decided he was only bad. Byron.

tr, a slight kind of woollen stuff, some-  
all wool, sometimes half wool half  
ometimes corded, but usually plain.  
have the wof of wool, and the warp  
are called threaded druggets; and  
light with the shuttle on a loom of four

marches, as the serges of Moui, Beauvois, and  
other like stuffs corded, are called corded drug-  
gets. The plain are wrought on a loom of two  
marches, with the shuttle, in the same manner  
as cloths, camblets, and other like stuffs not  
corded.

DRUID, n. s. & adj. Gr. *δρυς*, Celt. *deru*;  
Welsh and Arm. *derio*, an oak. An ancient  
priest of Gaul and Britain. See below.

In yonder grave a *druid* lies  
Where slowly steals the winding waves. Collins.  
Sage beneath a spreading oak  
Sat the *druid*, hoary chief;  
Every burning word he spoke  
Full of rage and full of grief. Cooper.

It stood embosomed in a happy valley,  
Crowned by high woodlands, where the *druid* oak  
Stood like Caractacus in act to rally  
His host with broad arms 'gainst the thunder-  
stroke. Byron.

DRUIDS, DRUIDES, or DRUIDE, the priests  
or ministers of religion among the ancient Gauls,  
Britons, and Germans. Picard (Celtoped. lib.  
ii. p. 58) believes the druids to have been thus  
called from *Druis*, or *Dryius*, their leader, the  
fourth or fifth king of the Gauls, and father of  
Saron or Naumes. Pliny, Salmatius, Vigenere,  
&c., derive the name from *δρυς*, an oak; on ac-  
count of their inhabiting, or frequenting, and  
teaching in forests; or because they never sacri-  
ficed but under the oak. Menage derives the  
word from the old British *drus*, demon, or magi-  
cian: Borel, from the Saxon *dry*, magician; or  
from the old British *dru* or *derw*, 'oak,' whence  
he takes the Greek word *δρυς* to be derived;  
which is the most probable supposition. Corop.  
Becanus, lib. i. takes *druis* to be an old Celtic  
and German word, formed from *trawis* or *truwis*,  
'a doctor of the truth and the faith;' which ety-  
mology Vossius also approves.

The druids were the first and most distin-  
guished order among the Gauls and Britons;  
they were chosen out of the best families; and  
the honors of their birth, joined with those of  
their function, procured them the highest veneration  
among the people. They were versed in  
astrology, geometry, natural philosophy, politics,  
and geography; they were the interpreters of  
religion, and the judges of all affairs indifferently.  
Whoever refused obedience to them was declared  
impious and accursed. We know but little as  
to their peculiar doctrines; only that they be-  
lieved the immortality of the soul; and the me-  
tempsychosis. Their chief settlement in Britain  
was in the isle of Anglesea, the ancient Mona,  
which was well stored with spacious groves of  
their favorite oak. They were divided into se-  
veral classes. Strabo, however, only distin-  
guishes three kinds, bardi, vates, and druids.  
The bardi were the poets; the vates, *sarug*; were  
the priests and naturalists; and the druids, be-  
sides the study of nature, applied themselves to  
morality. Diogenes Laertius assures us, that  
the druids were the same among the ancient  
Britons with the philosophers among the Greeks;  
the magi among the Persians; the gymnosophists  
among the Indians; and the Chaldeans among  
the Assyrians. Their garments were remarkably  
long; and, when employed in religious cere-

monies, they wore a white surplice. They generally carried a wand in their hands; and wore a kind of ornament enchased in gold about their necks, called the druid's egg. See *ASGRÆUS OVUM*. Their necks were also decorated with gold chains, and their hands and arms with bracelets: they wore their hair very short, and their beards remarkably long. The druids had one chief or arch-druid, in every nation, who acted as high-priest. He had absolute authority over the rest; and commanded, decreed, punished, &c., at pleasure. At his death he was succeeded by the most considerable among the survivors; and, if there were several pretenders, the matter was ended by an election, or else decided by arms. The druids presided at sacrifices, and other ceremonies; and had the direction of every thing relating to religion. The British and Gaulish youth were instructed by them. The children of the nobility, Mela tells us, they carried into caves, or the most desolate parts of forests, and kept them there, sometimes for twenty years, under their discipline. They were here instructed in the motion of the heavens, and the course of the stars; the magnitude of the heavens and the earth; the power and wisdom of the gods, the metempsychosis, immortality, &c. They preserved the memory and actions of great men in their verses, which they never allowed to be written down, but made their pupils get them by heart. In their common course of learning, they are said to have taught them 24,000 such verses. Thus their doctrines appeared more mysterious by being unknown to all but themselves; and, having no book to recur to, they were the more careful to fix them in their memory.

It has been disputed, whether the druids were themselves the inventors of their opinions and systems of religion and philosophy, or received them from others. Some have imagined, that the colony of Phocians, who left Greece and built Marseilles, in Gaul, about the fifty-seventh Olympiad, imported the first principles of learning and philosophy, and communicated them to the Gauls and other nations in the west of Europe. But though we may allow, that the druids of Gaul and Britain borrowed some hints of their philosophy from this Greek colony, we have reason to believe that the substance of it was their own. Others have suggested, that the druids derived their philosophy from Pythagoras, which seems to be confirmed by Ammianus Marcellinus, and indeed the philosophy of the druids bore a much greater resemblance to that of Pythagoras, than to that of any other sage of antiquity. But this resemblance may, perhaps, be best accounted for by supposing that Pythagoras adopted some of the opinions of the druids, as well as imparted to them some of his discoveries. And Aristotle says that the philosophy of the druids passed into Greece. It is therefore highly probable, and in fact directly asserted by several authors, that Pythagoras visited the druids of Gaul, and was initiated into their philosophy. From the concurring testimonies of several authors, it appears that natural philosophy was the favorite study of the druids of Gaul and Britain. According to Dio-

dorus Siculus, Strabo, Cæsar, Mela, Ammianus Marcellinus, and others, they entered into disquisitions, in their schools, concerning the form and magnitude of the universe, and of this earth in particular, and even touching the most sublime and hidden secrets of nature. On these subjects they formed systems of systems and hypotheses, which they taught to their disciples in verse, that they might more easily retain them in their memories: they were not allowed to commit them to writing. Strabo has preserved one of the poetical opinions of the druids concerning the universe, viz. that it was never to be destroyed or annihilated; but was to undergo a succession of great changes and revolutions, which were to be produced sometimes by the predominancy of water, and sometimes by that of fire. This opinion, he intimates, was peculiar to them, but was entertained also by the philosophers of other nations; and he treats of it as a truth universally acknowledged and undeniable. But they did not express their sentiments on these and the like heads in a plain and natural, but in a dark, figurative, and poetical manner. We know not what their notions were about the dimensions of the universe or of the earth, but we have several reasons to suppose that they believed both to be of circular form. This is visibly the shape of the sun, moon, and stars, the most conspicuous parts of the universe; and the druids had a favorite figure of the druids, as appears in their houses and places of worship.

It may be thought improbable that the druids had made any considerable progress in arithmetic, as this may seem to be impossible without the mere strength of memory, without the use of figures and of written rules. But it is difficult to ascertain what may be done by memory alone, when it has been long exercised in this way. There is reason to think that they made use of the letters of the Greek alphabet in their calculations. Cæsar, speaking of the druids of Gaul, says, 'In almost all other public actions, and private accounts or computations, they make use of the Greek letters.' This is further confirmed by what the same author says of the Helvetii, a people of the same country, language, and manners with the Gauls and druids. 'Tables were found in the camp of the Helvetii, written in Greek letters, containing an account of all the men capable of bearing arms, who left their native country, and also separate accounts of the boys, old men, and women.'

Astronomy appears to have been one of the chief studies of the druids of Gaul and Britain. 'The druids,' says Cæsar, 'have many disquisitions concerning the heavenly bodies and their motions, in which they instruct their disciples.' Mela, speaking of the same philosophers, observes, 'That they profess to have great knowledge of the motions of the heavens and of the stars.' Some knowledge of these sciences, it was absolutely necessary for fixing the proper returns of their religious solemnities, and which the druids had the sole direction. They computed their time by nights, and by days, a custom which they had received from the

ancestors by tradition, and in which affirmed by their measuring their time by the moon. They assembled upon either at the new or full moon; for these to be the most auspicious times for all affairs of importance. Their ceremony of cutting the mistletoe was always performed on the sixth moon. Nay, they even regulated operations very much by this lumined, as much as possible, to continue while the moon was on the wane. Both by Cæsar and Mela that the druids the stars as well as the sun and that they professed to know, and disciples many things concerning of these heavenly bodies.

still many monuments remaining in the adjacent isles which give reason the ancient Britons could apply the powers so as to produce very astonishing. As these monuments appear to designed for religious purposes, we in that they were erected under the he druids. Many obelisks or pillars, unpolished stone each, are still to Britain and its isles. Some of these very thick and lofty, erected on the arrows and of mountains; and some at Stonehenge) have ponderous aloft, and resting on the tops of pillars. We can hardly suppose possible to cut these prodigious one (some of them above forty tons without wedges, or to raise them out without levers. But it certainly greater knowledge of the mechanism, and of the method of applying transport those huge stones from the places of their destination, to erect ular pillars, and to elevate the imtops of these pillars. That the Britons were acquainted with the principles the balance, we have good reason on some druidical monuments still called Lagan stones, or rocking-stone, resting upon an upright ik, and so equally balanced, that a orce, sometimes even a child, can ind down, though hardly any force to remove it from its station. Some es may have fallen into this position but others of them evidently appear placed in it by art. That the an understood the construction and is, the great number of their war- other wheel-carriages is a sufficient that they knew how to combine er, and with the other mechanical s to form machines capable of transporting very heavy weights, we have to believe.

ny and in the northern nations of healing art was chiefly committed to en of every state; but in Gaul and as entrusted to the druids, who were ins as well as the priests of these Pliny says expressly, 'That Tiberius

Cæsar destroyed the druids of the Gauls, who were the poets and physicians of that nation. The people of Gaul and Britain were probably induced to devolve the care of their health on the druids, and to apply to these priests for the cure of their diseases, not only by the high esteem they had of their wisdom and learning, but also by the opinion which they entertained, that a very intimate connexion subsisted between the arts of healing and the rites of religion; and that the former were most effectual when accompanied by the latter. It was indeed a prevailing opinion of all the nations of antiquity, that all internal diseases proceeded from the anger of the gods; and that the only way to obtain relief was to appease them by sacrifices.—That this was the practice of the Gauls and Britons, who, in some cases sacrificed one man as the most effectual means of curing another, is attested by Cæsar. This gave rise also to that great number of magical rites and incantations with which the medical practice of the druids, and of most ancient physicians was attended. The druids entertained a very high opinion of the medical virtues of the mistletoe, and esteemed it a remedy for all diseases. They believed it to be a specific against barrenness; a sovereign antidote against the effects of poisons; excellent for softening and discussing hard tumors; good for drying up scrofulous sores; for curing ulcers and wounds; and (provided it was not suffered to touch the earth after it was cut) very efficacious in the epilepsy. The selago, a kind of hedge hyssop, resembling savin, was another plant, much admired by the druids for its supposed medicinal virtues, particularly in diseases of the eyes. But its efficacy, according to them, depended much upon its being gathered under certain magical directions. They entertained a high opinion also of the herb samolus or marshwort for its sanative qualities; and gave many directions for gathering it. The person who was to perform that office was to do it fasting, and with his left hand; he was on no account to look behind him, nor to turn his face from the herbs he was gathering. It would be tedious to relate the extravagant notions they entertained of the many virtues of the vervain, and to recount the ridiculous mummeries which they practised in gathering and preparing it, both for the purposes of divination and physic. These may be seen in Pliny's Hist. Nat. l. 25. c. 9, from whom we have these anecdotes; but who, like other Greek and Roman writers, seems designedly to represent the philosophers of Gaul and Britain in an unfavorable light. We learn from Cæsar that the druids were the judges and arbiters of all differences and disputes, both public and private: they took cognizance of murders, inheritances, boundaries, and limits; and decreed rewards and punishments. Such as disobeyed their decisions they excommunicated, which was their principal punishment; the criminal being hereby excluded from all public assemblies, and avoided by all the world; so that nobody durst speak to him for fear of being polluted. Strabo observes, they had sometimes authority enough to stop armies upon the point of engaging, and accommodate their differences.

If the British druids made no contemptible proficiency in several parts of real and useful learning, it cannot be denied that they were also great pretenders to superior knowledge in certain vain fallacious sciences, by which they excited the admiration, and took advantage of the ignorance and credulity of mankind. These were magic and divination; by which they pretended to work miracles, and exhibit astonishing appearances in nature; to penetrate into the counsels of heaven, to foretel future events, and to discover the success or miscarriage of public or private undertakings. Their countrymen not only believed that the druids were possessed of these powers, but they were celebrated on this account by the philosophers of Greece and Rome. 'In Britain' says Pliny, 'the magic arts are cultivated with such astonishing success, that the Britons seem to be capable of instructing even the Persians themselves in these arts. They pretend to discover the designs and purposes of the gods. The Eubates or Vates, in particular, investigate and display the most sublime secrets of nature; and by auspices and sacrifices they foretel future events.' They were so famous for the supposed veracity of their predictions, that they were not only consulted on all important occasions by their own princes and great men, but even sometimes by the Roman emperors. Stonehenge, and several other works of the druids, were believed to have been executed by the art of magic, for many ages after the destruction of their whole order. The natural and acquired sagacity of the druids, with their long experience in public affairs, enabled them to form very probable conjectures about the event of enterprises. These conjectures they pronounced as oracles when they were consulted; and they pretended to derive them from inspecting the entrails of victims, observing the flight of certain birds, and other mummeries. By such arts they obtained and preserved the reputation of prophetic foresight among an ignorant and credulous people.

They worshipped the Supreme Being under the name of Esus, or Hesus, and the symbol of the oak; and had no other temple than a wood or a grove, where all their religious rites were performed. Nor was any person admitted to enter that sacred recess unless he carried with him a chain, in token of his absolute dependence on the Deity. Indeed, their whole religion originally consisted in acknowledging that the Supreme Being, who made his abode in these sacred groves, governed the universe; and that every creature ought to obey his laws, and pay him divine homage. They considered the oak as the emblem, or rather the peculiar residence, of the Almighty; and accordingly chaplets of it were worn both by the druids and people in their religious ceremonies; the altars were strewed with its leaves, and encircled with its branches. The fruit of it, especially the mistletoe, was thought to contain a divine virtue, and to be the peculiar gift of heaven. It was therefore sought for on the sixth day of the moon with the greatest earnestness and anxiety; and when found, was hailed with such raptures of joy, as it almost exceeds imagination to conceive. As soon

as the druids were informed of this fortunate discovery, they prepared every thing ready for a sacrifice under the oak, to which they felled two white bulls by the horns; then the druid, attended by a prodigious number of people, ascended the tree, dressed in white, and with a consecrated golden knife, or iron hook, cropped the mistletoe, which he received in his sagum or robe, amidst the rapturous exclamations of the people. Having secured the sacred plant he descended the tree; the bulls were sacrificed, and the Deity invoked to bless his own gift, and render it efficacious in the distempers in which it should be administered. The consecrated groves, in which they performed their religious rites, were fenced round with stones, to prevent any person's entering between the trees, except through the passages left open for that purpose, and which were guarded by some inferior druids, to prevent any stranger from intruding into their mysteries. These groves were of different forms: some quite circular, others oblong, and more or less capacious. The votaries in the districts to which they belonged were more or less numerous. There, in the centre of the grove was encompassed several rows of large oaks set very close together. Within this large circle were several smaller circles surrounded with large stones; and in the centre of these smaller circles were stones of a prodigious size and convenient height, on which the victims were slain and offered. Each drum being a kind of altar, was surrounded by another row of stones, the use of which was now be known, unless they were intended as inclosures to keep the people at a convenient distance from the officiating priest. Strabo, in his life of Claudius, assures us the druids sacrificed men; and Mercury is said to be a god to whom they offered these victims. Suetonius Sículus (lib. vi.) observes it was one of the extraordinary occasions they made use of to learn what should befall them, &c., by the tearing of the victim, the tearing of his member, &c. In this manner of his blood gushing out. Drusus condemned the custom, and Tiberius punished and abolished it.

DRUIDE, or DROUIN, in ancient times the principal place of the Druids, where they met annually in a consecrated grove according to Cæsar. It was also called *Dreux*; and is now named *Dreux*.

DRUM, n. s. & v. n.	{ Dan. <i>trammel</i> . <i>trummel</i> . trumbe, perhaps Arab. <i>drum</i> & <i>drum</i> beat: but in Sax. Sax. <i>drumma</i>
DRUM-FISH, n. s.	
DRUM-MAJOR,	
DRUM-MAKER,

the following account of the different

drum from James's Military Dic-

The *General*, to give notice to the troops that they are to march.

The *Assembly*, or *Trump*, to order the troops to repair to the place of rendezvous, or to their colors.

The *March*, to command them to move, always with the left foot first.

*Tat-too*, or *Tap-too*, to order all to retire to their quarters.

*To Arms!* for soldiers who are dispersed, to repair to them.

The *Reveille* always beats at break of day, and is to warn the soldiers to rise, and the sentinels to forbear challenging, and to give leave to come out of quarters.

The *Retreat*, a signal to draw off from the enemy. It likewise means a beat in both camp and garrison a little before sun-set, at which time the gates are shut, and the soldiers repair to their barracks, &c.

The *Alarm*, to give notice of sudden danger, that all may be in readiness for immediate duty.

The *Purley*, or *Chamade*, a signal to demand some conference with the enemy.

*Long March*, a beat which was formerly used in England; on the sound of which, the men clubbed their firelocks, and claimed and used the liberty of talking all kind of ribaldry.

The *Church Call*, called, also, *Beating the Bank*; a beat to summon the soldiers of a regiment, or garrison, to church.

The *Pioneer's Call*, known by the appellation of round heads and cuckolds! come dig; this is beaten in camp to summon the pioneers to work.

The *Sergeants' Call*, a beat for calling the sergeants together in the orderly-room, or in camp, to the head of the colors.

The *Drummers' Call*, a beat to assemble the drummers at the head of the colors, or in quarters at the place where it is beaten.

The *Preparative*, a signal to make ready for firing.

The *Warning Drum*, a beat to give officers and soldiers time to assemble for their meals in camp or quarters.

The *Round-beef of Old England*, a beat to call officers to dinner.

**DRUMMER, or DRUM**, he that beats the drum; of whom each company of foot has one, and sometimes two. Every regiment has a drum-major, who has the command over the other drums. They are distinguished from the soldiers by clothes of a different fashion: their post, when a battalion is drawn up, is on the flanks, and on march it is betwixt the divisions.

**DRUMBLE, v. n.** A diminutive of drum; probably from the noise of a sluggish stream. Hence drumblily, or drumly, is stagnant: see below. To drone; to be sluggish.

Take up these cloaths here quickly: where's the cowlsstaff? Look, how you drumble! carry them to the landress in Datchet Mead.

*Shakespeare. Merry Wives of Windsor.*

**DRUMLY, adj.** From drumble. Stagnant thick; muddy.

Then houses drumly German water,  
To mak himself look fair and fatter,

An' clear the consequential sorrows,  
Love-gifts of Carnival signoras. Burns.

**DRUMMOND** (William), the son of Sir John Drummond, of Hawthornden, knight of the black rod to king James I., was born in Scotland in 1585. He was educated at Edinburgh, where he took the degree of A.M. In 1606 he was sent by his father to study civil law at Bourges in France; but, having a dislike for the law, he returned to his agreeable seat at Hawthornden, where he applied himself with great assiduity to classical learning and poetry. Here he wrote his *Cypress Grove*, and, about the same time, *Flowers of Zion*, in verse. But on the death of a lady, to whom he was about to be married, he went to Paris and Rome. He travelled through France, Germany, and Italy, where he visited the universities; and, after an absence of eight years, returned to his native country. On the appearance of a civil war, he retired again; and is now supposed to have written his *History of the Five James's, kings of Scotland*, which was not published till after his death. He was steadily attached to Charles I.; and, in a piece called *Irene*, he harangues the king, nobility, and clergy, about their mutual mistakes, fears, and jealousies; and lays before them the consequences of a civil war. His attachment to the king was so strong, that when he heard of his being executed, he is said to have been overwhelmed with grief, and to have lifted up his head no more. He died in 1649, leaving behind him several children: the eldest of whom, William, was knighted by Charles II. He was the intimate friend of Michael Drayton and Ben Jonson; the latter of whom, at the age of forty-five, travelled from London on foot to visit him at Hawthornden. An edition of his works, with his life prefixed, was printed in folio at Edinburgh in 1711. Among all the writers of the seventeenth century, who flourished after the death of Shakspeare, there is not one whom a general reader of the English poetry of that age will regard with so much and so deserved attention, as William Drummond. His thoughts are generally bold and highly poetical: he closely follows nature, and his verses are delicately harmonious. On the death of Henry prince of Wales, in 1612, Drummond wrote an elegy entitled *Tears on the death of Moeliades*; a name which that prince had used in all his challenges of martial sport, as the anagram of *Miles à Deo*.

**DRUNK'ARD,**

**DRUNK'EN,**

**DRUNK'ENLY,**

**DRUNKEN'NESS.**

} See **DRINK.**

**DRUPA**, or **DRUPPA.** See **BOTANY.** The cherry, plum, peach, apricot, and all other stone fruit are of this kind. The term, which is of great antiquity, is synonymous to Tournefort's *fructus mollis ossiculo*, 'soft fruit with a stone;' and to the *prunus* of other botanists. The stone or nut, which in this sort of fruit is surrounded by the soft pulpy flesh, is a kind of ligneous or woody cup, which contains a single kernel or seed. This definition, however, will not apply to every seed-vessel denominated *drupa* in the *Genera Plantarum*. The almond is a *drupa*, so is the seed vessel of the elm trees and the genus

*emphrin*, though far from being palpeaceous; the first and third are of a vitreous leather, the second like parchment. It may be said of the walnut, the pistachio, *guetterda*, *quisqualis*, *jack-in-a-box*, and others. The seeds of the elm schœlar, *laria*, and the mango tree, are not covered with stone. The seed-vessel of *but-red* is shaped like a top, and contains two large stones.

**DRURY** (Robert), an English man of a humble but respectable author, was born in Leicestershire. In 1702, while a boy, he was wrecked in the *Degrave*, East India ship, on the south side of the island of Madagascar, and remained in captivity there for fifteen years. On his return he published, in 1713, an account of the island, and of his own adventures, in a plain unadorned manner, and being considered as far as it went by the journal of Mr. Bellin, son of the admiral, who was wrecked at the same time, his book has always been considered authentic. It was republished in 1808. Drury was porter at the India-house, and inherited a little property, but when he died it was not large.

**DRUSES**, **DRUZES**, or more properly **DRUSI**, signifying riches, or sensual comforts, are the rewards of their faith, a remarkable sect of Palestine, inhabiting the environs of Mount Lebanon, of whose origin and history we have considerable details from the pen of M. Vissier to which we subjoin the more modern descriptions of Messrs. Niebuhr, Burckhardt, &c.

Twenty-three years after the death of Mahomet the disputes between Ali his son-in-law and Moadaia governor of Syria, occasioned a schism in the empire of the Arabs, and the sects subsist to this day: but, in reality, no difference related only to power; and the *Medans*, however divided in opinion respecting the rightful successor of the prophet, agreed with respect to their dogmas. It was not until the following century, that the Greek books introduced among the *Druses* the spirit of discussion and controversy, and till then they were utter strangers. The consequence was, as might be expected, by reason on matters not susceptible of demonstration, guided by the abstract principles of a sensible logic, they divided into a multitude of sects and opinions. At this period, the power of Mahomet lost its authority; and that of the *Druses*, which derives from it alone the basis preserving its unity, shared the same fate. The nations which had received the religion of Mahomet, mixed with it their former notions; and the errors which had prevailed over Asia again made their appearance, though altered in their form. The *Druses*, the doctrine of a good and evil god, and the renovation after 6000 years, which had been taught by Zoroaster, were again revived. In this political and religious confusion, the enthusiast became an apostle, and every man the head of a sect. No less than eleven sects were reckoned, remarkable for the diversity of their followers, all differing in some point of faith, and all disavowing heresy and idolatry. Such was the state of these countries, and

commencement of the eleventh century, it became the theatre of one of the most violent scenes of enthusiasm and absurdity recorded in history. The following account is taken from the eastern writers. In the year of Hejira 386 (A. D. 996), the third caliph of the race of the Fatemites, called Hakem B' Allah, succeeded to the throne of Egypt at the age of eleven years. He was one of the most cruel and capricious princes of whom history has preserved the name, not excepting Caligula himself. He caused the first caliphs, the companions of Mahomet, to be cursed in the mosques, afterwards revoked the anathema: he compelled the Jews and Christians to abjure their religion, and then permitted them to resume it, prohibited the making slippers for women, to prevent them from coming out of their houses. He burnt one half of the city of Cairo for his opinion, while his soldiers pillaged the other. He prohibited the pilgrimage to Mecca, fasting, the five prayers; and at length carried his cruelty so far as to desire to pass for God himself.

He ordered a register of those who acknowledged him to be so, and the number amounted to 1,000! This impious pretension was supported by a prophet, named Mohammed Ben Ismael, who came from Persia into Egypt, and declared that it was not necessary to fast or pray, to practise circumcision, to make the pilgrimage to Mecca, or observe festivals; that the prohibition of pork and wine was absurd; and that marriage between brothers and sisters, fathers and children, was lawful. To ingratiate himself with Hakem, he maintained that this caliph was himself incarnate; and instead of his name being B' Amr-Ellah, which signifies governing in the order of God, he called him Hakem B' Allah, governing by his own order. Unluckily for the prophet, his new god had not the power to protect him from the fury of his enemies, for he slew him in a tumult almost in the arms of the caliph, who was himself massacred soon after at Mount Mokattam, where he, as he said, had conversation with angels. The death of the prophet did not stop the progress of their errors; a disciple of Mohammed Ben Ismael, called Hamzah Ben Ahmud, propagated their indefatigable zeal in Egypt, in Palestine, along the coast of Syria, as far as Sidon and Tyre.

His proselytes being persecuted by the power, they took refuge in the mountains of Lebanon, where they were better able to defend themselves; at least it is certain, that, after this era, we find them established as a sect forming an independent society. The diversity of their opinions disposes them to be quarrelsome; but the urgent interest of their common defence forces them to allow mutual toleration, and they have always appeared united, and have opposed, at different times, the Crusaders, the Arians of Aleppo, the Mamelukes, and the Ottomans. The conquest of Syria by the latter, did not change in their situation. Selim I. on his return from Egypt, meditating no less than the conquest of Europe, disdained to waste his time before the rocks of Lebanon. Soliman II. his son, incessantly engaged in important wars, and with the knights of Rhodes, the Persians,

the kingdom of Yemen, the Hungarians, the Germans, or the emperor Charles V. had no time to think of the Druses. Emboldened by this inattention, and not content with their independence, they frequently descended from their mountains to pillage the Turks. The pachas in vain attempted to repel their inroads; their troops were invariably routed or repulsed. And it was not till 1588, that Amurath III. wearied with the complaints made to him, resolved, at all events, to reduce these rebels, and had the good fortune to succeed. His general, Ibrahim Pacha, marched from Cairo, and attacked the Druses and Maronites, with so much address and vigor, as to force them into their strong holds in the mountains. Dissension took place among their chiefs, of which he availed himself to exact a contribution of upwards of 1,000,000 of piastres, and to impose a tribute which has continued to the present time.

This expedition was the epocha of a considerable change in the constitution of the Druses. Till then they lived in a sort of anarchy, under the command of different sheiks or lords. The nation was likewise divided into two factions, such as is to be found in all the Arab tribes, and which are distinguished into the Kaisi and Yamani parties. To simplify the administration, Ibrahim permitted them only one chief, who should be responsible for the tribute, and execute the office of civil magistrate; and this governor, from the nature of his situation, acquiring great authority, became almost the king of the republic; but, as he was always chosen from among the Druses, a consequence followed, which the Turks had not foreseen, and which was nearly fatal to their power. The chief thus chosen, having at his disposal the whole strength of this people, was able to give it unanimity and energy, and naturally turned it against the Turks; who, by becoming their masters, had not ceased to be their enemies. They took care, however, that their attacks should be indirect, so as to save appearances, and only engaged in secret hostilities. About this time, viz. in the beginning of the seventeenth century, the power of the Druses attained its greatest height; which it owed to the talents and ambition of the celebrated Faker-el-din, commonly called Fakardin. No sooner was this prince advanced to be the chief of that people, than he turned his whole attention to humble the Ottoman power, and aggrandise himself. In this enterprise he displayed an address seldom seen among the Turks. He first gained the confidence of the Porte, by every demonstration of loyalty and fidelity; and as the Arabs at that time infested the plain of Balbec, and the country around Acre, he made war upon them, freed the inhabitants from their depredations, and thus rendered them desirous of living under his government. The city of Bairout was situated advantageously for his designs, as it opened a communication with foreign countries, particularly with the Venetians. Faker-el-din availed himself of the misconduct of the aga, expelled him, seized on the city, and even had the art to make a merit of this act of hostility with the divan, by paying a more considerable tribute. He proceeded in the

same manner at Saïde, Balbec, and Sour; and at length, about A. D. 1613, saw himself master of all the country as far as Adjaloun and Safad. The pachas of Tripoli and Damascus sometimes opposed him by open force, though ineffectually, and sometimes endeavoured to ruin him at the Porte by secret insinuations; but the emir, who maintained there his spies and defenders, defeated every attempt. At length, however, the divan began to be alarmed at the progress of the Druses, and made preparations for an expedition capable of crushing them. Whether from policy or fear, Faker-el-din did not think proper to wait this storm. He had formed connexions in Italy, on which he built great hopes, and determined to go in person to solicit the succours they had promised him; persuaded that his presence would increase the zeal of his friends, while his absence might appease the resentment of his enemies. He therefore embarked at Bairout; and after resigning the administration to his son Ali, repaired to the court of the Medici at Florence. The arrival of an oriental prince in Italy did not fail to attract the public attention. Enquiry was made into his nation, and the origin of the Druses became a popular topic of research. Their history and religion were found to be so little known, as to leave it a matter of doubt, whether they should be classed with the Mahomedans or Christians. The crusades were called to mind; and it was suggested, that a people who had taken refuge in the mountains, and were enemies to the natives, could be no other than the offspring of the crusaders. This conceit was too favorable to Faker-el-din for him to endeavour to disprove it; he was artful enough, on the contrary, to pretend he was related to the house of Lorraine; and the missionaries and merchants, who promised themselves a new opening for conversion and commerce, encouraged his pretensions. When an opinion is in vogue, every one discovers new proofs of its certainty. The learned in etymology, struck with the resemblance of the names, insisted that Druses and Dreux must be the same word; and on this foundation formed the system of a pretended colony of French crusaders, who, under the conduct of a count de Dreux, had formed a settlement in Lebanon. This hypothesis, however, was completely overthrown by the remark, that the name of the Druses is to be found in the itinerary of Benjamin Tudela, who travelled before the time of the crusades. Indeed the futility of it ought to have been sufficiently apparent at first, from the single consideration, that had they been descended from any nation of the Franks, they must have retained at least the traces of some European language; for a people, retired into a separate district, and living distinct from the natives of the country, do not lose their language. That of the Druses, however, is almost a pure Arabic. After a stay of nine years in Italy, Faker-el-din returned to resume the government of his country. During his absence, his son Ali had repulsed the Turks, appeased discontents, and maintained affairs in good order. Nothing remained for the emir, but to employ the knowledge he had acquired, in perfecting the internal administration of govern-

ment, and promoting the welfare of his subjects; but, instead of the useful arts, he rendered himself to the frivolous and the expensive, in which he had imbibed a passion in Italy. He built numerous villas; constructed baths, and planted gardens; he even presumed, that the laws they are prohibited by the Koran, and in respect to the prejudices of his country, to employ the ornaments of painting and sculpture. The consequences of this were, the Druses paid the same tribute as in time of war, were dissatisfied. The Yamani faction was ready to revolt, the people murmured at the expenses of the prince, and the luxury he displayed renewed the jealousy of the pachas. He attempted to levy greater tribute; but his attempts again commenced, and Faker-el-din repulsed the forces of the pachas; who took occasion, for this resistance, to render him suspected to the sultan himself. Amurath III. incensed that any of his subjects should dare to enter into competition with him, resolved on his destruction, and the pacha of Damascus received orders to march, with all his forces, against Baniyas, the usual residence of Faker-el-din; where the galleys invested it by sea, and cut off all communication. The emir, who depended on a good fortune and succours from Italy, determined at first to brave the storm. His son, who commanded at Safad, bravely opposed the progress of the Turkish army, notwithstanding the great disparity of his forces; but the engagements, in which he had the advantage being slain in a third attack, the face of affairs was greatly changed, and every thing seemed in ruin. Faker-el-din terrified at the loss of his troops, afflicted at the death of his son, and feeble by age and luxury, lost his courage, and sent his second son to solicit a peace of the Turkish admiral, whom he attempted to win by presents; but the admiral, detaining his presents and envoy, declared he would have the prince himself. Faker-el-din, intimidated by flight, and was pursued by the Turks, the masters of the country. He took refuge in the steep eminence of Niha, where they besieged him ineffectually for a whole year, and then left him at liberty: but shortly after, the companions of his adversity, weary of his sufferings, betrayed and delivered him to the Turks. He was carried to Constantinople, where Amurath, pleased to behold at his feet a prince so celebrated, at first treated him with the benevolence which arises from the consciousness of superiority; but afterwards yielded to the suggestions of his courtiers, and, in one of his fits of passion, ordered him to be strangled. After the death of Faker-el-din, his family still continued in possession of the country as vassals of the Turks. But this family continued in the male line at the beginning of the sixteenth century, the authority devolved, by the election of the sheiks, on the house of Shihab, in which it still continues. The emir of that house who merits notice is a prince who reigned from 1740 to 1760, restored the losses of the Druses, and restored them to the consequence which they had lost by the ruin of Faker-el-din. Towards the end of his reign,

1754, Melhem, wearied with the cares of government, abdicated his authority, to live in retirement, after the manner of the sultans; but the troubles that succeeded occasioned him once more to resume the reins of government, which he held till 1754, when he universally regretted. He left three sons, the eldest of whom ought to have succeeded him: but, being only eleven years of age, authority devolved on his uncle Mansour, able to a law very general in Asia, that the country shall be governed by a sovereign who arrived at the years of maturity. The young prince was but little fitted to maintain his predecessors; but a Maronite, named Sad-el-Kouri, whom Melhem had entrusted his education, this upon himself. Aspiring to see his nephew a powerful prince, that he might himself be a powerful vizier, he made every exertion to advance his fortune. He first retired him to Djebail, in the Kesraouan, where his nephew possessed large dominions, and undertook to conciliate the Maronites, by using every opportunity to serve both individuals and the nation. The great revenues of the empire, and the moderation of his expences, amply furnished him with the means. The country of the Kesraouan was divided between the Druses, with whom the Porte was not well satisfied. Sad treated for the whole of the pacha of Tripoli, and got himself appointed receiver. The Motoualis of the pacha of Balbec had for some years before made frequent encroachments on Lebanon, and the pacha began to be alarmed at the near approach of those intolerant Mahomedans. Sad treated of the pacha of Damascus a permission to make war upon them; and in 1763 expelled them out of the country. The Druses at that time divided into two factions; Sad, by his interest with those who opposed Mansour, secretly prepared the plot which was to be the ruin of the nephew, by the ruin of the uncle. In the period the Arab Daher, who had made himself master of Galilee, and fixed his residence at Acre, disquieted the Porte by his insolent and pretensions: to oppose him, the pacha had just united the pachalics of Damascus, Sidon, and Tripoli, in the hands of Osman Bey; and it was evident that an attempt to make war was not very remote. Mansour, who did not like the Turks too much to resist them, made use of the policy usual on such occasions, pretending a zeal for their service, while he secretly was the enemy. This was a sufficient motive to pursue measures directly opposite to the policy of the Porte against the faction of Daher, and manoeuvred with so much address to depose that emir in 1770, and place his nephew in his government. In 1771 Ali Bey, who had just attacked Damascus. Youssef, who was then by the Turks, took part in the quarrel, without being able to draw the Druses from Lebanon, to enter into the army of the pacha. Besides their natural repugnance, the Druses, to make war out of their country, were on this occasion too much divided at to quit their habitations, and they had to congratulate themselves on the event.

Vol. VII.

The battle of Damascus ensued; and the Turks were completely routed. The pacha of Sidon, escaping from this defeat, and not thinking himself safe in that town, sought an asylum even in the house of Youssef. The moment was unfavorable: but the face of affairs soon changed by the flight of Mohammed Bey. The emir, concluding that Ali Bey was dead, and not imagining that Daher was powerful enough singly to maintain the quarrel, declared openly against him. Saide was threatened with a siege, and he detached 1500 men of his faction to its defence; while himself in person, prevailing on the Druses and Maronites to follow him, made an incursion with 25,000 peasants into the valley of Bekaa; and in the absence of the Motoualis, who had joined the army of Daher, laid the whole country waste with fire and sword from Balbec to Tyre. While the Druses, proud of this exploit, were marching in disorder towards the latter city, 500 Motoualis, informed of what had happened, flew from Acre inflamed with rage and despair, and fell with such impetuosity on their army as to give them a complete overthrow. Such was the surprise and confusion of the Druses, that, imagining themselves attacked by Daher himself and betrayed by their companions, they turned their swords on each other as they fled. The steep declivities of Djizin, and the pine woods which were in the route of the fugitives, were strewed with dead, few of whom perished by the hands of the Motoualis. The emir Youssef, ashamed of this defeat, escaped to Dair el Kamer, and shortly after attempted to take revenge, but being again defeated in the plain between Saide and Sour (Tyre), he was constrained to resign to his uncle Mansour the ring, which, among the Druses, is the symbol of command. In 1773 he was restored by a new revolution; but he could not support his power but at the expense of a civil war. In order, therefore, to prevent Barrout from falling into the hands of the adverse faction, he requested the assistance of the Turks, and demanded of the pacha of Damascus a man of sufficient abilities to defend that city. The choice fell on Ahmad, an adventurer, who, from his subsequent fortune, merits particular notice. This man was a native of Bosnia, and spoke the Slavonian as his mother tongue. It is said, that flying from his country at the age of sixteen, to escape the consequences of an attempt to violate his sister in law, he repaired to Constantinople, where, destitute of the means of procuring a subsistence, he sold himself to the slave-merchants to be conveyed to Egypt; and, on his arrival at Cairo, was purchased by Ali Bey, who placed him among his Mamelukes. Ahmad was not long in distinguishing himself by his courage and address—[His patron employed him on several occasions in dangerous coups de main, such as the assassination of such boys and chiefs as he suspected; of which commissions he acquitted himself so well, as to acquire the name of Djazzar. With this claim to his friendship, he enjoyed the favor of Ali, until he was disturbed by an accident. The jealous Bey, having promised one of his benefactors called Saleh Bey, commanded Ahmad Djazzar to cut off his head.

2 L

Either from humanity or some secret friendship for the devoted victim, Djeddar hesitated, and even remonstrated against the order. But learning the next day that Mohammed Bey had executed the commission, and that Ali had spoken of him not very favorably, he thought himself a lost man, and, to avoid the fate of Saleh, escaped unobserved, and reached Constantinople. He there solicited employments suited to his former rank; but meeting, as is usual in capitals, with a great number of rivals, he pursued another plan, and went to seek his fortune in Syria as a private soldier. Chance conducted him among the Druses, where, being hospitably entertained in the house of the kaysa of the emir Yousef, he repaired to Damascus, and obtained the title of Aga, with the command of five pair of colors, that is to say of fifty men. He was thus situated when fortune destined him to the government of Bairout. Djeddar was no sooner established there, than he took possession of it for the Turks. Yousef was confounded at this proceeding. He demanded justice at Damascus; but finding his complaints treated with contempt, entered into a treaty with Daher, and concluded an offensive and defensive alliance with him at Rafien, near Sour. No sooner was Daher united with the Druses, than he laid siege to Bairout by land, whilst two Russian frigates, whose service was purchased by 600 purses, cannonaded it by sea. Djeddar was compelled to submit to force, and, after a vigorous resistance, gave up the city and surrendered himself prisoner. Sheik Daher, charmed with his courage, and flattered with the preference he had given him in the surrender, conducted him to Acre, and showed him every mark of kindness. He even ventured to trust him with a small expedition into Palestine; but Djeddar, on approaching Jerusalem, went over to the Turks, and returned to Damascus. The war of Mohammed Bey breaking out, Djeddar offered his service to the captain Pacha, and gained his confidence. He accompanied him to the siege of Acre; and that admiral, having destroyed Daher, and finding no person more proper than Djeddar to accomplish the designs of the Porte in that country, named him pacha of Saide. Being now, in consequence of this revolution, superior lord to the emir Yousef, Djeddar was mindful of his past injuries, and, by a conduct truly Turkish, feigning alternately gratitude and resentment, he extorted from the emir, within the space of five years, 4,000,000 of French money (above £160,000), a sum the more astonishing as the farm of the country of the Druses did not then amount to 100,000 livres, £4000. In 1784 he made war on him, deposed him, and bestowed the government on the emir of the country of Hasbeya, named Ismael. Yousef, having once more purchased his favor, returned, towards the end of the same year, to Dair-el-Kamar, and even courted his confidence so far as to wait on him at Acre, from whence nobody expected him to return; but Djeddar was too wise to shed blood while there were any hopes of obtaining money: he released the prince, and sent him back with every mark of friendship. The present emir bashir is a descendant of Yousef. He pays 130 purses annually to the pacha of Tripoli, and 400 to the

pacha of Saide; and, perhaps, 600 purses in the way of extraordinary demands, at £20,750 altogether. He has also to pay annually, the friendship of the pacha of Acre. This revenue is derived from the country situated between Bilad Acre, and declivity of Mount Libanus, and the neighbourhood of Akri. The internal wars of the Druses have continued from the end of the last century: in 1799 or 1800, several chiefs of one faction were put to death in the palace of the emir: and the most powerful in the country in 1812, was, according to Schardt, El-sheikh Beshir, of the Jonteh tribe. He has a clear income of about £50,000, while that of the emir, his nominal superior, is not above £10,000.

Neither the chief nor the individual can maintain troops; they have only persons devoted to the domestic service of their families, and a few black slaves. When the nation meets, every man, whether sheik or peasant, will bear arms, is called upon to march. He goes with him a bag of flour, a musket, some powder, and a small quantity of powder, made in his village, and repairs to the rendezvous appointed by the governor. If it be a civil war, as it often happens, the servants, the farmers, and the friends, take up arms for their patron, the chief of their family, and repair to his residence. In such cases, the parties irritated by each other seem on the point of proceeding to the most extreme measures; but they seldom have recourse to violence, or attempt the death of each other. Mediators always interpose, and the quarrel is appeased the more readily, as each party is obliged to provide his followers with food and ammunition. This system, which produces happy effects in civil troubles, is attended with great inconvenience in foreign wars, and was recently appeared in that of 1784. Daher knew that the whole army lived at the expense of the emir Yousef, aimed at nothing but to ruin him, and the Druses, who were not doing anything being fed for doing nothing, prolonged the negotiations; but the emir, wearied with peace, concluded a treaty, the terms of which were a little rigorous for himself, and even for the whole nation. 'The ceremonies to which I have been a witness on these occasions,' says Volney, 'bear a striking resemblance to those of ancient times. When the emir had determined on war at Dair-el-Kamar, in the evening ascended the summit of a mountain, and there began to cry with a loud voice: 'To war, to war; take up your arms; your pistols: noble sheiks, mount your arms yourselves with the lance and sword: rendezvous to-morrow at Dair-el-Kamar. God! zeal of combats!' This shout was taken up from the neighbouring villages, and there; and, as the whole country is a chain of lofty mountains and deep valleys, a proclamation passed in a few hours to all quarters. These voices, from the distance of many miles, the long resounding echoes, and the effect of the subject, had something awful in their effect. Three days after, the two parties met at Dair-el-Kamar.

might have been immediately commenced. I can easily imagine that troops of this kind may resemble our European soldiers; they wear uniforms, discipline, nor order. They are a crowd of peasants with short coats, naked swords and muskets in their hands; differing from the Mamelukes in that they are all on foot, the sheiks and emirs alone have horses, and are of little use from the rugged nature of the country. War there can only be a war of ambush.

The Druses never risk themselves in the field, and with reason; for they would be unable to stand the shock of cavalry, having no bayonets for their muskets. Their whole art consists in creeping among the bushes and rocks, from whence their fire is the most dangerous, as they are covered, fire at their head, by hunting and military sports, have acquired the habit of hitting a mark with great accuracy. They are accustomed to sudden attacks by night, ambuscades, and all sorts of coups de main which require to fall suddenly, and come to close fight with the enemy. In improving their success, easily disappointed and prompt to resume their courage; even to temerity, and sometimes ferocious, possess above all two qualities essential to the excellence of any troops; they strictly obey their leaders, and are endowed with a temperance and vigor of health, at this day unknown to most civilized nations. In the campaign of 1784 they lived three months in the open air without any other covering than a sheep-skin; there were not more deaths or maladies than if they had remained in their houses. Their food consisted, as at other times, of small cakes baked on the ashes or on a brick, raw meat, cheese, olives, fruits, and a little wine. The table of the chiefs was almost as frugal; and they affirm, that they subsisted 100 days, on the same number of Englishmen or Frenchmen would not have lived ten. They have no knowledge of the science of fortification, the management of artillery or encampments, nor, indeed, any thing which constitutes the art of war.

But had they among them a few persons skilled in military science, they would readily learn its principles, and become a formidable army. This would be the more easily effected, as the mulberry plantations and vineyards do occupy them all the year, and they could afford much time for military exercises.

The Druses are considered, throughout the country, as restless, enterprising, hardy, and brave to temerity. Only 500 of them have been known to enter Damascus in open day, and spread terror and carnage. No people are more fierce than they, with respect to the point of honor; any offence of that kind, or open insult, is instantly punished by blows of the handjir or stick; while, among the inhabitants of the country, it only excites injurious retorts. This has occasioned in their manners and conduct a reserve, or, if you will, a politeness, which is astonishing to discover among peasants.

It is carried even to dissimulation and falsehood, especially among the chiefs, whose interests demand greater attentions. Circumference is necessary to all, says M. Volney,

from the formidable consequences of that retaliation of which I have spoken. These customs may appear barbarous to us; but they have the merit of supplying the deficiency of regular justice, which is necessarily tedious and uncertain in these disorderly and almost anarchical governments. The Druses have another point of honor, that of hospitality. Whoever presents himself at their door, in the quality of a suppliant or passenger, is sure of being entertained and lodged in the most generous and unaffected manner. M. Volney often saw the lowest peasants give the last morsel of bread they had in their houses, to the hungry traveller; and when it was observed to them that they wanted prudence, their answer was, 'God is liberal and great, and all men are brethren.' There are, therefore, no inns in their country any more than in the rest of Turkey. When they have once contracted with their guest the sacred engagement of bread and salt, no subsequent event can make them violate it. Various instances of this are related, which do honor to their character. A few years ago, an aga of the janissaries having been engaged in a rebellion, fled from Damascus and retired among the Druses. The pacha was informed of this, and demanded him of the emir, threatening to make war on him in case of refusal. The emir demanded him of the sheik Talhouk, who had received him; but the indignant sheik replied, 'When have you known the Druses deliver up their guests? Tell the emir, that as long as Talhouk shall preserve his beard, not a hair of the head of his suppliant shall fall!' The emir threatened him with force; Talhouk armed his family. The emir, dreading a revolt, adopted a method practised as juridical in that country. He declared to the sheik, that he would cut down fifty mulberry-trees a-day until he should give up the aga. He proceeded as far as a thousand, and Talhouk still remained inflexible. At length the other sheiks, enraged, took up the quarrel; and the commotion was about to become general, when the aga reproaching himself with being the cause of so much mischief, made his escape without the knowledge even of Talhouk. The Druses have also the prejudices of the Bedouins respecting birth; like them, they pay great respect to the antiquity of families; but this produces no essential inconveniences. The nobility of the emirs and sheiks does not exempt them from paying tribute in proportion to their revenues. It confers on them no prerogatives, either in the attainment of landed property or public employments. Every man, after paying his miri and his rent, is master of his property. In short, by a particular privilege, the Druses pay no fine for their succession: nor does the emir, like the sultan, arrogate to himself original and universal property: there exists nevertheless, in the law of inheritance, an imperfection which produces disagreeable effects. Fathers have, as in the Roman law, the power of preferring such of their children as they think proper: hence it has happened in several families of the sheiks, that the whole property has centered in the same person, who has perverted it to the purpose of intriguing and caballing, while his relations remain, as they well express

it, 'princes of olives and cheese;' that is to say, poor as peasants. In consequence of their prejudices, the Druses do not choose to make alliances out of their own families. They invariably prefer their relation, though poor, to a rich stranger; and poor peasants have been known to refuse their daughters to merchants of Saïde and Bairout, who possessed from 12,000 to 15,000 piastres. They observe also, to a certain degree, the custom of the Hebrews, which directed that a brother should espouse his brother's widow; but this is not peculiar to them, for they retain that as well as several other customs of that ancient people, in common with other inhabitants of Syria and all the Arab tribes. In short, the proper and distinctive character of the Druses, is a sort of republican spirit, which gives them more energy than any other subjects of the Turkish government, and an indifference for religion, which forms a striking contrast with the zeal of the Mahomedans and Christians. They are further said to be remarkably domestic and intelligent. In the evening they sometimes assemble in the court, the area, or house of the chief of the village or family. There, seated in a circle, with legs crossed, pipes in their mouths, and poniards at their belts, they discourse of their various labors, the scarcity or plenty of their harvests, peace or war, the conduct of the emir, or the amount of the taxes; they relate past transactions, discuss present interests, and form conjectures on the future. Their children, tired with play, come frequently to listen; and a stranger is surprised to hear them, at ten or twelve years old, recounting, with a serious air, why Djezzar declared war against the emir Youssef, how many purses it cost that prince, what augmentation there will be of the miri, how many muskets there were in the camp, and who had the best mare. This is their only education. They are neither taught to read the psalms, as among the Maronites, nor the Koran like the Mahomedans; hardly do the sheiks know how to write a letter. But if their minds be destitute of useful or agreeable information, at least it is not pre-occupied by false and hurtful ideas; and, without doubt, such natural ignorance is well worth all our artificial folly. This advantage results from it, that their understandings being nearly on a level, the inequality of conditions is less perceptible. For, in fact, we do not perceive among the Druses that great distance, which, in most other societies, degrades the inferior, without contributing to the advantages of the great. All, whether sheiks or peasants, treat each other with that rational familiarity, which is equally remote from rudeness and servility. The grand emir himself is not a different man from the rest: he is a good country gentleman, who does not disdain admitting to his table the meanest farmer. In a word, their manners are those of ancient times, and of that rustic life which marks the origin of every nation; and prove that the people among whom they are still found are yet only in the infancy of the social state.' *Volney's Travels*.

The opinions of Mohammed ben Ismael may be regarded as the substance of the religion of

the Druses. They practise neither circumcision, nor prayers, nor fasting; they observe no festivals nor prohibitions. They drink wine, eat pork, and allow marriage between brothers and sisters, though not between fathers and sons. From this we may conclude, that the Druses have properly no religion; but one must be excepted, whose religious customs are very peculiar. Those who compose the rest of the nation what the initiated call the profane; they assume the name of *Druses*, which means spiritualists, and bestow the vulgar epithet of *Djabel* or *ignorer* on those who have various degrees of initiation, the orders of which require celibacy. They are distinguished by the white turban they wear, as a symbol of their purity; and as they are they of this supposed purity, that they themselves sullied by even touching a profane person. If such eat out of their plate, or drink out of their cup, they break them; and follow the custom, so general in this country, of drinking vases with a sort of cock, which may be put out of without touching them with the hand. Their practices are enveloped in mystery; their oratories always stand alone, and are commonly situated on eminences: in these they hold their secret assemblies, to which women are excluded. It is pretended they perform ceremonies in presence of a small statue resembling a bull or calf; whence some have attempted to say that they are descended from the Sabians. But, besides, that the fact is not well ascertained, the worship of the ox may be deduced from other sources. They have one or two oracles, which they conceal with the greatest care, and chance has deceived their jealousy; and in a civil war, which happened about twenty years ago, the emir Youssef, who is but ignorant, found one among the pillage of their oratories. M. Volney was assured by persons who had read it, that it contained much mystic jargon, the obscurity of which renders it valuable to adepts. Haker ben Allah is there spoken of, by whom the God incarnate in the person of the emir is likewise treats of another life, of a punishment, and a place of happiness after the Okkals shall of course be most distinguished. Several degrees of perfection are mentioned, which they arrive by successive trials. In respects these sectaries have all the nature of all the fears of superstition; they are not communicative, because they are weak; but it is probable that, were they powerful, they would be promulgators and intolerant. Profane Druses, strangers to this spirit, are quite different about religious matters. The Christians, who live in their country, profess several of them believe in the mission of Jesus; that others worship the sun, moon, and stars, which is possible; for, as among the Druses, every one, left to his own fancy, holds an opinion that pleases him most; and there are those which present themselves to the unenlightened minds. What the Turks, they affect the exterior of Mahomedanism, frequent the mosques, and perform prayers and prayers. Among the Maronites

ry them to church, and, like them, make holy water. Many of them, importuned missionaries, suffer themselves to be baptised and if solicited by the Turks, receive cision, and conclude by dying neither as nor Mahomedans.

Burckhardt confirms this general picture of travellers. Though a sect of the Mahomedans, they mingle so much of the tenets of the eastern Christian heretics with their religion, that it belongs as a whole to the east only. Niebuhr has printed a catechism of their faith, which is principally remarkable for its affected mysteriousness on the one hand, and its positive injunction to curse its author (a great poet) on the other. 'We are they,' says their patriarch Hamzah, 'have been put in possession of the Faith of the religion of Mahomet, the son of Mary; may the curse of our Lord be upon

us; we are a branch, it is clear, of the sect of the Enquiries,' says Burckhardt, 'have been made concerning the religious doctrines of this sect, as well as those of the Anazir and Druses. Not only European travellers, and Europeans resident in Syria, but natives of influence, have endeavoured to penetrate the mysteries of these idolaters, without success, and several causes combine to make it difficult, that their doctrines will long remain secret. The principal reason is, that few individuals among them become acquainted with the most important and secret tenets of their religion; the generality contenting themselves with the observance of some exterior practices, while the interior are possessed by the select few. It is asked, perhaps, whether their religious secrets could not be unveiled by the mystery? It is true that the different sects possess books, which regard as sacred, but they are intelligible only to the initiated. A sacred book of the Anazir fell into the hands of a chief of the army of the pacha, who plundered the castles of Aleppo in 1809; it came afterwards into the possession of my friend Selym of Hamah who carried it as a present to me; but he was obliged upon to part with it to a travelling Frenchman, and the book is now in the possession of M. Rousseau, the French Consul at Aleppo, who has had it translated into French, and means to publish it, but it will probably throw little light upon the question. Another difficulty arises from the extreme caution of the Ismaylys on this subject; whenever they are obliged to obey any part of the country under the Turkish Government, they assume the character of Muslims; being well aware that if they should be detected in the practice of any rite contrary to the Turkish religion, their hypocrisy, in attempting to follow the latter, would no longer be concealed, and their being once clearly known as infidels, which they are only suspected to be, would expose them to the heaviest punishment, and might even be followed by their expulsion or extermination. Christians and Jews are tolerated because Mahomet and his successors granted them protection, because the Turks acknowledge Christ and

the prophets; but there is no instance whatever of pagans being tolerated.

'The Ismaylys, when they go to Hamah, pray in the mosque, which they never do at Kalant Maszyad. This castle has been from ancient times their chief seat. One of them asserted that his religion descended from Ismayl, the son of Abraham, and that the Ismaylys had been possessed of the castle since the time of El Melek el Dhaher, as acknowledged by the Firmans of the Porte. A few years since they were driven out of it by the Anzevrys, in consequence of a most daring act of treachery. The Anzevrys and Ismaylys have always been at enmity; the consequence, perhaps, of some religious differences.'

With respect more particularly to the true religion of the Druses, says this intelligent traveller, 'none but a learned Druse can satisfy the enquirer's curiosity. What I have already said of the Anzevrys is equally applicable to the Druses; their religious opinions will remain forever a secret, unless revealed by a Druse. Their customs, however, may be described; and, as far as they can tend to elucidate the mystery, the veil may be drawn aside by the researches of the traveller. It seems to be a maxim with them to adopt the religious practices of the country in which they reside, and to profess the creed of the strongest. Hence they all profess Islamism in Syria; and even those who have been baptised, on account of their alliance with the Shehab family, still practise the exterior forms of the Mahomedan faith. There is no truth in the assertion, that the Druses go one day to the mosque, and the next to the church. They all profess Islamism, and whenever they mix with the Mahomedans they perform the rites prescribed by their religion. In private, however, they break the fast of Ramadan, curse Mahomet, indulge in wine, and eat food forbidden by the Koran. They bear an inveterate hatred to all religions except their own, but more particularly to that of the Franks, chiefly in consequence of a tradition current among them, that the Europeans will one day overthrow their commonwealth. This hatred has been increased since the invasion of the French; and the most unpardonable insult which one Druse can offer to another, is to say to him, 'May God put a hat on you.'

'Nothing is more sacred with a Druse than his public reputation: he will overlook an insult, if known only to him who has offered it; and will put up with blows, where his interest is concerned, provided nobody is a witness; but the slightest abuse given in public he revenges with the greatest fury. This is the most remarkable feature of the national character: in public a Druse may appear honorable; but he is easily tempted to a contrary behaviour, when he has reason to think that his conduct will remain undiscovered. The ties of blood and friendship have no power amongst them; the son no sooner attains the years of maturity, than he begins to plot against his father. Examples are not wanting of their assailing the chastity of their mothers, and towards their sisters such conduct is so frequent, that a father never allows a full grown son to remain alone with any of the fe-

males of his family. Their own religion allows them to take their sisters in marriage; but they are restrained from indulging in this connexion, on account of its repugnance to the Mahomedan laws. A Druse seldom has more than one wife, but he divorces her under the slightest pretext; and it is a custom among them, that if a wife asks her husband's permission to go out, and he says to her 'Go,' without adding 'and come back,' she is thereby divorced; nor can her husband recover her, even though it should be their mutual wish, till she is married again according to the Turkish forms, and divorced from her second husband. It is known that the Druses, like all Levantines, are very jealous of their wives; adultery, however, is rarely punished with death: if a wife is detected in it, she is divorced; but the husband is afraid to kill her seducer, because his death would be revenged, for the Druses are inexorable with respect to the law of retaliation of blood; they know too that if the affair were to become public, the governor would ruin both parties by his extortions. Unnatural propensities are very common amongst them.

The Akal are those who are supposed to know the doctrines of the Druse religion; they superintend divine worship in the chapels, or, as they are called, Khaloue, and they instruct the children in a kind of catechism. They are obliged to abstain from swearing, and all abusive language, and dare not wear any article of gold or silk in their dress. Many of them make it a rule never to eat of any food, nor to receive any money, which they suspect to have been improperly acquired. For this reason, whenever they have to receive considerable sums of money, they take care that it shall be first exchanged for other coin. The sheik El Nedjem, who generally accompanies the sheik Beshir, in his visits to the emir, never tastes food in the palace of the latter, nor even smokes a pipe there, always asserting that whatever the emir possesses has been unlawfully obtained. There are different degrees of Akal, and women are also admitted into the order, a privilege which many avail themselves of, from parsimony, as they are thus exempted from wearing the expensive head-dress and rich silks fashionable among them.

'A father cannot entirely disinherit his son; in that case his will would be set aside; but he may leave him a single mulberry-tree for his portion. There is a Druse Kadhi at Daer-el Kamar, who judges according to the Turkish laws, and the customs of the Druses; his office is hereditary in a Druse family; but he is held in little repute, as all causes of importance are carried before the emir or the sheik Beshir.

'The Druses do not circumcise their children; circumcision is practised only in the mountain by those members of the Shehab family who continue to be Muhammedans.

'The best feature in the Druse character is that peculiar law of hospitality, which forbids them ever to betray a guest. I made particular enquiries on this subject, and I am satisfied that no consideration of interest or dread of power will induce a Druse to give up a person who has once placed himself under his protection. Per-

sons from all parts of Syria are in the practice of taking refuge in the mountains, where they are in perfect security from the emir's troops, who enter upon the emir's territory: should the emir ever be tempted by large offers to consent to give up a refugee, the whole country would rise to prevent such a stain upon their national honour. The mighty Djerzar, who had intended to create creatures with the government of the mountains, never could force them to give up a single individual of all those who fled thither in a rainy. Whenever he became very importunate in his demands, the emir informed the fugitives of the danger, and advised him to conceal himself in a time in some more distant part of the mountains. An answer was then returned to Djerzar, that the object of his resentment had fled. The mountains, which is thus afforded by the mountain, is one of the greatest advantages that the inhabitants of Syria enjoy over those of the other parts of the Turkish dominions.

'The Druses are extremely fond of raw meat, whenever a sheep is killed, the raw liver, &c., are considered dainties; the Christians imitate their example, but with the addition of a piece of brandy to every slice of meat. In all parts of Syria I have seen the common people eat raw meat in their favorite dish, the *hams*, the women especially indulge in this habit.

'Mr. Barker told me that during his 10 years' residence at Harissa and in the Druse country, he never heard any kind of music. The Christians are too devout to occupy themselves with such worldly pleasures, and the Druses have no sort of musical instruments.

'The Druses have a few historical books, but mention their nation; Ibn Shebat, for instance, I was told, gives in his history of the country that of the Druses also, and of the first of the Shehabs. Emir Haidar a relation of the sheik Beshir, has lately begun to compile a history of the Shehabs, which already forms a thick volume.

'I believe that the greatest amount of military forces of the Druses is between 10,000 and 15,000 firelocks; the Christians of Syria may, perhaps, be double that number; but I conceive that the most potent power would never be able to collect more than 10,000 men from the mountain.' *Travels*, p. 30.

DRUSIUS (John), a protestant scholar of great learning, born at (Huldenburg in Pomerania) in 1555. He was designed for the clergy, but his father being outlawed and deprived of his estate, they both retired to a town where the son became professor of the oriental languages at Oxford; upon the peace of Ghent, they returned to their native country, where also Drusius was appointed professor of oriental languages. From thence he went to Friesland, where he was admitted professor in the university of Franeker, of which he was discharged with great honor at his death in 1616. His works show him to have been well skilled in Hebrew; and the States employed him in 1600 to write out the most difficult passages in the Old Testament with a pension of 400 florins a year. He was frequently disturbed in this undertaking.

I till after his death. He held a  
 audience with the learned; among  
 re were found 2300 Latin letters.  
 (John), the son of the preceding,  
 Franeker in 1588; and began to

 up a fountain, as either of them shake, *dry* up, or  
 impair the delight of conscience. *South.*

*DRY-ROT*, a term or name applied to a rapid  
 decay of any vegetable matter, when it has the  
 appearance of being tolerably *dry*, but, in ge-  
 neral, is applied only to timber when in that  
 state, and is so named in contradistinction to the  
 common mode of decay, by being exposed to the  
 alternate states of wet and *dry*. There are a  
 great number of causes for this species of decay:  
 some are quite simple, others are very compli-  
 cated; yet, whatever may be the original cause,

simple or compound, the effects are the same, namely, to render the timber useless, by destroying its elasticity and toughness, rendering it insufficient to resist any considerable pressure, and indeed, for any of the useful purposes to which timber is applied. When timber is in a tolerably dry state, any means which will absorb or extract its oxygen from the other component parts, will leave it in the state commonly called dry-rotten. Moist, warm situations, with little or no current of air, are the most likely to generate this evil. The effluvia from timber in such a state of decay will rapidly carry its effects to the circumjacent timber, however dry it may appear; and any sort of timber will be, in a very little time, rendered quite useless. When timber is exposed to any considerable degree of moisture and heat, fungi of various shapes and texture, according to the species of timber, and other causes, will appear upon it; and although this fungous matter be really an effect of the dry-rot, yet it is as truly a cause of the same evil. There are no means of restoring rotten timber to a sound state, and the dry-rot can be cured, as it is called, by removing the decayed and affected parts, clearing away all the fungi, and destroying its vegetating principle, with which the hard materials, such as bricks or stone, may have been impregnated. For this purpose, a strong solution of iron, copper, or zinc, is used with advantage. This, with the admission of a large quantity of air, as in Mr. George's ventilation system, is very advantageous. Much also may be done by cutting timber in winter, and properly seasoning it, by steeping it in water for some time, and then thoroughly drying it before it is used in building. But the following is the most approved remedy:—let the timber, prior to its application, be immersed in a solution of corrosive sublimate: in the course of a week one load will be found to have absorbed five gallons of the solution. Let it then be removed, and shortly after it becomes fit for building.

DRYADES, or DRYADS, in the heathen mythology, a sort of deities, who, the ancients believed, inhabited groves and woods. They differed from the Hamadryades; these latter being attached to some particular tree, with which they were born, and with which they died; whereas the Dryads were goddesses of trees and woods in general. See HAMADRYADES.

DRYANDER (John), A.M. university of Lund, a Swedish naturalist, the pupil and friend of Linnæus, was born in 1748, near Gottenburgh, where his father was a clergyman. In consequence of the decease of his father, the care of his education devolved on a maternal uncle, Dr. Lars Montin, a member of the Stockholm Academy. This gentleman was also the intimate friend of Linnæus, and published under his presidency, an Inaugural Dissertation on the Genus Splachnum, reprinted in the *Amœnitates Academicæ*, vol. ii. 263. Young Dryander received his early education in the university of Gottenburgh; but removed to Lund, where he took his degree of Master of Arts, or Doctor of Philosophy, in 1776; he published on this occasion a dissertation, *Fungus Regno Vegetabili Vindicans*, asserting the vegetable nature of these

bodies. He was afterwards a student for some time at Upsal, and tutor to a young Swedish nobleman. He first visited England with a countryman Dr. Solander, who introduced him to the acquaintance of Sir Joseph Banks, on whose sudden death, in 1782, he succeeded to the place of librarian to Sir Joseph Banks. Dryander was also librarian to the Royal Linnæan Societies. Of the latter institution was indeed one of the first founders, and set up its laws and regulations, when in 1800 a society was incorporated by royal charter, which continued an able and active vice-president of the society until his death, which took place towards the end of October, 1810, in the thirty-third year of his age. The publications of Dryander on the subject of botany are valuable, and consist of, 1. An Account of the Genus *Albica*, in the *Stockholm Transactions*, 1784, in Swedish. 2. *Observations on the Genus Bagonia*, in the *Transactions of the Linnæan Society*, vol. i. 3. On certain Species of Plants which occur twice a year, in Professor Gmelin's edition of *Systema Nature*; Trans. of Linn. Soc. 4. *Lundsea*, a New Genus of Fern, *Trans. Linn. Soc.* v. iii. 5. A Botanical Description of the Benjamin Tree of Sumatra, *Phil. Trans.* v. lxxvii. He also superintended and assisted the publication of Mr. Aiton's *Hortus Kewensis*, and Dr. Roxburgh's *Plants of the Coromandel*. But his *Catalogus Botanicus Historico-Naturalis Josephi Banksii*, is his most celebrated work, and a model for future bibliographers.

DRYANDRA, in botany, a genus of plants of the class diccia, order monadelphia, two-leaved; petals five; stamens more or less three or four grained; stamens solitary. No one only; a dwarf tree of Japan.

DRYAS, in botany, a genus of the pentandria order, and icosaandria class of plants, order thirty-fifth, scitoseae: car. setaceous: petals eight: stamens long and hairy with long Species, one only; a native of Dorian, sometimes found on our own mountains.

DRYRURGH ABBEY. This place was dedicated to religious institutions so early as the year 522, when Modan, a prominent missionary was there seated; as appears from records cited in Chalmers de Stat. Brit. veteris simul ac novæ Ecclesiæ, b. i. p. 140. King, in his *Kalendar. Breviar. Martii*. &c. is no doubt that the Roman station of Trintum was at the foot of the Eildon hills, a district, about three miles distant from Dryburgh; as appears from the *Antiquities* and from General Roy's Survey and Map of the man Scotland. Many coins of Vespasian, Hadrian, and Trajan, are found in this neighbourhood; and a considerable part of the road is still in good preservation, passing through the parishes of Ancrum, Letham, and Dryton. In the abbey of Dryburgh, a famous English poet, passed some time with Ralph Strode, a Welshman, a monk of the abbey, to whom Chaucer dedicated some of his verses. At the Reformation the abbey lands were erected into a township.

mes VI. in favor of John, earl of Marr, and lord high treasurer of Scotland; who to Henry his third son, from whom the succeeded to the present earl of Buchan, bought the abbey lately from the heirs of Tod, and has made it his principal residence. It was here that James Thomson composed his beautiful poem of Winter, the first of his *Seasons*; having occasionally resided at the Haliburtons of Newmains, who were proprietors of the place. Thomas Hannah, sonomer, was born here, in a house built on a part of the abbey, in 1662; and Allan Cunningham composed an epitaph for his tomb in the church-yard, which is still extant. The remains of Sir Walter Scott are deposited here.

DRYDEN (John), one of the most eminent poets of the seventeenth century, descended of a respectable family in Huntingdonshire, was born at Aldwinkle 1631, and educated at Westminster school under Dr. Busby. Thence he removed to Cambridge in 1650, being a scholar of Trinity College, of which he was, by his *Epithalamia Cantabrigiensia*, &c., to have been afterwards a fellow. On the death of Oliver Cromwell he wrote some heroic lines to his memory; but on the Restoration, desirous of ingratiating himself with the court, he wrote first a poem entitled *Astræa*, and afterwards a panegyric on the king. On 1st January, 1662, he addressed a poem to the earl of Hyde; and published in the same year his *Essay on the Dutch*. In 1668 appeared his *Mirabilis*, an historical poem in celebration of the duke of York's victory over the Dutch. These pieces at length obtained him the favor of the crown; and Sir William Davenant appointed him as poet laureate. In 1669 he produced his *Wild Gallants*, his first comedy. This was very indifferent success; yet the author, encouraged by its failure, soon after published his *Indian Emperor*. Other pieces now followed with such rapidity, that in the key to the duke of Buckingham's *Rehearsal* he is reported to have engaged himself by contract, to write four plays per year; and in the years 1679 and 1680, he appears to have fulfilled it. To be attributed those irregularities, bombast, and even puerile exuberances, for which he has been so severely criticised. In the earl of Rochester, who was chagrined at the applause with which Dryden's dramas had been received, was determined if he could shake his interest at court; and he led so far as to recommend a Mr. Crowne, of obscure reputation, to write a play in an honor which certainly belonged to his office. The duke of Buckingham also severely ridiculed several of our author's pieces at this time, in his admired *Rehearsal*. He, however, did not suffer these attacks to his impunity; for in 1679 there came out by him a *Satire*, said to be written jointly by him and the earl of Mulgrave, containing some very severe reflections on the earl of Rochester and the duchess of Portsmouth; and in 1680 he published his *Abolition and Abolition*, in which the well-known character of

Zimri, drawn for the duke of Buckingham, is certainly severe enough to repay all the ridicule of that nobleman. The resentment shown by the two peers was very different. Lord Rochester, who was a coward, as well as a man of the most depraved morals, basely hired three ruffians to cudgel Dryden in a coffee-house; but the duke of Buckingham took the task upon himself; and at the same time presented him with a purse containing a large sum of money; telling him that he gave him the beating as a punishment for his impudence, but bestowed that gold on him as a reward for his wit. In 1682 Dryden published his *Religio Laici*, designed as a defence of revealed religion against Deists, Papists, &c. Soon after the accession of James II. he went over to the church of Rome, and wrote two pieces in vindication of the Romish tenets: viz. *A defence of the Papers written by the late king, found in his strong box*; and the celebrated poem, afterwards answered by lord Halifax, entitled, *The Hind and the Panther*. By this extraordinary step he not only engaged himself in controversy, and incurred much censure and ridicule from his contemporary wits: but on the completion of the Revolution, being, on account of his newly-chosen religion, disqualified from bearing any office under the government, he was stripped of the laurel, which, to his still greater mortification, was bestowed on Richard Blackmore, a man to whom he had a most settled aversion. This circumstance occasioned his writing the very severe poem called *Mac-Blackmore*. Mr. Dryden's circumstances had never been affluent; but now, being deprived of this little support, he found himself reduced to the necessity of writing for bread. From this period, therefore, he was engaged in works of labor as well as genius, translating the works of others, &c.; and to this necessity we stand indebted for some of our best translations. In the year he lost the laurel, he published the life of St. Francis Xavier from the French. In 1693 came out his *Juvenal and Persius*. In 1695 his prose version of *Fresnoy's Art of Painting*; and in the year 1697 a translation of Virgil's entire work, which still stands foremost among the translations of that author. The minor pieces of this eminent writer, viz. his prologues, epilogues, epitaphs, elegies, songs, &c. are too numerous to specify here, but may all be found in the elegant editions of this poet by Sir Walter Scott, Malone, and Dr. Warton. His last work is his *Fables*, which consist of many of the most interesting stories in Homer, Ovid, Boccaccio, and Chaucer, translated or modernized in the most elegant manner; together with some original pieces, among which is the celebrated ode on St. Cecilia's day. Dryden married the lady Elizabeth Howard, sister to the earl of Berkshire, who survived him eight years. By this lady he had three sons, Charles, John, and Henry. Of the eldest there is a circumstance related by Charles Wilson, esq. in his *Life of Congreve*, which seems so well attested, and is itself of so very extraordinary a nature that we cannot avoid giving it a place here. Dryden, with all his understanding, was weak enough to be fond of judicial astrology, and used to calculate the nativity of his children. (See

casting that of Charles he found, according to the rules by which he calculated, that his eighth, twenty-third, and thirty-third years were of peculiar omen. In his eighth year, notwithstanding his father's precautions, he went out on his birth-day to see a stag hunted, and the animal flung down on him a wall ten feet in length which was nearly fatal to him. In his twenty-third year he fell from the top of a tower in the Vatican, and never fully recovered his health; and in his thirty-third year he was drowned in swimming across the Thames near Windsor.

Dryden died May 1701, and was buried in Westminster Abbey. The day after his death, the dean of Westminster sent a message to his widow, that he would make a present to her of the ground and all other abbey-fees for the funeral; lord Halifax likewise sent to lady Elizabeth, and to Mr. Charles Dryden, offering to defray the expenses of our poet's funeral, and afterwards to bestow £500 on a monument in the abbey. Accordingly, on Sunday following, the company being assembled, the corpse was put into a hearse and attended by eighteen mourning coaches. When they were just ready to move, lord Jefferys, son of lord chancellor Jefferys, a name dedicated to infamy, riding by with some of his companions, asked whose funeral it was; and being told it was Mr. Dryden's, he protested he should not be buried in that private manner; that he would himself, with lady Elizabeth's leave, have the honor of the interment, and bestow £1000 on a monument in the abbey for him. This put a stop to the procession; and lord Jefferys, with several of the gentlemen who had alighted from their coaches, went up stairs to the lady, who was sick in bed. His lordship repeated the purport of what he had said below; but lady Elizabeth refusing her consent, he fell on his knees, vowing never to rise till his request was granted. The lady under a sudden surprise fainted away; and lord Jefferys, pretending to have obtained her consent, ordered the body to be carried to Mr. Russel's an undertaker in Cheapside, and to be left there till further orders. In the mean time the abbey was lighted up, the ground opened, the choir attending, and the bishop of Rochester waiting some hours to no purpose for the corpse. The next day Mr. Charles Dryden waited on lord Halifax and the bishop, and endeavoured to excuse his mother by relating the truth. Three days after, the undertaker having received no orders, waited on lord Jefferys; who pretended that it was a drunken frolic, that he remembered nothing of the matter, and he might do what he pleased with the body. Upon this the undertaker waited upon lady Elizabeth, who desired a day's respite, which was granted. Mr. Charles Dryden immediately wrote to lord Jefferys, who returned for answer, that he knew nothing of the matter, and would be troubled no more about it. Mr. Dryden hereupon applied again to lord Halifax and the bishop of Rochester, who absolutely refused to do any thing in the affair. In this distress, Dr. Garth, who had been Mr. Dryden's intimate friend, sent for the corpse to the college of physicians, and proposed a subscription; which succeeding, about three weeks after Mr. Dryden's decease,

Dr. Garth pronounced a fine Latin eulogy on the body, which was conveyed from the college, attended by a numerous train of coaches, to Westminster Abbey, but in great haste. It was interred in a private manner. After the funeral Charles Dryden sent a challenge to lord Jefferys, and repeatedly sought admission to him to provoke a duel, or to chastise him for above barbarous indignity, in that he had no monument erected to him for some years, to which Mr. Pope alludes in the epigram intended for Mr. Rowe, in this line.

Beneath a rude and nameless stone he lies.

In a note upon which we are informed, that the tomb of Mr. Dryden was erected upon the side by Sheffield, duke of Buckingham, to whom it was originally intended this epitaph:

This Sheffield raised.—The sacred dust below  
Was Dryden once; the rest, who does not know.

Which was afterwards changed into the present inscription now upon it, viz.

J. DRYDEN,

Natus Aug. 9, 1631.

Mortuus Mart 1, 1701.

Johannes Sheffield, dux Buckinghamiensis, erexit.

Were we to form a judgment of this poet from some of his dramatic writings, we should be apt to conclude him a man of the most licentious morals; many of his comedies containing gross obscenity. But we know whose authority cannot be respected, but we know him as no less amiable in his private character as a man, than he was illustrious in his public one as a poet. He was, according to the purity, humane, compassionate, forgiving, friendly; gentle in the correction of the faults of other authors, and patient under the censure of his own; easy of access himself, but diffident in his advances to others; and all men the most modest, and the most to be discountenanced in his approaches to his superiors or his equals. As to his verse, he has been thought to have attained the greatest general harmony in his numbers, of any of our poets.

DRYPIS, in botany, a genus of the triandria order, and pentandria class of plants, and in the order twenty-second, Caryophyllæa: calyx quinquedentatus: petals five; the opening of the capsule as if cut round horizontally, and perpendicular. Species one only, a native of Barbary and Italy.

DRYSDALE (John), D. D., a late Scottish clergyman of the church of Scotland, was born at Kirkcaldy, April 29th 1718. He distinguished himself as a classical scholar, and in 1732, was sent to finish his studies at the university of Edinburgh. In 1740 he was licensed to preach by the presbytery of Kirkcaldy, and after having been several years employed as a minister of the college church at Edinburgh, he settled at Kirkcaldy in 1748. After fifteen years in this town, he obtained a nomination to Lady Yester's church, from the presbytery council of Edinburgh. This nomination he

The magistrates of Edinburgh had exercised right of presentation, a most formidable position was now made to his settlement. The opposition however, which was more against the man than the man, being at last overcome, he was settled as minister of Lady Yester's. In the Marischal College of Aberdeen conferred on him the degree of D. D. In 1766, on the death of Dr. Jardine, he was translated to that church, where he became colleague to Dr. Wishart; and was also appointed one of the chaplains, with one-third of the emolument of the deanery of the chapel royal. In 1773 he was unanimously elected moderator of the General Assembly; 'the greatest mark of respect,' says Professor Dalziel, 'which an ecclesiastical man of wealth can bestow;' and in 1784 he was raised to the same dignity, by a great majority.

In May, 1788, he appeared in his place at the meeting of the Assembly, and acted as principal clerk the first day; but was obliged to retire on the assistance of professor Dalziel during the succeeding days; and, being violently attacked with a cough, became gradually weaker, till he died on the 16th June following, aged seventy. Dr. Dalziel's sermons have been published since his death, and are esteemed a valuable addition to the stock of instruction.

**DUBJAL**, a sect of Mahomedan Arabs, inhabiting Meccan, a maritime province of Arabia. 'Its first author,' says Mr. Niebuhr, 'is a venerable old man, who was found by wood-cutters shut up in the middle of a desert having a book in his hand.' This mysterious origin he was informed of at Meccah; 'each sect,' he adds, 'tells ridiculous stories of the others, to bring them into contempt.'

**DUBLA**, an ancient city of Arabia, in the south of Yemen; the capital of a district and of a Dola; seated on the brink of a precipitous mountain, containing about 600 houses, of considerable height and of good appearance. Its streets are paved.

**DUB**, *adj.* Lat. *duilis*, from *duo*; Gr. *δύω*; *v. s.* two. Expressing two.

Two languages have only one variation, and so Latin, but the Greek and Hebrew have one to two, and another to signify more than two, and the variation the noun is said to be of the *duilis*, and under the other of the plural.

*Clarke's Latin Grammar*

**DUB**, *v. a. & n. s.* Goth. *dubba*; Sax. *dub-ber*, *aduber*. The Northern words mean to dub, and have been thought to allude to the ceremony of making a knight by a slight blow with a sword. To make a knight. To confer any kind of dignity or honor. Butler uses it as a substitute for a blow.

'Knight, knight, good mother' Basilisco like,

'I am dubbed; I have it on my shoulder.'

*Shakespeare.*

**Id.**

'There no instance why thou shouldst do treason, to dub thee with the name of traitor.'

*Id.*

'The jealous o'erworn widow and herself,

'that our brother dubbed them gossipwomen, mighty gossips in this monarchy'

*Id. Richard III.*

The robes which the kings then allowed to each knight, when he was dubbed, of green, or barnet, as they spake in that age, appeareth upon record.

*C Camden's Remains.*

The king stood up under his cloth of state, took the sword from the lord protector, and dubbed the lord mayor of London knight. *Hayward on Edward VI.*

As skilful coopers hoop their tubs

With Lydian and with Phrygian *dubs* Hudibras.

O poet! thou hadst been discreteter,

Hanging the monarch's hat so high,

If thou hadst dubbed thy star a mirror,

That did but blaze, and rove, and die. *Prior.*

These demoniacs let me dub

With the name of legion club. *Swift.*

A man of wealth is dubbed a man of worth;

Venus shall give him form, and Anstis birth.

*Pope.*

Women commence by Cupid's dart,

As a king hunting *dubs* a hart. *Cleaveland.*

A plain gentleman, of an ancient family, is of better quality than a new knight, though the reason of his *dubbing* was meritorious. *Collier on Pride.*

I have on the seat behind me the constitution of Mr. John Probert; a knight-errant, dubbed by the noble lord in the blue ribbon, and sent to search for revenues and adventures upon the mountains of Wales.

*Burke.*

**DUBIOUS**, *adj.*

**DUBIOUSLY**, *n. s.*

**DUBIOUSLY**, *adv.*

**DUBIOUSNESS**, *n. s.*

**DUBITABLE**, *adj.*

**DUBITATION**, *n. s.*

Lat. *dubius*; anciently *dubius*, from *duo*, two, and *via*, a way; drawn two ways; in doubt.

Doubtful; uncertain in argument or event; not plain. Dubitable is also doubtful, or that may be doubted.

*Dubitation* may be called a negative perception; that is, when I perceive that what I see is not what I would see.

*Grew.*

Men often swallow falacies for truths, *dubiousness* for certainties, feasibility for possibilities, and things impossible for possible. *Broune's Vulgar Errors.*

Authors write often *dubiously*, even in matters wherein is expected a strict definitive truth. *Id.*

Many of the ancients denied the antipodes; but the experience of our enlarged navigation can now assert them beyond all *dubitation*. *Id.*

No quick reply to *dubious* questions make.

*Denham.*

His utmost power with adverse power opposed,

In *dubious* battle, on the plains of heaven. *Milton.*

Satan with less toil, and now with ease

Wafts on the calmer wave, by *dubious* light. *Id.*

Yet where truth and knowledge are concerned in the case, I know not what fault it can be to desire the explication of words, whose sense seems *dubious*.

*Locke.*

She speaks with *dubiousness*, not with the certainty of a goddess. *Broom.*

Almanack-makers wander in generals, and talk *dubiously*, and leave to the reader the business of interpreting. *Swift.*

It is a common and just observation, that, when the meaning of any thing is *dubious*, one can no way better judge of the true intent of it, than by considering who is the author, what is his character in general, and his disposition in particular. *Pope.*

We also call it a *dubious* or doubtful proposition, when there are no arguments on either side.

*Warre's Logic.*

Now hope evales the fisher's beating heart;

Now he turns pale, and fears his *dubious* art. *Gay.*

When a question of orthography is *dubious*, that practice has, in my opinion, a claim to preference, which preserves the greatest number of radical letters, or seems most to comply with the general custom of our language. *Johnson: Plan of Dictionary.*

In clay-formed beds the trickling streams collect, Strain through white sands, through pebbly veins direct;

Or point in rifted rocks their *dubious* way,  
And in each bubbling fountain rise to day. *Darwin.*

Where Reason's meteor-rays, with sickly glow,  
O'er the dun gloom a dreadful glimmering throw;  
Disclosing *dubious* to the affrighted eye  
O'erwhelming mountains tottering from on high,  
Black billowy deeps in storms perpetual tossed,  
And weary ways in wildering labyrinths lost. *Beattie.*

You'll find there are such shordy,  
By its rich harvests, new disease, and gold;  
From one-half of the world named a whole new one,  
Because you know no better than the dull  
And *dubious* notice of your eyes and ears. *Byron.*

DUBITZA, a town and fortress in Bosnia, European Turkey, situated on the right bank of the Unna, near its confluence with the Save; and opposite a fortified Austrian town of the same name in Croatia. The Austrians, in the campaign of 1788, twice attempted to take it by storm, and it at last surrendered; but, at the peace of Sistov, it was restored to the Porte. Population 6000. Twelve miles north-east of Kostainitza: the Austrian town has about 1600 inhabitants.

DUBLIN COUNTY, the metropolitan county of Ireland, lies on the east coast of that country, immediately opposed to the Welsh coast: it is between  $53^{\circ} 16'$  and  $53^{\circ} 37'$  N. lat., and  $6^{\circ} 36'$  W. long. from Greenwich. The boundaries are, on the north the county of Meath, on the west parts of Kildare and Meath counties, on the south the county of Wicklow, and on the east the Irish sea. Its sea-front is terminated by the Nanny Water on the north, and by Bray River on the south.

This county contains 240,113 statute acres: seventy-three parishes and fourteen parts of parishes, with 693 townlands; and is divided into eight baronies and one half barony. The surface of that part north of the river Liffey is flat and badly supplied with water, on which account it is less inhabited by gentry but more applied to agriculture: the surface of the southern side is a beautiful inclined plane, ascending gradually from the sea-shore to the foot of the Dublin and Wicklow Mountains. The soil in this part is lighter than the rich loam in the northern baronies, but this disadvantage is not felt, as from the natural beauty of the country south of the Liffey it is almost wholly appropriated to the demesnes of the gentry of Dublin and to marine villas for the summer season.

The entire county may be considered as naturally divided into two parts, by a line drawn from the village of Newcastle to Rathfarnham, where it will form a very obtuse angle with its new direction, which may be represented by a line drawn from Rathfarnham to Booterstown, where the limestone crops out on the strand: all north of this line rests on a base of floetz limestone, except one patch extending from Skerries to Balbriggan, which rests on transition rocks. Fuel

is scarce in the centre of the county, but there are coals at Naul and an extensive tract at Capistown, but the coal vein is not wide. The northern baronies are still in a very wild and uncultivated state, although much improved by the new Drogheda road by Ashdown, a place hitherto almost unknown. The distance between the great western road near Rathfarnham and the Blessington road, with the Golden Mile at Ballinscorney, rests on slaty rock. The greater part of the county, with little exception, is a granite formation; the field of granite commencing at Williamstown strand and extending to Brandon Hill in the county of Kilkenny, has an average breadth, in that distance, of thirty miles.

There are few good harbours on the coast of this county; piers have been constructed at Balbriggan, at Howth, &c., and an extensive harbour at Kingstown, enclosing 220 acres, with two piers of several kants, having a depth of twenty-six feet at low water. The Holyhead and Liverpool mail packets sail from the pier, and it is in contemplation to connect the city with Ringsend docks by a ship canal, or else to convey merchandise hence to the city of Dublin by a rail-way: the distance is about six miles and a half. It was here that his majesty George III. embarked in 1821, and a handsome obelisk, bearing an appropriate inscription, is erected on this spot, to commemorate the event. Kingstown harbour is too large, and the pier should have been faced with cut stone down to the low water mark.

DUBLIN, the metropolis of Ireland, the capital city in his majesty's dominions, is situated in the province of Leinster, and county of Dublin. The river Liffey, which falls into the sea, divides the city immediately below the custom-house, and divides the city into two nearly equal parts. Dublin is seventy-two miles west of Holyhead, and 303 south-west of Edinburgh, and 470 west of London. Long.  $6^{\circ} 6'$  W. lat.  $53^{\circ} 28'$  N.

Dublin is a place of great antiquity, and was anciently confined to the south side of the river. In the tenth century, after the foundation of the city, the towers and walls of the city were repaired by the Ostmen, the Danes of the city, including those of the castle, which did not occupy more than an Irish mile. The city was extended from Wine-Tavern gate to Adam's Arch, and were continued thence to the present Thomas-street; they were continued to Ormond's-gate, or, as it has been since called, Wormwood-gate; thence to the Wicklow bridge, and along the banks of the river to Newman's Tower, nearly the present entrance of the south entrance of Essex-bridge, and to Newman's Tower, in an oblique direction, to Dame's-gate, at the west end of the city. From the gate at the south-west end of the castle, the wall ran to Nicholas-gate, and was continued thence to Newgate. The streets without the walls were, on the north, Row, Francis-street, Thomas-street, and James-street; on the south, Patrick-street, and Ship-street; and on the east, Thomas-street, George's-lane, and Stephen-street. The ground now occupied by the city, and the bar, Fleet-street, Lazar's hill, &c., is a tract

2. Townsend-street, Crampton, Aston's, &c., and Sir John Rogerson's quays, &c., then overflowed by the Liffey. On the side of the river there were only Church-st., Mary's-lane, Hammond-lane, and Pill-lane built but on one side as far as Mary's-st., which terminated the extent of that part of town to the east. Grange-gorman, Stoney-st., now called Manor-street, and Glassinagh, were then villages at some distance from the city; and, at the latter, the sheriffs have held courts in times of the plague. In 1664 the citizens amounted to 2565 men, and 2986 women, Protestants; and 1252 men, and 1406 women, Roman Catholics: in all 8159. Ptolemy, who flourished about A.D. 140, it was anciently called *Ascheled*. In 1558, whose daughter, Auhana, was drowned in the Liffey, changed the name from *Ascheled* to *Auhana*. It was afterwards named *Dublana*, Ptolemy calls it *Eblana*. *Dublana*, whence *Dunum* and *Dublin*, is evidently derived from *Deana*, the place of the black harbour, or rather the lake of the sea; the Bay of Dun being frequently so called. The city had a variety of names. The Irish call it *Ucholl-coil*, 'the brow of a hazel wood.' In 1609, king of Munster, being on a royal visit to this place, which was then *Atha Cliath Dubh-Line*, 'the passage of a ford of hurdles over the black pool.' The name of Dublin was likewise known by the name of *Lean-Cliath*, or *Leann-Cliath*, from *Lean*, a harbour; and from *Cliath* or *ab*, which literally signifies a hurdle or any made of wicker-work; it also signified in wires formed with hurdles, and placed in bays by the ancient Irish, for the use of taking fish; whence any river or wherein these wires were fixed, had the name of *Cliath* or *Clubb* annexed to it, to signify establishment of a fishery. Dublin, therefore, originally built on or near one of these bays, was anciently called *Bally-lean-Cliath*; i.e., the town on the fishing harbour. It is distinguished in the Irish language by the names of *Ath-Cliath*, 'the ford of hurdles,' *Ballyath-Cliath*, 'the town of the ford of hurdles,' the inhabitants having formerly had to go to the city, over the river, by hurdles laid in low marshy grounds adjoining the water; the name was also extended to the north of the river, from a temporary bridge of hurdles thrown over the Anna-Liffey, a corrupt name of *Aun Loulla*, or the swift river, so termed from the rapidity of the mountain floods. The name was enlarged by Mac-Turkill, the first prince; who, notwithstanding, fixed his residence on the south side, and abandoned the northern town; which, from the original name of the invaders, was called *Eastmuntown*, *Eastmuntown*, since corrupted to *Oxman-King*. King Edgar, in the preface to his charter, dated 964, mentions Ireland, with its noble city (*nobilissima civitas*) of Dublin, the *Fingalians*, it is called *Diveilin*, and by the *Welsh* *Dinas Dulin*, or the city of Dulin.

448 Alpin M'Eachard, king of Dublin, and his subjects, are said to have been converted to

Christianity by St. Patrick. In 498 the Ostmen, or Danes, having entered the Liffey, with a fleet of sixty sail, made themselves masters of Dublin and the adjacent country, and soon after environed the city with walls. About 1170 Dermot M'Murrough, king of Leinster, having quarrelled with the other princes of the kingdom, a confederacy was formed against him by Roderic O'Connor, monarch of Ireland. Dermot applied to Henry II., king of England, who sent over a number of English adventurers, by whose assistance he was reinstated in his dominions; in 1171 the descendants of the Danes still continuing to hold possession of Dublin, it was besieged and taken by a powerful party of the English, under Raymond-Le-Gros. M'Turkill, the Danish king, escaped to his shipping; but returned soon after, with a strong fleet, to recover the city; he was killed in the attempt, and in him ended the race of Easterling princes in Ireland. In 1172 Henry II. landed at Waterford, and obtained from Richard, earl Strongbow, who married Eva, the daughter of M'Murrough, and by compact was his successor, a surrender of the city of Dublin; where he built a pavilion of wicker-work near St. Andrew's church, then situated where Castlemarket lately stood, and there entertained several Irish princes, who voluntarily submitted to him, on condition of being governed by the same laws as the people of England. Henry also held a parliament here. In 1173 he granted his first charter to Dublin, and by divers privileges encouraged a colony from Bristol to settle in it. In 1210 upwards of twenty Irish princes swore allegiance to king John at Dublin; engaging to establish the English laws and customs in the kingdom; and in the same year courts of judicature were instituted. In 1216 *Magna Charta* was granted to the Irish by Henry III., an entry of which was made in the red book of the exchequer at Dublin. In 1217 the city was granted to the citizens, in fee-farm, at 200 marks per annum; and, in 1227 Henry ordained, that the charter granted by king John should be kept inviolably. In 1404 the statutes of Kilkenny and Dublin were confirmed in a parliament, held at the city, under the earl of Ormond. The charter of the city of Dublin was renewed in 1609 by James I. The civil government of the city was anciently under the management of a provost and bailiffs; in 1308 John le Dever was appointed the first provost, Richard de St. Olave and John Stakebold bailiffs. In 1409 the title of the chief magistrate was changed to that of mayor, when Thomas Cussac was appointed to the office, Richard Bove and Thomas Shortall being bailiffs; the office of bailiffs was changed to sheriffs in 1547. In 1660 Charles II. gave a collar of SS. and a company of foot-guards to the mayor; and in 1665 he conferred the title of lord mayor on the chief magistrate, to whom he also granted £500 per annum, in lieu of the foot company. Sir Daniel Bellingham was the first lord mayor of Dublin; Charles Lovet and John Quelsh were sheriffs the same year. In 1672 Arthur, earl of Essex, introduced new rules for the better government of the city; and in 1693 the old Tholsel was built by Inigo

Jones, for the magistrates to hold their courts, assemblies, &c.

The hospital for lying-in women, founded by Dr. Bartholomew Mosse, and opened in 1757, stands on the north side of Great Britain-street. The building, designed by Cassels, is light and elegant; a beautiful steeple rises in the centre, and the wings are formed by semicircular colonnades on each side. Adjoining the east colonnade is the rotunda, where balls and assemblies are held, and concerts performed for the benefit of the charity. The blue-coat hospital was founded on the west side of Queen-street, by Charles II., in 1670, for educating the children of reduced freemen of the city; but the original building being greatly decayed, was taken down, and the new blue-coat hospital, situated on Oxmantown-green, was begun in 1773. The front is enriched by four three-quarter Ionic columns, supporting a pediment in the centre, over which the steeple rises, embellished with Corinthian and composite columns in an admired taste. Connected with the front by circular walls, ornamented with balustrades and niches, are the school on one side and the church on the other, which form two well-proportioned wings, each crowned with a small turret; the steeple is not yet finished. The royal hospital at Kilmainham, for the support of invalids of the Irish army, was founded by king Charles II., on a plan similar to that of Chelsea. It was completed in 1683, and cost upwards of £23,500. It is situated at the west end of the town, on a rising ground, near the south side of the river, from whence there is an easy ascent to it through a handsome avenue and park. It is of a quadrangular form, enclosing a spacious area, laid out in grass-plots and gravelled walks; an arcade is carried along the lower story in each square, to the entrance of the hall and chapel, which are both curiously decorated; in the former are several whole length portraits of royal personages, and other distinguished characters. Madam Steven's hospital, the foundation of which was laid in 1720, is a quadrangular building, pleasantly situated on the banks of the river, near the west end of James's-street; the hospital for lunatics, in Bow-lane, founded by Dean Swift, and opened in 1757; Sir Patrick Dun's hospital, in which the royal college of physicians hold their meetings and examinations; the Cork-street fever hospital; the new Meath hospital, built by Mr. Pleasants; Mercer's hospital, in Johnson's-place, founded by the amiable Mrs. Mercer; Simpson's hospital, in Great Britain-street, an asylum for blind and gouty men; the house of industry, in Brunswick-street, for the aged and infirm; the hospital for incurables, on the Donnybrook-road; and the charitable infirmary, Jervis-street, are the most conspicuous in alleviating the afflictions of disease, and ministering to the numerous calls of the impoverished. There are several noble institutions also, that derive aid, either wholly, or in part, from parliament; such are the Hibernian school, in Phoenix park for the education of the children of soldiers, and the Royal Marine school, for the maintenance and education of the children of distressed sailors.

Dublin is seated in view of the sea on the east, and a fine country which swells into many eminences on the north and west, while it rises boldly up in lofty mountains, that bound the town, on the south. The city itself cannot derive full advantage on entering the harbour, but approach to it exhibits a fine prospect of the country for improvement and cultivation, interspersed with numerous villas, that enhance the delightful scene, which, beginning at the very edge, is continued all over the coast to the end of the bay, as far as the eye can reach, and is finely contrasted by a distant view of the low mountains on the south, where the hills, called the Sugar Loaves, contribute a little, by the singularity of their appearance, to embellish the landscape, so extensive and picturesque as not on be equalled by any other scenery in Europe, except the entrance of the Bay of Naples, to which it bears a striking resemblance.

The form of Dublin is rectangular. From the royal hospital at Kilmainham, at the western extremity of the town, to the east end of Thomas-street, the length is two miles and a half, and its greatest breadth two, and it is about ten miles in circumference. It contains about 16,000 houses, whose inhabitants are estimated at 180,000.

The civil government of Dublin is managed by a lord mayor, recorder, two sheriffs, four aldermen, and a common-council composed of representatives from the twenty-four parishes of Dublin, being the seat of government, and the chief courts of justice, has received many charters and ample privileges from the kings of England, since the reign of Henry II. In 1703, it was erected into a marquise in favour of Robert de Vere, earl of Oxford, whose descendant created duke of Ireland. It is an archiepiscopal see, and sends two members to parliament.

Dublin is remarkable for the breadth and elegance of its leading streets; from the Custom-house bridge, in Baggot-street, along the north side of Stephen's-green, or by Merrion-square, to the Custom-house, and College-green, thence through Westmoreland-street, Sackville-street, and to the Custom-house square, is probably the most elegant and spacious of city avenues to be seen in any Irish capital; but the back streets are a strong contrast, very few of them presenting the appearance either of wealth or comfort. There are five handsome squares in the city, the best of which, called Stephen's-green, is one mile in circumference, enclosed by iron-railings, and on a dwarf wall, outside of which is a wide gravel-walk, protected from the sun by iron chains and pillars. In the centre of this level space, stands a fine equestrian statue of Van Nott, of king George II. Merrion-square is a large rectangle, surrounded by mansions; those on the north side are built on the basement story, by rustic workmen; these were built from the designs of Mr. Webb, who laid out this fine square. The Custom-house square is the Grosvenor-square of Dublin; few of the Irish nobility still remain in the city, the noblest of which is Chester-

Considerable improvements are still going on in the avenues of Dublin, under the direction of the Wide-street commissioners, particularly in the vicinity of St. Patrick's cathedral, by the most miserable part of the city or cities.

Dublin is divided into four districts, each submitted to the care and protection of a police constable, who have an office and court within their respective districts. The head office of the police is in the Castle division; to this belong the peace-officers, and to each of the other, three divisions.

Police stations are established at convenient distances round the city, and a patrol of police is in constant motion during the night, even to a distance of miles from the city. The old archiepiscopal palace has been converted into the headquarters of the police corps.

The public buildings of Dublin are both numerous and noble: the most architectural is the Parliament House (formerly the Parliament House) the foundation of which was laid in 1729; it was erected under the instruction of Sir Edward Pearce, after a design by Mr. Cassels. The original building consisted of a grand colonnade in the Ionic order, forming three sides of a circular court-yard. The central colonnade was intersected with the two noble porticos, forming the east and west fronts, by circular curtain walls, intersected with three-quarter columns. These porticoes are built from the designs of Messrs. Gandon and Parke. No part of the building remains as formerly, except the corridors of the House of Lords, in the last of which is the statue of George III. by Bacon jun. The House stands on the site of the old House of Commons, and is a very spacious, light and airy apartment. The establishment for engraving and printing of bank notes, under the direction of Mr. Oldham, exhibits a singular specimen of ingenious mechanism; it was visited by the present Majesty during his stay in Ireland in 1801. The General Post Office, established in 1794, stands in Sackville Street at the intersection of four leading streets and adjacent to Nelson's Pillar. The portico in front of Portland House is a remarkably beautiful piece of architecture; the ornaments of the frieze are not surpassed by any similar designs in the city. This large and convenient building was raised for a comparatively moderate sum of £50,000 from the design of Francis Johnston Esq. The Post Office, in William Street, is also a fine specimen of cut granite stone raised in the Wick Mountains.

The Castle of Dublin, now the town residence of the lord-lieutenants who formerly lodged at the Hospital of Kilmainham, may be considered as divided into two parts, called the upper and lower yards. The upper is a quadrangle of buildings, with ornamental stone arches to the windows; the entrance to his excellency's apartments is by a fine colonnade, antecedent grand flight of steps; opposite to the entrance is a handsome building, containing the apartments of the guard of honor and of the household; the basement is an open colonnade surmounted

by a pediment, above which rises an octagonal tower crowned by a tapering dome. This pretty building is terminated as wings, by two lofty archways of rustic-work, on the crowns of which rest statues of Justice and Fortitude. The Castle was built by Henry de Londres, archbishop of Dublin in 1220, but not used as the vice-regal residence until the year 1560, by command of queen Elizabeth, since which time it has received so many additions that it does not present the appearance of any regular edifice, but an assemblage of irregular buildings raised for some immediate necessity. In the state apartments there is a fine room, eighty-two feet in length, called St. Patrick's Hall, having the ceiling ornamented by three characteristic paintings of Walsby's. Here the knights of the noble order of St. Patrick were regaled after their original institution, and here, by annual balls, the birth-day of the great patron saint of Ireland is celebrated. The lower Castle yard contains several offices, the Old Treasury, the ordnance office, &c., beside the very beautiful chapel lately erected after a design by Francis Johnston Esq. the very best specimen of modern pointed architecture in the city. It is built of cut stone, highly enriched with carved heads and Gothic pinnacles. Nor does the interior lose any of that masterly style so conspicuous in the exterior. The regal seat and front pannels of all the pews are adorned with armorial bearings in carved oak of a series of viceroys; the great window embellished with stained glass, and the ceiling decorated with highly enriched pendants. The first stone of the chapel was laid by his grace John duke of Bedford, in 1807, and the expense of its erection was about £40,000. The Record Tower, adjoining the chapel, was erected by king John, its walls are fourteen feet thick: here James II. established a mint and secreted a quantity of the royal plate. Birmingham Tower, another of the flankers of the town wall, stands at a little distance from the record tower. The old building of this name having been destroyed by fire, the present unmeaning mass was erected in its stead.

The Royal Exchange contiguous to the castle, is a magnificent pile, erected after a design of Mr. Cooley; the ground plan is simply a circle inscribed in a square. It is wholly built of Portland stone, has three fronts adorned with pillars and pilasters, and contains a noble area within, lighted by a beautiful and spacious dome, for the transaction of commercial business. In the circular ambulatory, fronting the principal entrance door, stands a handsome statue of his late majesty in Roman military costume designed by Van Nott. Besides the royal exchange, which is now almost disused for commercial purposes, there are two other handsome buildings faced with stone appropriated to the accommodation of merchants, the commercial buildings in College Green and the corn exchange on Burgh Quay, in the former of which the chamber of commerce hold their meetings. The Custom House is acknowledged to be one of the noblest buildings in the city; its south front towards the river is built of Portland stone, extends 375 feet, and is adorned with a beautiful portico in the centre, consisting of

four Doric columns supporting an enriched entablature and pediment, the tympanum of the latter decorated with a group of figures in alto relievo, representing Hibernia and Britannia presenting emblems of peace and liberty. A magnificent dome supporting a cupola, on whose apex stands a colossal figure of Hope, rises nobly from the centre of the building to a height of 125 feet. The north front is of equal extent; but, the ornamented parts excepted, is entirely of granite stone, which produces rather a sombre effect. The only handsome apartments within for public use are the Board room, and what is called the Long room. To the custom house are attached large and well designed docks, much too capacious and of too expensive a character for the trade of Dublin. The old dock, which is quite sufficient for the present trade, is 400 feet in length by 200 in breadth; the second dock measures 380 feet by 250, and the third or inner basin is 650 in length by 300 in breadth. Extensive stores have also been erected: the tobacco store is 500 feet long, its breadth being 160. Besides these docks which belong to government, and are leased for about £7000 per annum to private individuals, there are canal docks on both sides of the river which alone would afford abundant accommodation to all the shipping engaged in the Dublin trade; these, of course, are quite unemployed. These seven great basins are faced with limestone of the very best description and in a workmanlike style. The linen hall is a very extensive range of building, not uninteresting in external appearance: a handsome statue of his present majesty has lately been erected there by the trustees; it was executed by Kirk. A most useful building has lately been erected, to be called the National Mart, or Usher's Quay, the object of which is to encourage the small capitalist, who is here to be supplied, not only with an immediate sale for the produce of his labor, but also with a loan, to enable him to bring something more valuable to market as a second venture.

There are two noble buildings appropriated to the accommodation of the legal profession, and to the administration of justice. The principal is the stately edifice called the Four Courts, or Inn's Quay: the first stone was laid in March 1786, by his grace the duke of Rutland, but the whole structure was not completed for fourteen years after. The design which is by Cooley, but executed by Gandon, is truly noble. It consists of a grand central building, with squares on each side, enclosed by ranges of lofty buildings, containing the different offices of records, &c. The front of the centre is adorned with an elegant picture of six Corinthian columns, supporting a frieze and pediment; on the apex of the latter stands a statue of Moses, and at each extremity are allegorical figures of Justice and Mercy. Behind the pediment and statues rises a circular lantern, sixty-four feet in diameter, crowned by a lofty dome. The spacious court yards on each side are enclosed in front by light and beautiful open arcades, in the centre of which are great coach ways, ornamented by groups of allegorical emblems. The four law courts are contained in the central buildings, radiating from a spacious

circular hall of sixty-four feet diameter, all of equal dimensions, rather small for a building of the kind. The rolls court is in the same building. The extent of the quadrangle of the four courts, presented to the public, is 170 feet, and its depth 170. It is built of granite, the ornamental parts being of Portland stone: the expense is estimated at £250,000.

The Inns of court, at the upper end of Henrietta Street, occupy a beautiful and elegant original building, designed by Mr. Gandon. The front is hewn of granite, the ornamentation being of Portland stone. The plan consists of a centre and wings, each of the latter crowned with noble pediments. In the central compartment of the three great saloons, the front, beautiful panels are met with allegorical representations in the centre of which represents the authorities of Ireland, receiving from Elizabeth a translation of the Bible and of incorporation. The door-ways of the saloons are ornamented by caryatides, the only one of this description of sculpture in Dublin. One of the wings is the dining hall for the benchers and students of the inn; the other are the Prerogative Court and Common Pleas Office, &c. A law library is now fitting up, with a front of cut stone, at the back entrance to the Inns on the site of the Duke's old city palace. There are other buildings in Dublin and its vicinity. The city council or Sessions House, adjacent to Newgate, is an uninteresting building, and rather built to the purpose of its erection. The Court of Conscience, in Coppinger's Row, where the lord mayor, or his substitute, presides, is a miserable apartment in the basement of the City Assembly Room: besides the Courts, only one of which has a suitable house; and the Insolvent Court, held in a humble description of building.

The ecclesiastical division of Dublin consists of nineteen parishes, to each of which a church is attached. There are also the cathedral of St. Patrick, Christ Church, which is only a parish though called metropolitan; seven conventual chapels to the parish church of St. Peter; and many private chapels, which are independent of the diocesan, such as those of Kildare Hospital; the Foundling Hospital, the Blue-coat Hospital; the St. Vincent's School; Hibernian School, &c. The Catholic division of parishes does not correspond with that of the established church: their places of worship are numerous, as chapels in Anne Street and Exchange Street, &c. possessed of much architectural elegance. The Metropolitan Chapel in Marlborough Street, when finished, will be a great ornament to the city. The great aisle is 150 feet in length, 120 in breadth; the exterior is still in an unfinished state. The Quakers, Wesleyan Methodists, &c., have meeting houses in several parts of the city: the number of these meeting houses is not increasing, and only one of them has been purchased by the church, for the Protestant poor, and others have been made for the purchase of a small

## D U B L I N.

the cathedral of St. Patrick is a venerable originally possessing much grace, beauty, and lightness of style. The ground plan is a cross with four side aisles: the nave, 150 feet in length, is adorned with several fine monuments. Here is the simple slab, inscribed with a Latin epitaph written by himself, consecrated to the memory of Swift; and an adjacent column supports a small plain tablet, with an inscription, also the pen of dean Swift, to Stella. The monuments of Dr. Marsh, the founder of the public library, called after his name, and Dr. Smyth, the donor of the Bethesda, are the most rich and beautiful designs. The south transept has been refuted, and in levelling the floor variously figured tiles, forming the steps of the great altar, were discovered, which, together with the remains of the altar, are left uncovered to the gratification of the public taste in matters of antiquity. The northern transept, lately rebuilt, is used as the parish church of St. Nicholas. The choir of St. Patrick's is strikingly unique; it is lighted by five lancet-shaped windows at the summit of the eastern wall, which admit an indefinite and partial light upon the objects beneath. The organ is large and fine: the echo of the chancel most grateful to the ear. The walls and panelled gallery are decorated with the helmets, swords, and surcoats of the knights of St. Patrick; and the canopied stalls adorned with their armorial bearings, emblazoned in golden characters. Near the communion table is the monument of the earl of Cork; opposite is a tablet to duke of Berg; while, amongst the fantastic relics of the past, are preserved the skull of the duke, pierced by a musket ball, and the chain ball by which Lord Lofton was slain at the siege of Limerick. St. Patrick's Cathedral was built upon the site of a church said to have been founded by St. Patrick himself. The steeple was added in 1370, and the spire in 1749; the height of which is 223 feet from the level of the sea. The collegiate church of the Holy Trinity, called also Christ Church, is said to have been built in 1038, by Liricus, the son of Amalgand, an Ostunan king of Dublin. Its site had been appropriated to sacred purposes by St. Patrick, who is said to have preached to the people in the precise vaults on which this antediluvian stands, these being the stores used by the Danes for lodging merchandise. The original building was destroyed almost wholly by fire, with the exception of a fine Norman doorway in John's Lane, little either of the Norman architecture, or of any intelligible date discoverable in the present mutilated remains of Christ Church. In this church the great service was first read in Ireland; and here Lambert Simnell was crowned by the king Edward VI. St. Andrew's Church still retains some few traces of Norman architecture, worth the attention of the antiquarian. Several other parish churches are well designed, executed in a masterly style: St. Werburgh's, St. Mary's, and Catherine's, are not unlike each other in internal arrangements, and are all ancient and venerable. St. Werburgh's had a handsome spire, which the parishioners

removed, from an apprehension that the foundation was sinking. St. Paul's, lately erected, has a low and clumsy spire; St. George's possesses not only a grateful and delicate spire, but also a beautiful Grecian portico, supporting a frieze and pediment; the elevation resembles that of St. Martin's, in London, but is probably less heavy, owing to the omission of the Græco-Italian block ornaments of the latter. The parishioners of St. Michan's are about to rebuild their church, the present being decayed to a perilous extent: underneath the old church are the vaults remarkable for their antiseptic power; bodies deposited here 120 years ago are found as perfectly preserved this moment as if they had undergone the process of embalming.

Amongst the useful institutions of Dublin are,—the Royal Dublin Society, for the encouragement of husbandry and the arts, established in 1731: here public lectures are delivered by the society's professors, in geology, mineralogy, botany, and chemistry: and free-schools are opened for instruction in drawing and sculpture. The Society occupy the noble mansion of the dukes of Leinster, built from Cassel's designs, and perhaps one of the noblest private residences in Europe;—the Royal Hibernian Academy, for the advancement of the arts, built at the sole expense of Francis Johnston, Esq., now president, who bestowed it upon the artists of Ireland, to whom his present majesty had most graciously granted a charter of incorporation (the first exhibition of the Royal Hibernian Academy took place in 1826);—and the Royal Irish Academy situated in Grafton Street, whose Transactions contain many valuable articles; in the library are several valuable MSS. The principal public libraries in Dublin are, those of the college; the Dublin Society, rich in botanical works; the Dublin Library Society, in D'Olier Street; and Marsh's Library, in Kevin Street. Since the erection of the Royal Hibernian Academy, the committee of the Irish Institution have felt themselves called upon to contribute their aid to the advancement of the arts in Ireland, and in consequence erected a handsome gallery in College Street, for the exhibition of the works of the old masters, a situation both central and convenient.

Trinity College was founded by queen Elizabeth, and endowed with many valuable livings by James I. The foundation was laid in 1591, and students were admitted in 1593. By the original charter, the corporation consisted of the provost, three fellows, and three scholars; but it is now enlarged to seven senior fellows, eighteen juniors, and seventy scholars, besides the provost; each of the junior fellows having nearly 100 private pupils to instruct, independent of the delivery of occasional public lectures. The independent members are divided into an equal number of classes, called fellow-commoners, pensioners, and sizars. The provost, fellows, masters, and scholars, return two members to parliament, and the provost and senior fellows alone transact all the 'negotia collegii.' A senior fellowship is supposed to be worth about £1500 per annum. There is a limit placed to the number of pupils permitted to enter under a junior fellow in each class, viz. thirty-six; but this limit is so great

that 144 may thus be intrusted to one lecturer to instruct in the short periods of each year called terms. The scholars have the privilege of voting for representatives to parliament; commons for five years (the duration of a scholarship); chambers at half fire and rent, and £4 per annum. They are also eligible to chapel markerships, and assistant librarianships; but these places are few in number, and neither valuable nor permanent. The independent members merely receive instruction, for which they pay their tutors, the fellow-commoners sixteen guineas, the pensioner eight guineas, per annum (the sizars are exempt from charges), besides some small annual fees. The first class graduate after three years and a half, the second and third not until the expiration of four years. During the collegiate course quarterly examinations are held in the theatre, at a certain number of which every student is obliged to answer in the prescribed course, from which it follows that in this college no pupil can possibly graduate without having obtained a certain quantity of information, while the most distinguished are rewarded by the collegiate honors of premiums and certificates. The number of names on the college books has for some few years amounted nearly to 2000.

The buildings of Dublin College are numerous and elegant. The grand front, presented to College Green, is entirely of cut granite, the ornamental parts being of Portland stone. It measures 300 feet in length, is enriched by a centre beautifully relieved by four noble three-quarter Corinthian columns supporting a pediment, and terminated by two lofty pavilions, surmounted by balustrades, and adorned with graceful coupled pilasters. Within are three large squares, and one smaller, called formerly the quadrangle. The Parliament Square, 316 feet long by 212 in breadth, is enclosed by lofty buildings (four stories in height) of cut stone, terminated by the beautiful porticoes of the chapel and theatre, which correspond while they oppose. The quadrangle contains the dining hall, vice-provost's residence, and a corresponding building (fellows' chambers) beyond the quadrangle in the Library Square, 265 feet in length by 214 in breadth, enclosed on three sides by ancient brick buildings, chiefly inhabited by the students, but, on the fourth, by the college library, the noblest apartment in the city of Dublin. To the north of the Library Square is that usually called Botany Bay, somewhat larger than any of the others, and surrounded by lofty buildings. The College Park, containing about twenty acres, is planted with noble elms. Here are the New Anatomy House, and the Printing House, a beautiful little Doric building. The chapel and theatre have similarly beautiful fronts of Portland stone, consisting of porticoes of four Corinthian pillars supporting a pediment; behind the porticoes, arcades open into a vestibule on each side, and in the centre of which are the entrances to the great hall and chapel. The hall contains an admired monument to provost Baldwin, and several fine portraits of eminent persons, former students, amongst whom are Swift and Burke. The dimensions of the chapel are equal, but the internal arrangement necessarily different from those of the

theatre. The dining hall is a singular design; the front, of cut stone, is adorned with many pilasters, and a shallow pediment; the great hall opens on a broad terrace, approached by a flight of steps the entire breadth of the building; the ante-hall, leading to the refectory, is an apartment in which the Historical Society hold their meetings. The library is an ancient, though stately edifice: it is perforated by many windows, that it defied the efforts of an artist to consult beauty of elevation. The library room (where his majesty George III. received by the corporation) measures 110 feet in length by forty-one in breadth, is beautifully adorned with carved oak pilasters, and a dentated frieze; while many fine busts of celebrated persons, standing on tapering pedestals, are ranged along either side: the inner, called the Fagel Library, is fifty-two feet long, and contains the collection of a Dutch family, the name it bears, of about 20,000 volumes. The manuscript room is over the Fagel Library; here are Persian and Arabic MSS., an edition of king James II., and a most valuable collection of unpublished MSS. on Irish history and antiquities; to the south of the library is the garden, being a continuation of the garden ground attached to the provost's house; the mentioned building is a very beautiful structure built entirely of cut stone, from a design by Burlington. The College Museum does not contain many things of interest: there is a curious model, by Mr. Bald, of the ruins of the county of Mayo. The College Observatory is situated at Dunsink, three miles from town, and the Botanic Garden at Beggar's Bush, half a mile from College Green.

The College of Surgeons was endowed by charter in 1784; the first licentiate was William Wright, author of some valuable works on anatomy. It is a handsome building of cut stone; consisting of a rusticated basement surmounted by a handsome façade, adorned with three-quarter columns, separated by large headed windows: the present elevation is the improvement by Mr. Murray: it stands in a commanding position in Stephen's Green, at the corner of York Street. The School of Anatomy here is highly valued, and much visited by medical students from England and Wales. The College of Physicians hold their meetings at Patrick Dunn's Hospital, a noble building in Canal Street, erected at the expense of a magnificent testator whose name it bears. There are several private schools of anatomy in Dublin, in Park Street, Brunswick Street, &c., attended by students from various parts of Great Britain. Dublin possesses numerous dissenting schools, conducted by distinguished clergymen of its university.

The river Liffey, which divides the city, is enclosed by magnificent walls of cut stone, from Kingsend to Bloody Bridge, a distance of about two miles, in which length it is crossed by several noble bridges, six of cut stone, and one of iron: an additional bridge of cast-iron is to be thrown across the river, near the bridge of the Phoenix Park, and above the bridge of the racks; and a magnificent arch spans the

one mile west of Bloody Bridge, called Bridge.

It is encompassed by a circular road, and between two canals of noble breadth; canals terminate in docks, communicating with the Liffey, capable of accommodating all the boats that visit Dublin river, and of harbouring the boats from the interior, which could be employed in transmitting the inland produce to the harbour for exportation: it is very probable that most of the export trade of Ireland will be carried on, by means of these canals, at

the population of Dublin has increased but the last twenty years, and the number of houses has rather diminished.

**DUKO**, a town of Volhynia, European Russia, on the river Irwa. The great annual fair of Poland, called the Contract, was for long held here. The population was then considerable; at present it is not above 1000. Great numbers of Jews reside here, who carry on an extensive trade in wood, cattle, and honey, brought from Podolia, the Ukraine, &c. East of the town stands a castle, four miles S. S. E. of Lucko.

**DUKOS** (John Baptist), a learned and ingenious French author, born at Beauvais in 1670. He finished his studies at Paris, and was involved in the management of several important affairs in Italy, England, and Holland. At length he returned to Paris, he obtained a prebendary; afterwards had a pension of 2000 livres, and was made a member of the Académie de Notre Dame at Reims, near Paris. He died at Paris, when perpetual secretary of the French Academy, on the 23d of March 1742. His principal works are, 1. Criticisms on Poetry and Painting, 3 vols. 2. A Critical History of the French Language in Gaul, 2 vols. 4to.

**DUCAL**, *adj.* From duke. Pertaining to a duke, or a ducal coronet.

**DUCCIO FALIERO**. (*reading.*) Decreed all, without one dissenting voice, when Michel Steno, by his own confession, was hanged on the last night of Carnival, and his name was graven on the ducal chair.

**DUCAL**, letters patent granted by the senate of Venice, or written in the name of the senate, to foreign princes: so named because the name of the doge or duke was prefixed to them.

**DRUCAREL** (Andrew Coltee), an eminent lawyer, was born at Caen in Normandy; but his father, removing to England, brought him at Eton, and afterwards at Oxford, where he took the degree of doctor of civil law. He became a member of Doctors' Commons, and in 1755 was elected commissary, and had the jurisdiction of the collegiate church of St. Catherine, near the Tower. In 1760 he was appointed librarian of the palace of Westminster; and the following year became commodore of the diocese of Canterbury. He was the first fellow of the society of Antiquaries.

In 1762 he was elected F. R. S.; and died in 1763, together with Sir Joseph and Mr. Astle, to methodise the records

in the State Paper office at Whitehall, and in the Augmentation office. Dr. Ducarel died at his house in South Lambeth, in May 1785. His principal works are, Anglo-Norman Antiquities, 1767, folio; a series of above 200 Anglo-Gallic, or Norman and Aquitaine Coins of the ancient Kings of England, &c., 1757, 4to.; the History and Antiquities of the Archbishop's Palace at Lambeth, 4to.; and the History of the Royal Hospital and Collegiate Church of St. Catherine, 4to.

**DUCAS** (Michael), a Greek historian who wrote a history of the empire, from the elder Andronicus to its termination. Though his style is barbarous, he relates facts not elsewhere to be found, and was an attentive observer of what passed. Nothing is known of his life except that he was often engaged in diplomatic employments. His works were printed at the Louvre in 1649, folio; accompanied with a Latin version and notes. This was afterwards translated into French by Cousin, of whose History of Constantinople, printed at Paris, 1672, 4to., and at the Hague, in 1685, 12mo., it concludes the eighth volume.

**DUCAT**, *n. s.* } From duke. Coins struck by the duke. **DUCATON**, *n. s.* } by dukes. See COINS.

I cannot instantly raise up the grout of full three thousand ducats. *Shakespeare.*

There was one that died in debt: it was reported, where his creditors were, that he was dead: one said, he hath carried five hundred ducats of mine into the other world. *Bacon.*

An ounce of silver, whether in pence, groats, or crown pieces, stivers, or ducatoons, or in bullion, is, and eternally will be, of equal value to any other ounce of silver. *Loche.*

**DUCAT**. See COINS. The origin of ducats is assigned by Procopius to Longinus, governor of Italy; who, revolting against the emperor Justin II., made himself duke of Ravenna, and called himself Exarcha, i. e. without lord or ruler; and, to show his independence, struck pieces of money, of very pure gold, in his own name, and with his own stamp, which were called ducati. After him, the first who struck ducats were the Venetians, who called them rechini or sequins, from Zecca, the place where they first were struck. This was about A. D. 1280, in the time of John Danduli: but we have pretty good evidence, that Roger, king of Sicily, coined ducats as early as 1240. And Du Cange affirms, that the first ducats were struck in the duchy of Apulia. The chief gold ducats are, the single and double ones of Venice, Florence, Genoa, Germany, Hungary, Poland, Sweden, Denmark, Flanders, Holland, and Zurich. The double ducats weigh from five pennyweights seventeen grains, to five pennyweights ten grains; and the single in proportion. The Spaniards have no ducats of gold; and the silver one, with them, is no real species, but only a money of account like our pound. It is equivalent to eleven reals. The silver ducats of Florence serve there for crowns.

**DUCATON**, a silver coin, struck chiefly in Italy; particularly in Milan, Venice, Florence, Genoa, Lucan, Mantua, and Parma: though there are also Dutch and Flemish ducatoons. See COINS.

**DUCE CREEK**, called also Cross Roads and Salisbury, a town of the United States, America, in the state of Delaware, standing on Duce Creek, which runs into Delaware Bay. It is a celebrated wheat market, and has a flourishing trade with Philadelphia.

**DUENARIUS**, *Δουναριος*, in antiquity, an officer of the Roman army, who had the command of 200 men. The emperors had also duenarii among the procurators or intendants, called procuratores duenarii. Some say that these had salaries of 200 sesterces; as in the games of the circus, horses hired for 200 sesterces were called duenarii. Others hold, that duenarii were those who levied the 200th penny, the officers appointed to inspect the raising of that tribute. In the inscription at Palmyra, the word occurs very often.

**DUCK**, *n. s.*, *v. a.*, *v. n.* & } From Dut. *ducken*;  
**DUCKER**, *n. s.* [adj] Swed. *dyka*; Teut.  
**DUCK'ING-STOOL**, } and Welsh *tuck*;  
**DUCK'LEGGED**, *adj.* } to dip or dive; from  
**DUCK'LING**, *n. s.* } Goth. *doggwa*, wa-  
**DUCK'WEED**, } ter. A bird of the  
*anas* genus; a term of endearment; and, from the common habits of the duck, a stone made to dip in and out of the water in throwing: to dive as a duck, hence to bow; and, as an active verb, to put under water.

The varlet saw, when to the flood he came,  
 How without stop or stay he fiercely leapt;  
 And deep himself he ducked in the same,  
 That in the lake his lofty crest was steep.

*Faerie Queene.*

Let the labouring bark climb hills of seas  
 Olympus high, and duck again as low  
 As hell's from heaven. *Shakspeare. Othello.*

The learned pate

*Ducks* to the golden fool. *Id. Timon.*

Will you buy any tape or lace for your cap,  
 My dainty duck, my dear-a? *Id. Winter's Tale.*

That we call *duckweed* bath a leaf no bigger than a  
 thyme leaf, but of a fresher green; and putteth forth  
 a little string into the water, far from the bottom.

*Bacon.*

Back, shepherds, back; enough your play

Till next sunshine holyday;

Here be without duck or nod,

Other trippings to be trod,

Of lighter toes, and such court guise

As Mercury did first devise.

*Milton.*

The *ducks*, that heard the proclamation cried,

And feared a prosecution might betide,

Full twenty mile from town their voyage take,

Obscure in rushes of the liquid lake. *Dryden.*

Thou art wickedly devout;

In Tiber *ducking* thrice by break of day. *Id.*

*Ducklegged*, short waisted, such a dwarf she is,

That she must rise on tiptoes for a kiss.

*Id. Juvenal.*

*Ducklings*, though hatched and led by a hen, if she  
 brings them to the brink of a river or pond, presently  
 leave her, and in they go. *Ray on the Creation.*

As some raw youth in country bred,

When at a skirnish first he hears

The bullets whistling round his ears,

Will *duck* his head aside, will start,

And feel a trembling at his heart.

*Swift.*

She in the *duckingstool* should take her seat,

Drest like herself in a great chair of state.

*Dorset.*

Reclaim the obstinately opprobrious and cross  
 women, and make the *duckingstool* more used.

*Adrian's Favourite.*

Every man

Amid the *ducklings* let her scatter corn.

*Guy's Ransom.*

Neither cross and pile, nor *ducks* and *ducks*—  
 quite so ancient as handy-dandy.

*A Shepherd and His.*

But still 'tis rural—trees are to be seen

From every window, and the *ducks* are seen

There's nothing whets the beak or arms so soon

And what could a remoter scene show more?

*Comus.*

The wanton coot the water skims,

Among the leaves the *ducklings* skim.

The stately swan majestic swims,

And every thing is blest but I.

*Id.*

The love of offspring's nature's general law,

From tigresses and cubs to *ducks* and *ducks*.

There's nothing whets the beak or arms so soon

Like an invasion of their babes and sucklings.

*Id.*

**Duck**, in ornithology. See *ANAS* and *LO*.

This fowl is furnished with a peculiar count  
 of vessels about the heart, which enable it to  
 live a considerable time under water, as is ne-  
 cessary for it in diving. This made Mr. H.  
 think it a more proper subject for experiment  
 with the air-pump than any other bird. A  
 grown duck being put into the receiver of the  
 pump, of which she filled one third part, as  
 the air exhausted, the creature seemed to do  
 better for the first moments, than a less hardy  
 fowl; but, after about a minute, she showed  
 signs of uneasiness, and in less than two  
 her head fell down, and she appeared to be  
 revived by the letting in of air. A young  
 duck was afterwards tried in the same manner,  
 and with the same issue, it being nearly  
 to death in less than two minutes. Be-  
 servable, that both birds swelled very much  
 pumping out the air, so that they appeared  
 larger to the spectators, especially about the  
 it not being intended that any water had  
 live in so exceedingly rarefied air, but was  
 able to continue occasionally some time  
 water. The strongest instance of their  
 being calculated to live almost in an  
 we have in the accounts of the blind men  
 the Zirknitz Zee lake in Carniola, who are  
 posed to communicate with another lake  
 ground in the mountain Savornic, and be-  
 empty itself according to the custom of the  
 ness of that lake. See *ZIRKNITZ ZEE*. The  
 which always frequent it in great numbers,  
 often carried down along with the water,  
 forced into the subterraneous lake to swim  
 tires. In this unnatural habitation, these  
 these creatures undoubtedly perish, but re-  
 main alive. These become blind, and lose  
 feathers; and in the next filling of the lake  
 they and vast numbers of fish are thrown  
 the water. In about a fortnight they are  
 recover their sight and feathers.

**DUCKING**, plunging in water, a custom  
 anciently practised among the Goths by way of  
 exercise; but among the Celts, Franks, and  
 Germans, it was a sort of punishment for  
 of scandalous lives. At Marston and South

the revolution, men and women of scandalous life were condemned to the gale; i.e. to put up in an iron cage fastened to the yard of a ship, and ducked several times in the river. The same was done at Toulouse to blasphemers. **DUCKING**, a sort of marine punishment, introduced by the French before the revolution, on those who had been convicted of desertion, blasphemy, or sedition. It was thus performed: the criminal was placed astride of a short thick rope, fastened to the end of a rope, which passed through a block hanging at one of the yards. Thus fixed, he was hoisted suddenly up to the yard, and the rope being slackened at once, he was plunged into the sea. This was repeated several times conformably to the sentence against the culprit, who had also several cannon-shots fired over his head. A gun was also fired to admonish the other ships of the fleet, that their crews might become spectators.

**DUCKING** is also a penalty which veterans pretend to have a right to inflict on those who, for the first time, pass the tropic of Cancer, the equator, or the straits of Gibraltar, in consequence of their refusal or incapacity to pay the fine levied on such occasions.

**DUCKING-STOOL**. See **BRANK** and **CUCKING-STOOL**.  
**DUCKOY**, *v. o. & n. s.* Mistaken for the decoy being commonly practised upon, produced the error. To entice to a snare: are laid.

A fish hath a slender membranous string, which he sucks and draws in at pleasure, as a serpent doth (saith) with this he *duckoys* little fishes, and swallows them. *Greiv.*

Writers have found it the most compendious way of designs, to lead captive silly women, and to draw them the *duckoys* to their whole family.

*Decay of Piety.*

**DUCK UP**, is a phrase used at sea by the crew, when the main sail, fore sail, or sprit hinders his seeing to steer by a land-mark upon which he calls out, duck up the tops of these sails, that is, hale the sails up the way. When a shot is made by a piece, if the clew of the sprit sail hinders him, they call out duck up, &c.

**DUCT**, *n. s.* Lat. *ductus*, from *duco*, to lead. Hence; direction: a passage through which being is conducted.

The doctrine, by fastening all our actions by a fatal fate, that the foot of God's chair, leaves nothing to us but to obey our fate, to follow the *duct* of the necessity of those iron chains which we are under. *Hammond.*

But from each of those cells ran into the root of the tongue, where both joined together, and passed on in one common *duct* to the tip of it.

*Addison's Spectator.*

It was observed that the chyle, in the thoracic *duct*, had the original taste of the aliment.

*Archibut on Aliments.*

**DUCTILE**, *adj.* Lat. *ductilis*, from *duco*, to lead. **DUCTILITY**, *n. s.* Tensile; easy to be drawn out.

Bodies *ductile* and *tensile*, as metals, that will be drawn into wires; wool and tow, that will be drawn into yarn or thread, have the appetite of not being strong. *Boehm.*

I, when I value gold, may think upon  
The *ductileness*, the application;  
The wholesomeness, the ingenuity,  
From rust, from soil, from fire ever free.

*Denne.*

Thick woods and gloomy night  
Conceal the happy plant from human sight:  
One bough it bears; but wondrous to behold!  
The *ductile* rind and leaves of rousant gold.

*Dryden's Æneid.*

Yellow colour and *ductility* are properties of gold: they belong to all gold, but not only to gold; for saffron is also yellow, and lead is *ductile*.

*Watts's Logick.*

He generous thoughts instils  
Of true nobility; forms their *ductile* minds  
To human virtues. *Philips.*

Their designing leaders cannot desire a more *ductile* and easy people to work upon.

*Addison's Freeholder.*

Hence *ductile* clays in wide expansion spread,  
Soft as the cygnet's down, their snow-white bed;  
With yielding flakes successive forms reveal,  
And change obedient to the whirling wheel.

*Darwin.*

**DUCTILITY**, in physics, a property possessed by certain solid bodies, which consists in their yielding to percussion or pressure, and in receiving different forms without breaking. Some bodies are *ductile* both when they are hot and when they are cold, and in all circumstances. Such are metals, particularly gold and silver. Other bodies are *ductile* only when heated to a sufficient degree; such as wax and other substances of that kind, and glass. Other bodies, particularly some kinds of iron, called by the workmen red-hot, brass, and some other metallic mixtures, are *ductile* only when cold, and brittle when hot. The degrees of heat requisite to produce *ductility* in bodies of the first kind, vary according to their different natures. In general, the heat of the body must be such as is sufficient to reduce it to a middle state betwixt solidity and perfect fusion. As wax for instance, is fusible with a very small heat, it may be rendered *ductile* by a still smaller one; and glass, which requires a most violent heat for its perfect fusion, cannot acquire its greatest *ductility* until it is made perfectly red-hot, and almost ready to fuse. Lastly, some bodies are made *ductile* by the absorption of a fluid. Such are certain earths, particularly clay. When these earths have absorbed a sufficient quantity of water, to bring them into a middle state betwixt solidity and fluidity, that is to the consistence of a considerably firm paste, they have then acquired their greatest *ductility*. Water has precisely the same effect upon them in this respect, that fire has upon the bodies above-mentioned.

The *ductility* of metals is distinguished into three states by professor Chaptal, relative to the manner in which it is modified by various processes: viz. 1. Under the hammer: 2. Through the wire-drawer's plate; and 3. Between the laminating rollers. Metals *ductile* under the hammer he ranks thus, in the order of their *ductility*: gold, silver, copper, iron, tin, and lead. Through the wire-drawer's plate they rank in this order: gold, iron, copper, silver, tin, and lead. Some metals that are neither *ductile* under the hammer, nor through the plate, become very

considerably so, when an equal and gradual pressure is applied. Thus zinc may be reduced into very thin and flexible leaves by being passed between the laminating cylinders.

**DUDGEON.** Anciently *dadgeon*, a diminutive of *dag*; or, says Dr. Johnson, from Germ. *dolch*, a dirk; or *degen*, a sword. A dagger; a quarrel in which daggers are either used, or 'spoken;' ill temper.

It was a serviceable *dudgeon*,  
Either for fighting or for drudging.

*Hudibras.*

Civil *dudgeon* first grew high,  
And men fell out they knew not why. *Id.*  
The cuckoo took this a little in *dudgeon*.  
*L'Esrange.*

**DUDLEY** (Edmund), an eminent lawyer and able statesman in the reign of Henry VII. who, with Sir Richard Empson, assisted in filling that rapacious monarch's coffers, by arbitrary prosecutions of the people, on old penal statutes. They were both beheaded on the accession of Henry VIII. to pacify the clamors of the people for justice.

**DUDLEY** (John), duke of Northumberland, son of the above, a statesman memorable in the English history, for his unsuccessful attempt to place the crown on the head of his daughter-in-law, lady Jane Grey, who fell a victim to his ambition; was born in 1502, and beheaded in 1553. Ambrose his eldest son was a brave, generous and able statesman under queen Elizabeth; and received the appellation of the good earl of Warwick. Henry, his second son, was killed at the siege of St. Quintin. Robert, the third son, a man of bad character, was created earl of Leicester; and was one of queen Elizabeth's favorites. His fourth son, was the unfortunate lord Guildford Dudley, whose only crime was his being the husband of lady Jane Grey, for which he was beheaded in 1554.

**DUDLEY** (Sir Robert), earl of Warwick and duke of Northumberland, was the son of Robert above-mentioned, by the lady Douglas Sheffield; and was born at Sheen in Surrey in 1573, where he was carefully concealed, to prevent the queen's knowledge of the earl's engagements with his mother. He studied at Oxford; when his father dying, left him the bulk of his estate. Having a particular fondness for navigation, he fitted out a small squadron at his own expense, with which he sailed to the river Oronoco, and took and destroyed nine sail of Spanish ships. In 1595 he attended the earl of Essex, and the lord high admiral of England, in their expedition against the Spaniards; when he was knighted for his gallant behaviour at the taking of Cadiz. He now endeavoured to prove the legitimacy of his birth, in order to be entitled to his hereditary honors. But being overpowered by the interest of the countess dowager of Leicester, he applied for a licence to travel; and, being well received at the court of Florence, resolved to continue there, notwithstanding his receiving a letter of recall; on which his whole estate was seized by king James I. and vested in the crown. He discovered at the court of Cosmo II., great duke of Tuscany, those great abilities for which he had been admired in England, and was at length

made chamberlain to his highness's court. There contrived several methods of improving shipping; introduced new manufactures; and by other services obtained so high reputation, that at the desire of the archduchess, the emperor Ferdinand, in 1620, created him a duke of the holy Roman empire. He afterwards drained a vast tract of morass between Pisa and the sea, and raised Leghorn, which was then a most pitiful place, into a large and beautiful city, improving the haven by a mole, which rendered it both safe and commodious; and having gained his highness to declare it a free port, he increased his influence and correspondence, drew many large merchants to settle and set up houses, one of which was of very great service to his country, as well as to the Spaniards. He was also the patron of learned men, and held a place himself in the republic of letters. His celebrated work is his *Del Arcano del Mare*, 2 vols. folio.

**DUDLEY** (Rev. Sir Henry Bate), was born at Fenby Compton, August 25th 1745. He was Henry Bate, was rector of St. Nicholas in Leicester, and of North Farmbridge, in Essex. His son also was educated for the church, and took degrees in arts at the University of Cambridge, after which he became curate of Haverhill, Middlesex. At this period of his life, however, he became entirely a man of pleasure, and exhibited considerable literary talent, and distinguished in succession, the *Morning Post*, and *Morning Herald*, newspapers. He also produced some dramatic pieces, of which the principal were, *The Rival Candidates*, *The Fool of Bacon*, and *The Woodman*. In 1781 the advowson of Bradwell just in Essex, was purchased in trust for Mr. Dudley, subject to the life of the incumbent; without which, for whose demise, he commenced these alterations and improvements of the church, sonage, and glebe, which are said to have cost him upwards of £28,000. But when he applied for institution, on the death of the incumbent of the living, the bishop of Exeter refused him on the ground of simony. Shortly afterwards the rectory lapsed to the crown, and Dr. Gamble was presented to it. This was considered an exceedingly hard case, and eventually ruined Mr. Dudley, who had now taken no addition to his name in compliance with the wish of a relative. In 1804 he was in some degree compensated for his loss, by a presentation to the rectory of Kilscoren in Ireland, and in 1806, three years afterwards, was added to the rectory of Kilglass, in the county of Longford. He then resigned the two Irish benefices, and was presented to the rectory of Willingham in the county of Cambridge; and the same year created a baronet. In 1816 he obtained a prebend in the cathedral of Ely. See place. He was at one time magistrate for seven counties in England and four in Ireland. He died at Ely, tenham, February 1st, 1824.

**DUDLEY**, a town of England, in the county of Worcester, but insulated in Staffordshire, has a weekly market on Saturday. Most of the inhabitants are employed in manufacturing and

of iron. It has two churches; and east of Birmingham, and 120 north-on. It sends one member to par-

Robert, earl of Leicester), was the he duke of Northumberland, and nt 1532. He was knighted when was made gentleman of the bed-Edward VI. Though involved in designs of his father, and included e of attainder passed against him on of Mary, he was pardoned, and that queen. After Elizabeth as- throne, Dudley soon acquired the being her favorite. Offices, honors ere showered on him with an un-

He was appointed master of the of the garter, and privy counsellor; ad grants of the princely domains Denbigh, and Chirk castle. In h of his wife took place at Cum-Berkshire. This event, according inion, as appears from Aubrey, in- ry in the guilt of murder. If he life of his consort, in the hope of queen, his ambitious views were

Elizabeth, however, encouraged to the hand of Mary of Scotland, him with disdain. In 1564 he was Denbigh and earl of Leicester, same year elected chancellor of ersity, having previously been same office at Cambridge. About ars to have married the barones-Field, lady Douglas Howard, by children, but whom he disowned and even compelled her to marry m. In 1575 he gave a princely to the queen, at Kenilworth stivities of which are described in manner, in the celebrated romance t, and, in defiance of chronology, th the death of Leicester's first er, in 1578, offended the queen ge with the widow of Walter De- f Essex. He, however, recovered , in 1585, was appointed, through governor of the Netherlands, then acipated from the Spanish yoke.

He returned to his command 7; but he was finally displaced e after, and returned to England. ed of misconduct by lord Buck- bers; but Elizabeth still retained ality for him, that she supported ll his enemies; and, on the pros- Spanish invasion, in 1588, ap- commander of the forces, as- ilbury, for the defence of theicester died, on the fourth of at that year, at Cornbury Park, in and was interred in a chapel at e collegiate church of Warwick, famous monument was erected to his

DUE, *n. s. adj. & v. a.*

DUEFULL,

DUTY, *n. s.*

DUTEOUS, *adj.*

DUTEOUSNESS, *n. s.*

DUTIFUL, *adj.*

DUTIFULLY, *adv.*

DUTIFULNESS, *n. s.*

exact; consequent to. Shakspeare uses it as an active verb; but we have met with no other instance. Duty is also obligation, and reciprocal with right. What one man has a right to claim, another has a duty to yield or give.

When ye shall have done all those things which are commanded you, say, We are unprofitable servants: we have done that which was our duty to do.

*Luke xvii. 10.*

They both atone,

Did duty to their lady as became.

*Faerie Queene.*

All which that day in order seemly good  
Did on the Thames attend, and waited well  
To doe their duefull service as to them befall.

*Spenser*

This is the latest glory of their praise,  
That I thy enemy due thee withal.

*Shakspeare.*

My due from thee is this imperial crown,  
Which, as immediate from thy place and blood,  
Derives itself to me.

*Id.*

Like the Pontick sea,

Whose icy current, and compulsive courser,  
Ne'er feels retiring ebb, but keeps due on  
To the Propontick and the Hellespont.

*Id. Othello.*

My prayers

Are not words duly hallowed, nor my wishes  
More worth than vanities; yet prayers and wishes  
Arc all I can return.

*Id. Henry VIII.*

Thou better know'st

Effects of courtesy, dues of gratitude;

Thy half o' th' kingdom thou hast not forgot,

Wherein I thee endowed.

*Id. King Lear.*

Think'st thou that duty shall have dread to speak,  
When power to flattery bows? To plainness honour  
Is bound, when majesty to folly falls.

*Id.*

I know thee well; a serviceable villain!

As dutious to the vices of thy mistress,

As badness would desire.

*Id.*

There is due from the judge to the advocate some commendation and gracing, where causes are well handled and fair pleaded. There is likewise due to the public a civil reprehension of advocates, where there appeareth cunning, gross neglect, or slight information.

*Bacon.*

The key of this infernal pit by due,

And by command of heaven's all-powerful king,

I keep.

*Milton. Paradise Lost.*

And Eve within, due at her hour prepared

For dinner savoury fruits.

*Id.*

Be friend

Us, thy vowed priests, till outmost end

Of all thy dues be done, and none left out.

*Id.*

Every beast, more dutious at her call,

Than at Circean call the herd disguised.

*Id.*

Some duties we owe to humanity, more to nearness of blood.

*Bp. Hall. Contemplations.*

All our duty is set down in our prayers, because in all our duty we beg the Divine assistance; and remember that you are bound to do all those duties, for the doing of which you have prayed for the Divine assistance.

*Taylor's Devotion.*

Mirth and cheerfulness are but the *due* reward of innocence of life. *More's Divine Dialogues.*

A present blessing upon our fasts is neither originally due from God's justice, nor becomes due to us from his voracity. *Smalridge's Sermons.*

There is a respect *due* to mankind, which should incline ever the wisest of men to follow innocent customs. *Watts.*

The *duty* of a collator is indeed dull, yet, like other tedious tasks, is very necessary. *Johnson.*

Turn on the prudent and thy heedful eyes,  
Observe her labours, sluggard, and be wise:  
No stern command, no monitory voice,  
Prescribes her duties, or directs her choice;  
Yet timely provident, she hastes away,  
To snatch the blessings of the plenteous day.

*Id. Poems.*

Nothing is more common than to say, when a person does not behave with *due* decency towards his superiors, such a one does not understand himself. *Mason.*

Estates are landscapes, gazed upon awhile,  
Then advertised, and auctioneered away.  
The country starves, and they that feed the' o'er-  
charged

And purfited lewd town with her fair *dues*,  
By a just judgment strip and starve themselves.

*Conquer.*

*Duty* at my time I come,  
Publishing to all aloud—

Soon the grave must be your home,  
And your only suit a shroud. *Id.*

'Do as you would be done by,' and 'Love your neighbour as yourself,' include all our *duties* of benevolence and morality; and if sincerely obeyed by all nations, would a thousand-fold multiply the present happiness of mankind. *Durwin.*

Whatever tenderness may be *due* to the errors into which they would inevitably fall in their speculations concerning the present condition of mankind, and the apparent constitution of the moral world, of which, destitute as they were of the light of revelation, they knew neither the beginning nor the end,—the Christian is possessed of a written rule, delivered from on high, which is treated with profane contempt, if reverence be not had to it upon all questions of *duty*. *Bp. Horsley.*

Salt, *duty* free, is a great deal cheaper, and (as far as experiments have gone) very superior in power and permanency of effect to lime. *Sir T. Bernard.*

Triumphant Sylla! Thou, who didst subdue  
Thy country's foes are thou wouldst pause to feel  
The wrath of thy own wrongs, or reap the *due*  
Of hoarded vengeance till thine eagles flew  
O'er prostrate Asia. *Byron.*

Forgive me; there is something at your heart  
More than the mere discharge of public *duties*,  
Which long use, and a talent like to yours,  
Have rendered light, nay, a necessity  
To keep your mind from stagnating. *Id.*

DU'EL, *n. s., v. n. & v. a.* } Fr. *duel*, from  
DU'ELLER, *n. s.* } Lat. *duellum*, i. e.  
DU'ELLIST. } *duo*, two and *bell-*  
DU'ELLO. } *lum*, war. A  
fight or combat between two. Dueller and duellist appear synonymous.

The gentleman will, for his honour's sake, have one bout with you: he cannot by the *duello* avoid it. *Shakespeare.*

In many armies, if the matter should be tried by *duel* between two champions, the victory should go on the one side; and yet, if it be tried by the gross, go on the other side. *Bacon.*

Victory and triumph to the Son of God  
Now entering his great *duel*, not at arms,  
But to vanquish by wisdom, brilliant *idea*. *Minn.*

Who single

*Duelled* their armies ranked in proud array,  
Himself an army, now unequal match  
To save himself against a coward arm.  
At one spear's length. *Id. (quoting)*  
His bought arms Mung not liked; for his enemy  
Of bearing them in field, he threw 'em away,  
And hath no honour lost, our *duellists* say. *Ben Jon.*

'Twas I that wronged you; you my *duel* sought;  
No *duel* ever was more justly fought.  
Henceforth let poets, ere allowed to write,  
Be searched like *duellists* before they fight. *Travis.*

He must at length, poor man! die dull; a time  
when here he might so fashionably and gracefully  
been *duelled* or fluted into another world. *Sam.*

If the king ends the differences, the case will  
out no worse than when two *duellists* meet there,  
where the worsted party hath his sword *drawn*  
out further hurt. *Scot.*

I never read of a *duel* among the Romans, as  
their nobility used more liberty with their spears,  
than one may now do without being challenged. *Travis.*

They perhaps begin as single *duels*, but they  
soon get their troops about them. *Drey of War.*

DUEL, a single combat, at a time and place appointed, in consequence of a challenge. The custom came originally from the northern nations, among whom it was usual to decide all controversies by arms. Both the accused and accuser gave pledges to the judges on the respective behalf; and the custom prevailed amongst the Germans, Danes, and Franks, none were excused from it but women, the people, cripples, and such as were under ten or one years of age or above sixty. Even ecclesiastics, priests, and monks, were obliged to be champions to fight in their stead. The punishment of the vanquished was either death by hanging or beheading, or mutilation of a limb according to the circumstances of the case. *Duties* were at first admitted not only on criminal questions, but on some civil ones, for the maintenance of rights or estates, and the like: in later times, however, before they were entirely abolished, they were restrained to these four cases: 1. That the crime should be capital. 2. That it should be certain the crime was perpetrated. 3. That the accused must by common fame be supposed guilty. And 4. The matter must not be capable of proof by witnesses.

DUEL, at present, is used for single combat on some private quarrel; and is prohibited, otherwise it is called a *rencontre*. If a person is killed in a *duel*, both the principals are considered as guilty, whether the seconds consent or not. See MURDER. It is also a very high offence to challenge a person either by word or deed to be the messenger of a challenge. See CHALLENGE. The general practice of *duelling*, as we now understand it, took its rise in 1527, at the conclusion of a treaty between the emperor Charles V. and Francis I. The former desired Francis to acquaint his sovereign, that he would have

consider him not only as a base violator of faith, but as a stranger to the honor and of a gentleman. Francis, too highly to bear such an imputation, had recourse to an uncommon expedient to vindicate his character.

He instantly sent back the herald with a defiance, in which he gave the emperor in form, challenging him to single combat, and to name the time and place of the duel, and the weapons with which he chose to fight.

Charles, as he was not inferior to his opponent in spirit or bravery, readily accepted the challenge; but after several messages, concerning the arrangement of all the circumstances relative to the combat, accompanied with mutual reproofs bordering on the most indecent scurrilous thoughts of this duel, more becoming of a clown than the two greatest monarchs of the age, were entirely laid aside. The duel of two persons so illustrious, drew such attention, and carried with it so much consequence, that it had considerable influence in bringing about an important change in manners all over Europe. Duels had been long permitted by the laws of all European nations; and, formerly, of their jurisprudence, were authorised by the magistrate on many occasions, as the most proper method of terminating questions with respect to property, or of deciding in those which related to crimes. But single combats being considered as solemn appeals to the omniscience and authority of the Supreme Being, they were allowed in public causes, according to the prescription of the law, and carried on in a judicial form.

**DUETTEL.** Men accustomed to this manner of proceeding in courts of justice, were naturally led to apply it to personal and private quarrels, which at first could only be appointed by a judge, were fought without the interposition of his authority, and in cases to which the law did not extend. Upon every affront or injury, it seemed to touch his honor, a gentleman considered himself entitled to draw his sword, and to challenge his adversary to make reparation. This opinion, introduced among men of fortune and high spirit, and of rude manners, whose offense was often given, and revenge always prompt, produced most fatal consequences. Much blood was shed; many useful arts were lost; and, at some periods, war itself was more destructive than these contests of honor. So powerful, however, is the influence of fashion, that neither the terror of laws, nor reverence for religion, nor the prospect of a future state, has yet been able to abolish a practice unknown among the ancients, and not justifiable by any principle of morality. Its best defence only seals the greater error on the parties who have recourse to it; and we must ascribe to it, in some degree, the extraordinary gentleness and complaisance of the manners in high life, and that respectation of one man to another, which at least renders the social intercourse of life far more agreeable and decent than among civilised nations of antiquity. In other words, that gentleness can only be governed by the weapons of moral force by which, in fact, the vilest ruffian is at last restrained. Public opinion, however,

is not easily controlled by civil institutions; for which reason it may be questioned whether any human regulations can be contrived of sufficient force to suppress or change that false rule of honor, which stigmatises all scruples about duelling with the reproach of cowardice. The inadequate redress which the law of the land affords, for those injuries which chiefly affect a man in his sensibility and reputation, tempts many to redress themselves; and prosecutions for such offences, by the trifling damages that are recovered, serve only to make the sufferer ridiculous. This ought to be remedied. A court of honor might be established, especially for the army, where the point of honor is cultivated with exquisite attention and refinement, with a power of awarding those submissions and acknowledgments, which it is generally the object of a challenge to obtain; and it might grow into a fashion with persons of rank of all professions, to refer their quarrels to the same tribunal. In fact, as the law now stands, duelling can seldom be overtaken by legal punishment. The challenge, appointment, and other previous circumstances, which indicate the intention with which the combatants met, being suppressed, nothing appears to a court of justice but the actual rencounter; and if a person be slain when actually fighting with his adversary, the law deems his death nothing more than manslaughter.

**DUE'NNA, n.s.** Spanish. An old woman kept to guard a younger.

I felt the ardour of my passion increase as the season advanced, till in the month of July I could no longer contain: I bribed her *duenna*, was admitted to the bath, saw her undressed, and the wonder displayed.  
*Arbutnot and Pope.*

**DUETT, duetto**, in music, a composition expressly written for two voices or instruments, with or without a bass and accompaniments. In good duets the execution is pretty equally distributed between the two parts, and the melodies so dependent on each other, as to lose every effect when separated, but to be perfectly related and concinnous when heard together.

**DUFF'S ISLANDS, or DUFF'S GROUP**, a range of islands in the South Pacific Ocean, discovered by captain Wilson, in the course of his missionary voyage in the Duff. They are about eleven in number, and extend fourteen or fifteen miles in a north-west to south-east direction. They are of different sizes; the smallest is apparently barren, but the largest two, which are about six miles in circumference, and situated in the middle of the others, are well wooded. Between these two there is a small islet; and at the end of one on the north-west part of the group rises a remarkable rock in the shape of a pillar. The natives, who are stout and well made, were shy and apprehensive of strangers. A village was seen on the south-west side of Disappointment Island, the largest of this group. They have ornamented canoes about twelve or fourteen feet long, and about fifteen inches broad, which seemed to be made of a single tree. Long. 167° E., lat. 9° 57' S.

**DUFRESNE, or DU FRASSE** (Charles), lord of Cange, hence often called Ducange; a man

of letters, who did much for the history of the middle ages, especially as regards his own country, as well as for the Byzantine history. He was born in 1610, at a farm near Amiens, of a respectable family, and studied in the Jesuits' college, at that place, afterwards at Orleans and Paris. At this last place he became parliamentary advocate, in 1631, and, in 1645, royal treasurer at Amiens, from which place he was driven by a pestilence, in 1668, to Paris. Here he devoted himself entirely to literature, and published his great works, viz., his Glossary of the Greek and Latin peculiar to the Middle Ages and the Moderns; his *Historia Byzantina* (Paris, 1680, fol.); the *Annals of Zonaras*; the *Numismatics of the Middle Ages*, and other important and valuable works. He died in the year 1688.

**DUGDALE** (Sir William), an eminent English historian, antiquarian, and herald, born in Warwickshire in 1605. He was introduced into the herald's office by Sir Christopher Hatton; and ascended gradually through all the degrees, until he became garter principal king at arms. His chief work is the *Monasticum Anglicanum*, in 3 vols. folio; containing the charters and descriptions of all the English monasteries, adorned with engravings. Nor are his Antiquities of Warwickshire less esteemed. He wrote likewise the History of St. Paul's Cathedral; a History of Embanking and Draining; a Baronsage of England; and completed the second volume of Sir Henry Spelman's Councils, with a second part of his Glossary. He died in 1686. His son John was Norroy king at arms, and published a Catalogue of English Nobility.

**DUGOMMIER** (M.), a French republican general, a native of Martinique in the West Indies, where, at the beginning of the revolution, he defended Fort St. Pierre against a body of troops sent from France. He was at this time a considerable proprietor, and colonel of the national guards of the island. He afterwards went to France to procure succours for the patriots. In 1793 he rapidly rose to be general of brigade; and then commander in chief of the army in Italy, where he gained many advantages with a very inferior force. He took Toulon December 19th, 1793, as commander in chief of the army of the Eastern Pyrenees, and prosecuted the war against the Spaniards with great success. On the 1st of May, 1794, he gained the battle of Albeides, and seized Montesquieu, taking 200 pieces of cannon, and 2000 prisoners. In August, 1794, he defeated an army of nearly 30,000 men at St. Laurence de la Mouga, and was killed November 17th, in an engagement at St. Sebastian. The convention decreed that his name should be inscribed on a column of the Pantheon.

**DUILIA LEX**, the Duillian law, a Roman law, enacted by M. Duillius, a tribune, A. U. C. 304. It made it a capital crime to leave the Roman people without its tribunes, or to create any new magistrate without a sufficient cause. There was another Duillian law in 392, regulating the interest to be paid for money lent.

**DUILIUS NEPOS** (Caius), a Roman consul, the first who obtained a victory over the naval

power of Carthage, A. U. C. 492. He was the first that ever appeared at Rome in the senate rewarded his valor by permitting him to have music playing, and torches lighted, at public expense, every day while he was a senator. There were some medals struck in commemoration of this victory; and there still was a column at Rome, which was erected on the occasion.

**DUISBURG**, a town of Prussia, in the circle of Westphalia, and that part of the former territory of Cleves which lies on the east, or right bank of the Rhine. It has two churches, three convents. The university founded here for Protestants, in 1635, was removed to Duisburg in 1806. Its chief manufactures are in steel and iron. It is seated on the Roer, a little way where it falls into the Rhine. Inhabited in 4600. It lies fourteen miles north of Düsseldorf, and thirty-five north-west of Cologne.

**DUKE**, *n. s.* } Fr. *duc*; Span. *duque*; Port. *Duque*; Ital. *duca*; and *dux*, *dux*, *dux*, to lead. See the article.

And thou Bethlehem, the fond of Jada, lead on a dugh schal go out that schal govern my people Israel.

The duke of Cornwall, and Regan his brother will be here with him this knight.

Shakespeare. *King Lear*

Her brother found a wife.

Where he himself was lost; Prospero has turn'd In a poor isle.

Id. *Tempest*

Aurnarle, Surrey, and Exeter, were dukes.

The names of dukes, their titles, dignities,

And whatsoever profits thereby rise.

Dan. *God Fre*

The cardinal never resigned his purple in prospect of giving an heir to the dukedom of Tuscany.

Johnson

A prince can mak a belted knight,

A marquis, duke, and a' that;

But an honest man's aboon his knight.

Guid faith he mauna fa' that!

Scott

**Duke**, *dux*, was originally a Roman name denominated a *ducendo*, leading or conducting. Accordingly, the first dukes, *duces*, or *ductores exercituum*, commanders of armies. Under the later emperors, the governors of provinces during war were entitled *duces*; but after times the same denomination was given to the governors of provinces, in times of peace. The first governor under that name was duke of the Marchia Rhætica, or Germany, whose mention is made in *Cassiodorus*; then were afterwards thirteen dukes in the eastern empire, and twelve in the western. The Goths and Vandals, upon their overrunning the provinces of the western empire, abolished the Roman cities wherever they settled. But the Franks, to please the Gauls, who had long been used to that form of government, made it a part of politics not to change any thing therein, and accordingly they divided all Gaul into duchies and counties; and gave the names of dukes, and sometimes of counts, *comites*, to the governors of them. In England, during the time of the Saxons, Camden observes, that the dukes and commanders of armies were called dukes, *duces*, after the ancient Roman manner.

not any addition. After the Conqueror, in the title lay dormant till the reign of Edward III., who created his son Edward, first the Black Prince, duke of Cornwall; and has ever since been the peculiar inheritance of the king's eldest son during the life of the father; so that he is *dux natus, non creatus*. From him there were more made, in such manner that their titles descended to their posterity. They were created with much solemnity, *cincturam gladii, cappæque, et circuli in capite impositionem*. However, in the reign of queen Elizabeth, A. D. 1572, the whole became utterly extinct; but it was revived fifty years afterwards by her successor, in person of George Villiers, duke of Buckingham.

Though the French retained the names and form of the ducal government, yet under the second race of kings there were scarcely any dukes; but all the great lords were counts, or barons; excepting, however, the dukes of Burgundy and Aquitaine, and the duke of Normandy, which was a dignity Hugh Capet himself held, corresponding to that of *maire de France*, or king's lieutenant. By the weakness of the kings, the dukes or governors sometimes considered themselves sovereigns of the provinces subject to their administration. This change ended chiefly about the time of Hugh Capet, when the lords began to dismember the kingdom, so that that prince found more competitors among them than subjects. It was even with a great deal of difficulty they could be brought to acknowledge him their superior, or to hold of him by fealty and homage. By degrees those provinces, duchies and counties, which had been rent from the crown, were again united to it. But the duke was no longer given to the governors of provinces. From that time it became a title of dignity, annexed to a person and his male, without giving him any domain, territory, or jurisdiction over the place whereof he was duke. All the advantages therefore now remaining in the name, and the precedence it carries.

Modern dukes retain nothing of their former splendor but the coronet on their helmet. It is composed of a rim of gold, with an emerald, and is surmounted with eight strawberry leaves, in continuation from that of a marquis, which has four strawberry leaves and four pearls.

The annexed dukes are created by patent, cincture of sword, mantle of state, imposition of a coronet of gold upon the head, and a scepter of gold in their hand. The eldest sons of dukes are by the courtesy of England styled marquises, though they are usually distinguished by their father's second title, whether it be marquis or earl; and the younger sons lords.

The addition of their Christian name, as James, lord Thomas, &c., and they take the name of viscounts, though not so privileged by law.

A duke has the title of grace; and he is styled, in heraldic language, most high, potent, and noble prince. Dukes of the blood royal are styled most high, most mighty, and illustrious princes. There are also sovereigns who bear the title of duke. The title of *GREAT DUKE* belongs to the heir-apparent of Russia; that of *Arch-duke* to all the sons of the house of Austria, and that of *Anon-duchess* to all the daughters. See these articles.

*DUKE*, among Hebrew grammarians, is an appellation given to a species of accents answering to our comma.

*DUKE* (Richard), a clergyman and inferior poet of the last century. Dr. Johnson says, 'His poems are not below mediocrity, nor have I found much in them to be praised.' He was a native of Otterton in Devonshire, and educated at Westminster school, and Trinity College, Cambridge, where he obtained a fellowship. He was presented to the living of Blaby in Leicestershire in 1688, and was soon after made a prebend of Gloucester. Just previous to his death, which took place in 1710, he became possessed of the valuable benefice of Witney in Oxfordshire. He was the author of Translations of some of the Odes of Horace, and some detached poems.

*DUKE-DUKE*, a title given in Spain to a grandee of the house of Sylva, on account of his having several duchies, from the uniting of two considerable houses in his person. Don Roderigo de Sylva, eldest son of Don Ruy Gomez de Sylva, and heir of his duchies and principalities, married the eldest daughter of the duke de l'Infantado; by which marriage the present duke de l'Astrana, who is descended therefrom, and is grandson of Don Roderigo de Sylva, has added to other titles that of duke-duke; to distinguish himself from the other dukes; some whereof may enjoy several duchies, but none so considerable ones, nor the titles of such eminent families.

*DUKE'S COUNTRY*, a county on the south-east coast of the state of Massachusetts, comprehending Martha's Vineyard Island, Chabaquiddick Island, Norman's Island, and the Elizabeth Islands. The chief town is Edganton. Population 3290.

*DUKE OF CLARENCE'S STRAIT* is a channel on the east coast of North America, bounded on the east by the Duke of York's Islands, part of the continent, and the isles of Gravina. To the west the shore is an extensive tract of land, forming an archipelago, to which Vancouver gave the name of the Prince of Wales's Archipelago.

The *DUKE OF GLOUCESTER'S ISLANDS* are two woody islands of the South Pacific Ocean, about five or six leagues asunder. They were visited in 1767 by captain Carteret. The most southern is of a half-moon shape, low, flat, and sandy, with a reef projecting half a mile from the south end, where the sea breaks violently: its appearance is agreeable, but it affords neither vegetables nor water. There seemed also no traces of inhabitants. Many birds were seen on it, however, and they were so tame, that they readily allowed themselves to be taken. Captain Carteret thought these islands were seen by Quiros, the Spanish navigator, in 1606. One lies in lat.

20° 38' S., long. 146° W.; the other in lat. 20° 34' S., long. 146° 15' W.

**DUKE OF YORK'S ISLAND**, an island of the South Pacific Ocean, in St. George's Channel, which divides New Ireland and New Britain. It is situated between Cape Palliser and Cape Stephens, where the strait is about fifteen leagues broad, and has a beautiful aspect, being covered inland with lofty woods, which near the water-side are interspersed with the houses of the natives. Their canoes are very neat. Long. 151° 20' E., lat. 4° 9' S.

**DUKE OF YORK'S ISLAND**, an island in the South Pacific Ocean, discovered in 1765 by commodore Byron. It is low, and about thirty miles in circumference. There is a large lake in the centre, and the whole island is well wooded. The surf breaks violently round the coast. No inhabitants were seen. Long. 187° 30' E., lat. 7° 56' S.

**DUKE OF YORK'S ISLANDS**, a cluster of islands off the north-western coast of America. They were first discovered by Vancouver, from whom they received their present name. They extend about fifty miles in length, and twenty-five in breadth. Long. 227° 15' to 228° 15' E., lat. 55° 50' N.

**DUKER** (Charles Andrew), a celebrated German editor and critic, was born at Unna in Westphalia in 1670. He was educated at the university of Franeker, and appointed professor of ancient history at Utrecht, where he acquired great notice. His works are, *Oratio de Difficultatibus Quibusdam Interpretationis Grammaticæ Veterum Scriptorum Græcorum et Latinorum*; *Sylloge Opusculorum Variorum de Latinitate Jurisconsultorum Veterum*; an edition of *Thucydides*; and an edition of *Florus*, &c. &c. He died at Meyderick, near Duisbourg in 1752.

**DUL'CET**, *adj.* } Fr. *doucet*, from Lat. *dulcis*, sweet. To dulcify  
**DUL'CIFY**, *v. a.* }  
**DUL'CIMER**, *n. s.* } or dulcorate, is to make  
**DUL'CORATE**, *v. a.* } sweet: dulcimer, an instrument remarkable for its sweet tones.

Ye hear the sound of the cornet, flute, harp, sackbut, psaltery, dulcimer, and all kinds of musick.

*Daniel* iii. 5.

I sat upon a promontory,  
And heard a mermaid, on a dolphin's back,  
Uttering such dulcet and harmonious breath,  
That the rude sea grew civil at her song.

*Shakespeare.*

The ancients, for the dulcorating of fruit, do commend swine's dung above all other dung. *Bacon.*

Malt gathereth a sweetness to the taste, which appeareth in the wort: the dulcoration of things is worthy to be tried to the full; for that dulcoration importeth a degree to nourishment: and the making of things insinual to become alimental, may be an experiment of great profit. *Id.*

A decoction of wild gourd, or colocynthis, though somewhat qualified, will not from every hand be dulcified into aliment, by an addition of flour or meal. *Brounne.*

A fabrick huge  
Rose like an exhalation, with the sound  
Of dulcet symphonies, and voices sweet.

*Milton.*

In colocothar, the exactest calcination, the exquisite dulcification, does not reduce the body into elementary earth; for after the trial, if the calcination have been too far out of the colocothar, the residue is not a mixt body, rich in medical virtues.

Turbith mineral, as it is sold in the rough medicine; but, being somewhat procured vomiting, and then calcined.

I dressed him with a pledgit, the tincture of vitriol.

Spirit of wine dulcifies spirit of salt, and have other bad effects. *Arbutus.*

They to the dome where smoke with roll  
Announced the dinner to the region  
Summoned the singer blithe, and harp  
And aided wine with dulcet-streaming

*Dr. J. A.*

High o'er the chequered vault with train  
Bright lusters dart, as dash the waves  
And echo's sweet responsive voice proclaim  
The dulcet tumult of their silver tongues.

So well that thought the' employment  
suit,

Psaltery and sackbut, dulcimer and flute.  
O fie! 'tis evangelical and pure:  
Observe each face, how sober and demure.

**DUL'IA**, *n. s.* *Δουλία*. An idolatrous adoration.

Paleotus saith, that the same worship to the prototype may be given to the same the different degrees of lairia and dulia.

**DULL**, *adj. & v. a.* } Got. *Julla*,  
**DUL'LARD**, *n. s.* } dole; Swed.  
**DUL'L-EYED**, *adj.* } dull; West.  
**DUL'L-HEAD**, *n. s.* } dull; Ger. *dull*;  
**DUL'LY**, *adv.* } want. Teut.  
**DUL'NESS**, *n. s.* } the Ang.

to thicken. Heavy, thick; stupid; sad; melancholy; drowsy: as a very stupid; to blunt; thicken; weak; make heavy. A dullard, or dullhead.

This people's heart is waxed gross, they are dull of hearing.

For to illumine she said I was to dull  
Adwaysenge me my penne awayes to dull

Nothing hath more dulled the wits, of  
the will of children from learning, the making of Latin.

This people be fools and dulled to be  
but subtle, cunning, and bold in any matter.

Now forced to overflow with teaching  
The troublous noise did dull their ears.

O help thou my weak wit, and sharpen  
tongue.

Prayers were short, as if darts through  
sudden quickness, lest that vigilant attention of mind, which in prayer is required, should be wasted or dulled through care.

Such is their evil hap to play upon  
men.

He that hath learned no wit by  
may complain of gross breeding, or of  
dull knitted.

Borrowing dulls the edge of industry.

This arm of mine hath chafed  
The petty rebel, dulbrain'd Buckingham.

made a soft and dull-eyed fool,  
 dead, relent, and sigh, and yield  
 mercersors. *Id. Merchant of Venice.*  
 Is't thou me a dullard in this act?  
 speak to me? *Id. Cymbeline.*

cease more questions;  
 and to sleep. 'Tis a good dullness,  
 thy. *Id. Tempest.*

as) dullerth the spirits, and destroyeth  
 both an old tree, or as the worm that  
 is kernel of the nut. *Raleigh.*

is so near a dead man, that he is  
 dead in the list of the living; and as  
 buried whilst he is half alive, so he is  
 employed whilst he is half dead.

*Saville.*  
 and damps all industries, wherein  
 stirring, if it were not for the slug.  
*Bacon.*

Germany had but a dull fear of the  
 it, upon a general apprehension: now  
 opened and pointed. *Id.*

continual use of any thing, groweth  
 dulness either of appetite or working.  
*Id.*

be moist, doth in a degree quench  
 whatsoever maketh it burn more dully.  
*Id.*

press weak spirits, and our sense  
 dull; the more the less we see.  
*Donne.*

in Time, Slack thing, said I,  
 dull; what it, for shame. *Herbert.*  
 my reform negligent boys, but not  
 it are insensibly dull. All the whil-  
 it can never set a razor's edge on that  
 steel in it. *Fidler.*

ow like thee ' and make thy stream  
 ample, as it is my theme;  
 clear, tho' gentle yet not dull;  
 a rage, without o'erflowing full.

*Denham. Cooper's Hill.*  
 I think those pantomimes,  
 action with the times,  
 zealous in their art  
 who dully act one part. *Hudibras.*  
 ven the dullest, is thinking more than  
 it can teach him how to utter.

*Dryden.*  
 alone my perfect image bears,  
 fulness from his tender years. *Id.*

lent to imitate nature in every cir-  
 cularly, and meanly; but it becomes  
 what is most beautiful.

*Id. Dufresnoy.*  
 bulled with all, that we could come to  
 ter speeches, and yet she not perceive  
 for lamentations. *Kidney.*

e necessary to all conditions of life,  
 to fear it should grow dull for want of  
 ease would make it stronger. *Locke.*

ness of the scholar to extinguish, but  
 it, the charity of the teacher. *South.*

ew, Andrew? cries his brother droll;  
 methinks, is something dull. *Prior.*

to affect the politician's part,  
 nod, and smile, and churr with art.  
*Congress.*

has travelled life's dull round,  
 the stage may have been,  
 to think he still has found  
 as welcome at an inn. *Shenstone.*

As turns a flock of geese, and, on the green,  
 Poke out their foolish necks in awkward spleen,  
 (Ridiculous in rage)! to hiss, not bite,  
 So war their quills, when sons of Dullness write.

*Young.*  
 In England every man may be an author that can  
 write; for they have by law a liberty, not only of say-  
 ing what they please, but of being as dull as they  
 please. *Goldsmith.*

Dullness it is easy to despise, and laughter it is  
 easy to repay. *Johnson. Plan of Dictionary.*

The punch goes round, and they are dull

And lumpish still as ever;

Like barrels with their bellies full,

They only weigh the heavier. *Cooper.*

Could thine art

Make them indeed immortal, and impart

The purity of heaven to earthly joys,

Expel the venom and not blunt the dart—

The dull satiety which all destroys—

And root from out the soul the deadly weed which  
 cloyes? *Higgin.*

DULL, in the manege. The marks of a dull  
 horse, called by the French, *marques de ladic*,  
 are white spots round the eye and on the tip of  
 the nose, upon any general color whatsoever.  
 Though some take these spots for signs of stu-  
 pidity, it is certain they are great marks of the  
 goodness of a horse; and the horses that have  
 them are very sensible and quick upon the spur.

DULSE, or DILLS, a kind of esculent sea-  
 weed, eaten by the common people near Edin-  
 burgh. See *FUCUS, PALMATUS*.

DULWICH, a hamlet of Camberwell, five  
 miles from London; celebrated for its college,  
 founded by Alleyn, the actor, in consequence of  
 a supposed apparition of the devil. See *ALLEYN*.  
 This foundation was endowed for the mainte-  
 nance of six poor men, six poor women, and  
 twelve poor boys; the latter of whom, when  
 they arrive at a proper age, are either sent to the  
 universities, or apprenticed. This establishment  
 is under the direction of a master (who must  
 always be of the name of Allen), a warden, and  
 four fellows, of whom three must be divines,  
 and the fourth an organist. The master is lord  
 of the manor for a considerable extent; but  
 both he and the warden and fellows must con-  
 tinue unmarried, on pain of exclusion. The  
 building was erected after a design of Inigo  
 Jones, and contains the chapel and master's  
 apartments in front; the chambers for the poor  
 men, women, and boys, are in the wings. The  
 beautiful prospects of this village and its neigh-  
 bourhood have made it a favorite residence of  
 many gentry and citizens of London.

DULVERTON, a town in Somersetshire,  
 seated on a branch of the Ex; twenty-four  
 miles east of Barnstaple, and 105 west by south  
 of London. It has a market on Saturday, and  
 a manufacture of coarse woollens and blankets.  
 There are some lead mines near the town, but  
 the ore is hard and barren. Market on Saturday,  
 the toll of which is annually distributed to the  
 poor.

DUMAS (Louis), an ingenious Frenchman,  
 was the natural son of Montcalm, lord of  
 Candiac, born at Nismes, in 1676. He was bred  
 to the law, but applied himself to mathematical  
 and mechanical studies. He invented an instru-

ment called the Bureau Typographique, to teach children reading and writing mechanically. He also devised another, for instructing them in music. On both these subjects he wrote explanatory treatises, besides a history of the unfortunate Mary, queen of Scots. He died in 1744.

DUMAS (Charles Louis), a French surgeon and anatomist, who suggested considerable improvements in the nomenclature of anatomy. He was professor of the science at Montpellier, where he died in 1814. His works are A Treatise on Mythology, in which is proposed a new mode of classification and denomination of the muscles; and Principes de Physiologie, Paris, 1806, 4 vols. 8vo.

DUMB, *adj.*

DUMB'LY, *adv.*

DUMB'NESS, *n. s.*

DUMB-FOUND, *v. a.*

Goth. *dumbs*; Saxon, } dumb; Dan. *dun*; Belg.  
DUMB'LY, *adv.* } dumb; and Germ. *stumm*, from  
DUMB'NESS, *n. s.* } Heb. *ḥēṭ*, he was silent.

Mute; incapable or deprived of speech: hence silent, refusing to speak. To dumbfound, is to strike dumb.

And the angel answerde and seyde to him, for Y am Gabriel that stonde nygh before God, and Y am sent to thee to speke and to evangelise to thee these thingis, and to thou schalt be dumble. *Wiclif.*

It hath pleased himself sometime to unloose the very tongues even of dumb creatures, and to teach them to plead in their own defence, lest the cruelty of man should persist to afflict them. *Hooker.*

They spake not a word;

But like dumb statues or unbreathing stones,

Stared each on other. *Shakespeare. Richard III.*

There was speech in their dumbness, language in their very gesture: they looked as they had heard of a world ransomed or one destroyed.

*Id. Winter's Tale.*

Silence in love bewrays more woe

Than words, tho' ne'er so witty;

A beggar that is dumb, you know,

May challenge double pity. *Raleigh.*

The tenants wonder at their land-lord's sense,  
And blesse them at so sudden coming on,  
More than who vies his pence to view some trick  
Of strange Morocco's dumble arithmetike.

*Bp. Hall. Satires, iv. 2.*

His gentle dumb expression turned at length

The eye of Eve to mark his play. *Milton.*

Her humble gestures made the residue plain,

Dumb eloquence persuading more than speech.

*Roscommon.*

'Tis love, said she; and then my downcast eyes,

And guilty dumbness, witnessed my surprize. *Dryden.*

For he who covets gain in such excess

Does by dumb signs himself as much express,

As if in words at length he showed his mind.

*Id. Juvenal.*

They had like to have dumbfounded the justice; but  
his clerk came in to his assistance. *Spectator.*

Nothing is more common than for lovers to complain, relent, languish, despair, and die in dumb show.

*Addison.*

Some positive terms signify a negative idea; blind implies a privation of sight, dumb a denial of speech.

*Watts's Logic.*

The dumb shall sing, the lame his crutch forego,  
And leap exulting like the bounding roe. *Pope.*

At length our mighty bard's victorious lays

Fills the loud voice of universal praise;

And baffled spite with hopeless anguish  
Yields to renown the centuries to come.

*Johnson.*

Loud when they beg, dumb only when they

Unless an instance has occurred of their having in a disorderly manner, or in a barking in consequence of the hydrophobia, receive such a phrase could not have been

And near, the beat of the alarming drum  
Roused up the soldier ere the morning  
While thronged the citizens with terror  
Or whispering, with white lips—'The  
come! they come!'

DUMBNESS. The most general, and sole cause of dumbness, is the want of hearing. The use of language is acquired by imitating articulate sounds; this source of intelligence, deaf people are excluded: they cannot acquire articulation by the ear: unless, therefore, articulated sounds be communicated to them by some other means, these unhappy people must for ever be deprived of the use of language. Deafness is sometimes considered as such a total want of speech or written language, that it is to teach the deaf to speak or read was regarded as impracticable, till Dr. W. some others showed that although they cannot learn to speak or read by the use of the ear, there are other sources of knowledge by which the same effect may be produced. The organs of hearing and of speech are in some connexion. Persons deprived of the former generally possess the latter in such a manner, that nothing further is necessary to make them articulate, than to teach them to use these organs. This indeed is not always the case, but experience shows that it is practicable.

The late Mr. Thomas Braidwood, was the first who ever brought this surprising degree of perfection. He began with a single pupil in 1764; and, since that time, he has taught great numbers of people to speak distinctly; to read, to write, to figure, the principles of religion and of natural philosophy, &c. and even to make a rapid progress in the most useful branches of education. Mr. B. the principal difficulty, after he had discovered the art, was to make the public believe in the capability of it. He advertised in the papers; he exhibited his pupils to noblemen and gentlemen; still he found the incredulity of mankind unwilling to receive his claims.

The first effort in this method was to teach a pupil to pronounce the simple vowels and consonants. He would point out the sound of a slowly, pointing out the position of the letter at the same time, and making the pupil observe the motion of his mouth, and imitating him all the while. At first at a loss to understand what he was to do. In this manner he proceeded till the pupil had learned to pronounce the simple letters. He went on in the same manner till a vowel and a consonant were joined, and the pupil was enabled both to speak and to write. His pupils were taught not only to

tion, but also to understand the meaning of every real, was easily ascertained by a person with any of them. Of this Mr. Braidwood gives a remarkable instance in a young girl about thirteen years of age, who had some time under the care of Mr. Braidwood. She wrote well, says that writer, her words were not by rote. She could clothe the thoughts in a new set of words, and never lose the original sense.

A new and different method, equally laborious and successful, was practised by the abbé de l'Épée, of Berlin. He began not by endeavouring to form the organs of speech to articulate, but communicating ideas to the mind by means of signs and characters: to effect this, he laid down the names of things; and, by a system of signs, established a connexion between these words and the ideas to be excited. After he had thus furnished his pupils with a medium of communication, he taught them to articulate and pronounce. In manner he enabled one of his pupils to deliver a Latin oration in public, and another to write a thesis against the objections of one of his pupils in a scholastic disputation; but it does not appear that the abbé taught his pupils to understand what was spoken. There is no word, says the abbé, more difficult to learn by signs than the verb croire, 'to believe.'

To do this, he wrote the verb with its significations in the following manner:—

*Je dis oui par l'esprit, Je pense que oui.  
Je dis oui par le coeur, J'aime à penser que oui.  
Je dis oui par la bouche.  
Je ne vois pas des yeux.*

In teaching these four significations by signs, he connected them with the verb, and added other signs to express the number, tense, and mood, in which it is used. If four signs, corresponding with the lines mentioned, he added that of a substantive, the pupil will write the word foi, 'faith;' but, by indicating a participle used substantively, he will express la croyance, 'belief;' to make him write croyable, 'credible,' the signs of the verb must be accompanied by that which indicates an adjective terminating in -able. All these signs are rapidly made, and easily comprehended. M. Linguet, a member of the Royal Academy, having asserted that persons thus instructed could be considered as more than automata, the abbé invited him to be present at his lessons, and expressed his astonishment, that M. Linguet should be so much in favour of the medium by which he received the first rudiments of knowledge, to conclude that they could not be imparted in any other; desiring him, at the same time, to observe, that the connexion between ideas and articulate sounds by which they are excited in the mind, is not less arbitrary than that between these ideas and the written characters, which are made to represent them to the eye. M. Linguet complied with the invitation; and, after having desired him to fix on some term, which he would by signs communicate to his pupils, he chose the word un-

intelligibility; which, to his astonishment, was almost instantly written by one of them. The abbé informed him, that to communicate this word he had used five signs, which, though scarcely perceivable to him, were immediately and distinctly apprehended by his scholars: the first of these signs indicated an internal action; the second represented the act of a mind that reads internally, or, in other words, comprehends what is proposed to it; a third signified that such a disposition is possible; these, taken together, form the word intelligible; a fourth sign transforms the adjective into the substantive; and a fifth, expressing negation, completes the word required. M. Linguet afterwards proposed this question, What do you understand by metaphysical ideas? which being committed to writing, a young lady immediately answered on paper in the following terms: 'I understand the ideas of things which are independent of our senses, which are beyond the reach of our senses, which make no impression on our senses, which cannot be perceived by our senses.'

In the Ephemerides of the Curious, we have an account of a periodical dumbness, which had continued for more than fifteen years, and had not gone off at the time the account was written. The person was son to an inn-keeper at Jesing, in the duchy of Wirtemberg. He was one night taken so ill after supper, that he could neither stand nor sit. He continued, for about an hour, oppressed with sickness, to such a degree as to be in danger of suffocation. At the expiration of this time he grew better; but, during three months, he was much dejected, melancholy, and, at times, fearful. He was then suddenly struck dumb, and became unable to pronounce the least word, or form the least sound, though he could speak very articulately before. The loss of speech was at first instantaneous, and continued only a few minutes: but the duration of it began to lengthen every day; so that it soon amounted to half an hour, two hours, three hours, and at last to twenty-three hours, yet without any order. And at last the return of speech kept so constant and regular an order, that, for fourteen years together, he could not speak except from noon, during the space of one entire hour, to the precise moment of one o'clock. Every time he lost his speech, he felt something rise from his stomach to his throat. Excepting this loss of speech, he was afflicted with no other disorder of any animal function. Both his internal and external senses continued sound; he heard always perfectly well, and answered the questions proposed to him by gestures or writing. All suspicion of deceit was removed by his keeping exactly the same hour, though he had no access to any instruments by which time can be measured.

Modern researches into this curious and interesting topic, instigated mainly, perhaps, by the efforts of the abbé de l'Épée, have made us better acquainted both with the few historical facts that belong to the subject, and with the actual faculties possessed by the dumb. In this country, in particular, the art of instructing these unhappy persons has been cultivated, of late years, with great success.

Aristotle notices, *Hist. An.* iv. 9, that deafness produces dumbness, but speaks of no remedy for this calamity. Pliny, who quotes the learned Stagirite on this subject, mentions a young painter, Q. Pedius, xxv. 7, who was born deaf and dumb; but through the care of a kinsman in his education, he attained considerable eminence in his art. The first person who is recorded to have made any systematic attempts to instruct the deaf and dumb, is Pedro de Ponce, a Benedictine monk of Sahagen, in Spain. He died in 1584. The earliest publication on this subject, is a Spanish work of the early part of the seventeenth century, 1620, *Reduccion de las Letvas, y Arte para enseñar a hablar los Mudos*, written by the then secretary to the constable of Castile, Bonet. A brother of the constable having been born deaf, was likewise dumb, and Bonet was one of his tutors. But Sir Kenelm Digby, who saw the former in the course of his travels, ascribes the faculty he possessed of understanding conversation, to the successful efforts of an ecclesiastic. 'There was a priest,' he says, 'who undertook the teaching him to understand others when they spoke, and to speak himself that others might understand him, for which attempt at first he was laughed at; yet, after some yeares he was looked upon as if he had wrought a miracle. In a word, after strange patience, constancie, and paines, he brought the young lord to speak as distinctly as any man whatsoever, and to understand so perfectly what others said, that he would not loose a word in a whole day's conversation. I have often discoursed with the priest whilst I waited upon the prince of Wales, now our gracious sovereign, in Spaine, and I doubt not but his majesty remembreth all I have said of him, and much more; for his majesty was very curious to observe and inquire into the utmost of it. He could discern in another whether he spoke shrill or low; and he would repeat after any body any hard word whatsoever, which the prince tried often, not only in English, but by making some Welshmen that served his highness, speak words of their language, which he so perfectly echoed, that I confesse I wondred more at that than at all the rest, and his master himselfe would acknowledge, that the rules of his art reached not to produce that effect with any certainty. And therefore concluded, this in him must spring from other rules he had framed unto himself out of his attentive observation, which the advantages which nature had justly given him in the sharpnesse of senses to supply the want of this, endowed him with an ability and sagacity to do beyond any other man that had his hearing. He expressed it surely, in a high measure, by his so exact imitation of the Welsh pronunciation, for that tongue, like the Hebrew, employeth much the guttural letters, and the motion of that part which frameth them cannot be seen or judged by the eye, otherwise than by the effect they may happily make by consent, in the other parts of the mouth exposed to view! For the knowledge he had of what they said, sprung from his observing the motions they made, so that he could converse currently in the light, though they he talked with whispered never so softly; and I have seen him, at the dis-

tance of a large chamber's breadth, to repeat after one, that I, standing close by the speaker, could not hear a syllable of.'

The next writer on the subject was Dr. Bulwer, 'surnamed,' as he tells us, 'the Deaf Man's Tutor,' in 1648. His tract was entitled, *De Philosophia, or the Deafe and Dumble Man's Tutor, exhibiting the philosophical rectitude of the little arte which may inable with an obsequious heare what any man speaks by the motion of the lips*. Upon the same ground, with the advantage of an historical exemplification, apparently, that a man borne deafe and dumble may be taught to heare the sound of words with his eyes, and hence learne to speake with his tongue. This writer was tutor to Sir Edward Dering of Wellington, in Bedfordshire, and Dr. Gastwicke his youngest brother, who was likewise dumb. He also published, in 1644, *Chironomia, or the Art of Manuel Rhetorica*. In 1670 Dr. Wallis inserted a Letter to Boyle on this subject, in the *Philosophical Transactions*; and another in 1698. It is described by him incidentally in his *Grammatica Anglicana*; and a treatise printed by Loquell, seu de Sonorum omnium Locutione Formatione. In the *Philosophical Transactions* for January, 1668, an account is given of a person published the preceding year by a M. of Salzburg, entitled *Alphabetum Mudo*.

Dr. Holder's *Elements of Speech* appeared in 1669, with an appendix expressly concerning persons deaf and dumb, and containing an account of his successful endeavours to teach A. Popham, a dumb son of colonel Popham, to speak. He was one of those persons who hear a softer sound when the action of the tympanum was excited by a loud one. He was first taught him to write, and then showed the motion of the lips necessary to produce each separate letter. Dr. Wallis had been successful a little earlier in the education of a person similarly circumstanced, the son of the mayor of Northampton. In the course of a year he could read 'a great part of the English tongue had attained so much skill as to express himself intelligibly in ordinary affairs; to read letters written to him, and to write letters to them, though not elegantly, yet so as to be understood.' In the presence of many persons 'who out of curiosity had come to see him, as well as before the court and the royal family' he had 'often not only read English and Latin pronounced the most difficult words of that language, even Polish itself, which was proposed to him.' Young Popham was removed to the care of Dr. Wallis, in the same circumstance, together with what Dr. Holder calls an unfair passage in one of Dr. Wallis's transactions, produced a controversy between writers, to be found in the *Philosophical Transactions*, 1670. In *Transactions*, 1670 Dr. Wallis enters fully into his own defence, which, it is contended by some writers, is a material addition has been since made.

We ought not here, perhaps to mention the early and scarce tract of George Thomson, a Scottish schoolmaster, entitled *Deaf and Dumb Man's Tutor*, &c.

in a small volume at Oxford, in 1680 might he states to be, 'to bring the way of a deaf man to read and write, as near as possible to that of teaching young ones to understand their mother tongue.' 'In stating this general idea,' says Mr. Dugald Stewart, 'he has treated in one short chapter, of Man's Dictionary; and, in another, of a treatise for Deaf Persons; both of them containing a variety of precious hints, from which practical lights might be derived by those who have any concern in the tuition of the deaf during the first stage of their education.' Mr. Stewart's Account of a Boy born Blind and Deaf, Transactions, Royal Society edition, 1729. Dalgarno had, twenty years before, written to the world a very ingenious piece, entitled Ars Signorum, from which, says Mr. Stewart, it appears indisputably that he was the precursor of bishop Wilkins in his Speculation concerning 'a real character, and a philosophical language'. 'That Dalgarno's suggestion with respect to the education of the deaf,' adds Mr. Stewart, 'were not altogether new to Dr. Wallis, will be readily admitted by those who take the trouble to compare his Essay to Mr. Beverly, published eighteen years before Dalgarno's Treatise, with his Tractatus de Lingua, published in 1653. In this letter valuable remarks are to be found on the method of leading the dumb to the signification of words; and yet the name of Dalgarno is not mentioned to his correspondent.'

The recent professors of this useful art have been Father Vannin and Mons. Perceval of Paris; Mr. Heinrich, of Leipzig; Mr. Braidwood of London; and Mr. Braidwood, of Edinburgh; the abbé de l'Épée; and his successor the abbé Sicard; Dr. Watson, formerly assistant of Mr. Braidwood; and Mr. Young, of Glasgow.

We have noticed the plans of Mr. Braidwood and the abbé de l'Épée. The latter, in the last years of his life, relinquished an object upon which he employed considerable pains at the commencement of his career, viz. teaching the deaf to use articulate sounds: the abbé Sicard, in the year 1815, also abandoned every thing of this kind.

In England and Scotland this has been a point with professors, and Dr. Watson is decidedly of its utility, as multiplying the means of association, whereby the dumb, like other persons, retain and digest ideas. He is of opinion that he constantly found deaf persons who had learnt to articulate, speaking softly to themselves, and rehearsing words or sentences, for the purpose of better remembering or of framing such expressions as would convey their ideas. This appears very important, and we understand that the abbé Sicard, since his visit to England in the year above mentioned, has resumed the abbé de l'Épée's original plan.

The gentleman is at the head of the continent in the system of employing artificial signs for the conveyance of ideas, or a set of conventional gestures prescribed by the teacher in the education of the dumb. In his first lessons he endeavours

to teach his pupil the relation between the names of objects and the objects themselves; the analysis of words into the letters of the alphabet; and the particular gesture which he is to attach to each word. He now explains the meaning of collective words, as distinguished from those denoting individual objects or parts of objects. Then he proceeds to general terms, applicable in common to a number of individuals, and to generic names comprehending a number of species; and lastly, to the most general and abstract words, such as being, thing, object. The accidents, modifications, and variations of objects, as denoted by adjectives, are next taught. He first endeavours to make his pupil conceive these qualities as inherent in the objects themselves, and next as being capable of being detached by a mental operation. For instance, taking several pieces of paper, each white on one side, and colored on the other with a common color, he places them on a table, before a black board, with their white sides uppermost. He then proceeds to inscribe some familiar word, like HORSE, on the board, leaving sufficient intervals between the letters for the insertion of other letters. Then turning the sheet painted gray, so that the colored side is now uppermost, he writes the word GRAY between the letters of the former word, but in smaller characters, thus,

## H O R S E G R A Y E.

This is done successively with regard to the other sheets of paper, inserting the name of its respective color between the letters of the word HORSE, which is repeated for that purpose. The gray sheet is again turned down, so that its white side is presented; upon which the smaller letters, composing the word gray, are effaced, while the great letters, H, O, R, S, E, are allowed to remain. Thus the pupil is taught to consider the quality as part of the object, or as inherent in it. In like manner, he proceeds with other adjectives, such as round, square, &c., expressing the form of objects; writing them in the intervals of the letters composing the name of the respective objects; effacing them, and substituting others in succession.

To lead the pupil to form the abstraction of the quality thus expressed, that is, to the use of the adjective as a separate word that may be applied to different substantives, he employs the following diagram, the different lines of which he traces before his eyes, in order to point out the steps by which he is to arrive at this notion

H O R S E G R A Y E

H O R S E

G R A Y

H O R S E

G R A Y

.....  
 .....  
 .....  
 .....  
 .....  
 .....  
 .....  
 .....  
 .....  
 .....

Thus obtaining separately, the two words, he afterwards unites them by a connecting line, thus:

HORSE—GRAY

In order to form this into a sentence, he inserts the word *is*, instead of the line; of which it may accordingly be regarded as the substitute, thus:

HORSE *is* GRAY.

Thus by making his pupils understand the nature of a verb, and afterwards teaching them that the verb can express either an existence or an action, *past, present, or future*, he leads them to the system of conjugation, and to all the shades of tenses. The varieties of significations, and of pronouns, with the corresponding affections of verbs, in regard to number and person, are conveyed by contrivances analogous to the preceding. They proceed upon the principle of connecting together words by lines, denoting the ideas, which are the component parts of other ideas; and writing in the place where the lines unite, or in place of the other words in a similar diagram, the name of the compound idea.

Mr. Sicard also employs a system of cyphers, written on the top of every word or member of a sentence, according to the office it performs in the sentence; by the help of which his pupils are better enabled to analyse it into its parts, distinguishing the name of the object, which is either acting or receiving an action, the verb and its regimen, direct, indirect, or circumstantial; and displaying in a similar way every part of speech.

The mere child, while learning written words, is made to copy them himself, so that, by dwelling upon their forms sufficiently, they make a strong impression on his mind. Then from time to time he is shown the objects, and required to write their names himself: and in these preliminary lessons, much assistance is derived from drawings of the objects. The abbé Sicard has availed himself, with much ingenuity, of this mode of denoting them. He begins, for instance, by tracing the outline of a familiar object, such as a key, on a black board, with a chalk pencil; and placing the object itself before the eye of the pupil, he readily understands the resemblance of the design with what it is meant to represent. He does the same with other objects; and exercises his pupil in pointing out the objects denoted by each drawing, which of course is an amusement to him. He next writes the name of each object within the outline of the figure on the board; and after effacing the outlines, so that nothing but the words remain, signifies to the pupil that he is still to consider what he now sees as the representation of the drawing, that is, of the object denoted. Dr. Watson has had a set of plates engraved, containing delineations of 600 objects most generally met with. These are annexed to his book of Instruction of the Deaf and Dumb, in eighty octavo pages, and accompanied by a printed vocabulary, consisting of the names of all the objects represented, as also of most of the words explained in the earlier lessons, before the engravings are had recourse to. The first time of going through this vocabulary, the heads or

generic names under which the objects are classed are not regarded. But, in subsequent lessons, these are particularly attended to, and explanations to the subordinate specific names explained.

It is also found extremely advantageous to instruct the pupil, as soon as he is capable of the use of letters, in the manual alphabet, as is called; or the expression of letters by different positions of the fingers. This is not only a quick and ready means of communication, commonly learned at other schools; but is retained, or recovered if lost, and is a wonderfully excellent substitute for the pencil, or pen and ink, when those materials are not at hand. The dumb, when properly instructed, converse together with the utmost rapidity.

Another mode of yet quicker intercourse has also been devised for the dumb. It consists in writing the forms of the letters by the point of the finger in the air, and on various prominent parts of the body, as the back for instance. It must, however, be recollected that, to a person who stands before us, writing in the air must appear reversed, if traced in the ordinary manner, and this must be remedied by the letters being written in a reversed form, a method which is said to be easily acquired by practice, and with a looking-glass. For the particulars of Dr. Watson's course we must refer to his *Instruction of the Deaf and Dumb*, by Joseph Watson, LL.D, 2 vols. 8vo. London, 1809.

A singular example of a child being born deaf and blind, has recently occurred in the person of James Mitchell, whose history has been narrated by Mr. Dugald Stewart, in a paper published in the Transactions of the Royal Society of Edinburgh, Vol. VII. p. 70. Described Mr. Wardrop, performed upon and the operation of couching, and has also given some valuable and interesting particulars of the case, in a separate work, entitled *History of James Mitchell, a Boy, born Blind and Deaf, with an Account of the Operation performed for the Recovery of his Sight*. Lond. 4to. 1810. The eighth volume of the Transactions of the Royal Society of Edinburgh, are to contain Additional Communications respecting the Deaf and Deaf Boy, James Mitchell, by the Rev. John Gordon; a gentleman who had paid particular attention to the case of Mitchell, and from whom Mr. Stewart acknowledges he received much information. The volume also contains a paper on the Education of James Mitchell, by Dr. Dewar.

An Asylum for Educating the Deaf and Dumb Children of the Poor, was established in the neighbourhood of London, in the year 1807, and is now under the superintendence of Dr. James Watson, to whose work we have alluded. A child is admitted under the age of seven years, and fourteen is the earliest age at which it can be apprenticed.

In a report, issued in July 1820, by the committee appointed for managing this establishment, the subscribers are informed that the sum, on the average, have amounted to between one and fifty within each year; yet the number have much increased. At the present time

1820, a list of ninety-five candidates was presented to the governors, out of which they selected under the painful necessity of electing only five, though all seemed to have powerful, equal, claims to their notice. An examination of this report will show that a defect of organs of hearing is a misfortune of much frequent occurrence than is generally supposed. From a statement given by the committee, the public will see that among those who are applied to this charitable institution for admission are to be found twenty-four families, which contain no fewer than eighty-seven children deaf and dumb. We shall extract some of their names.

Samuel Coleman, with eleven children, of whom five are deaf and dumb.

John Thomson, with ten children, five deaf and dumb.

John Franklin, with eight children, five deaf and dumb.

John Vokins, with seven children, five deaf and dumb.

Seven families, with three children, in each, four deaf and dumb.

A greater number of the successful applicants for admission into this asylum are natives of the metropolis, or of the adjoining counties.

Similar institutions have been established at Birmingham and Edinburgh. In the latter, besides the ordinary branches of education, a certain number of boys are taught the trade of shoemaking; and some profit arises from the sale of shoes manufactured by them.

The Asylum for the Deaf and Dumb at Paris is under the management of the abbé Sicard, who employs apprenticeship of such as are designed for the manual arts. He begins on their first entering the institution under the inspection of ten different masters. These are: 1. a printer; 2. an engraver of precious metals; 3. a copper-plate engraver; 4. a drawing-master; 5. a turner; 6. a mosaic artist; 7. a cabinet-maker; 8. a shoemaker; 9. a cabinet-maker; 10. a painter. These masters reside in the asylum, receive their board and a regular salary. They give exercises, which the abbé Sicard gives twice a month, are meant to excite emulation among the pupils, and to make the establishment known.

Institutions formed upon a similar model have been established in Holland, Germany, Russia, and Sweden.

It has been suggested that a very competent system of instruction may be imparted to a deaf and dumb pupil by any teacher who undertakes it with the talents and temper of an ordinary schoolmaster, and the art of instructing the deaf and dumb; by John Painesfort Arden, Esq. Lond. 1823, offers some considerable encouragement to this attempt. The editor's son, now an artist of considerable merit, was at an early age sent, like other boys, to a school; with a request, on the part of his father, that he might be treated, in every respect, like the other children. The worthy old man to whom he was sent, exclaimed, 'How can I be taught his letters? He cannot hear.' The boy replied his mother, 'he cannot hear, but

he can see. As you can do nothing with the ear, try what can be done with the eye. If he cannot make out the difference between the sound of *a* and that of *b*, you will acknowledge that he is as competent as any other child to distinguish the form of one from that of the other.' And this expectation was soon proved to be correct, to the astonishment of those who ridiculed the idea; 'for in a very little time he knew the twenty-six letters, large and small, as well as any child in the school.' Then vanished all the difficulty; the dame and her wondering neighbours began to see, as his mother had predicted, that he would learn by the window, his eyes, as well as any other child could by the door, his ears.' 'At this school,' proceeds Mr. Arrowsmith, 'every child went up to his governess twice in the morning and afternoon. By constantly going up in the same manner, to look at the letters, he soon observed the difference between himself and the other children, by taking notice of their mouths; so that, at length, when the letters were pointed out to him for observation, he looked up to the governess, as much as to say, what is it? She endeavoured to gratify his curiosity, and called the letters by their names as she pointed to them; and in a few months he learnt to pronounce the alphabet, in his own way, which he does to this day.' The moment he convinced his mother that he knew every letter, she got several sets of alphabetical counters, large and small, with which he was exercised, and taught the name of every thing he could see at home and at school. By these means he constantly gained information from his school-fellows without the knowledge of his mistress.

'To those who are still incredulous, and feel an interest in the subject,' says an able writer in the Quarterly Review, 'we earnestly recommend the account which Mr. Arrowsmith gives of the plan adopted in educating his brother. And to render their conviction more certain—let them try the plan which he details. There are few neighbourhoods in which, unfortunately, a subject may not be found for such a purpose. Let him be regularly sent to any village school with other children. Let him be treated, in all respects, like them, and we venture to predict that it will be even impossible to prevent him from acquiring the knowledge of a medium which may enable him to converse with his youthful associates. The mind is fully as active and vigorous in the one as it is in the other; and the curiosity of a deaf and dumb child, being strongly excited by the objects which attract his attention, he can hardly fail to devise some means of obtaining from his companions the information which he wishes to procure.

'We are perfectly convinced that the deaf and dumb might be admitted, with peculiar advantages, into seminaries in which children who hear and speak receive their instruction. The efforts which would be made by the latter class of pupils to explain their ideas to their less fortunate associates would, in the end, prove highly beneficial even to themselves. It is well known that children frequently acquire a knowledge of words without comprehending the ideas of which they are representatives. A constant association with

the deaf and dumb, would impose upon them the necessity of acquiring a precise conception of the words which they used, for the purpose of making them intelligible to their young companions. The advantages which would, inevitably, result from this admixture would be, therefore, mutual, and would much more than counterbalance any imaginary excess of skill which a teacher who confines himself to the sole instruction of the deaf and dumb may be supposed to possess. The admission of deaf and dumb pupils into establishments now exclusively devoted to the reception of those who can hear and speak, could, by no possibility, retard the progress of the latter, while it would greatly facilitate the instruction of the former. Were the intercourse of the deaf and dumb to be confined, in after-life, to persons laboring under a similar misfortune, separate establishments for their education would be recommended by reasons much more cogent than any which can be urged in their favor, while it is remembered that, when they leave these institutions, they must converse principally, if not exclusively, with persons who hear and speak.'

DUMFRIES, or DUMFRIES-SHIRE, a county in the south of Scotland, comprehending the district of Nithsdale, the stewartry of Annandale, and the lordship of Eskdale, extending in length from north-west to south-east about sixty miles, and about thirty miles in breadth where broadest. It is bounded on the south-west by Galloway and part of Kyle: on the north-east by the counties of Roxburgh, Selkirk, and Peebles; on the north-west by Clydesdale; and on the south-east by Solway Frith and the marshes between Scotland and England. A great part of the county is mountainous, overspread with heath, and well stocked with game of all kinds: but the valleys, through which the Esk, the Annan, the Nith, and other smaller rivers run, are extremely pleasant; and some of them well cultivated and very fertile, producing oats, barley, and wheat, in abundance, both for exportation and home consumption; while the mountainous parts afford pasture for innumerable flocks of sheep and herds of black cattle, many thousands of which are annually exported to England. In the valleys are several natural woods and some extensive plantations of different kinds of timber. In Nithsdale, are the rich lead mines of Wanlockhead, the coal mines of Sanguhar and Cairnburn, the inexhaustible lime quarries of Closeburn and Barjarg, and freestone in almost every parish. Annandale has the rich lime quarries of Kellhead and Comtongan, with plenty of free stone near the towns of Annan and Lochmaben: and in the lower part of Eskdale are limestone and coal in abundance. In some places there are indications of iron; copper is wrought; and in Westerkirk is a valuable mine of antimony. Besides the mineral springs of Moffat and Hartfell Spa, there are a great many wells which contain metallic or mineral impregnation. This county contains four royal boroughs, Dumfries, Sanguhar, Annan, and Lochmaben, several small towns and villages, and is divided into forty-two parochial districts, containing in all about 55,000 inhabitants. It sends one member to parliament. The manufactures of Dumfries

are not very extensive. Cotton-wool is carried on at Langholm and Annan, in cotton-weaving at the latter place; a mill-work has been erected at Kirkcudbright; a mill, two small foundries, and several iron and tan-works at Dumfries, and a large factory near Sanguhar. Salt was formerly got from sleet, in the parishes of Cumma, Ruthwell, without paying duty, in consequence of an act of 1671; but the right to this has been lately questioned. In 1800, 493 vessels came inwards to this county were 493 vessels, 1339 men, and 18,985 tons; and 2,700 cleared outwards, with 802 men, and 1,000 tons. Most of the inward vessels are laden with coal, and of the outward with grain. The most valuable exports are cattle, sheep, and wool; almost all of which, excepting what is sent out of it by land.

DUMFRIES, the capital of the shire, is a handsome town, situated on a rising ground, on the north-east side of the river, about nine miles above its junction with the Solway Frith. Its present name appears to have been derived partly from its situation, and partly from the monastery of grey friars, which formerly stood near the head of the river, and of which only a corruption of Drum-fries, or Drumm-fries, remains; whence the friary; and accordingly, for these eighty or a hundred years, it was called Drumfries. Besides the pleasant situation, on the side of a beautiful wood, it is surrounded on all sides with one of the most fertile and best cultivated sheets of dale in Scotland, and are any where to be met with; and from it is terminated, at the distance of about eight miles, by a continued chain of hills, altogether one of the grandest natural theatres perhaps in Britain. On the south side of it, at some little distance, are the ruins of a chapel built by king Robert Bruce, which appears to have been erected in the borough before the middle of the thirteenth century, as a grave-stone was discovered in 1790, bearing the date of 1079, and the name of the person buried under it to have been a knight and burgess of the town. And in the place of consequence in the beginning of the fourteenth century, is evident, from the fact, that Edward II. called the king of Scotland to meet there in 1307. In the mentioned monastery, too, king Robert killed his rival, Cumming, lord of Annandale, with the assistance of James Lindsay, bishop of Kirkpatrick, on the 5th February, 1306. The houses of Dumfries are well built and commodious; the principal street extends for a mile, the whole length of the town, in a direction parallel to the Nith, and the general is well paved. It has two churches, an episcopal chapel, a prison, a hospital, an infirmary, a bridge of nine arches over the river, which has been built by one of the three daughters, co-heiresses of Alan, lord of Galloway, as assizes for the county, and for the lowland and stewartry of Kirkcudbright, in the town twice a year. It is the place for holding the sheriff's and county

sions of the peace, and the courts  
donors of supply. It is governed  
three bailies, a dean of guild,  
twelve merchant councillors, with  
the incorporations. The corpo-  
d from king James I., in one of  
to England, a small silver tube,  
barrel, called the silver gun, with  
use to shoot for it every year; a  
is still kept up. The town has a  
on Wednesday, with two fairs in  
September, at which vast numbers  
black cattle are sold. Dumfries  
iles W.N.W. of Carlisle, and  
S.W. of Edinburgh.

a town of the United States, the  
ince William county, in Virginia.  
entry and post town, and has an  
arch and court house. It lies  
side of Quantico Creek, ten miles  
lar, twenty-eight north by east  
arg, and 185 south-west of Phila-

(John), baron of Carlesroom a  
historical writer, who became a re-  
land on account of religion, and  
biographer to the emperor of Ger-  
in 1726, leaving behind him  
valuable for the facts they contain,  
Politiques, pour servir a l'Intelli-  
Paix de Ryswick, 4 vols. 12mo.,

vols. 12mo., 1699; Corps Univer-  
du Droit des Gens, 8 vols. fol.  
Historiques depuis Janvier 1652

IEZ (Charles Francis Duperier),  
t reduced family, was born in  
mary 25th, 1739. He entered into  
ilitary service at the age of eigh-  
he same duke of Brunswick whom,  
of many years, he compelled to  
France. Having, in his twenty-  
obtained the rank of captain, and  
St. Louis, he went on his travels,  
ther countries visited Portugal, of  
to he published an account in 1767.  
s he was employed in Corsica, with  
colonel. In 1770 he was sent to  
ist the confederates. He was next  
mission to Sweden, but was com-  
3 to the Bastille, from whence he  
on the death of Louis XV. During  
war he was much employed at  
which place he was made com-  
the commencement of the revolu-  
tished himself as a patriot, was  
rank of lieutenant-general, and  
tr of foreign affairs. When the  
0,000 strong, advanced on France,  
them with a very inferior force,  
superiority of his tactics. The  
appe shortly after consolidated his  
l revolutionised Belgium. On his  
is, he found the trial of the king  
ress; and, becoming suspected of  
p that unfortunate prince by the  
soon retired, and replaced himself  
of his army. He now concluded a

treaty with the prince of Saxe Coburg for the  
evacuation of Belgium, while he himself deter-  
mined to lead his troops to Paris, and re-estab-  
lish the constitution of 1791. Coburg promised,  
if necessary, to furnish an auxiliary force, but  
the design was frustrated by some of the subor-  
dinate generals conveying intelligence of it to  
the convention. Commissioners were sent to  
arrest Dumouriez, when he took the decisive  
step of instantly arresting them, and handing  
them over to the custody of the enemy, as hos-  
tages for the safety of the king and his family.  
Finding insubordination now beginning to show  
itself among his troops, he resolved on quitting  
them, and repaired for refuge to the head-  
quarters of the prince of Coburg, who offered  
him a command, but he declined it, and retired  
to Switzerland. The cautious were however too  
near to France to render that country a safe  
asylum, especially as the sum of 300,000 francs  
was offered for his head. He afterwards retreat-  
ed to Hamburg and to England, where he for  
some time subsisted on a pension of 400 louis,  
granted him by the landgrave of Hesse Cassel.  
He survived the restoration of the Bourbon  
dynasty several years. In 1821 he published  
two memoirs, addressed to the Greeks, and died  
in his eighty-fifth year, at Turville Park, near  
Henley-upon-Thames, March 14th, 1823.

DUMP, *n. s.* } Dutch *dom*; Dan. *dum*;  
DUMPSH, *adj.* } Goth. *dump*; perhaps from  
DUMPLING, *n. s.* } dumb. Sorrow; sadness:  
DUMPSH, } hence, first a melancholy  
tune of air; and then any tune. The Scottish  
dumpy, according to Dr. Jamieson, signifies short  
and thick: a dumpling is a dumpy pudding.

New year, forth looking out of Janus' gate,  
Doth seem to promise hope of new delight,  
And bidding thr' old adieu his passed date  
Bids all old thoughts to die in dumphish spite,  
*Spenser.*

Sing no more ditties, sing no more  
Of the dumps so dull and heavy;  
The frauds of men were ever so,  
Since summer brat was leafy.

*Shakespeare. Much Ado About Nothing.*  
Visit by night your lady's chamber window  
With some sweet consort; to their instruments  
Tune a deploring dump: the night's dead silence  
Will well become such sweet complaining grievance.  
*Shakespeare.*

Funerals with stately pomp  
March slowly on in solemn dump. *Hudibras.*  
Padding and dumpling hurn to pot. *Dryden.*  
This shame dumps cause to well-bred people, when  
it carries them away from the company. *Locke.*  
The squire who fought on bloody stumps,  
By future bards bewailed in doleful dumps.

*Gay's Pastoral.*  
The life which I live at this age is not a dead,  
dumphish, and sour life; but cheerful, lively, and plea-  
sant.

She, in sooth,  
Possessed an air and grace by no means common:  
Her stature tall—I hate a dumpy woman. *Byron.*

DUN, *adj.* Sax. *dun*; Goth. *daucn*; Welsh  
*dunn*; Belg. *dunker*. A dark tawny color: hence  
dark, gloomy, in a figurative sense.  
Come, thick night!  
And pall this in the dunest smoke of hell.

*Shakespeare.*

He then surveyed

Hell and the gulph between, and Satan there  
Boasting the wall of heaven on this side,  
In the *dun* air sublime. *Milton. Paradise Lost.*

The cattle droop, and o'er the furrowed land,  
Fresh from the plough, the *dun*-discoloured flocks  
Untended spreading crop the wholesome root

*Thomson.*

Oh send them to the sullen mansions *dun*,  
Her baleful eyes where sorrow rolls around ;  
Where gloom-enslaved mischief loves to dwell,  
And murder, all blood-boltered, schemes the  
wound. *Dr. Johnson's Poems.*

It changed of course ; a heavenly camelion,  
The airy child of vapour and the sun,  
Brought forth in purple, cradled in vermillion,  
Baptized in molten gold, and swathed in *dun*.

*Byron.*

*DUN, v. a. & n. s.* Sax. *bunan*, to clamor.  
To claim a debt with vehemence and importu-  
nity : a clamorous creditor.

Borrow of thy back, and borrow of thy belly :  
they'll never ask thee again. I shall be *dunning* thee  
every day. *Bacon.*

An university *dun* is a gentleman's follower cheaply  
purchased, for his own money has hired him.

*Bp. Earle.*

When thou *dunnest* their parents, seldom they,  
Without a suit before the tribune pay. *Dryden.*

They are ever talking of new silks, and serve the  
owners in getting them customers, as their common  
*dunners* do in making them pay. *Spectator.*

I remember what she won :

And hath she sent so soon to *dun* ? *Swift.*

It grieves my heart to be pulled by the sleeve by  
some rascally *dun*—Sir, remember my bill.

*Arbuthnot's John Bull.*

Secretaries of state, presidents of the council, and  
generals of an army, have crowds of visitants in a  
morning, all soliciting for past promises ; which are  
but a civil sort of *duns*, that lay claim to volun-  
tary debts. *Congreve.*

*DUN*, or *BURGH*, the name of an ancient species of buildings, of a circular form, common in the Orkney and Shetland isles, the Hebrides, and northern parts of Scotland. The latter term points out the founders, who at the same time bestowed on them their natal name of *borg*, a defence or castle, a Suedo-Gothic word ; and the Highlanders universally apply to these places the Celtic name *dun*, signifying a hill defended by a tower, which plainly points out their use. They are confined to the countries once subject to the crown of Norway. With few exceptions, they are built within sight of the sea, and one or more within sight of the other ; so that on a signal by fire, flag, or trumpet, they could give notice of approaching danger, and yield a mutual succour. In the Shetland and Orkney islands they are most frequently called wart or ward-hills, which shows that they were garrisoned. They had their wardmadher, or watchman, a sort of sentinel, who stood on the top and challenged all who came in sight. The gackman was an officer of the same kind, who not only was on the watch against surprise, but was to give notice if he saw any ships in distress. He was allowed a large horn of generous liquor, which he had always by him, to keep up his spirits. Along the Orkney and Shetland shores they almost form a chain ; and by these means not only kept the natives in

subjection, but were situated commodiously in covering the landing of their couriers, who were perpetually roving on piratical expeditions. These towers vary in their inner structure, but externally are universally the same ; yet some have an addition of strength on the outside. The burgh of Culswick in Shetland, notwithstanding it is built on the top of a hill, is surrounded by a dry ditch thirteen feet broad ; that of Sealep in Unst, has both a wet and a dry ditch, the former cut, with great labour, through the rocks. The burgh of Moura is surrounded by a wall reduced to a heap of stones, and the walls are cylindrical, not taper, as usual with others.

*DUNAN AULA*, an ancient tower in Craignish parish, in Argyllshire, where the son of Olaus, the son of a king of Denmark, was deposited, near the field of battle in which he was killed many centuries ago. General Campbell converted this mount into a baroque, and erected a neat monument on the summit in memory of his only son. The tumulus supposed to have been raised before the introduction of Christianity, as the urn, containing the son of Olaus, was discovered under a heap of stones by the workmen ; and the practice of burying the dead was discontinued after the conversion of the ancient Caledonians.

*DUNBAR*, a royal borough of Scotland in the county of East Lothian, once remarkable for a strong castle, the key of Scotland from the east, which gave shelter to Edward II. of England in his flight from Bannockburn, but of which now a vestige now remains. This castle was never defended, in 1336, by Agnes, countess of Murray, sister of Randolph earl of Murray. In the absence of her husband, this heroine found in Montague to raise the siege and leave the castle. Here are still preserved some of the Scottish pikes, six ells long, and formed for both attack and defence. Under the rock, on which the castle stands, are two natural arches, through which the tide flows. Between the battlements of the castle is a stratum of vast basaltic masses of red grit-stone. Dunbar is remarkable for the defeat of John Balliol's army by earl Wallace in 1296, and for a victory gained over Cromwell over the Scotch in 1650. Dunbar was governed by a provost, three bailies, a guild, treasurer, and fifteen councillors. It was with Haddington, North Berwick, Leith, and Jedburgh, in sending a representative to parliament. Within the royalty there is a hamlet, a village, called Belhaven, near which the present harbour was begun during the reign of Cromwell, who granted £3000 towards the expense. But it was still very small, and could only receive a few small vessels, even now, though a great deal of the money have since been expended in enlarging it, the access is difficult and the breakers. It is defended by a battery of twelve guns, nine, twelve, and eighteen pounders, and which, here, are a large and convenient store, and two considerable rope-walks, the latter is carried on to some extent. Here are a woollen work and a cotton manufactory, and foundries, and spinning-mills. Its position

portation of corn and of kelp. It is a staple trade in the fisheries. It is in Edinburgh and Berwick-upon-Tweed, twenty-seven miles from each. (William), a celebrated Scottish poet, b. in East Lothian, in 1465. He wrote good poems for that age; and he is only styled the Scottish Horace. *Perse*, and *The Thistle* and the most admired pieces of his produced about 1530. Sir David Dalziel had an edition of his poems with

DUN, the chief town of Lennox or Duns, in Scotland, remarkable for its being on a steep rock, rising up in two parts where inaccessible, except by passage or entry, fortified with a rampart. Within this wall is the town with lodgings for the officers; and a long flight of stone steps ascends to the top of the castle, where there are several pieces mounted with cannon, the wall almost round the rock. In the upper part, where the rock divides, are several barracks, with a deep well; there is always plenty of water. Here, he remains of a gateway and high top of which there was a wooden communication from one rock to another. It was sometimes blocked up during commotions of Scotland, so that different factions possessed different parts, and each had a gate towards the castle stands in an angle formed of the Clyde and Leven: so that it is surrounded by water, except a narrow passage even this is overflowed at every high water there is any hill or eminence half a mile of this fortress. It commands the mouth of the Clyde; and, being deemed the strongest in the western Highlands, is kept in some garrisoned with invalids, under the command of a governor and some subaltern officers. The government of it is worth £700 a year. There is a considerable manufactory of glass bottles in the town. It has a good harbour where vessels employ seventy seamen and about 2000 tons. Dunbarton was a royal borough by king Alexander III.

It contains about 2000 inhabitants, ten miles north-west of Glasgow, ten miles from Edinburgh, and eighty-nine from London.

DUNDEE, a town in a parish of the same name, situated on the river Allan, thirty miles from Edinburgh. The battle of Dunbar, in 1706, was fought near it, in which duke of Argyll defeated the rebels of Mar. It has four fairs; in August, and November.

DUN, from Lat. *densus*, thick.—*Mint*—*mint*, stupid, —*Skinner*; still by a word of reproach introduced by the Scotch, from the name of Mr. Tooke and Mr. Todd, Duns' disciples, dunces.

the best, in streets but scarce at home  
thy straw, the stupid crowd. *Dryden*.

Was Epiphanius to great a dunce to imagine a thing, indifferent in itself, should be directly opposite to the law of God?

*Stillington*.

Till critics blame, and judges praise,

The poet cannot claim his bays.

On me when dunces are satiric,

I take it for a panegyric.

Hated by fools, and fools to hate,

Be that my motto, and my fate.

*Swift*.

The schools became a scene

Of solemn farce, where ignorance in stilt,

His cap well lined with logic not his own,

With parrot tongue performed the scholar's part.

Proceeding soon a graduated dunce. *Cowper*.

DUNCOMBE (William), a laborious author, born in London in 1690. He published a Translation of Racine's *Athalie*, which was well received by the public, and has gone through many editions. In 1724 he was editor of the works of Mr. Needler; in 1733, of the poems of his deceased brother-in-law, Mr. Hughes, 2 vols. 12mo.; in 1737 of the miscellanies of his younger brother Mr. Jabez Hughes, for the benefit of his widow, in 1 vol. 8vo.; and in 1745, of the works of the Rev. Mr. Samuel Say, in 1 vol. 4to. In 1726 he married the only sister of John Hughes, Esq. whom he long survived. In 1734 his tragedy of *Lucius Junius Brutus* was acted at Drury-lane theatre. It was published in 1735, and again in 1747. The works of Horace, in English verse, by several hands, were edited by him in 2 vols. 8vo., with notes, &c. in 1757. A second edition, in 4 vols. 12mo. with many imitations, was published in 1762. In 1763 he collected and republished *Seven Sermons* by Archbishop Herring, on Public Occasions; with a Biographical Preface. He died Feb. 26, 1769, aged seventy-nine.

DUNCAN (Adam), lord viscount, a gallant British admiral, born at Dundee, in Scotland, in 1731, of an ancient and respectable family. Being a younger son, he was brought up to the sea, and after the usual gradations was appointed a lieutenant in the navy on the 10th of January, 1755; and about four years after he became a commander. He received his naval education, it is said, under the auspices of lord Keppel, through whom he was appointed captain of the *Valiant* of seventy-four guns. He was likewise on the court-martial of that distinguished veteran. In 1778 he was appointed to the *Monarch*, of seventy-four guns, one of the ships employed on the home station. About the end of December he was ordered, with Sir George Rodney, to Gibraltar, and greatly distinguished himself in the encounter with the Spanish squadron under Don Juan de Langara. Not long after this captain Duncan quitted the *Monarch*, and in 1782 was appointed to the *Blenheim* of ninety guns. He continued in this ship during the remainder of the war, being constantly attached to the channel fleet, then commanded by lord viscount Howe, and consequently proceeded with his lordship to Gibraltar in September. When peace was settled, captain Duncan was appointed to the *Edgar* of seventy-four guns, and continued in that command the three succeeding years. On the 14th of September 1787 he was made rear-admiral of the blue; of the white on the 22d of September 1790; and

In 1793 he became vice-admiral; thus rising progressively till the 1st of June 1795, when he obtained the rank of admiral of the blue. Upon this last advancement he hoisted his flag on board the *Venerable* of seventy-four guns, and was appointed to the command of the squadron stationed in the North Sea, and particularly destined to act against the Dutch, who had then a considerable naval force lying ready for service in the Texel. The mutinous spirit which, about this time, had broken out among the British seamen in different quarters, having spread itself to the squadron under admiral Duncan, occasioned a slackening of the blockade of the Texel; and the enemy, acquainted with his situation, prepared for sea, and in his absence, early in October, slipped out, but he soon gained intelligence of their motions, and on the 11th of October, about nine in the morning, a signal was given of having discovered the enemy: after a pursuit of three hours, the British fleet came up with the Dutch; the action commenced at about forty minutes past twelve o'clock, at which time every ship of the British had broken the enemy's line, and cut them off from getting into the Texel, the land being then distant about seven miles. While the rear was attacked by the larboard division under vice-admiral Onslow, admiral Duncan directed all his attention to the enemy's van, and his own ship, the *Venerable*, was in close action for nearly two hours and a half, when he observed all the masts of the Dutch admiral's ship (*Vryheid*) go by the board; she was, however defended for some time after in a most gallant manner; but was at last obliged to strike to the *Venerable*, admiral de Winter himself being the only man left on the quarter deck, who was not either killed or wounded. The Dutch lost also their vice-admiral, in the ship *Jupiter*, and seven other ships of the line; the remainder having escaped with the greatest difficulty. The attack, on the part of the British admiral, was considered one of the most daring, and the issue of the contest one of the most important, during the war; indeed it afterwards appeared that the Dutch fleet was designed to assist the French in their intended invasion of this country. In consequence of this very brilliant success, the gallant admiral was, on the 1st of the same month, created viscount Duncan of Camperdown, and baron Duncan of Lundie, in the shire of Perth. A pension also of £2000 per annum was granted to him, and the two next heirs of the peerage. He died in 1804. Lord Duncan was married to Miss Dundas, daughter of Robert Dundas, Esq. lord president of the court of session in Scotland, June 6th 1777, by whom he had several children. His first son, Mr. Henry Duncan, died at Edinburgh on the 23d December, 1787; and his second son, Robert, born in 1785, succeeded to the estate and honors.

DUNAN (Daniel), an eminent physician, born at Montauban, Languedoc, in 1649. He received his education at Montpellier, where he took his degree. He resided at Paris till the death of Colbert, who was his patron, after which he removed to his paternal estate at Montauban; but during the persecution of the Protestants, in 1690, he went to Geneva. He afterwards became successively physician to the

prince of Hesse Cassel and the king of Prussia. He died in London in 1745. His works are, *Explanation of the Animal Functions*, *Vegetable Chemistry*; *Salutary Advice against the use of Hot Liquors*, particularly coffee, chocolate and tea.

DUNDAS (Henry), viscount Melville and lord Arncliffe, was born in 1740, and educated at the University of Edinburgh. He was called to the bar in 1763, a member of the faculty of advocates in 1773 became solicitor-general; in 1774 an advocate; and in 1777 joint keeper of the great seal for Scotland. In 1782 he was sworn of the privy council, and made treasurer of the navy; but did not continue long in office, the coalition between lord North and Mr. Fox having dispersed the party. On their return to power, he was in office under the ministry of Mr. Pitt, but he was not firmly attached himself during their administration. On the passing of the act for regulating the affairs of the East India Company, Dundas was appointed president of the board of control; in 1791 he was made secretary of state for the home department; and in 1792 secretary at war. On the resignation of Melville in 1801, he also retired, and was succeeded by count Melville. When the former resigned the helm of affairs, he was appointed president of the admiralty. In 1805 lord Melville was impeached before the house of lords, on charges of crimes and misdemeanors in his office as treasurer of the navy. But the evidence did not directly implicate him in the transactions of his deputy Mr. Trotter. He was accordingly acquitted. But he never afterwards enjoyed any public situation, except that of private councillor. His death took place in May 1811.

DUNDALK, a barony in the county of Dublin, province of Leinster, in which is a borough, market, post, fair, and sea-port town of the same name on a bay of the Irish channel, bearing from Drogheda, and fifty-two miles from London. It lies above twenty-one miles five furlongs from Drogheda, and fifty-two miles from London. Lat. 53° 57', long. 6° 42'. A handsome bridge was thrown over the Castletown River at the end of the town. It is the seat of a barony, and has some trade; it consists of one street, near a mile long, and some cross streets, and a very good market-house, a court-house, and a beautiful specimen of Grecian architecture, the design of the Temple of Theseus; and on a manufacture called Dundalk candles. It has been fortified, though now dismantled, and may be seen by the ruins of the walls, the castle destroyed in 1641. In the reign of James II. it was a royal city, and in the reign of a monarch of Ireland was actually a city. It is very advantageously situated for an inland trade, and the port is very good for shipping. The bay, which is nine miles long and nine inland, has good moorings at the end in four to upwards of eight fathoms water, and very good land-marks either for bringing in or making the harbour, and in crossing the bar, high water in ordinary neap tides, runs from fifteen to eighteen feet water; besides these other good qualities, the bay abounds in all kinds of fish customary in the channel. A pier might be built for about £3000 at a particular

rich would shelter vessels waiting at the bar, and enable the inhabitants to have fuel at a cheap rate, while at the same time they supply the town with a bog ten miles from its mouth, forty feet high, and twenty-three east of Perth. Its commerce is very advantageous.

Here are a charter-school of 264 children on the town's foundation, and an endowed school of high character; a Protestant and a Roman Catholic chapels, and two others, one for Presbyterians, the other for Catholics.

Exports, corn, live cattle, beef, mutton, coal and flax-seed. Manufactures, soap, and leather; here is a great trade.

Dundee is a royal borough of Scotland, in the county of Fife, situated on the north-side of the Firth of Tay, five miles from its mouth, forty feet high, and twenty-three east of Perth. Its commerce is very advantageous. One of the largest burdens can get into the town by the quay there are very commodious warehouses, as well as good buildings, which is carried on to the quay.

The houses are built of stone, or four stories high. The market-place is in the middle of the town is a long square, from whence branch the principal streets, which, with a number of lanes, are well paved. On the south-west corner stands the town house; a large building, with a very handsome front, and a neat spire over it 140 feet high. This building was finished in 1734, by the gift of the town, the court-room, the repository for the records, and the prison, which is in the upper story, and is a place of great utility to the taste and humanity of the town, under whose auspices it was constructed. It is well aired commodious rooms, at the top of the building, and is very strong and secure. The old shambles, which were formerly in the High street, were removed, and was erected by the nine incorporated companies of the town, at the east end of the above large building, with a large and elegant ground floor of which is a very commodious hall, and several merchants' shops; over the shops are public rooms for each company, and a common hall fifty feet long, and twenty-five feet high; and at the top of the building is a square decorated with a clock. St. Andrew's Church, also built by the town, stands on a rising ground from the Cowgate-street; and has a steeple 120 feet high, with a peal of bells. Dundee has also four other churches, in which were originally four hundred and thirty-four persons, had been a very magnificent building, a large square Gothic tower or steeple, on the west end of the town, in the form of a cross, erected by the earl of Huntingdon, brother to William the Lion, and was dedicated to the Virgin Mary. He did on his return from the continent, with 500 of his countrymen, accompanied Richard I. of England, in gratitude for his deliverance from the hands of the Danes, and particularly from

shipwreck, by which he had nearly perished when in sight of this town. At the same time he changed its name from Alectum to Dei Donum, whence its present name is thought by many to be derived; while others maintain that its name was Duntay, or the Hill of Tay. A hill rises on the north of the town to a great height, and is called The Law of Dundee. On its top, there are evidently the remains of a camp, said to have been first erected by Edward I. of England, and last repaired by general Monk. Dundee had an old castle which was demolished by the celebrated Scotch governor Sir William Wallace, who was educated in this town, which so exasperated Edward I. that, taking the town by storm, he set fire to the churches; and a number of the inhabitants, having taken sanctuary there, with their most valuable effects, were all burnt along with them. The desolation he brought on the church continued till the year 1787, when a noble edifice began to be built on the site of the one that was burnt down, in which the ancient Gothic of the outside is excellently united with internal modern architecture, making one of the largest and neatest churches in the kingdom, and again completing the superb superstructure, as erected at the first by the earl of Huntingdon. Besides the public grammar-school, and the English schools, there is an academy, or rather college, for mathematics, the French and Italian languages, and the polite arts, with proper professors in the different branches, and a large apparatus for natural and experimental philosophy. This town suffered greatly last century during the civil war, being sometimes under the command of one party, and at others of another. In 1645 the marquis of Montrose took it by storm; and in 1651, under the command of his provost major-general Lumden, it vigorously opposed general Monk, who carried it by storm, September 1st, and put all in arms to the sword. And so great were the riches of Dundee, all the neighbouring gentlemen having retired to it with their best effects, as a place of safety, that every private soldier in Monk's army had nearly £60 sterling to his share of the plunder, there being above sixty merchant vessels in the harbour at that time; and the like number of vessels sailed for England loaded with the spoils of the unfortunate inhabitants. The magistrates have been at great expense in enlarging and fitting up the harbour, so as to render it of easy access, safe and commodious; and have made the passage over the Tay, where there is a great resort, so convenient, that travellers with their horses can get over it at any time of tide; a sufficient number of boats properly manned being always ready. The river Tay before Dundee is about three miles broad; and, being sheltered by high lands on both sides, is a safe road for ships of the greatest burden. The piers are extensive, broad, and well adapted for the purposes of loading and discharging vessels; and the harbour is equal to any in Scotland. There are upwards of 160 ships of different denominations belonging to the port, which employ upwards of 1300 seamen in the Greenland fishery, and the Baltic and the London trades. A wet-dock has been constructed on a

very extensive scale, and on the quay are several new ranges of warehouses. The principal manufacture here is of linen, particularly osanaburghs, canvas, bagging, &c., for exportation, and the Dundee colored thread has long been in high repute. Two sugar-houses are also established here. Till 1745 the town had only drawwells; but since that period, it is most amply supplied from a large fountain of excellent water, conveyed into the town in leaden pipes, and discharged by good wells at proper distances. The salmon fishing in the Tay is of much importance; and the town is well supplied with fish of various kinds, though much raised in price of late years, on account of the quantities sent to London. Dundee was the birth-place of the celebrated Hector Boethius. It possesses the privilege, separately, of returning one representative to the British parliament.

**DUNDONALD CASTLE**, an ancient royal castle, seated on an eminence near a village of the same name, where Robert II. the first monarch of the house of Stuart, resided much and at last died in 1390.

**DUNFERMLINE**, a royal borough of Fife-shire, Scotland, fourteen miles west of Kirkcaldy, and fifteen north-west of Edinburgh. The greatest part of the town is situate on a hill which commands a view of the surrounding country. Here are the remains of a magnificent abbey and palace of the kings of Scotland, in which the princess Elizabeth, daughter of king James I. was born. In the inn of this town was the marriage bed of James VI. and his queen; it is still entire, and is now in the possession of the earl of Elgin. This place is noted for a manufactory of figured diapers. It is governed by a provost, two bailies, dean of guild, and eighteen counsellors, among whom are the eight deacons of incorporations. The houses of Dunfermline are well built, and the size of the town is rapidly increasing. A large suburb, connected by the bridge, and road over the glen on the west, opposite to the principal street, add much to the elegant appearance of the town. This bridge is of a peculiar structure. An arch 207 feet long, twelve broad, and fifteen feet five inches high, was thrown over the burn in the bottom of the glen; and the remaining hollow filled up by a mound of earth, sixty-eight feet six inches thick at the centre, having a gradual slope on both sides to the extremity of the stone arch below. On the top is the road, enclosed on both sides by houses forming a very neat street. On the slopes of the mound, and at the back of the houses, are very convenient hanging gardens. The church of Dunfermline was the burial place of several of our Scottish monarchs; particularly of Malcolm III. with his queen St. Margaret; Edgar; Alexander I. with his queen Sibilla; David I. and his two queens; Malcolm IV.; Alexander III. with his queen Margaret; and Robert I. with his queen Isabel; besides many other princes and nobles. About 85,000 tons of limestone are quarried in the neighbourhood; and about 200,000 bolls of limeshella, and 35,000 chuldrons of lime, are sold annually; 90,000 tons of coals are also raised, of which 60,000 are exported. A beautiful specimen of the art of

weaving is preserved in the chest of the corporation. It is a man's shirt wrought in the last, about 100 years ago, by a weaver of the name of Ingles. The shirt is without seam, and is finished by the ingenious artisan, who has at least assistance from the needle. Dundee has eight annual fairs and a market on Friday.

**DUNG-HILL**,

**DUNG-YARD**,

**DUNG**, *v. adj.*

fatten land. To manure with dung. Dung, base, mean, vile.

He raiseth the poor out of the dust, and lifts up the beggar from the *dung-hill*, to set them among princes. *Bible. 2 Sam. i. 1*

The poor he raiseth from the dust.

Even from the *dunghill* lifts the just. *Sage*

His *dunghill* thoughts, which do themselves raise To dirty dross, no higher dare aspire. *Figures in Language*

Out, *dunghill*! dar'st thou brave a nobleman? *Shakespeare*

I, his brother, gain nothing under him for pork for the which his animals on his *dunghill* are much bound to him as I. *Id. As You Like It*

We need no grave to bury honesty;

There's not a grain of it, the face to earth.

Of the whole *dungy* earth. *Id. Winter's Tale*

For *dung*, all excrements are the refuse and satisfactions of nourishment. *Bacon's Natural History*

It was received of old, that *dunging* at evening when the west wind bloweth, and in the darkness the moon, doth greatly help.

*Bacon's Natural History*

For when from herbs the pure part must be taken From gross by 'stulling, this is better done.

By despised *dung* than by the fire or sun. *Id.*

There cannot be a more evident, palpable manifestation, of poor, degenerate, *dunghill* breeding, than a rude, unpolished, *dunghill* manner. *Manners*

There as his dream foretold, a cart he found That carried compost forth to *dung* the ground. *Dryden*

Perhaps a thousand other worlds, that lie

Remote from us, and latent in the sky,

Are lightened by his beams, and *dunghill* earth

Of which our earthly *dunghill* is the worm. *Id.*

Two cocks fought a duel for the mastery in a *dunghill*. *Id.*

Never enter into a league of friendship with an ingrateful person; that is, plant not thy trust upon a *dunghill*: it is too noble a plant for a *dunghill* soil. *Id.*

He soon would learn to think like me,

And bless his ravished eyes to see

Such order from confusion spring.

Such gaudy tulips raised from *dung*. *Id.*

*Dung-forks* and paddles are common every where.

Any manner of vegetables cast into the *dunghill*.

They are not hawks or vultures; they are not able fowls whose flight is not above their *dunghill* nest.

Aye, as the *dunghill* may conceal a gem

Which is now set in gold, as jewels should.

**DUNGANNON**, a barony in county Tyrone, province of Ulster, having in it a *dunghill*.

CF, HILLS or, two artificial mounts  
of the same name in Stirlingshire

said to be of great antiquity. Each of them covers about an acre of ground. The whole structure of these mounts is of earth; but they are not both of the same form and dimensions. The more easterly one is perfectly round, resembling an oven, and upwards of fifty feet in height. The other bears no resemblance to the eastern one either in shape or size. At the foundation it is nearly of a triangular form; but the superstructure is quite irregular; nor does the height thereof bear any proportion to the extent of its base. These mounts are now planted with firs, which, with the parish church of Dunipace standing in the middle between them, and the river running hard by, give this valley a very romantic appearance. The common account given of them is, that they were erected as monuments of a peace concluded in that place between the Romans and the Caledonians, and that their name partakes of the language of both people; dun signifying a hill in the old language of this island; and pax, peace, in the language of Rome. And we find in history, that no less than three treaties of peace were, at different periods, entered into between the Romans and Caledonians: the first, by Severus, about A.D. 210; the second, soon after, by his son Caracalla; and the third, by Carausius, about 280; but of which of those treaties Dunipace is a monument, we cannot pretend to determine.

DUNKELD, a town of Scotland, in Perthshire, seated on the north side of the river Tay, in a situation truly romantic, among high and almost inaccessible crags, partly naked and partly wooded. It is the chief market town of the Highlands, and has been greatly improved with buildings by the dukes of Athol. It was the capital of ancient Caledonia. About the dawn of Christianity, a Pictish king made it the seat of religion, by erecting a monastery of Cul-dees there; which king David I., in 1130, converted into a cathedral: it ranked as the first in Scotland. The entire shell of the cathedral still remains, the east end serving for a parish church, on the north side of which is the burial place of the dukes of Athol. The architecture is simple and elegant, the pillars are round. The monument of one of its bishops remains in the south aisle of the nave, with that of Alexander Stuart, earl of Buchan, third son of Robert II., called, for his cruelty, The Wolf of Badenoch. The tower at the west end, with a singular crack down one of its sides, adds to the picturesque appearance which the whole makes, among the venerable pines at the end of the duke's garden. His grace's seat is a neat modern building, with pleasant gardens, and a fine cascade on the water of Brian, which, in its way from the western hills, forms a fall of 150 feet, called the Rumbling Brig, from a narrow bridge made by the fall of two rocks across the stream. Dunkeld has four fairs, January 21, February 3, March 8, and second Tuesday in November. Besides the tanning of leather, the linen manufacture has been carried on to considerable extent, for a number of years, and the manufacture of cotton goods is now also introduced. Dunkeld is fifteen miles north-west from Perth.

**DUNKIRK**, from *dun*, Celt. a hill, and *kirk*, Flem. a church; a maritime town of France, in the department of the north, and ci-devant province of French Flanders. It is the most easterly harbour on that side of France which is next to Great Britain, and was originally a mean hamlet, consisting only of a few fishermen's huts. Baldwin, earl of Flanders, about A. D. 960, thinking the situation convenient, enlarged it into a town, and surrounded it with a wall. In the year 1322 Robert, earl of Flanders, who held it as an appendage, built a castle for its defence, which was afterwards demolished by the revolt of Flanders. Robert of Bar erected a fortification round it, the remains of which are visible on the side next the harbour. The emperor Charles V., who held it as part of Flanders, built another castle to defend the harbour, but this was also demolished soon afterwards. In 1558 the French, under marshal de Thermes, took Dunkirk by storm, and almost ruined the place; the Spaniards recovered it again in about a fortnight, and put all the French to the sword. During a peace procured for the inhabitants by Philip II. of Spain, they rebuilt their town with greater splendor than before, and flourished for some time by privateering against the Dutch; at length they fortified their town and harbour, and fitted out fifteen ships of war at their own charge. In 1634 the inhabitants agreed with those of Bergues to dig a canal, at their joint expense, for a communication between the two towns; which was some time afterwards effected. By this time Dunkirk was become the best harbour the Spaniards possessed in Flanders, which induced many foreigners to settle there; and, it being necessary to enlarge the town, a new fortified wall was built at a considerable distance from the former. In 1646 it was besieged and taken by the prince of Condé. In 1652 it was retaken by the archduke Leopold, then governor of the Netherlands. France entering into a treaty with England, in 1655, the Dunkirkers, with views of pecuniary advantage, fitted out privateers against both these powers; the consequence of which was, that the French, assisted by Cromwell, attacked and took it, and it was left in the hands of the English. It was even then of great importance to us; for, during the war in which it was taken, the Dunkirkers had made prizes of no less than 250 English vessels, many of which were of great value. The fortifications were now, therefore, improved, and a citadel built; yet the English kept it only four years; for in 1662, two years after the Restoration, Charles II. sold this valuable acquisition to France, for the paltry sum of £500,000. It was accordingly taken possession of, for Louis XIV., by the count d'Estrades, on the 29th November, 1662. The celebrated engineer, Monsieur Vauban, now erected an arsenal here, large enough to contain all the stores necessary for fitting out and maintaining a large fleet; the fortifications on the land side were constructed in a manner that was thought to render them impregnable; and, towards the sea, the entrance of the harbour was strongly fortified. These works were completed in 1683; and, in 1685, the whole circumference

of the basin was faced with masonry, and the quays completely formed. In 1686 the tower, called the Cornichon, and some other works were added. Upwards of thirty years were employed in improving the fortifications. After the treaty of Utrecht, it having been made known that the privateers of Dunkirk had, during the war then closing, taken from the English more than 1614 prizes, valued at £1,334,375, it was stipulated, that the fortifications of town and port of Dunkirk should be entirely destroyed, and the harbour filled up; and queen Anne and colonels Armstrong and Clayton, to inspect the execution of this part of the treaty. A dyke bar was now built across the mouth of the harbour, between the jetties and the town, by which all communication between it and the sea, which formed its entrance, was entirely cut off. The sluices were also broken up, and the materials of them broken to pieces. This was not accomplished, when Louis XIV. ordered his men to construct the new canal of Marais, which in a short time they accomplished, and the harbour was rendered almost as commodious as ever; but in 1717 this likewise was rendered unserviceable. In 1720, during a great storm, the sea broke up the bar, and restored the harbour in a very considerable degree. Then, in 1740, Great Britain was engaged in war with Spain, Louis XV. set about improving to advantage which Dunkirk had derived from the storm in 1720, by restoring the works and repairing the harbour. He rebuilt the citadel, erected new forts in the place of those which had been destroyed; and soon afterwards espoused the cause of Spain, and became principal in the war. But at the peace of Villa-Chapelle, in 1748, it was stipulated, that the works towards the sea should be done a second time; yet, in 1756, the place was again in a good state of defence. At the end of 1763 it was once more stipulated that British commissary should reside at Dunkirk, to see to the destruction of this harbour. After the peace of 1763 he was withdrawn, and the French were left to resume their wars. The British, under his late royal highness the duke of York, laid siege to this town in 1763, but were soon obliged to abandon it.

Dunkirk is, on the whole, a well-built city; the houses are chiefly of white brick; but they consist of more than two stories. It is a place of brisk trade in fish, corn, colonial produce, and home manufactures. Its chief inconvenience is a scarcity of fresh water. The harbour is extensive and elegant; and the churches contain some beautiful paintings. The town is approached by a canal of a mile and a half in length, the port and basin being in the middle of the town; the roadstead is at the extremity of the canal, and formed by a dyke running parallel to the shore. A moat or ditch surround the town. Dunkirk was raised to the privilege of a free port by a royal ordinance of the 22d April, 1816. Population, 20,000. It is twenty-five miles north of Calais, and forty north-west of Lille.

**DUNMORE**, EAST, a post town in the county of Waterford, eighty-four Irish miles from

Waterford city, lat.  $50^{\circ} 8' 17''$ , is remarkable for a pier built a packet station to ply between Ilford Haven, from which it is eight nautical miles. This great work was taken at the expense of government as a step in the desirable object of facilitating communication between Ireland in 1814, from a cost of £80,000. The packets formerly arrived at or from Cheek Point, the river and Barrow rivers; and at not unfrequently wind-bound, it is immediately upon the Atlantic, carried into five fathoms at low tide at all times, and may be reached in all winds. The pier is a conglomerate rock, which has been rubble stone consumed in its construction, carried in a N. N. E. direction 1000 feet, having a base of 250 feet back, being exposed to the Atlantic, is paved with enormous stones. The inside of the pier is a wall, forty-five feet in height, of sand-stone; the foundations of the pier are of the diving-hell in of water. On the quay is an vaulted apartments, containing residence, coals for the steam stores. The platform over these is a promenade, and has a light-house, the design of which is a lantern, copied from the pillars of the lantern exhibits red and bright towards Waterford a slip constructed on the inside of the harbour, being a safe and convenient place for unloading at all times. On the side of the harbour is a small rock-formed pier, perforated by natural arches; this rock, below water, is marked by a bridge of very simple construction. This island divides the space into an outer and inner harbor of which, a surface of six acres is sheltered from the Atlantic by the judicious position of the outer might be so enlarged as to admit line of battle ships. This is a fully realised expectation; the pier in its construction is very small, during the period of the erection little or no damage was sustained that were necessitated to seek

Little, a village in Essex. It had been still famous for the custom of the reign of Henry III., by Robert Fitzwalter, now the tenure of the manor: whatever married couple will go to wear, kneeling upon two sharp stones in the church, that they had not repented of their marriage, within a year after it took place, shall receive of the manor a fitch of bacon. This custom mentions several that have

claimed and received it. It has been actually received so lately as since the year 1750, by a weaver and his wife, of Coggeshall in Essex. It has been demanded more recently still; but the ceremony being attended with considerable expense to the lord of the manor, the demand is now evaded. See BACON, SERVICE OF THE.

DUNN (Samuel), an English mathematician, born at Crediton in Devonshire. He opened a school in his native town, where he gained considerable reputation as a teacher, and where he continued for several years. He afterwards removed to Chelsea, where he kept an academy, and became mathematical examiner for the East India service. He published an *Atlas*, folio; *Treatises on Book-keeping, Navigation, &c.* He died in 1792, and left his property towards founding a mathematical school at Crediton.

DUNNEMARLE CASTLE, i.e. the castle near the sea, an ancient fort of the Macduffs, thanes of Fife, now in ruins; said to have been their utmost boundary to the west. It was here that lady Macduff and her children were murdered by the tyrant Macbeth. It was seated on the banks of the Forth, in a fine situation, now called Castle-hill.

DUNNING (John), an eminent English lawyer, born at Ashburton in Devonshire, in 1731, where his father practised as an attorney, and where he began the studies connected with his profession. But after continuing some time with his father, he entered of the Temple, and was called to the bar, where he soon distinguished himself as an able lawyer and a powerful orator. He likewise obtained a seat in parliament, where he was particularly noticed on the side of the opposition. He afterwards became solicitor-general and recorder of Bristol, and chancellor of the duchy of Lancaster. In 1782 he was created lord Ashburton, but died the year following, leaving an infant son to inherit the title. His lordship was an upright lawyer, and it is recorded of him, much to his honor, that he often pleaded the cause of the poor unsolicited, and without a fee.

DUNNOTAR CASTLE, an ancient fortress, now in ruins, built in the reign of Edward I. by an ancestor of the Marischal family. In 1661 the regalia of Scotland were lodged in it, to preserve them from the English army, and a garrison, with ammunition and provisions, obtained for their defence by E. Marischal, the proprietor; who, upon joining the king's forces in England, appointed George Ogilvy, of Barmas, lieutenant-governor of the fort. This trust he maintained with the greatest heroism. For though besieged and summoned to surrender by general Lambert, so early as November 1651, he held out obstinately for six months, till May 1652; when, the siege being turned into a blockade, and provisions and ammunition all spent, the garrison began to mutiny, and he at last capitulated upon honorable terms; but not till he had privately conveyed the regalia to the clergymen of Kinross. The English not finding the regalia, shut up the governor and his wife close prisoners for years, using every means of severity and allurements to produce a discovery, but in vain. Mr. Ogilvy continued faithful to his trust till the Restoration, when he

returned the regalia to E. Marischal; but to the disgrace of Charles II.'s administration, received no other reward for all his fidelity, sufferings, and losses, but the title of baronet, and a new coat of arms! In 1685 Dunnottar castle was employed as a prison for 167 Presbyterians, who had been seized in the west of Scotland, during the persecution, and were here treated with the greatest cruelty; the whole number of men and women being confined during the warmest season of the year, in one vault, which is still to be seen entire, and hence called the Whigs' Vault. A list of their names is on record in the sheriff court office of the county; and a grave-stone in the church-yard of Dunnottar, placed upon those who died under the confinement, narrates the fact.

DUNSE, a market town of Scotland, in the county of Merse, containing about 2100 inhabitants. It is situated on a rising ground in the middle of the county, and has a weekly market for cattle. Dunse has four fairs, in March, June, August, and November, for horses, sheep, and black cattle.

DUNSINNAN, a hill of Scotland in Perthshire, celebrated in dramatic story by the immortal Shakspeare. It lies partly in the parish of Collace and partly in that of Abernethy. The ruins of Macbeth's castle are still to be seen on that part of the hill which lies in Collace. 'The site of it,' says Mr. Adamson, 'was admirably chosen for a place of defence, being a conical rising on the west end of the hill, almost inaccessible except on one side. The excellence of its situation had before pointed it out to Kenneth III. and other kings, as a secure place of residence. Upon the top of king's seat, there is the ruin of a circular enclosure, similar to Macbeth's castle, but much smaller. This, as it commanded a more extensive prospect than the castle, taking in a vast extent of country, great part of the sea-coast, from the mouth of the Frith of Forth, to the south Esk, probably was a watch-tower, or outpost; and from this circumstance had received its name.'

DUNS SCOTUS (John), a Franciscan friar, commonly called Doctor Subtilis, was born in 1274; but whether in England, Scotland, or Ireland, has long been a matter of dispute among the learned of each nation. When a boy, he became accidentally known to two Franciscan friars; who, finding him to be a youth of extraordinary capacity, took him to their convent at Newcastle. From thence he was sent to Oxford, where he was made fellow of Merton College and professor of divinity; and Mackenzie says, that not less than 30,000 students came to Oxford to hear his lectures. His fame was now become so universal, that the general of his order sent him to Paris, in 1304, where he was honored first with the degree of B. D. then of D. D. and in 1307 was appointed regent of the divinity schools. During his residence here, the famous controversy about the immaculate conception of the virgin Mary arose. Albertus Magnus maintained that she was born in original sin. Scotus advanced 200 arguments in support of the contrary opinion, and convinced the university, that she was really conceived immaculate. This important nonsense continued to be disputed till 1496, after the

council of Basil, when the University of Paris made a decree, that no student who did not believe the immaculate conception, should be admitted to a degree. Our author had not been above a year at Paris, when his general seat was to Cologne; where he was received with pomp and ceremony by the magistrates and nobles of that city, and where he died of an apoplexy soon after his arrival, in 1308, at the fourth year of his age. Paul Jovius and others have reported, that Scotus was buried in an epileptic fit; and that, upon removing his body, appeared to have turned himself in his coffin; he was doubtless one of the first wranglers of his time, admirably well versed in scholastic divinity, and a most indefatigable writer; and, if his huge volumes hardly contain a page unworth perusal, it was the fault of the age. He was author of a new sect of schoolmen called Scotists, who opposed the opinions of the Thomists; he was a most voluminous writer; his works numbering 12 vols. folio; as published at Lyons by Luc Wadding, in 1629.

DUNSTABLE, a town in Bedfordshire, was a market on Wednesdays; was made a borough and market town by Henry I. who had a palace near the church, called Kingsbury; he also built a priory here, of which there remains only a part. The front of the church is singular; the great door is under a window arch, richly ornamented with various grotesque sculptures; the tower stands at the north-east angle of the building. The town is seated on a chalky hill. It has several good inns, and is a great thoroughfare on the northern road; consists of four streets, intersecting each other at right angles; and in the centre stood one of the beautiful crosses of queen Eleanor, but destroyed by the enthusiasts in the times of the civil wars. Here is an extensive manufactory of various articles of use and ornament, particularly hats, known by the name of dunstable, all over the kingdom; and which employ a great number of women and girls. It is seventeen miles south of Bedford, and twenty north-west of London.

DUNSTAFNAGE, an ancient castle and royal palace of Scotland, in the county of Moray and Lorne. It was a chief seat of the Scottish kings before the conquest of the Picts by Kenneth II., A. D. 843. In this place was long preserved the famous stone, the palladium of Great Britain, says the legend, out of Spain, which was first used as a seat of justice by the son of Cecrops, contemporary with Minos, continued here as the coronation chair in the reign of Kenneth II. who removed it to Perth. Some of the ancient regalia were preserved here, but the late keeper's servants, during his infirm years, embezzled them for the ornaments; and left only a battle-axe, and a sword of beautiful workmanship, and ornamented with silver. The castle is square; the walls are eighty-seven feet; partly ruinous, partly inhabitable. At three of the corners are round towers; one of them projects very little. The church is towards the east at present by a staircase of old times probably by a drawbridge, and entered from a little gateway. The manse is a

erient; the tops battlemented. This pile  
 ed on a rock at the mouth of Loch Etive,  
 waters expand within to a beautiful bay,  
 ships may safely ride in all weathers. Of  
 king, the founder of which is unknown,  
 remains except the outer walls, which,  
 roofless, are still in good order; and  
 which some buildings have been erected,  
 serve as the residence of the laird. The  
 of Argyll is hereditary keeper under the  
 —At a small distance from the castle is a  
 chapel, once an elegant building; and at  
 ed an enclosure, a family cemetery. Op-  
 to these is a high precipice, ending ab-  
 and turning suddenly towards the south.  
 A person concealed in the recess of the  
 a little beyond the angle, surprises friends  
 ed at some distance beneath the precipice  
 a very remarkable echo of any word, or  
 sentence, he pronounces; which reaches  
 last distinct and unbroken. The repeti-  
 single, but remarkably clear. In 1307  
 title was possessed by Alexander Macdou-  
 of Argyll, a friend to the English; but  
 that year reduced by Robert Bruce, when  
 sought for peace with that prince, and  
 received into favor. About 1455 it was  
 residence of the lords of the Isles; for here  
 last earl of Douglas, after his defeat in  
 battle, fled to Donald, the regulus of the  
 and prevailed on him to take arms and  
 in a predatory war against his sovereign,  
 II.

DUNSTAN (St.), an Anglo-Saxon divine and  
 man of the tenth century, whose history  
 has come down to us sufficiently adorned with  
 facts. He appears to have been born about  
 925, and to have been educated at Glas-  
 gow by Irish ecclesiastics. In addition to a  
 knowledge of the Latin tongue, and the usual  
 of his profession, he acquired in his  
 a considerable skill in music, metallurgy,  
 the arts of painting and carving. He con-  
 structed an organ of brass pipes, and filled with  
 him bellows; and there is preserved in the  
 library a drawing made by him of  
 himself kneeling at his feet. He  
 excelled, like a modern statesman and prince  
 of peace, in preparing ladies' robes, to be after-  
 embroidered (MS. Cleop. b. 13.). Thus  
 finished, he was early introduced to the  
 of king Athelstan, by his uncle Athelm,  
 bishop of Canterbury. But some indiscretion,  
 jealousy of the courtiers, compelled him to  
 retire from this hopeful scene; and the disap-  
 pointment of his prospects produced a serious  
 illness. He now took the vows at Glas-  
 gow, and devoted himself with ardor to the  
 study of St. Benedict. It is said that he  
 lived between the church and the poor at this  
 a valuable estate bequeathed to him by a  
 Saxon lady, as well as his paternal  
 estate. To this period of his life is also  
 attached the memorable legend of his conflicts  
 with the spirit of darkness, who is said to have  
 tormented him often in his cell; till he one day  
 beat the demon by the nose with a red-hot  
 iron pincers, after which he no more molested  
 him. On the accession of Edmund, the brother

and successor of Athelstan, he was again invited  
 to court, and the rich abbey of Glastonbury was  
 bestowed on him. He advanced still higher in  
 the confidence of Edred, the next monarch, who  
 made him his prime minister.

At the coronation feast of his successor, Edwy,  
 this lordly ecclesiastic distinguished himself by  
 a remarkable outrage on the person of the king.  
 'The popular account of this affair is, that the  
 young prince had espoused a beautiful young  
 lady of the royal blood, Elgiva, who was pro-  
 nounced by the monks to be within the canon-  
 ical degrees of affinity. Before his accession,  
 therefore, she had been a source of dispute  
 between the dignified ecclesiastics and the king.  
 On the coronation-day he did not obtrude her  
 claims upon the people; nor, on the contrary,  
 would he forego his private comforts in her  
 society. When the barons were indulging  
 themselves in the pleasures of the feast, Edwy  
 retired to his domestic apartments, and, in the  
 company of Elgiva and her mother, laid aside  
 his crown and regal state. Dunstan surmised  
 the cause of his retreat; and taking with him  
 his creature Odo, the nominal primate, pene-  
 trated into the interior of the palace, upbraided  
 the prince with this untimely indulgence of his  
 passions, and after branding his consort with the  
 most opprobrious name of woman, brought him  
 back with considerable violence into the hall.  
 Mr. Turner, our able Anglo-Saxon historian,  
 regards the transaction as a bold attempt of  
 Dunstan to subvert the regal power to his  
 ambition. He represents the nobility as evincing  
 some displeasure at the king's early departure,  
 and the anxiety of Odo to communicate the  
 state of their minds to Edwy. That the persons  
 he first addressed excused themselves from  
 undertaking this errand: and the commission  
 devolved by a sort of general wish on Dunstan,  
 and Cynewulf, a bishop, his relative. 'But with  
 the delivery of the message,' he observes, 'his  
 commission must have terminated; and on the  
 king's refusal [if he did refuse] it was his duty  
 to have retired. As an ecclesiastic, he should  
 not have compelled him to a scene of inebriety;  
 as a subject, it was treasonable to offer violence  
 to his prince.'

'The latest, and not least able of our English  
 historians, however, would place these events in  
 a different light. He insists, somewhat in the  
 spirit of the monkish writers, on this amour  
 being highly disgraceful to the king; and while  
 he represents it as 'the scandal of the age'  
 (whose sources, in the king's disputes with the  
 ecclesiastics, Mr. Lingard in any other instance  
 would have readily traced), he states it as not  
 altogether incredible that both Ethelgiva, the  
 mother, and her daughter, whom he does not  
 name, had sacrificed their honor to the equivocal  
 ambition of one of them becoming queen. The  
 nobles, he adds, accompanied their demand for  
 the king's return with an injunction in the name  
 of the whole assembly, for Ethelgiva to leave the  
 court. The rest of his account does not mate-  
 rially differ from that of former historians. But  
 with all the unfeigned respect for his impartiality,  
 with which the perusal of this writer's volumes  
 has inspired us, we cannot hold him successful

in this attempt to disengage the character of Dunstan and his associates from the imputation of great indecorum.

Were the lady the king's mistress, and not his wife, was a dignified ecclesiastic justified in following him into her apartments? and, had the amour been ever so unbecoming, was this a species of conduct likely to detach him from it? But the story of the wife and daughter together speculating upon his affections is surely improbable in the highest degree: we know that the monkish writers, who furnish the only account we have of the transaction, would call a wife, espoused in opposition to the will of the church, a mistress; and the sufferings of the young monarch from this interference with his affections, should teach us to exercise the judgment of charity on his memory.

Dunstan was now compelled to retire to Flanders, and this was a severe blow to the monks, who were expelled from several monasteries; but their sufferings were not of long continuance. For Edgar, the younger brother of Edwy, having raised a successful rebellion against the latter, and usurped his dominions north of the Thames, recalled Dunstan, and gave him the bishopric of Worcester, A.D. 957. From this time he was the chief confident and prime minister of king Edgar, who became A.D. 959 sole monarch of England. In 960 Dunstan was raised to be archbishop of Canterbury; and being thus possessed of the primacy, and assured of the royal support and assistance, he prepared to execute the grand design which he had long meditated, of compelling the secular canons to put away their wives, and become monks; or of driving them out, and introducing Benedictine monks in their room. With this view, he procured the promotion of Oswald to the see of Worcester, and of Ethelwald to that of Winchester: two prelates who were monks themselves, and animated with the most ardent zeal for the advancement of their order. These confederates, by their arts and intrigues, in the course of a few years, filled no fewer than forty-eight monasteries with Benedictines. But on the death of Edgar in 975 they received a check. The sufferings of the persecuted canons had excited much compassion; and many of the nobility, who had been overawed by the power and zeal of the late king, now espoused their cause, and promoted their restoration. Elfric, duke of Mercia, drove the monks by force out of all the monasteries in that extensive province, and brought back the canons, with their wives and children; while Elfwin duke of East Anglia, and Brithnot duke of Essex, raised their troops to protect the monks in these countries. To allay these commotions several councils were held: in which Dunstan was so hard pressed by the secular canons and their friends, that he was obliged to have recourse to miracles, we are told, to overcome their opposition. St. Dunstan died A.D. 988, in the sixty-fourth year of his age, having held the bishopric of London, together with the archbishopric of Canterbury, about twenty-seven years.

DUNWICH, a town in Suffolk, most of

which is destroyed by the sea, and not one church left in the market on Saturday; until 1592 a sea-bombardment sent 2000 persons to parliament. The walls of the town are close seven acres, and the remains of the city are yet visible. It is thirty miles from Ipswich, twenty-four south of Yarmouth, ninety-nine north-east of London.

DUO, in music, a song or composition performed in two parts only, one sung, played on an instrument, or by two voices when two voices sing different parts, accompanied with a third, which is a bass. It is seldom that unisons and thirds are used in duos, except at the beginning.

DYODECUPLE, *adj.* Lat. *duo* and *decem*. Consisting of twelve.

Grisepius, a learned Polander, endeavored to establish the dyodecuple proportion among the numbers, by comparing some passages of Scripture together.

DU PAN (James Mallet), a modern French writer, was born at Geneva in 1745, appointed through the interest of Voltaire, professor of belles lettres at Cassel, and went to Paris. During the three years of the first French assembly he published an able analysis of their debates. Being appointed in 1792 on a confidential mission to the XVI. to his brothers, his estate, and the whole of his personal property, was confiscated. He after this wrote at Brussels on the French Revolution, which was translated and eulogised by Mr. Burke. He finally carried on a journal in London, called *le Courrier Britannique*. His death took place in 1800.

DUPE, *v. a. & n. s.* Dr. Johnson defines it, *Fr. duppe*, a foolish bird, easily caught. The verb, to dupe, is probably the root, and derived from Lat. *duplex*, double. The trick: one easily tricked or imposed on.

An usurping populace is its own dupe, a workman, and a purchaser in trust for a tyrant.

First slave to words, then vassal to a king,  
Then dupe to party; child and man the same.

The throne a bigot keep, a genius quit,  
Faithless through piety, and duped through wit.

For, believe me, you will find, that in the world there is not a fairer subject for satire and ridicule, than a knave become the dupe of his own art.

I have not been thy dupe, nor art thou my dupe.  
But was my own destroyer, and will be  
My own hereafter.—Back, ye baubles of the world!  
The hand of death is on me—but not yet.

DUPIN (Lewis Elia), a learned Frenchman, of the Sorbonne, and one of the greatest of his time in ecclesiastical matters, was born in 1657. When he published the *Essai de la Bibliothèque Universelle des Sciences Ecclésiastiques*, in 1686, the liberty, and treated some ecclesiastical writers with severity, that M. de Harlay, archbishop of Paris, obliged Dupin to retract many passages, and suppressed the work. He was never

E. EDWARDS.

to continue it, by altering the title from *Bibliothèque Universelle*, to *Bibliothèque Nouvelle*. This great undertaking, continued in several successive volumes, though sufficient to employ the life of an ordinary man, did not deter M. Dupin from publishing several other works. He was professor of philosophy in the college; but was banished some time from his chair to Chatelleraut, on account of the famous *Cas de Conscience*, but was restored, and died in 1719.

**DUPPLICATE**, *v. a.*, *n. s.* & *adj.* } French  
**DUPPLICATION**, *n. s.* } *duplicita*,  
**DUPPLICATION**. } from Lat.  
*duplex*, *i. e.* *two*, *two*, and *plicatus*, from *plere*, to fold; twice folded; double. To make double, or enlarge by doubling; to fold; the same thing or number so added: for the arithmetical use of the adjective, see the example. *Plication* is synonymous with duplicate.

And some alterations in the brain duplicate that which is but a single object to our undisturbed senses.

*Glanville.*

That great pains hath been taken concerning the nature of a circle, and the duplication of a cube, and some other mathematical problems.

*Hale's Origin of Mankind.*

The lymphducts, either dilacerated or obstructed, separate themselves into the foldings, or between duplicatures of the membranes.

*Ray on the Creation.*

A duplicate proportion is the proportion of squares. It is in a rank of geometrical proportions, the first to the third is said to be in a duplicate ratio of the second; so in 2, 4, 8, 16, the ratio of 2 to 8 is a duplicate of that of 2 to 4, or as the square of 2 to the square of 4.

*Phillips. Harris. Baileys.*

It has been found, that the attraction is almost regularly in a duplicate proportion of the distance of the middle of the drop from the concourse of the rain.

*Newton.*

Working is more needful for perfecting the natural strength of bodies, than the subjecting them to the fire; each end I have reserved duplicates of the most considerable.

*Woodward.*

The peritonæum is a strong membrane, every way double, in the duplications of which all the viscera of the abdomen are hid.

*Wiseeman's Surgery.*

Will you give me leave to illustrate this affair of wit and judgment, by the two knobs on the back of their chair? Here stands wit—and there stands judgment. You see they are the highest and most ornamental parts of its frame—as wit and judgment are here, and like them too, indubitably both made and to go together,—in order, as we say in all such sort of duplicated embellishments—to answer one another.

*Nerme.*

Understone marriage. This kind of sea-weed is set up by bladders of air, which are formed in duplicatures of its leaves, and forms immense float-beds of vegetation; the young ones, branching from the larger ones, and borne on similar little canals.

*Darwin.*

**DUPPLICATE**, in law, used for the second letters sent, granted by the lord chancellor, in a case when he had before done the same; which is therefore thought void. But it is more commonly a copy or transcript of any deed or writing, account, &c., or a second letter, written to the same party and purpose as a

former, or a copy of despatches, for fear of a miscarriage of the first, or for other reasons.—4 *Car.* 2. c. 10.

**DUPPLICITY**, *n. s.* Lat. *duplicitas*. Double-ness: the number of two.

This duplicity was ill contrived to place one head at both extremes, and it had been more tolerable to have set three or four at one. *Brucene's Vulgar Errors.*

Do not affect duplicities nor triplicities, nor any certain number of parts, in your division of things.

*Watts's Logic.*

**DUPONDIIUS**, in antiquity, a weight of two pounds, or a money of the value of two asses. See *As*. As the *as* at first weighed a just pondo, or libra, the dupondius then weighed two; and hence the name. And though the weight of the *as* was afterwards diminished, and of consequence that of the dupondius also, yet they still retained the denomination. See *LISNA*.

**DUPORT** (James), a learned English divine, was born in 1606, in Jesus' College, Cambridge, of which his father was master. He was educated at Westminster School, and at Trinity College, Cambridge, where he obtained a fellowship. In 1632 he was appointed regius professor of Greek; and, in 1641, made prebendary of Lincoln and archdeacon of Stow. He was deprived, in 1656, of his professorship for refusing the engagement, but recovered it at the Restoration, and resigned it again the same year in favor of Dr. Barrow. In 1664 he became D. D., and was promoted to the deanery of Peterborough. In 1668 he was elected master of Magdalen College. He died in 1679. His works are—1. *Gnomologia Homerica*. 2. *Tres Libri Solomonis, Græco Carmine donati*, 12mo. 3. *Metaphrasis Psalmorum versibus Græcis contexta cum versione Lat.* 4to. 4. *Musa Subseciva: seu Poemata Stromata*, 8vo. In 1712 some of his lectures were printed by Needham. His father was one of the translators of the Bible.

**DUPORT** (Marguerite Louis Francis du Tertre), was an advocate at Paris. In 1790 he was appointed minister of justice on the recommendation of La Fayette, and vainly endeavoured to adhere to the constitution which had been established. On the departure of Louis XVI. for Varennes, Duport went to the National Assembly, according to the king's directions, to deliver up the great seal; and when the representatives enjoined him to resume it, and seal the order for the arrest of that prince, being denounced anew, he gave in his resignation. He was however involved in the proscription of the 10th of August, 1792, and, being sent to Orleans, was condemned and executed in November, 1793, as an enemy to the liberty of the press. On hearing his sentence, he exclaimed, 'Revolutions destroy men; posterity will judge them.' Duport published, in conjunction with Kervessan, the first eight volumes of a work, entitled *L'Histoire de la Révolution, par deux Annis de la Liberté*.

**DUPPA** (Brian), a learned English bishop, born in 1589, at Lewinham, in Kent, of which place his father was then vicar. In 1634 he was instituted chancellor of the church at Sarum, and soon after made chaplain to Charles I. He was appointed tutor to Charles, prince of Wales, and his brother James, duke of York; was made

bishop of Chichester; and, in 1641, translated to Salisbury, though the confusion that followed deprived him of all benefit from his promotion. Charles I. held him in high esteem, and he is said to have assisted the king in composing the Eikon Basilike. On the Restoration he was made bishop of Winchester, and lord high almoner; but died in 1662. He bequeathed large sums to charitable purposes: and published a few sermons, with other religious pieces.

**DURA MATER**, from *durus*, hard, and *mater*, a mother; called *dura* from its comparative hardness with the *pia mater*, and *mater* from its being supposed to be the source of all the other membranes. *Dura meninx*, *Dermatodes*. A thick and somewhat insensible membrane, formed of two layers, that surrounds and defends the brain, and adheres strongly to the internal surface of the cranium. It has three considerable processes, the falciiform, the tentorium, and the septum cerebelli; and several sinuses, of which the longitudinal, lateral, and inferior longitudinal, are the principal. See **ANATOMY**.

**DURANGO**, a town of Spain, in Biscay, famous for its manufacture of sword-blades and steel articles. Population 2800. Fifteen miles east of Bilbao.

**DURANGO**, or New Biscay, an intendancy of Mexico, extending from south to north from the mines of Guariamey to the mountains of Carcay, north-west of the Presidio de Yanos, 232 leagues. Its breadth is unequal: near Párras it is scarcely fifty-eight leagues; but is taken on an average at sixty-three leagues. It does not appear to contain above 160,000 inhabitants, but, in this country, except through the details furnished by Humboldt in his *New Spain*, we are very little acquainted with this region. It is bounded on the south by New Galicia, or by the two intendancies of Zacatecas and Guadalupe, on the south-east by a small part of the intendancy of San Luis Potosí, and on the west by the intendancy of Sonora. North and east it is bounded by an uncultivated country, inhabited by warlike and independent Indians. But since the end of the last century these troublesome neighbours have been on the decline. The intendancy comprehends the northern extremity of the great table land of Anahuac, which declines to the north-east towards the banks of the Rio del Norte. The ground around the city of Durango is about 1500 feet above the level of the sea. The extent of surface at this intendancy is 16,873 square leagues.

**DURANGO**, a town of Mexico, the chief city of the intendancy of that name, is situated in the southern part of New Biscay, 170 leagues north-west from the city of Mexico, and 298 from the town of Santa Fe. It is the residence of the intendant and of a bishop. The height of the ground on which the town is built is 6845 feet above the level of the sea. There are frequent hills of snow, and the thermometer sometimes descends to 14° of Fahrenheit. The population is estimated at 12,000. The surrounding country is fertile in corn and fruits, and the fine pastures abound with cattle.

**DURANTA**, in botany, a genus of the angiospermia order and didynamia class of plants; natural order fortieth, personate: *cal.* quin-

quefid, superior: *HER.* tetraspermia locular. Species, three; natives of the East and South America.

**DURANTE ADSENTIA** (*durante*), in law, is an administration granted when the tutor is out of the realm, to continue until his return.

DURER (Albert), one of the first engravers and painters of his age, was descended of an Hungarian family, and born at Nuremberg, in 1471. He was also a man of letters and a philosopher; and was an intimate friend of Erasmus, who revised some of his works. He was one of the first improvers of the art of engraving. In many of those prints which he executed on copper, the engraving is elegant to a great degree. His 'hell scene,' in particular, which was engraved in 1513, is as highly finished a print as ever was engraved, and as happily executed. This artist understood the principles of design; his composition, too, is often pleasing; and his drawing generally good. But he knew very little of the management of light; and still less of grace: yet his ideas are purer than could well be expected from the awkward archetypes which his country and education afforded. In a word, he was a man of very extensive genius; and, as Vasari remarks, would have been an extraordinary artist, if he had had an Italian instead of a German education. His prints are very numerous. They were much admired in his own life-time, and eagerly bought up; which made his wife urge him to spend more time upon engraving than he was inclined to do. But he was rich; and chose rather to practise his art as an amusement than as a business. He died in 1527.

DURESS, *durities*, constraint, in English law, is more particularly applied to whatever is done by man to save either life or limb. If a man through fear of death or mayhem, is prevailed upon to execute a deed, or do any other legal act, though accompanied with all other requisite solemnities, it may be afterwards avoided. And the same is a sufficient excuse for the commission of many misdemeanours. There are two sorts of duress: duress of imprisonment, where a man actually loses his liberty; and duress per minas (by threats), where the hardship is only threatened and impending.

A man who was under duress of imprisonment, being an illegal restraint of liberty, until he seals a bond or the like, may allege this duress, and avoid the extorted bond. But if a man be lawfully imprisoned, and either to procure his discharge, or on any other fair account, seals a bond or deed, this is not by duress of imprisonment, and he is not at liberty to avoid it. 2 Inst. 482.

Duress per minas, is either for fear of loss of life, or else for fear of mayhem or loss of limb. And this fear must be upon sufficient reason: non suspicio enjuslibet variet metuculosi hominis, sed talis qui possit cadere in virum constantem. Bract. 1. 3. c. 5. A fear of battery (or being beaten) though never so well grounded, is no duress; neither is the fear of having one's house burned, or one's goods taken away and destroyed; because in these cases, should the threat be performed, a man may have satisfaction, by recovering equivalent damages; but no suitable

atonement can be made for the loss of life or limb. 2 Inst. 483.

D'URFEY (Thomas), an eminent English satirist and songster, whose name is well known, but of whose life few particulars are to be collected. He was born in Devonshire: but when, where, or of what family, are uncertain. He was bred to the law, which he forsook for the more agreeable employment of writing plays and songs; and the latter he had so happy a talent both of writing and singing, that he received many favors from persons of quality on that account. The writer of the *Guardian*, No. 67, tells us, he remembered to have seen Charles II. leaning on Tom D'Urfeys's shoulder more than once, humming over a song with him. This indeed was not extraordinary in so merry a monarch; but even the phlegmatic king William could relax his muscles on hearing him sing. D'Urfeys grew poor as he grew old, and prevailing on the managers of the playhouse to act his comedy of the *Plotting Sisters*, for his benefit, Addison wrote the above-mentioned paper in the *Guardian*, with another, No. 82, representing him in a good humored light, to procure him a full house. He died very old, in 1723.

DURHAM, a maritime county of England, is situated between the rivers Tees and Derwent, and along the German Ocean. It is bounded on the north by Northumberland, from which it is separated by the rivers Derwent and Tyne; on the east by the German Ocean; on the south by the river Tees, which divides it from Yorkshire; and on the west by Cumberland and Northumberland. Its form is triangular, extending forty-five miles in length, from its most western extremity, near the village of Kelhope, to Hartlepool on the east; and thirty-six in breadth, from the village of Stockburn in the south, to South Shields in the north. Though only a small part of the county is either of this length or breadth, it is nearly 180 miles in circumference. Its superficial area includes about 610,000 acres, containing four wards, one city, 120 parishes, ten market towns, and 230 villages. It is in the diocese of its own name, and is included in the northern circuit. Durham is divided into wards, and the archdeaconry comprehends four deaneries.

Before the Roman invasion Durham was inhabited by the Brigantes, but, after the conquest of this kingdom, it became part of the Roman province called *Maxima Cæsariensis*. The Anglo-Saxons included it in the kingdom of Northumberland. The etymology of the present name of this county appears to be derived, according to Bede, from *dun* a hill, and *holm* an island. It is usually called the bishopric of Durham, from the great power which the bishop of the diocese formerly possessed. It is, however, a palatine county, deriving its privileges from a grant made by Egfrid, king of Northumberland, in the year 685, of all the land betwixt the rivers Wear and Tyne, to St. Cuthbert, the apostle of the north, and to the ministers of his church for ever.

Speed remarks, that the air is sharp and very piercing, and would be more so, were it not that the vapors from the German Ocean help much to dissolve the ice and snow; yet the air is generally deemed healthy. It is milder and more

pleasant towards the sea than in other parts. Its general aspect is mountainous. A ridge of hills crossing the western angle has been termed the English Appenines. They are not, however, extremely elevated. Of the soils of this county Granger says: near the river Tees, and in some spots bordering the other rivers and brooks, this county, the soil is loamy or of a rich clay; at a further distance from these rivers and brooks the soil is of a poorer nature, commonly sandy and watershaken, with here and there spots of peat interspersed; but these are of small extent in the middle of none of them being half a mile from clay. The hills between the sea and a imaginary line drawn from Barnard Castle to the Tees, to Alansford on the Derwent, are the most part covered with a dry loam, the nature of which varies in proportion to its depth. To the westward of this line the summits as well as the sides of the hills are moorish wastes. Mr. Fox in his *Agricultural Report*, remarks that the soils of this county vary in such insensible degrees that it would be difficult to describe them in their varieties. The principal distinctions of heads of classification, may be taken as loam, and peat. The south-east part of the county, from the Tees mouth to a few miles of Stockton, and from thence by Heddon, Walviston, Elwrich, and as far north as the mouth of the Tyne, consists of a strong fertile clayey loam. To the westward of this, as far as Sedgfield, Thropton, and Eppleton, and northward to near South Shields, the soil is principally a poor stubble loam and clay. Of the loamy soils there are many varieties, as is the case with the clayey soils mentioned. The deep, mellow, tender, and fertile, loams are in general found in the valleys of rivers. The limestone district, extending from near Sunderland by Houghton-le-Spool, to Coxhoe, Ferryhill, and to Merrington, is a dry but not a productive loam. The peaty soils are most prevalent in the western part, the greatest portion of the moors that have been enclosed being of this description.

Hartlepool, situated on a promontory encompassed by the German Ocean, and forming a capacious bay on the south side of the county, is advantageously placed for the anchorage of vessels, and landing of troops from the continent. South Shields, also, sends out many vessels, and Stockton-upon-Tees is well situated for commerce.

The chief rivers which communicate with the sea are the Tyne, the Wear, and the Tees. The Tees rises in those vast moors which cover the Yorkshire from Durham, Cumberland, and Northumberland. In its course it is first rather inclined to the south-east, but at Darlington it turns abruptly to the north and falls into the sea below Stockton, a county, which may be called its port. The Tyne rises in the same wild moors, but continues to the north of the Tees. Its course is parallel with it, bearing at first to the north-east, and at Bishop's Auckland turning to the east; after nearly surrounding the city of Durham, it flows northward to Chester-le-foe, and then inclines a little towards the east to reach its port of Sunderland. The Rev. Mr. Skrine calls the miniature of the Tees, the

bling that river in character, though greatly inferior in width and rapidity. The Tyne, speaking, belongs to Northumberland, but it has its source in the Durham Moors. Fish in these rivers are salmon, trout, eels, pike, and sparrings in the Tees. The salt near Birtley, and the spas at Butterby and Dale, are also deserving of notice. Near Water-gate, at the south side of the town of Jarrow, is a chalybeate spring, covered every day by the sea, and slightly impregnated with iron.

The mineral productions of Durham are various and valuable.—The coal districts, in particular, are extensive in various parts of the county. Mr. Bailey has enumerated thirty-four collieries, which he calls Watersale Collieries, and five which he calls Landsale Collieries.

From these lists it appears that the quantity of coal obtained in this county annually is 180,080 chaldrons of thirty-six bushels; 10,000 men are employed. In the year 1809 there were eighty-six lead-mines working in this county. Of these, twenty-three belonged to the county of Durham; forty-seven, being all the mines in the county, except one, to the earl of Darlington. Lead is found in abundance in the western part of the coal district. The county, also, produces various kinds of excellent stone for chimneys, ornaments, mill-stones, grind-stones, &c.; also fire-stone for ovens, furnaces, &c., and stone for building; as also gray slates for roofs, &c. The cattle of Durham are in much esteem; as for form, weight, produce of milk and butter, and quickness of fattening, they are equal to any in England.

Durham sends ten members to parliament, viz. four to the county, two for the city of Durham, and four for other places. This county was the birthplace of Sir John de Baliol, founder of the College, Oxford, born at Barnard castle,

the venerable Bede, born at Wearmouth, probably at Iscomb, 672, died 735; Dr. Samuel Garth; Joseph Reed, a dramatic poet; Rev. W. Romane, a Calvinistic clergyman of the established church; Dr. Richard Owen, author of *Memoria Technica*, and many other works on theology, &c.

In this county are manufactures of all kinds of cast iron, foundries for casting iron and glass-houses, potteries, salt, copperas, saltpetre, coal tar, woollen, cotton, and linen; silk ribbon, and paper-mills. It abounds in gentlemen's and gentlemen's seats.

There are, likewise, several natural and artificial curiosities worth the notice of travellers: as, black hells, near Hartlepool, consisting of masses of rocks, formed by the force and concussion of the waves of the sea, which have formed several fine pointed archways and vast caverns, resembling those of a cathedral. At Hartlepool are some of those curious cavities called hell-kettles; the diameter of the largest is 100 feet, and that of the least seventy-five feet.

A pier hospital, near Durham, founded in 1790, has only part of the gateway standing, a fine and handsome piece of masonry with three arches. Remains of several monastic buildings occur near the church at Monk Wear-

mouth; that of Jarrow may still be traced in its ruins on the summit of an elevated ridge near the church; and the ruins of a monastery for grey friars may be seen at Hartlepool. On the east side of the main street of Gateshead are the ruins of St. Edmund's monastery, established, according to Bede, before the middle of the seventh century; and Finchall priory, once beautifully situated in a vale on the banks of the Wear, covers with its ruins an extensive plot of ground. The principal existing ecclesiastical buildings are—Sedgefield church, in the Saxon style; Bishop Wearmouth church, supposed to have been founded by Athelstan; the parish church of Brancepeth, an ancient structure of the conventual form; and the cathedral of Durham, begun in 1093, in the Saxon and Norman style.

Durham is also rich in civil architecture and remains: amongst the most conspicuous are Hilton castle, an ancient baronial residence of a family of that name, situated on the north side of the Wear, about three miles from Wearmouth; its form is an oblong square, the interior consisting of five stories. Ravensworth castle, which seems anciently to have formed a quadrangle, having four square towers, connected by a curtain wall; two of the towers are built up, and the others are in ruins. Brancepeth castle, an irregular stately pile, erected about Stephen's reign. Lumley castle, about a mile to the east of Chester-le-Street, a seat of the earl of Scarborough; it is a quadrangle, with an area in the centre, and at each angle are projecting turrets of an octangular form. Bishop Auckland's castle, standing on the north angle of the town, and covering with its courts and offices about five acres of ground. Raby castle, the magnificent seat of the earl of Darlington, enlarged on the basis of a more ancient castle which stood here prior to the year 1379. Barnard castle, situated on the southern acclivity of an eminence, rising with a steep ascent from the river Tees. And the castle of the county town. See DURHAM, the city.

Roman coins have been dug up at Gateshead, on Fulwell Hill, and at South Shields, which was clearly the *ad finem* of Richard of Cirencester's Itinerary. Binschester, the seat and manor of the Wren family, is the site of the Roman station *Vinovium*; and Eboraceter is supposed to be the *Vindomara* of Antoninus, many Roman inscriptions, and an urn of uncommon form, having been found here. The latter was nearly a yard high and seven inches wide, having in the centre a small cup. Chester-le-Street has been supposed to be the *Condercum* of the Romans. It is situated on the military way leading to Newcastle. Glanibanta, near Lanchester, is another, and remarkably distinct Roman station. It is of an oblong figure, 174 paces from north to south, and 160 from east to west, within the vallum, which occupies a beautiful eminence. In some parts, the wall remains perfect; the outside is perpendicular, twelve feet in height, built of ashler work in regular courses, each stone being about nine inches thick, and twelve long. The site of the *Pretorium* is very distinctly to be traced.

Three miles west of the city of Durham, and to the right of the road, is Brandon, a village

situated in the vicinity of a high hill. On the summit is a remarkable tumulus, of an oblong form, 120 paces in circumference at the base, and about twenty-four feet in perpendicular height; but it does not appear that this tumulus was ever opened. It is now covered with a thick plantation of fir, and seems a relic of British antiquity. Near Eggleston is an ancient structure, called the Standing Stones, also of this class: it originally consisted of a cairn in the centre, surrounded by a trench, and encompassed by a circular arrangement of rough stones; many of which have been removed and broken to repair the roads.

Durham is termed a county palatine (a palatio) because the owners thereof had, in this county, the authority to use the royal prerogative as fully as the king had in his palace. Its privileges are thought to have been originally granted to the county, on account of its bordering so near upon Scotland, in order that the inhabitants, having justice administered at home, might not be obliged to go out of their county and leave it open to the enemy. The bishopric of Durham was dissolved, and the king to have all the lands, &c., by a statute (7 Ed. VI.) not printed. But this act was afterwards repealed (1 Mary, stat. 3, c. 3), and the bishopric newly erected, with all jurisdiction ecclesiastical and temporal annexed to the county palatine. The justices of the county palatine of Durham may levy fines of lands in the county; and writs upon proclamation, &c., are to be directed to the bishop. (Stats. 5 Eliz. c. 27, 31 Eliz. c. 2). Writs to elect members of Parliament in the county palatine of Durham, also go to the bishop or his chancellor, to be returned by the sheriff, &c. There is also a distinct court of chancery in this county; and the bishop is at the head of the whole administration of justice.

DURHAM, a principal city of England, the capital of the foregoing county, is sixteen miles south from Newcastle, and 259 north from London. This city was founded in 995, on the monks of Landisfarnie removing to this spot, and making it the sacred depository of the relics of St. Cuthbert. It is nearly surrounded by the river Wear. Its situation, and the venerable appearance of its public buildings, strike the eye very agreeably at the southern entrance of the city. Altogether it is about a mile square, and is well paved, watched, and lighted. The municipal government is vested in a mayor, recorder, twelve aldermen, twenty-four common-council-men, who are chosen from twelve chartered trading companies, and an indefinite number of freemen: the corporation and freemen amounting in the whole to about 1000 electors, who return two members to parliament.

The cathedral and castle occupy the crown of an eminence, eighty feet perpendicular from the river, and enclosed by the remains of the old city walls. At the bottom flows the Wear. The slope of the hill is decorated with hanging gardens and rich meadows, and the opposite banks are clothed with wood and fruit trees. The cathedral is itself 411 feet long, the length of the nave 200 feet, and the width seventy-four; the great cross-aisle has an aisle towards the

east, at both ends, 170 feet in length, and the seven wide; the middle tower is 214 feet high. It is divided into five aisles by four rows of pillars. The pillars are vast cylinders, some three feet in circumference, and, within each of the interior, are adorned with carvings exhibiting fine specimens of the early Norman style. Near the west end is the font, an elegant basin, ornamented with carved red-oak. To the oak-skreen at the entrance of the choir, as the bishop's throne, and the stalls for the bishop, dean, and prebendary, are finished of magnificent style. The founder's tomb is on the south side of the throne. The beautiful isolated screen, on the eastern side of the choir, is the gift of John lord Neville. Behind the high altar stood the shrine of St. Cuthbert, the richest in England. The north aisle of the cathedral is now used as a register-office. In 1782 several parts of this structure were found in a ruinous condition, they were repaired with considerable taste. The Guildhall is St. Mary's chapel, at the west end of the choir, is said to have been built as a place of refuge for those females who were not allowed to enter the cathedral. The old Frater House is converted into an elegant library. The choir is an oblong square, containing the decorated prebendal houses. The kitchen here is small, and at the upper end of it is a beautiful hall. On the north side of the choir is the grammar-school, and the master's hall.

Durham has six other churches, namely, St. Oswald's, an ancient structure, with a fine vaulted roof of wood, and some fine stained glass: St. Nicholas, an ancient but poor church, at which the corporation attend divine service; St. Mary-le-bow, built of hewn stone, where the bishop and archdeacon's residence is held: and St. Margaret's, St. Giles's, and St. Mary's. In the city are two Roman Catholic chapels, a quakers', presbyterian, methodist, and other meeting-houses.

On the Palace-Green stands the monument erected by William the Conqueror, and which has been repaired, and made the residence of the bishop occasionally. The great hall stands upon an artificial mount, and is of a regular octagonal form, sixty-three feet in diameter. It formerly contained four tiers of apartments, but nothing now remains of it except the vaults, and part of the keep. Round the hall are three delightful terraces.

The market-place is large and spacious, the centre is an excellent fontain, from which the inhabitants are supplied with water. A spacious piazza has been built, where the market for corn, provisions, &c., is held. Near the Guildhall, where the public meetings are convened. Among the recent improvements are a new gaol, house of correction, new courts, and governor's house. There are five stone bridges in this city. The New bridge, finished in 1777, at the expense of the corporation. Framwellgate bridge consists of five elliptic arches, and crosses the canal. The bridge is at the southern entrance of the city. Between the New bridge and St. Cuthbert's church are the public walks called the

afford an agreeable retreat in fine weather. Extensive cloth and carpet manufactory has been established, from funds bequeathed by a family, which affords employment to a great number of men and boys. A county infirmary is well supported. In the town are many charities, a subscription library, and several other literary and useful institutions. A little theatre was erected in 1791, and races are held in July.

Wharfedale market on Saturday is well supplied with corn and all kinds of provisions. Sea fish brought from Hartlepool and Sunderland. Fairs are held on the 31st of March, for cattle; on Tuesday, for sheep and swine; and on the 1st of September, for horses; they each continue three days.

About half a mile eastward are the remains of a city called Old Durham and Maiden; and two miles and a half east stands Barnard Castle, an hospital founded by bishop Eborac, for a master and sixty-five lepers; in which are now maintained fifteen in-brethren, having a separate room, good diet, a suit of clothes annually, and 40s. in money: there are fifteen out-brethren. In a deep vale, near it, are the ruins of Finchall Abbey, founded in 1066 for Benedictines. On the west of the abbey is an old cross, erected by Ralph, lord Neville, in memory of a battle between the English and Scots, wherein the latter were defeated with the loss of 15,000 men, and their king David II. prisoner.

DURHAM, a township of Connecticut, in New-Haven county, settled from Guildford, in 1698, and incorporated in 1708. It is about twenty-miles south-west of Hartford, and eighteen miles east of New-Haven. It was called Canagwa, by the Indians; which name a small brook chiefly rises here still bears.

DURHAM, a township of the United States, in Ireland county, district of Maine, on the west bank of the Androscoggin, which separates it from Bowdoin on the north-east. It is 13 miles north-east of Boston.

DURHAM, a post town of New Hampshire, in Rockingham county, seated on Oyster River, near which it joins the Piscataqua; twelve miles west of Portsmouth. It was incorporated in 1633.

DURHAM, formerly a part of Dover, which adjoins to the north, and was called Oyster River.

DURHAM, a county of East Australia, bounded to the east by William's River and the church of England, on the north by Manning River and the Royal, on the west and south by the Hunter.

DURIO, in botany, a genus of the polyandria and polyadelphia class of plants: *cal.* a phyllous perianth; *cor.* petals five growing in calyx; stamens conjoined in five bodies; roundish; style bristly, the length of the fruit; fruit a roundish apple every where covered with a thin containing mucous orilla. It is one only, a native of the East Indies.

DURLACH, a well built town of Germany, formerly the capital of the margravate of Baden, now of the circle of the Pfalz and Rhenish, grand duchy of Baden. It is situated on the Rhine, at the foot of a long and lofty range

of mountains called the Thurmberg. It was burnt down in 1689, and, though rebuilt at the peace, never regained its prosperity. It contains 4000 inhabitants, for the most part Lutherans. Here is the ducal castle of Carlsburg, an elegant church, and an academy; but the seat of government has been removed to Carlsruhe. It is remarkable for its manufactory of porcelain. A considerable trade is also carried on in corn, madder, and tobacco. Durlach is five miles east of Carlsruhe, fifteen north-east of Rastadt, and thirty-two N. N. W. of Stuttgart.

DUROBRIVÆ, in ancient geography, a town of the Catyuechiani, in Britain, now in ruins; which lies on the Nen, between Castor and Dornford, in Northamptonshire, on the borders of Huntingdonshire.

DUROBRIVÆ, or DUROCORIVÆ, a town of the Trinobantes, in Britain; whose ruins are situated between Flamstead and Redburn, in Hertfordshire. See CATTI.

DUROBRIVIS, an ancient town of Britain, twenty-five miles west of Durovernum, or Canterbury; now called Rochester, which, in the charter of the foundation of the church, is styled Durobrevis.

DUROC (Marshal), duke of Friuli, was born at Pont-a-Mousson in 1772, and studied in the military school of that place. His father, who was a notary, intended him for that employment; but in 1792 he became a lieutenant of artillery, and soon after emigrated into Germany. Returning home, we find him aid-de-camp to general Lespinasse, and engaged in that capacity, in his first revolutionary campaigns. In 1796 he was appointed aid-de-camp to Buonaparte, in Italy, and distinguished himself at the passage of the Isonzo. He was also in the expedition to Egypt; and being wounded by a cannon-ball, at the siege of Acre, returned with Buonaparte to France. Duroc after this had several important missions to Berlin, Stockholm, Vienna, and St. Petersburg; in which he is said to have been remarkably successful. He was a great favorite with Napoleon, and an adroit diplomatist; but he never acquired much military renown. He was killed by a cannon-ball at Wartenburg, May 22d, 1813.—*Biog. Univ.*

DUROA, in botany, a genus of the monogynia order and hexandria class of plants: *cal.* cylindrical and loped above; the border six-parted; there are no filaments; fruit a hispid apple. Species one only, a Surinam tree.

DUROTRIGES, an ancient British nation, scattered in that part of the country which is now called Dorsetshire. Their name is derived from the two British words *dur*, water, and *trigo*, to dwell; and they got it from the situation of their country, which lies along the sea coast. It is not certain whether the Durotriges formed an independent state under a prince of their own, or were united with their neighbours the Damnonii; as they were reduced by Vespasian under the dominion of the Romans, at the same time, and with the same ease, and never revolted. Dorchester, its present capital, seems to have been a Roman city of some consideration, though our antiquaries are not agreed about its Roman name. It is most probable, that it was the Dur-

novaria, in the twelfth Iter of Antoninus. Many Roman coins have been found at Dorchester; the military way called Jenning Street passed through it; and some vestiges of the ancient stone wall with which it was surrounded, and of the amphitheatre with which it was adorned, are still visible. The country of the Durotriges was included in the Roman province called Flavia Cæsariensis, and governed by the president of that province, as long as the Romans kept any footing in these parts.

**DURY** (John), usually called *Dureus*, a learned and sanguine divine of the seventeenth century, who, conceiving the project of a union of the reformed churches, obtained leave to travel from place to place in order to bring about this event. He was a native of Scotland, and obtained the countenance of archbishop Laud, and the prelates Bedell and Hall; but, although he met with encouragement in various parts of the continent, it is needless to say that he failed in his plans. And after this he undertook an explanation of the Apocalypse, which was to reunite every order of Christians. He died in 1675.

**DUSK**, *adj.*, n. s., v. a. & v. n. } Sued.-Goth.  
*Dusk'ily*, *adv.* } *dyster*; Goth.  
*Dusk'ish*, *adj.* } *daucks*; Dut.  
*Dusk'ishly*, *adv.* } *dugster*; Teut.  
*Dusk'y*, *adj.* } *dus*; Gr. *δασ-  
 κωος*, from *δασυς*, thick, and *σκια*, shadow. Dark;  
 gloomy in color or general appearance; tendency  
 to darkness; to make or grow dark.

*Dusked* his eyes too, and failed his breath.

*Chaucer.*

From his infernal furnace forth he threw  
 Huge flames, that dimmed all the heaven's light,  
 Enrolled in *dusky* smoke, and brimstone blue.

*Spenser.*

Here lies the *dusky* torch of Mortimer,  
 Choked with ambition of the meaner sort.

*Shakespeare.*

It is not green, but of a *dusky* brown colour.

*Bacon.*

The sawdust burned fair, till part of the candle  
 consumed: the dust gathering about the snail, made  
 the snail to burn *dusky*.

*Id. Natural History.*

Sight is not contented with sudden departments  
 from one extreme to another; therefore rather a  
*dusky* tincture than an absolute black.

*Wotton's Architecture.*

Only, may the Good Spirit of the Almighty speedily  
 dispell all those *dusky* prejudices from the minds of  
 men, which may hinder them from discerning so clear  
 a light.

*Hp. Hall. Letter from the Tower.*

The hills, to their supply,

Vapour and exhalation, *dusky* and moist,

Sent up amain.

*Milton's Paradise Lost.*

Some sprinkled freckles on his face were seen,  
 Whose *dusky* set off the whiteness of the skin.

*Dryden.*

There fierce winds o'er *dusky* valleys blow,  
 Whose every puff bears empty shades away. *Id.*  
 I will wait on you in the *dusky* of the evening with  
 my show upon my back.

*Spectator.*

Through the plains of one continual day,  
 Six shining months pursue their even way;  
 And six succeeding urge their *dusky* flight,  
 Obscured with vapours and o'erwhelmed in night.

*Prior.*

The surface is of a *dusky* yellow colour.

*Woodward.*

While he continues in life, this *dusky* scene  
 rour, this melancholy prospect of final perdition,  
 frequently occur to his fancy. *Ben Jonson's Dramas.*

Umbriel, a *dusky*, melancholy spirit,

As ever sullied the fair face of light.

Down to the central earth, his proper realm,

Repairs to search the gloomy cave of Sycamore.

*Id.*

By mixing such powders, we are not to expect  
 strong and full white, such as is that of pearls,  
 some *dusky* obscure one, such as might arise from  
 mixture of light and darkness, or from white and  
 black; that is, a grey, or dun, or raven tawny.

*Newton's Optics.*

Less bold, Leander at the *dusky* hour

Eyed, as he swam, the far love-lighted tower.

Breasted with struggling arms the towering wave.

And sunk benighted in the watery grave. *Dem.*

Hark! through the silence of the old, *Id.*

The hum of armies gathering rank on rank

Lo! *dusky* masses steal in dubious night

Along the leaguered wall and bristling batt

Of the armed river, while with straggling

The stars peep through the vapours dim and

Which curl in curious wreaths. *Id.*

**DUSSARA**, a fortified town of Hindostan  
 the province of Gujerat. It is surrounded by  
 twelve villages, and is the property of a  
 hommedan zemindar, of Arabian descent, one  
 of his ancestors who was put to death in  
 A. D. 1209, by the rajah of Hulwad, for a  
 committed gowhattia (cow-killing), is held in  
 great veneration as a saint, by the adjacent  
 hommedan inhabitants. His tomb is on the  
 banks of a large tank in the neighbourhood,  
 which is well cultivated. A force of about  
 excellent cavalry is maintained here.

**DUSSAULX** (John), a French writer, born  
 Chartres in 1728. He was a military man in  
 early life, but quitted the army for literary  
 suits. At the beginning of the revolution  
 became a member of the convention, and of the  
 council of ancients. He died in 1794. His  
 works are, 1. A Translation of *Journal de*  
 2. *De la Passion de Jeu*, 8vo. 3. *Sur la*  
*pression des Jeux de Hazard*. 4. *Sur*  
*l'Abbé Blanchet*. 5. *Memoire sur les*  
*Latins*. 6. *Voyage à Barrege, et dans*  
*Pyrennées*, 8vo. 7. *Mes rapports*  
*Rousseau*, 8vo.

**DUSSELDORF**, or **DUSSELDORF**, a city  
 Westphalia, now belonging to Prussia, in the  
 duchy of Berg, situated on the Rhine, near  
 its confluence with the Rhine. It is an  
 and well built, the elector palatine having  
 the early part of the eighteenth century  
 from taxes for thirty years whoever lived  
 a house within its walls. It was taken by  
 French in September 1795, when the city  
 was greatly damaged; but it has since been  
 repaired, and contains a celebrated gallery of  
 ings, which after being removed, and the  
 time kept at Munich, was brought back by  
 is said to comprise the chef d'oeuvre of  
 Vandyk, Vanderwerf, and the Heemst  
 Here are also several elegant churches, an  
 cellent market-place, extensive terraces and  
 pleasant public walks. Dusseldorf has an  
 academy removed thither from Duisburg, and  
 and a school for painting. It has also a college

physical cabinet, and a mechanographical cabinet. Corn, and the local manufacture of cloth, paper-hangings, glass, and its chief articles of trade. Population, 19,000. The fortifications were after the peace of Luneville in 1801. In 1806, the residence of the grand duke, and the seat of his government; but was made over with the rest of that duchy, and is now the capital of a grand-duchy of 364,000 inhabitants. Twenty miles from Cologne, thirty north-east of Aix-la-Chapelle, and sixty-two south-west of Munster.

*L. s. & v. s. } Goth. and Sax. dust ;  
D. n. s. } Dan. dyt ; Belg. duust ;  
adj. } Erse, duist. Earth, or  
ter ; hence a mean, low state ; the  
catter, and to free from, dust.*

And thei crieden and kessen awei her  
threweu dust into the air, the tribune  
him to be led into the castels and to  
the accourgis. *Wiclif. Dedu. 22.*

Up the pour out of the dust, to set them  
free. *1 Sam. ii. 8.*

For yesterday have lighted fools  
To dusty death. *Shakespeare.  
As you like it, learning, physick, must  
be this, and come to dust.*

*Id. Cymbeline.*  
With the fruitfulness of trees, inasmuch as  
they upon them : that powdering, when a  
tree, maketh a soiling to the tree, being  
after newly laid on.

*Bacon's Natural History.*  
Dust will rather lie in the dust, than rise  
to. *Hop. Hall. Contemplations.*  
Thou

ground wast taken, know thy birth ;  
how art, and shalt to dust return. *Milton.*  
Laim the truth, say what is man !  
From the dust began ;  
Ten a few short years are o'er,  
Smiling fabric is no more.

*Cotton. Vision in Verse.*  
And the dusty fields I less admire,  
Than strangely in some new desire. *Dryden.*  
More I am no more troubled and disturbed  
By dust that is raised against it, than I  
am from the top of a high steeple, where  
Air and sunshine, a company of great  
Boys (for it is all one) throw up the dust  
which reached not me, but fell down in  
tears. *Locke.*

Reich, suppress thy knowing pride,  
Thy learned lust :  
Thy thoughts while thou thyself art dust.

*Prior.*  
Woman's care offends thy clothes and eyes,  
Though the street a cloud of ashes lies.

*Gay.*  
Even Dradgery himself,  
At the car be sweats, or dusty heaves  
Palace stone, looks gay.

*Thomson's Summer.*  
Etched in dust her gasping panthers lie,  
In foamy folds her serpents die.

*Sherridan.*  
Dier !—you're a walking block, fit only to  
quarry's regimentals on !

So revolves the scene ;  
Ordains, who rolls the things of pride  
Against to dust ! *Byron.*

**DUTCHESS**, *Fr. duchesse ; Ital. duchessa ;*  
from the low Latin formation (*duciessa*) of *dux*,  
*ducis*, a general. The lady of a duke.

For certes, lord, ther n' is non of us alle  
That she n' hath ben a *duchesse* or a queene ;  
Now be we caitives, as it is wel sene.

*Chaucer. Cant. Tales.*  
The duke of Cornwall, and Regan his *duchess*, will  
be here. *Shakespeare. King Lear.*

The duke was to command the army, and the *duchess*,  
by the favor she possessed, to be near her ma-  
jesty. *Swift.*

The gen'rous god who wit and gold refines,  
And ripens spirits as he ripens mines,  
Kept dross for *duchesses*, the world shall know it.  
To you gave sense, good humour, and a poet. *Pope.*

**DUTCHESS COUNTY**, a county of New York,  
on the east side of Hudson River. It has the  
state of Connecticut on the east, West Chester  
on the south, and Colombia county on the north.  
It is about forty-eight miles long and twenty-  
three broad, and contains fifteen town-ships, of  
which Poughkeepsie and Fish-Kill are the chief.  
Dutchess county sends seven representatives to  
the assembly of the state. In 1792 a remarkable  
cavern was discovered in the county, at a place  
called by the Indians Sepaseot, at Rhynbeck.  
The northern part is mountainous, and the eastern  
hilly, with occasional lofty summits, while the  
remainder presents a surface much broken. Its  
agriculture is in the most improved state, and in  
manufactures it has also made considerable pro-  
gress. Iron ore abounds, and some ores of  
copper, zinc, tin, lead, and silver, have been found.

**DUTCHY**, *n. s. Fr. duché.* The territory of  
a duke.

Different states border on it: the kingdom of  
France, the *duchy* of Savoy, and the canton of  
Bern. *Addison on Italy.*

France might have swallowed up his whole *duchy*.  
*Swift.*

**DUTENS** (Louis), was born in France in  
1729, and obtained orders in the church of  
England; he was appointed chaplain to the  
embassy at Turin, where he also held for some  
time the situation of *chargé des affaires*. In  
1766 he published at Paris his *Recherches sur  
l'Origine des Découvertes*, of which a translation  
soon appeared in London. The same year he  
was presented to the rectory of Elsdon in Nor-  
thumberland. In 1768 he travelled with lord  
Algermon Percy; and while abroad published  
an edition of Leibnitz, in 6 vols. 4to. He died  
in 1812. He published besides the above: 1. *Ex-  
plications des quelques Médailles des Grecques  
et Phéniciennes*, 4to. 2. *Journal d'un Voyage  
aux Villes Principales de l'Europe*. 3. *Histoire  
de ce qui s'est passé pour établissement d'une  
Regence en Angleterre*, 8vo. 4. *Recherches sur  
le tems reculé de l'usage des Voûtes chez les  
Anciens*. 5. *Memoires d'un Voyageur*, 5 vols.:  
thus he likewise published in English. He also  
wrote the French text of the second volume of  
the *Marlborough Gems*.

**DUTTAR**, a district of the Seik territories,  
Hindustan, in the province of Lahore, situated  
between the thirty-first and thirty-second degrees  
of north latitude. The chief towns are Begwa-  
rah, Horizpoor, and Malpoorah.

**DUTY**, in the military art, is the exercise of those functions that belong to a soldier; with this distinction, that mounting guard and, the like, where there is no enemy directly to be engaged, is called duty; but marching to meet and fight an enemy is called going on service.

**DUTY**, in polity and commerce, signifies the impost laid on merchandises, at importation or exportation, commonly called the duties of customs; also the taxes of excise, stamp-duties, &c. Peculiar duties once laid upon aliens are now repealed. See **CUSTOMS**.

**DUVAL** (Valentine Jamerai), a person of uncommon natural talents and singular fortune, born in the province of Champagne, in 1695. After serving a farmer and shepherd several years, when about eighteen years of age he became keeper of the cattle belonging to hermits of St. Anne, near Luneville. Here he took every opportunity of purchasing books, with what money he received, and attending to the instructions of these brothers, under whom he made a rapid progress in his studies. In this situation, he was accidentally discovered by two noblemen, while he was studying geography, under a tree, and they were so pleased with his conversation, that they introduced him to the duke of Lorraine, who placed him in the college of Pont a' Mousson. The duke afterwards appointed him his librarian, and gave him the professorship of history in the academy of Luneville. He now gratefully remembered his original benefactors by rebuilding the hermitage of St. Anne, and adding a chapel and some ground to it. In 1738 he followed the grand duke Francis to Florence, and on the marriage of that prince, with the heiress of the house of Austria, he accompanied him to Vienna, where the emperor took a great delight in his conversation, and made him keeper of his cabinet of medals. He died in 1775.

**DUUMVIRATE**, the office or dignity of the duumviri. See the next article. The duumvirate lasted till A. U. C. 388, when it was changed into a decemvirate. See **DECEMVIRI**.

**DUUMVIRI**, in Roman antiquity, a general appellation given to magistrates, commissioners, and officers, where two were joined together in the same functions: such as, 1. Duumviri capitales, the judges in criminal causes. From their sentence it was lawful to appeal to the people, who alone had the power of condemning a citizen to death. These were taken from the body of the decuriones; they had great power and authority, were members of the public council, and had two lictors to walk before them. 2. Duumviri municipales, two magistrates in some cities of the empire, answering to what the consuls were at Rome. They were chosen out of the body of the decuriones; their office lasted commonly five years, upon which account they were frequently termed quinquennales magistratus. Their jurisdiction was of great extent; they had officers who walked before them, carrying a small switch in their hands; and some of them assumed the privilege of having lictors, carrying axes and the fasces, or bundles of rods, before them. 3. Duumviri navales, two commissaries of the fleet, first created at the request of M. Decius, tribune of the people, in the time of the war

with the Samnites. Their duty consisted in giving order for the fitting out of ships, giving commissions to marine officers, &c. *De viri sacrorum*, two magistrates created by Numa quin II. for performing the sacrifices, consulting the Sibyls' books. They were chosen from among the patricians, and held their office for life; they were exempted from serving in wars, and from the offices imposed on the citizens; and without them the oracles of the Sibyls could not be consulted.

**DUXBOROUGH**, a town of Massachusetts, in Plymouth county, with a harbour for vessels, and a light-house at the south end of the beach. It is situated south by east of Plymouth, three miles across Plymouth bay.

**DUYVELAND**, *Duyveland*, or *Duyveland*, an island of the late Batavian republic, a department of the Meuse, and situated in the south-east of Zeeland, lying south-east of Schouwen, to which it is separated by a narrow channel, and is nine miles long from west to east, and broad.

**DWARACA** (the gate), a town and a temple in the province of Gujrat, Hindostan, situated at the south-west extremity of the island. It has twenty-one dependent villages, and a population of about 10,240 inhabitants. This place is, at present, possessed by Mooloo Manick, who is more powerful than any other of the Oacka chieftains. The scenery of the place attracts a rich and numerous population, and presents a safe asylum from the British. By an agreement of the 14th of December, 1800, Mooloo Manick Sumyane, of Dwara, agreed with the British government not to permit any person to enter the place, or to connive at any act of piracy committed by any person under his authority, and to abstain from plundering vessels in distress. In return, the British engaged to afford to the people at Dwara every suitable protection and encouragement; a free and open commerce to be permitted to vessels paying the usual duties.

'The original and most sacred spot in the quarter of India,' says Mr. Hamilton, 'is Dwara; but, about 600 years ago, the residence of their god Runchor (an incarnation of Vishnu) by a manoeuvre of the brahmins, was removed to Daccor, in Gujrat, where it still remains. After much trouble, the brahmins at Dwara substituted another in its stead, which, unfortunately, also took a flight across a narrow channel of the sea, to the island of Rata, or Shetland, about 130 years ago, and another temple was placed in the temple here.'

'Dwaraca is also designated by the name of the island; and, having been long the residence of Krishna, the favorite Hindoo deity, was a celebrated place of pilgrimage for the sectaries of that religion. In performing this pilgrimage, the following ceremonies take place: On the arrival of the pilgrim at Dwara, he is conducted to a sacred stream named the Gomany, from its waters; for permission to do which he pays the Dwara chief four rupees and a quarter. The brahmins pay only three and a half. After purification a visit is made to the temple, and

is presented, according to the circumstance, the devotee, and a certain number of re fed.

The pilgrim next proceeds to Aramra, where the stamp from the hands of a brahmin is made with an iron instrument, on engraved the shell, the ring, and the t, which are the insignia of the gods. ment is made hot, and impressed on the body, but generally on the arms; it being over-heated, generally leaves ion on the spot. It is frequently im- young infants; and a pilgrim may t only his own stamp, but also stamps y for any absent friend. This stamp ee and a half.

The pilgrim next embarks for the island of t, on his arrival, he must pay a tax of to the chief, present liberal offerings and dress him in rich clothes and or. The chief of Bate, who is a holy per- charge of the present, and retails it her pilgrims at a reasonable rate, who again to the deity, and it performs a plution. The average number of pil- gring annually to Dwaraca has been to exceed 15,000, and the revenues the temples a lack of rupees.

standing this existing place of pile most authentic Hindoo annals assert, ica was swallowed up by the sea a after the decease of Krishna. This of Vishnu spent much of his time at oth before and after his expulsion, by from Mathura, on the banks of the the province of Delhi, which would greater intercourse between these dis- than could have been expected at so period. The chalk with which the mark their foreheads comes from this re it is said to have been deposited t; and from hence, by merchants, is over India.' (M. Murdo, &c.)

F, n. s. & v. a. } Sax. *dwerf*; Dut. *tsn*, adj. } Dan. and Scotch, *dis-*  
isiness, n. s. } *dwerg*, or *dwerg*; Ger. *rch*, crooked. A small and generally person; often, in ancient times and y, a supernatural being, of no small elf or fairy. The verb means to ke dwarfish.

The champion stout,  
dismounted from his courser brave,  
*dwarf* awhile his needless spear he gave.  
Spenser.

er farro away a *dwarfe* did lag,  
tomed, in ever being last. *Id.* Sonnets.  
et you gone, you *dwarf*!

us, of hind'ring knot-grass made.  
Shakespeare.  
ard sauciness, and boyish troops,  
th smile at; and is well prepared  
a *dwarfish* war, these pigmy arms,  
a circle of his territories. *Id.* King John.  
tered that a good strong canvas, spread  
grafted low, soon after it putteth forth,  
t, and make it spread.

Bacon's Natural History.  
under that science hath not outgrown the

*dwarfishness* of its pristine stature, and that the intel-  
lectual world is such a microcosm.

Glennville's Scepia.

They, but now who seemed  
In bigness to surpass earth's giant sons,  
Now less than smallest *dwarfs*, in narrow room  
Throng numberless. Milton's Paradise Lost.

In a delicate plantation of trees, all well grown,  
fair, and smooth, one *dwarf* was knotty and crooked,  
and the rest had it in derision. L' Estrange.

We should have lost oaks and cedars, and the other  
tall and lofty sons of the forest, and have found no-  
thing but *dwarfish* shrubs, and creeping moss, and des-  
picable mushrooms. Bentley.

The whole sex is in a manner *dwarfed*, and shrunk  
into a race of beauties, that seem almost another spe-  
cies. Addison.

Saw off the stock in a smooth place; and, for *dwarf*  
trees, graft them within four fingers of the ground.  
Mortimer.

Other dramatists can only gain attention by hy-  
perbolical or aggravated characters, by fabulous and  
unexampled excellence or depravity, as writers of  
barbarous romances invigorated the reader by a giant  
and a *dwarf*. Johnson.

From giant oaks, that wave their branches dark,  
To the *dwarf* moss that clings upon their bark,  
What beaux and beauties crowd the gaudy groves,  
And woo and win their vegetable loves. Darwin.

This massy portal stood at the wide close  
Of a huge hall, and on its either side  
Two little *dwarfs*, the least you could suppose,

Were sate, like ugly imps, as if allied  
In mockery to the enormous gate, which rose  
O'er them in almost pyramic pride. Byron.

DWARFS. The Romans were passionately fond  
of dwarfs, whom they called *nani*, or *nanæ*, inso-  
much that they often used artificial methods to  
prevent the growth of boys designed for dwarfs,  
by enclosing them in boxes, or by the use of tight  
bandages. Augustus's niece, Julia, was extremely  
fond of a dwarf called Sonopas, who was only  
two feet and an hand-breadth high. We have  
many other accounts of human dwarfs, but most  
of them deformed in some way or other, besides  
the smallness of their size. Many relations, also,  
concerning dwarfs we must consider as fabulous,  
as well as those concerning giants. 1. Jeffery  
Hudson, the famous English dwarf, was born at  
Oakham in Rutlandshire, in 1619; and about  
the age of seven or eight, being then only eigh-  
teen inches high, was retained in the service of  
the duke of Buckingham who resided at Burleigh  
on the hill. Soon after the marriage of Charles  
I., the king and queen being entertained at Bur-  
leigh, little Jeffery was served up to table in a  
cold pye, and presented by the duchess to the queen  
who kept him as her dwarf. From seven years  
till thirty he never grew taller; but after thirty  
he shot up to three feet nine inches, and there  
fixed. Jeffery became a considerable part of the  
entertainment of the court. Sir William Daven-  
ant wrote a poem called *Jeffreidos*, on a battle  
between him and a turkey cock; and in 1638  
was published a very small book called *The New  
Year's Gift*, presented at court by the lady Par-  
vula to the lord Minimus commonly called Lit-  
tle Jeffery, her majesty's servant, written by  
Microphilus, with a little print of Jeffery pre-  
fixed. Before this poem, Jeffery was sent to France  
to fetch a midwife for the queen; and, on his

return with this gentlewoman and her majesty's dancing master, he was taken by the Dunkirkers. Jeffery had borne, with little temper, the teasing of the courtiers and domestics, and, at last, being provoked by Mr. Crofts, a young gentleman of family, a challenge ensued: and Mr. Crofts, coming to the rendezvous armed only with a squirt, the little creature was so enraged, that a real duel ensued; and the appointment being on horseback with pistols, to put them more on a level, Jeffery, at the first fire, shot his antagonist dead. This happened in France, whither he had attended his mistress during the troubles. He was again taken prisoner by a Turkish rover, and sold into Barbary. He probably did not remain long in slavery, for, at the beginning of the civil war, he was made a captain in the royal army, and in 1644, attended the queen to France, where he remained till the Restoration. At last, upon suspicion of his being privy to the popish plot, he was taken up in 1682, and confined in the Gatehouse of Westminster, where he ended his life in the sixty-third year of his age. 2. In the Memoirs of the Royal Academy of Sciences, a relation is given by count de Tressau, of a dwarf called Bebe, kept by Stanislaus III. king of Poland, who died in 1764, aged twenty-three, when he measured only thirty-three inches. At his birth he measured only between eight and nine inches.

DWELL, *v. n. & v. a.* Saxon, dwelian, DWEL'LEN, *n. s.* dwolian; Goth. *dwol* (delay); *duala*, old Teut., is to stay or delay. To remain; continue: hence to be in fixed attention on a person or thing; to continue speaking: as an active verb, to inhabit.

And he gede out and myghte not speke to hem . and thei knewen that he hadde seyn a visoun in the temple, and he bokenide to hem: and he *dwelide* stille doumbe. *Wiclif.*

If thy brother that *dwelleth* by thee be waxen poor, and be sold unto thee, thou shalt not compel him to serve as a bond servant. *Lev. xxv. 39.*

Hazor shall be a *dwelling* for dragons, and a desolation for ever. *Jer. xlix. 33.*

You lovers axe I now this question,  
Who hath the worse, Arcite or Palamon?  
That on may see his lady day by day,  
But in prison moste he *dwelleth* alway:  
That other wher him lust may ride or go,  
But'sen his lady shall he never mo.

*Chaucer. Cant. Tales.*

He in great passion all this while did *dwelt*;  
More busying his quick eyes her face to view,  
Than his dull ears to hear what she did tell.

*Spenser.*

People do often change their *dwelling-places*, and some must die, whilst other some do grow up into strength. *Id.*

The seed of God, which *dwelleth* in them that are born of God, neither will nor can, nor never will nor can, trespass or sin against God; by reason whereof, they that are born of God have great cause to rejoice, seeing in themselves, through God's goodness, not only a friend, but friendliness itself towards and with God.

*MS. Note of Bradford the Martyr, in Coverdale's Bible.*

'Tis safer to be that which we destroy,  
Than by destruction *dwelt* in doubtful joy.

*Shakespeare.*

The houses being kept up did of necessity, as a dweller; and the proportion of land for houses being kept up, did of necessity cause the poor not to be beggar or cottager, but a man of some substance. *Bacon's Henry IV.*

Why are you vexed, lady? Why do you fret?  
Here *dwelt* no frowns, no anger; from these joys  
Sorrow flies far. *Id.*

*All dwellings else*

Flood overwhelmed, and them with all their peers  
Deep under water roll'd; sea covered o'er,  
Sea without shore! *Id. Paradise Lost.*

I saw and heard; for we sometimes  
Who *dwelt* this wild, constrained by want or fear  
To town or village nigh. *Id. Paradise Regain'd.*

Their cries soon waken all the *dwelling* near;  
Now murmuring noises rise in every street. *Id.*

He preached the joys of heaven, and peace and  
And warned the sinner with becoming zeal;  
But on eternal mercy loved to *dwelt*.

*Id. Good Pastor.*

The force of fire ascended first on high,  
And took its *dwelling* in the vaulted sky. *Id. On*

We have *dwelt* pretty long on the consideration  
space and duration. *Id.*

Such was that face, on which I *dwelt* with joy,  
Ere Greece assembled stem'd the tide to Troy. *Id.*

A person ought always to be cited at the place of his *dwelling-house*, which he has in respect of his habitation and usual residence, and not at the house which he has in respect of his estate, or the place of his birth. *Ayliffe's Perpetua.*

And the soft quiet hamlet where he *dwelt*  
Is one of that complexion which seems made  
For those who their mortality have felt,  
And sought a refuge from their hopes decayed  
In the deep umbrage of a green hill's shade. *Id.*

The Scipios' tomb contains no ashes now,  
The very sepulchres lie tenantless  
Of their heroic *dwellers*: dost thou flow,  
Old Tiber! through a marble wilderness?  
Rise, with thy yellow waves, and mantle her *dwelt*!

DWIGHT (Timothy), LL.D., a learned American divine, was born at Northampton, state of Massachusetts, 4th May, 1792, his father being an opulent merchant, he was at the age of thirteen, at Yale College, and he subsequently became the distinguished and president. He twice represented his town in the state legislature, and, in 1815, came minister at Greenfield in Connecticut, obtained great reputation as a biblical and preacher. Besides his theological works, consisting of 5 vols. 8vo., he composed, in 1817, two poems, entitled *The Conquest of Canada* and *Greenfield Hill*; deemed, at that time, the best productions of the American muse. Dwight died January 11th, 1817, at the age of sixty-five.

DWINA, a large river of European Russia, rising in a lake of the same name, on the border of the governments of Pskov and Tver, and by Veliz, Witpeck, Polotsk, Drissa, and Luga, and falls into the gulf of Riga, a few miles below Riga. It communicates with the lake of Ladoga, and with the

by a canal which joins it to the  
and is navigable throughout.

Another large river of Russia, is formed by the Tschona and Jug, near the Jug, in the government of Vologda. It flows into the White Sea, a little west of Archangel, and is a broad stream, but its mouth is choked with

LE, v. n. } Sax. *dwinan*; Dut.  
ed, *adj.* } *dwynen*; Isl. *dwynn*.  
to shrink; wear away; degenerate:  
verb, to make less; to break down,  
to disperse.

Seven nights nine times nine,  
A dwindle, peak, and pine.

*Shakspeare. Macbeth.*  
 and there were only five hundred foot  
 and horse left; the rest were dwindled  
*Clarendon.*

led legs seem crawling to the grave.

*Dryden.*  
at some small part of the foot being in-  
volved or a blow, the whole leg or thigh  
loses its strength and nourishment, and  
the foot is affected.

have been such a gradual diminution of the faculty of the earth, that it hath dwindled animals to puny mice and insects, we not the like decay in the production of *Bentley.*

Proper names, when familiarized in English, dwindle to monosyllables; whereas in other languages they receive a softer turn, by the addition of a new syllable. *Addison.*

Physicians, with their milky cheer,  
The love-sick maid and *dwindling* beau repair.

Religious societies, though begun with excellent intentions, are said to have dwindled into factious clubs. Swift.

He found the expected council was *dwindling* into a conventicle, a packed assembly of Italian bishops, not a free convention of fathers. *Atterbury.*

Our drooping days are dwindled down to nought,  
Their period finished ere 't is well begun.    *Thomson.*

Lost in thoughtless ease and empty show,  
Behold the warrior dwindled to a beau;  
Since freedom, piety, refined away,  
Of France the mimic, and of Spain the prey.  
Johnson. London.

In its preventive police it ought to be sparing of its efforts, and to employ means, rather few, unfrequent, and strong, than many, and frequent, and, of course, as they multiply their puny politic race, and dunddle, small and feeble.

Burke.

Will they thank the noble lord for reminding us how soon these lofty professions dwindled into little jobbing pursuits for followers and dependants, as unfit to fill the offices procured for them, as the offices themselves were unfit to be created.

# DYEING.

a. & n. s. } Sax. deagan, to color.  
s. } Often written die. To  
tinge; color; stain.

was stern, and seemed still to threaten, which he in heart did hate,  
Child Sansloy in blood lines was dyed.

*Spenser. Fairie Queene.*  
't will help me nothing  
fine innocence; for that die is on me,  
kee my whit'at part black.

Shakspeare. Henry VIII.  
dainty works of feathers of wonderful  
ent dies, and many.

*Bacon's New Atlantis.*  
 So much of death her thoughts  
 Tinted, as did her cheeks with pale.

Minute man) will rather suffer self-martyrdom with the least scruple of his free-  
is impossible to dye his dark ignorance  
color.

to dye an author, like an old stuff into a  
but can never give it the lustre of the  
; as silks that are twice dyed lose their  
never receive a fair color. *Id.*

, that has been by the dew stained,  
its native whiteness gained. *Waller.*  
a virgin saint she sought the skies ;

though it sullies not, it dies. *Dryden.*

then we see emerges into light,  
 bright suns descend to sable night :  
 even itself receives another day,  
 feasted animals in slumbers lie  
 bright rose, another, when the grey  
 concludes the splendour of the day.

There were some of very low rank and professions who acquired great estates: cobblers, *diets*, and shoemakers gave publick shows to the people.

It is surprising to see the images of the mind stamped upon the aspect; to see the cheeks take the die of the passions, and appear in all the colours of thought.

Flowers fresh in hue, and many in their class,  
Implore the pausing step, and with their dyes  
Dance in the soft breeze in a fairy mass.      *Byron.*

## PART I.

## THE THEORY OF DYEING.

1. Dyeing is a chemical art which has for its object the extracting of the coloring particles from such substances as afford them, and transferring them to certain stuffs of wool, silk, cotton, or linen. No art has profited so much from the improvements of modern chemistry as the art of dyeing has; and it cannot be, nor ought it to be forgotten, that while we owe much to the discoveries of our own countrymen, and the application of those discoveries to the useful arts, the art of dyeing is highly indebted to the national operations of the French chemists.

2. The origin of this art seems to be of high antiquity; a circumstance which renders it impossible to say to whom or to what it is to be attributed: conjecture, therefore, is all we can pretend to. As most of the materials from which coloring matter is derived are, of themselves, either of dark and disagreeable colors, or else destitute of any particular color, it is probable that, even in the very earliest ages, the love of

ornament, which is natural to mankind, and which is founded on the love of distinction, one of the most active principles of the human mind, would induce them to stain their vestments with various coloring ingredients, especially with vegetable juices. But the means of imparting permanent dyes to cloth, and affixing to its fibres such coloring materials, as could not easily be washed out by water, or be obliterated or greatly changed by the action of air, or of certain saline substances, to which they are liable to be exposed, and which are necessary to render them clean when soiled, was an art which required the knowledge of principles not within the reach of untutored men, and only to be obtained by gradual investigation, and by the lapse of a considerable portion of time.

3. According to Pliny, the Egyptians had discovered a mode of dyeing, somewhat resembling that which we use for coloring printed linens: the stuffs, probably after having been impregnated with different mordants, were immersed in vats, where they received various colors. And M. Delaval is of opinion, that they were possessed not only of the art of dyeing, but even of that of printing on cloths.

4. The Phœnicians seem to have a strong claim to the invention of this art, and they held a decided pre-eminence in the practise of it for many ages: their purple and scarlet cloths were sought after by every civilised nation; and the city of Tyre, enriched by its commerce, increased to an amazing extent. But her career was stopped by the vanity and folly of the eastern emperors; under whose dominion this opulent city had unfortunately fallen. Desirous of monopolising the wearing of the beautiful cloths of Tyre, these tyrants issued most severe edicts, prohibiting any one from appearing in the Tyrian blue, purple, or scarlet, except themselves, and their great officers of state. To this injudicious restriction is to be attributed the destruction of the Tyrian dyes. For under the impolitic restraint imposed on the consumption of the Phœnician cloths, the manufacturers and dyers were no longer able to carry on their trade; it grew languid and expired: and, with the trade, the art itself also perished. It is generally supposed from the name, that the Tyrian purple, so much celebrated among the ancients, was discovered at Tyre, and that it contributed not a little to the opulence of that celebrated city. The liquor which was employed in dyeing the purple was extracted from two kinds of shell-fish, one of which, the larger, was called the purple, and the other was a species of whelk. Each of these species was subdivided into different varieties, which were otherwise distinguished, according to the places where they were found, and as they yielded more or less of a beautiful color. It is in a vessel in the throat of the fish that the coloring liquor is found. Each fish only afforded a single drop. When a certain quantity of the liquor had been obtained, it was mixed with a proportion of common salt, macerated together for three days, and five times the quantity of water added. The mixture being kept in a moderate heat, the animal parts which happened to be mixed with it separated, and rose to the surface. At the end of ten days, when these opera-

tions were finished, a piece of white was immersed, by which means they ascertained whether the liquor had acquired the proper color. Various processes were followed to prepare the stuff to receive the dye. By some it was immersed in lime-water, and by others compared with a kind of fucus, which was used as a mordant to give it a more fixed color. The liquor from the whelk did not alone yield color. The liquor from the other shell-fish was used by some for the same purpose, and the liquor of the whelk did not alone yield color. The liquor from the other shell-fish was used to increase its brightness; and these operations were in use to communicate the first dye was given by the liquor of the whelk, and a second by that of the whelk, for it was called by Pliny *purpure dibapha*, because it was dipped twice. The small quantity of color which could be obtained from each shell made the tedious process of its preparation a great addition to the stuffs, raised the price of it high, that in the time of Augustus a pound of the Tyrian purple dye, could be purchased for one thousand denarii, equal to £36 sterling.

5. Among the Greeks the knowledge of dyeing must have been very imperfect, and far from being science; for the art of dyeing seems not to have been known in Greece before Alexander's invasion of India, where, according to Pliny, they dyed the sails of his ships of different colors. The Greeks seem to have derived this art from the Indians.

6. India seems to have been the seat of the arts and sciences, which were afterwards introduced and perfected among other nations. India, which had a tendency to improve the arts, did not fail to be multiplied rapidly, and to become rich in natural productions; requiring the support of its inhabitants; and the cultivation of which was favored by the nature, and simplicity of manners, imposed by the tyranny of succeeding emperors. But religious prejudices, and the division into castes, soon shackled industry, and became stationary; and it would seem, that the knowledge of dyeing cotton in this country was then unknown, or at least it was as far advanced in the time of Alexander as it is at the present period.

7. The beautiful colors, which are obtained in some Indian linens, would lead one to suppose that the art of dyeing had there reached a degree of perfection; but we find in the relation which Beaulieu, at the request of the French government, gave of some operations performed in India, that the Indian processes were so tedious, and imperfect, that they were not practicable in any other country, except the great difference in the price of labor.

8. It is unquestionably true, that the East has far surpassed them in the design, variety of shade, and fastness of color; and, if we are inferior to them in the liveliness of some colors, it is attributed to the superior quality of our dyes, or perhaps to the length and nature of their operations and processes. In this country, however, the art of dyeing has made considerable progress till about the begin-

teenth century. Before that period our goods were sent to Holland, to be dressed and

11. This, however, was probably practised in the case of particular colors. The dyeing of woolen and silken goods has indeed long since reached a considerable degree of excellence; the manufactures of cotton, owing to the attraction of that substance for coloring matters, have been very deficient in this point. Within these few years, the colors employed in the dyeing of fustians and cotton velvets were improved, and, even at this day, many of them are still so. But it must be allowed that great improvements have been made within these few years, from the application of chemical principles, by a diligent investigation of the nature of coloring substances. There is however still much to be done for the improvement of the art, but this can only be effected by the practical dyer acquiring chemical knowledge, an acquisition now happily made within the reach of every dyer who is capable of reading and understanding the English language. It will not be necessary for our present purpose to enter into a minute examination of the various theories that have been advanced of the nature of colors; at the same time it may be proper, before we deduce a general theory of dyeing, to make a few observations on the common properties of coloring substances.

In explaining the cause of color, and the nature of coloring particles, two great inconveniences have arisen. First, from an attempt to illustrate the action, which the particles of coloring substances have on the rays of light, in consequence of their density and thickness, without using any means of ascertaining this, and without any regard to the attractions which result from their chemical composition; in comparing coloring particles to mucilages and resins, to some very faint resemblances; and in attempting to explain their coloring properties by pictures, formed respecting their component parts, while these properties ought rather to be explained by direct experiment than by an imaginary composition. It was also deduced from true theory, to ascribe to laws of a mechanical, the adhesion of the coloring matters to the substances dyed, the action of the elements, the difference between the true or durable and the false or fugitive dyes.

Hellot, who has written an excellent treatise on dyeing, seems to have erred on this point; and Macquer, who was amongst the first to entertain just notions respecting chemical attractions, seems to have been led astray by the same. It appears, however, that Dufay had observed, that the coloring particles were equally disposed to adhere more or less firmly to the filaments which receive them; and had justly remarked, that without this disposition, they would never assume any color but that of the bath, and would always divide the coloring matter equally with it; whereas the liquor of the bath sometimes becomes as limpid as water, leaving off all the coloring particles to the stuff; and, he observes, seems to indicate that the elements have less attraction for the water than for the particles of the wool.

1. Bergman seems to have been the first who

referred the phenomena of dyeing entirely to chemical principles. Having dyed some wool and some silk in a solution of indigo, in very dilute sulphuric acid, he explains the effects he observed in the operation, by attributing them to the precipitation, occasioned by the blue particles having a greater affinity for the particles of the wool and silk, than for those of the acidulated water. He remarks that this affinity of the wool is so strong, as to deprive the liquor entirely of the coloring particles; but that the weaker affinity of the silk can only diminish the proportion of these particles in the bath, and he shows that on these different affinities depend both the permanence and intensity of the color.

12. This is the true light in which the phenomena of dyeing should be viewed; they are real chemical phenomena, which ought to be analysed in the same way as all those dependent on the actions which bodies exert, in consequence of their peculiar nature. It is evident, that the coloring particles of bodies possess chemical properties, that distinguish them from all other substances; and that they have attractions peculiar to themselves, by means of which they unite with acids, alkalis, metallic oxides, or calces, and some earths, principally alumine or pure clay. They frequently precipitate oxides and alumine, from the acids which held them in solution; at other times they unite with the salts, and form supercompounds which combine with the wool, silk, cotton, or linen. And with these their union is rendered much more close by means of alumine or metallic oxide, than it would be without their intermedium.

13. The difference in the affinity of the coloring particles for wool, silk, and cotton, is sometimes so great, that they will not unite with one of these substances, while they combine very readily with another; thus, cotton receives no color in a bath which dyes wool scarlet. Dufay prepared a piece of stuff, the warp of which was wool and the woof cotton, which went through the process of fulling, that he might be certain, that the wool and the cotton received exactly the same preparation; but the wool took the scarlet dye, and the cotton remained white. It is this difference of affinity which renders it necessary to vary the preparation and the process, according to the nature of the substance which is intended to be dyed of a particular color. And these considerations ought to determine the means to be pursued for the improvement of the art of dyeing. It is highly proper to endeavour to ascertain what are the constituent principles of the coloring particles. And in this enquiry, the most essential circumstances are, to determine the affinities of a coloring substance; first, with the substances which may be employed as menstrua; secondly, with those which may, by their combinations, modify the color, increase its brilliancy, and help to strengthen its union with the stuff to be dyed; thirdly, with the different agents which may change the color, and principally with the external agents—air and light.

14. The qualities of the uncombined coloring particles are modified when they unite with a substance; and, if this compound unites with a stuff, it undergoes new modifications. Thus the

properties of the coloring particles of cochineal are modified, by being combined with the oxide of tin, and those of the substances resulting from this combination are again modified by their union with the wool or silk; so that the knowledge we may acquire by the examination of coloring substances in their separate states, can only inform us respecting the preparations that may be made of them; that which we acquire respecting their combinations with substances which serve to fix them, or to increase their beauty, may inform us what processes in dyeing ought to be preferred or tried; but it is only by direct experiment made with the different substances employed in dyeing, that we can confirm our conjectures, and properly establish the process.

15. These facts show, that the changes produced by acids and alkalis on many vegetable colors, such as the chemists employ, in order to discover the nature of different substances, are owing to the combinations, which take place between these coloring particles and the acids and alkalis. The compounds resulting from these may be compared to neutral salts, which possess qualities different from those of their component parts, but in which one of these parts may be in excess, and its qualities consequently predominant. This state of combination is observable between the coloring particles of cochineal and acidulous tartrate of potassa, or cream of tartar: by evaporating slowly a solution of this salt in a decoction of cochineal, crystals are formed, which retain a fine ruby color, much more bright and intense than that of the liquor which formed them.

16. It was the opinion of Berthollet that some of the acids, particularly the nitric, after combining with the coloring particles, changed the color which they at first produced, making it yellow, and finally destroying it; after which they act by means of one of their principles, viz. the oxygen. But this theory, Dr. Ure remarks, is not now tenable, since it is known that dry chlorine does not blanch dry litmus paper. When moisture intervenes, muriatic acid is formed, and oxygen evolved; to the action of which body on the color the bleaching effect is to be ascribed. Water is the source of the discoloration, both in the ancient and modern process of bleaching. Blue colors are not the only ones which become red by the addition of acids, and green by that of alkalis; most red colors, as that of the rose, for instance, are heightened by acids, and made green by alkalis; and some green colors, such as that of the green decoction of burdock, according to the experiments of Mr. Nose, and the green juice of Buckthorn, as is evident from the trials of Mr. Becker, are reddened by acids.

17. This property, which is common to most of the ordinary colors of vegetables, seems to prove that there is a close analogy between their coloring particles; and it is not without foundation, that Linnæus supposed, that the red in vegetables was owing to an acid, and indicated its presence; but there are also many vegetables which contain acid in a disengaged state, without their possessing a red color. It is therefore evident, that the coloring particles have affinities for acids,

alkalis, earths, and metallic oxides, which constitute a part of their chemical properties; the consequence of which, their colors are less varied; therefore these particles form the basis of the stuff on which they are fixed, a basis which retains only some of their original properties; they are also modified by these earths, alumine, or pure clay, metallic oxides, and other substances; as are also those resulting from the compounds, when they are further combined with the stuff.

#### OF MORDANTS.

18. The term mordant is derived from a French word *mordre*, which signifies to bite or corrode. In the art of dyeing, it is used to designate all those substances employed for the purpose of facilitating or modifying the combination of the coloring particles with the stuff dyed. Dr. Bancroft, and Dr. Hare of Manchester, proposed to denominate these substances by the term *basis*, since the action of many of them does not depend on the corroding principle; but this alteration has not been adopted. Mordants deserve the particular attention; as by their means colors are heightened, brightened, made to strike, and rendered more durable. We shall, therefore, examine the nature of the action of the principal basis mordants, and endeavour to determine how these attractions serve to unite the coloring particles with the stuff, and how they affect the quantity of colors.

19. A mordant is not always a simple substance; for new combinations are sometimes formed by the ingredients that compose it; so that the substances employed are not the immediate agents in the compounds which they have formed. Sometimes the mordant is fixed with the coloring particles, and sometimes the stuff is impregnated with it; on other occasions, both the coloring particles are united; and we may dye successively with liquors containing different substances, each of which only can act on the particles of the stuff is impregnated. The art of preparing mordants affords many processes, in which it is necessary to serve the effects of mordants; to elucidate this subject, therefore, we shall mention a few examples.

20. The basis employed for linens intended to receive different shades of red, is prepared by dissolving in eight pounds of hot water six pounds of alum, and one pound of lead, or lead, or sugar of lead, to which two ounces of potassa, and afterwards two ounces of pure chalk are added. The alum is decomposed by the acetite of lead, because the oxide of lead combines with the sulphure of the acid, and forms an insoluble salt which is precipitated; the base of the alum, alumine, at the same time combines with the acetic acid of the vinegar, and produces an acetite of alumine. The chalk and potassa answer the purpose of saturating the excess of acid. One of the effects which result from the formation of the acetite of alumine is, that the alumine is retained by a much weaker affinity than in the state in which it more easily quits its combination with the stuff and coloring particles.

stage is, that the acid liquor, from which alum is separated, has much less action on the stuff when it consists of the acetous, than when it consists of a stronger acid, such as the sulphuric. In short, the acetate of alumine not having the property of crystallising, the mordant is thickened with starch or gum, to prevent its being applied to the block on which the design is engraved, does not curdle, as it would if it contained alum capable of crystallising.

By attending to the operation performed on a piece of linen cloth, we find, that when it has been impregnated by the mordant, in the manner determined by the design, it is put into a bath of madder; the whole of the cloth becomes colored, but the tinge is deeper in those parts which have received the mordant; there coloring particles have combined with the alumine and the cotton, so that a triple compound has been formed, and the acetous acid separated from its basis remains in the bath.

Thus the coloring particles, combined with alumine and the stuff, are much more difficultly affected by external agents, than when they are in a separate state, or combined only with the stuff, without any intermediate bond of union; and on this property the operations, to which the stuff is afterwards subjected, are founded. After it has been maddered, it is boiled with bran, and laid upon the grass; and these operations are repeatedly repeated until the ground becomes black.

The coloring particles, which have not combined with the alumine, are altered in their composition, dissolved, and separated, while those which have combined with it remain, and are preserved, without alteration; and thus, the design remains colored. It seems that this decomposition of the coloring particles, by exposure on the grass and boiling with bran, is accomplished in the same manner as that of the coloring particles of flax, and admits of the same explanation. The only difference consists in substituting bran for alkalis, because they would dissolve a part of the coloring matter, which is fixed by alumine, and would change its color; instead of which, the bran, having a much weaker action on its substance, affects only the coloring particles, which, by the action of the air, have been rendered more easily to solution. If, however, instead of the mordant, a solution of iron be employed, similar phenomena are exhibited. The coloring particles decompose the solution of iron, form a triple compound with the stuff; but, instead of red, we obtain from the madder, brown of different shades, down even to black;

by uniting these two mordants, alum and iron, we have mixed colors, inclining to red on the one hand, and to black on the other, such as purple, and puce color. Other colors are also obtained by substituting dyers-weed for madder; and by means of these two coloring substances, alum, and the two mordants above mentioned, obtain most of the different shades that are obtainable in stuffs which are printed.

The different substances which enter into the composition of a mordant remain in combination till a new action is induced by the application of another substance. Thus the affinity of the stuff for one of their constituent parts pro-

duces a decomposition and new combinations. But even this effect is sometimes incomplete, or does not at all take place without the action of another affinity, namely, that of the coloring particles. We have an example of this in the mixture of alum and tartar, which is one of the most common mordants in the dyeing of wool.

22. M. Berthollet, having dissolved equal weights of alum and tartar, found that the solubility of the tartar was increased by the mixture. By evaporation and a second crystallisation, the two salts were separated, so that no decomposition had taken place. Half an ounce of alum and one ounce of wool were then boiled together for an hour, and a precipitate was formed, which, being carefully washed, was found to consist of filaments of wool incrustated with earth. To this sulphuric acid was added, and the solution being evaporated to dryness, crystals of alum were produced, with the separation of some particles of carbonaceous matter. The liquid in which the wool had been boiled being evaporated, yielded only a few grains of alum; what remained would not crystallise. This being again dissolved, and precipitated by means of an alkali, the alumina which was thrown down was of a slate color, became black when placed on red-hot coals, and emitted alkaline vapors. From this experiment it appears that the alum was decomposed by the wool, and that part of the alumina had combined with its most detached filaments which were least retained by the force of aggregation; that part of its animal substance had been dissolved and precipitated by the alkali from the triple compound thus formed.

23. M. Berthollet made the same experiment with half an ounce of alum and two drams of tartar; no precipitation took place: he obtained by evaporation a small portion of tartar, and some very irregular crystals of alum; the remainder would not crystallise: this, on being diluted with water, and precipitated by potassa, gave by evaporation a salt which burned like tartar. The wool which had been boiled with the alum felt harsh, but the other retained its softness. The first had acquired from the madder a more dull, though lighter tint, but the color of the latter was more full and bright.

24. From these experiments it appears, in the first place, that the wool had begun a decomposition of the alum; that it had united with a part of the alumine; and that even the part of the alum which retained its alumine had dissolved some of the animal matter. In the second place, that the tartar and alum, which cannot decompose each other solely by their own affinities, become capable of acting on each other when their affinities are assisted by that of the wool. And, in the third place, that the tartar appears principally useful for moderating the too powerful action of the alum upon the wool, whereby it is injured; for tartar is not used in the alumining of silk and thread, which have less action on the alum than wool has. As the decomposition of alum by the tartar and wool takes place in consequence of affinities which nearly balance each other, and the process must therefore go on slowly, it is useful to keep the stuff impregnated with alum and tartar for some days in a moist

does not take place with respect to those colors which are esteemed durable, being unchangeable by alkalis or acids, which are not strong enough to destroy their composition.

25. The attraction of alumine for animal substances is not, however, merely indicated by uncertain appearances, nor supposed for the purpose of being employed in explanations, but is proved by direct experiment. M. Berthollet united them together, by mixing an animal substance with a solution of alum; a double exchange took place, the alkali entered into combination with the acid of the alum, and the alumine, combining with the animal substance, was precipitated. He also proved the affinity of alumine for animal substances by another experiment: having mixed a solution of glue with a solution of alum, he precipitated the alumine by an alkali, and the glue with which it had combined fell down along with it. This compound has the appearance of a semitransparent jelly, and dries with difficulty. Thus, in the preceding experiments, the alkali precipitated the alumine combined with the animal substance, from the uncrystallisable residue of the alum which had been boiled with the wool.

26. The affinity of alumine for most coloring substances, may also be shown by direct experiment. If a solution of a coloring substance be mixed with a solution of alum, a precipitation sometimes takes place; but if to the liquor we add an alkali, which decomposes the alum, and separates the alumine, the coloring particles are then precipitated, combined with the alumine, and the liquor remains clear: this compound has obtained the name of lake. In this experiment, too much alkali must not be added, because alkalis are capable of dissolving lakes in general. No direct experiment has however yet shown, that alumine attracts any vegetable substance except the coloring particles: its affinity for them seems much weaker than that which it has for animal substances; hence the acetite of alumine is a better basis for cotton and linen than alum is, and upon this depend the different means employed to increase the fixity of the coloring

combination, only a white and some by the admixture of that which is proper to the but in many metallic oxides according to the proportion of change. Upon these circumstances in dyeing chiefly depend

29. The affinity of metallic solutions are, therefore, than that which they have for metallic solutions are, therefore, to serve as mordants for colors except iron, the oxide of with vegetable substances, moulds, which are owing to the action of this oxide. When articles have precipitated a menstruum, the supernatant disengaged acid, which is dissolving a portion of the coloring substance and oxide, remains colored; but sometimes coloring particles are precipitated portions have been accurate precipitation is facilitated, complete, by the presence, assists, by the tendency it has compound of oxide and color combined metallic oxides independent action on many coloring boiled with them, and mod oxide of tin in particular men and fixity of many.

29. The compounds of substances are similar to the compounds, which are insoluble principles of which they are formed; but which are supersaturated by an excess of oxides, and thence of becoming metallic oxide, united with to excess, produces a liquor, will be modified by the oxide

bring particles, and that these precipitates gained a considerable degree of solubility; it would seem that a small part of the salt becomes united with the coloring particles and the stuff. Salts with calcareous bases also modify colors; as these modifications are nearly similar to those which would be produced by the addition of a small quantity of lime, it is probable that they are decomposed, and that a little of the lime enters into combination with the coloring particles and the stuff. By attention to this, we shall easily discern what combinations are formed by the agency of the different reactives, employed in the analysis of coloring substances; but we must not forget, that the mordants and the coloring particles have a mutual action on each other, which may change their properties. It is evident that, by varying the mordants, we may easily multiply the shades obtained from a coloring substance; even to vary their mode of application may be sufficient: thus we shall obtain different effects by impregnating the stuff with the mordant, or by mixing the mordant in the bath; by applying heat, or using exsiccations, for we operate upon three elective actions; that of the coloring particles, that of the stuff, and that of the principle of the mordant; many circumstances may cause variations in the result of these attractions; circumstances which merit further explanation. Exsiccation, by drying, favors the union of the substances which have an affinity for the stuff, and the dispositions which may result from that union; it raises the water which held these substances in solution, by its attraction, opposed the action of the stuff; but the exsiccation should be slow, in order that the substances may not be separated from their mutual attractions have produced the effect.

32. Considerable differences must be observed in the manner of employing the mordant, as the force of affinity between the stuff and the coloring matter is greater or less. When the affinity is strong, the mordant and the coloring substance may be mixed together; the compound thus formed, immediately enters into combination with the stuff. But, when the affinity between the stuff and the coloring particles is weak, the compound formed of the latter and the mordant may separate, and a precipitation takes place, before it can be attached to the stuff; hence it is, that the mordant which is to be used as the medium of union between the stuff and the coloring matter, must be combined with the former, before the application of the latter. It is from these differences that different processes must be followed in fixing coloring matter on animal and vegetable productions.

33. In judging of the effects of mordants, and in the most advantageous manner of applying them, it is necessary to attend to the combinations which may be formed, either by the action of the mordants of which they are composed, or by the action of the coloring matter and the stuff. It is necessary, also, to take into consideration the circumstances which may tend to bring about these combinations with more or less rapidity, or that they render them more or less perfect. The action of the liquor in which the stuff is immersed

may have, either on its color or texture, must also be considered; and to be able accurately to judge of the extent of this action, we must know the proportions of the principles of which the mordant is composed; which of these principles remains in an uncombined state in the liquor, and the proportion or quantity which is separated.

32. The coloring particles have been hitherto considered only as substances capable of forming different combinations, by which their properties are modified; but they may be altered in their composition, either by other external agents, or by the substances with which they unite. The stability of a color consists in its power of resisting the action of vegetable acids, alkalis, soap, and more especially that of the air and light; but this power varies exceedingly, according to the nature of the color and the species of the stuff; for the same durability is not required in the colors of silk as in those of wool. There is not much obscurity in the action of water, acids, alkalis, or soap: it is a solution brought about by these agents: and it appears that a small quantity of acid, or of alkali, sometimes unites with the compound which gives the color; because the color is not destroyed, but only changed, and may be restored by taking away this acid; for instance, by chalk and ammonia, or volatile alkali. But this is not the case with respect to the action of air and light.

33. Scheele observed, that the oxygenated muriatic acid rendered vegetable colors yellow, and he attributed that effect to the property it had of taking up the phlogiston which entered into their composition. Berthollet has shown, that the properties of the oxygenated muriatic acid were owing to the combination of its oxygen with the substances exposed to its action; that it commonly rendered the coloring particles yellow; but that, by a continuance of its action, it destroyed their color; without determining in what this action consisted. Lavoisier afterwards made several observations on the action of oxygen on the coloring particles, which throw a great deal of light on the nature of the changes they undergo, chiefly when watery solutions of them are left exposed to the air, or have been subjected to a boiling heat. He observed that, in consequence of the action of the air, vegetable decoctions formed pellicles, which lost their solubility, and underwent successive changes of color; he marked the gradations of color thus produced, and concluded, from his observations, that oxygen entered into the composition of the coloring particles; that when it combined with them, their shade was changed; that the more they received, the more fixed did their color become; and that the best method of obtaining permanent unchangeable colors, for painting, was to choose such as had been exposed to the action of the oxygenated muriatic acid.

34. In considering the effects of air on colors, it is necessary to make a distinction between those produced by metallic oxides, and those produced by the coloring particles. Berthollet is of opinion that the modifications of the former are entirely owing to different proportions of oxygen, but from observation he has been led to

form a different opinion respecting the modifications of the latter. He observed, that the oxygenated muriatic acid exhibited different phenomena with the coloring particles; that sometimes it discharged their colors, and rendered them white; that most frequently it changed them to a yellow, fawn, or root-colored, brown, or black, according to the intensity of its action; and that, when their color appeared only discharged or rendered white, heat, or a length of time, was capable of rendering them yellow. He compared the effect produced by the oxygenated muriatic acid, when the particles are rendered yellow, fawn-colored, or brown, with the effect of a slight degree of combustion, and showed that they were the same; that they were owing to the destruction of the hydrogen, which, combining with the oxygen, more easily, and at a lower temperature than charcoal does, leaves it predominant, so that the natural color of charcoal is more or less blended with that which before existed. This effect becomes very evident, when sugar, indigo, or the infusion of the gall-nut, or of sumach, are exposed to the action of oxygenated muriatic gas; the sugar and the indigo assume a deep color, and afford indisputable marks of a slight combustion; the infusion of the gall-nut, and that of sumach, let fall a precipitate, which is not far from being pure charcoal or carbon. These appearances are analogous to those which are observed in the distillation of organised substances; in proportion as the hydrogen is extracted in the form of oil, or of gas, the substance grows yellow and at length there remains only a black coal. If the hydrogen be expelled from an oil, by heat, it grows brown, evidently in the same way.

35. Berthollet also found, by other experiments made on alcohol and ether, that the oxygen united to the marine acid, had the property of combining with the hydrogen, which abounds in these substances, and of thereby forming water. He therefore supposes, that when the oxygenated marine acid renders a color yellow, fawn-colored, or brown, the effect proceeds from the coloring matter having undergone a slight combustion, by which more or less of its hydrogen has been converted into water; and that the charcoal, thus rendered predominant, has communicated its own color. The art of bleaching linen by means of the oxygen of the atmosphere, of the dew, and of the oxygenated marine acid, he also supposes to depend on this change of the coloring matter. The coloring particles of the flax are rendered soluble in the alkaline lixivia, the action of which ought to be alternate with that of the oxygen. These coloring particles may be afterwards precipitated from the alkali, and by evaporation and drying become black, and prove the truth of this theory, both by the color they have acquired, and by the quantity of charcoal which they yield on being analysed. But the alkaline solution of the coloring matter of linen which is of a dark brown color, loses its color almost entirely, by the addition of a certain quantity of oxygenated muriatic acid; and the same effect is observable in many other substances, which have assumed a color originating from a commencement of combustion. A piece of linen, which appears white, may grow yellow in process of time, particularly

if exposed to a certain degree of long oxygenated parts have not been acted on by sufficiently strong lixivium. In the former, the green parts of vegetables become white by the oxygenated muriatic acid, and become yellow when boiled.

36. From these facts it appears, that air is capable of whitening, or rendering pale coloring matters with which it unites, either by having produced the effects of combustion upon them; or possibly these effects take place only afterwards in a gradual manner, more rapidly, when the whole is exposed to a certain degree of heat. It is extremely probable that in all cases a part of the oxygen unites to the coloring matter, without being combined with the hydrogen in particular, and that in this way that oxygen acts, in rendering coloring matter of flax more easily soluble in water. In many other cases oxygen has produced an influence on the changes which take place in coloring particles of vegetables; these particles are formed chiefly in the leaves, flowers, and inner bark of trees; by degrees they undergo a slight combustion, either from the action of atmospheric air which surrounds them, or from that of the air which is carried by a current of vessels into the internal parts of vegetables.

37. Berthollet, therefore, supposes that we can explain how the air acts upon coloring matters of an animal, or a vegetable nature; it combines with them, renders them weaker, and by degrees occasions a slight combustion, by means of which the hydrogen which enters into their composition is destroyed, thus changing them to a yellow, red, or fawn-color; that the force for the stuff seems to diminish; they are carried from it, and are carried off by water: all these effects vary, and take place more or less, and more or less completely, according to the nature of the coloring particles; or rather, according to the nature of the properties which they possess in the state of combination into which they are gone. The changes which occur in the coloring matter produced by the union of the coloring matter with metallic oxides, are effects comparable to the change which takes place in the coloring particles, and of that which is undergone by metallic oxide.

38. The light of the sun considerably accelerates the extinction of colors. It explains, therefore, if this theory be well founded, the effects of the combination of oxygen, and the color thereby induced. Sunnebier, who has made many interesting observations on the effects of light on different substances, and particularly their colors, attributes these effects to the combination of light with the substance. He observes the effects of light on the color of wood, long ago been noticed; it preserves its color and appearance while kept in the dark, but when exposed to the light, it becomes yellow, or of other shades. The same was observed in the varieties which occur in the color of linen in different kinds of wood, and in the changes are proportional to the intensity of the light, and that they take place more rapidly in water, but that wetted wood undergoes changes less quickly than that which

several folds of riband were required to and the wood completely, that a single leaf of paper was sufficient, but that, when paper of other color was substituted, the change was prevented; a single covering of white paper insufficient, but two intercepted the action of the rays of light.

39. He extended his experiments to a great number of vegetable substances, in a manner that may serve to illustrate different phenomena of vegetation. If a well-made solution of the parts of vegetables in alcohol, which has the green color, be exposed to the light of the sun, it very soon acquires an olive hue, and loses its color in a few minutes. If the light be weak, the effect is much more slow; and in perfect darkness, the color remains without alteration, if any change does take place, it requires a great length of time. An alkali restores the green color; but if the change of color in the liquor has been completed, the alkali has no effect.

No change of color takes place in azotic matter, nor in a bottle which is exactly full. A little half full of this green solution was inverted over mercury, by Berthollet, and exposed to the light of the sun; when the color was discharged, mercury was found to have risen in the bottle, and consequently vital air had been absorbed, the oxygen having united with the coloring matter. The precipitate which M. Sennebler mentions was not evident; the liquor had continued transparent, and retained a slight yellow tinge.

By evaporating this liquor, its color was immediately rendered darker, and became brown; the residue was black, and in a carbonaceous state.

40. Light, therefore, acts by favoring the absorption of oxygen, and the combustion of the coloring matter. At first, the marks of combustion are not evident; the liquor retains only a slight yellow tinge; but, by the assistance of the combustion is completed, the liquor becomes brown, and leaves a black residuum. The vessel which holds the liquor contains no oxygen gas, the light has no effect on the color-matter; azotic gas in this situation suffers no diminution. The observation, that ribands, or a single leaf of white paper, do not prevent the action of light, deserves attention, as it shows that light can pass through coverings which appear to be opaque, and exert its energy a considerable depth within. Beccaria and Sennebler have compared the effects of light on ribands of various colors; but the differences they have observed are rather to be attributed to the nature of the coloring matters, than to the colors; for a riband dyed with Brasil-wood will lose its color much sooner than one dyed with cochineal, though the shade should be exactly the same in each.

41. Although light greatly accelerates the combination of the coloring particles, and seems even necessary for their destruction in some cases, in others it is not required. It was found, by putting some plants into a dark place, in contact with vital air, that that air was absorbed by some of them; and, also, that the rose suffers a change, and becomes of a deeper hue, when it is not in contact with vital air, probably because it contains a little oxygen, the combination of which

then becomes more intimate. But many flowers, when in azotic gas, retain their color in perfection. The tincture of turnsole was placed in contact with vital air over mercury, both in the dark, and exposed to the light of the sun; the former continued unchanged for a considerable length of time, and the vital air had suffered no diminution; the other lost much of its color; became red; and the air was, in a great measure, absorbed, and a small quantity of carbonic acid was produced, which undoubtedly had occasioned the alteration of color from blue to red. From this we may form an idea of some of the changes of color, produced by a particular disposition of the component principles of vegetable substances, when, by their combination with oxygen, they undergo the effects of a slight combustion, which may generate an acid, as in the leaves in autumn, which grow red before they become yellow, and in the streaks which are seen in flowers, the vegetation of which is becoming weak.

42. On the whole it is evident, that coloring substances resist the action of the air more or less, according as they are more or less disposed to unite with oxygen, and thereby to suffer more or less quickly a smaller or greater degree of combustion. Light favors this effect, which in many cases is not produced without its assistance; but the coloring matter, in its separate state, is much more prone to this combustion, than when united to a substance, such as alumine, which may either defend it by its own power of resisting combustion, or, by attracting it strongly, weaken its action on other substances, which is the chief effect of mordants. This last compound acquires still greater durability, when it is capable of combining intimately with the stuff upon which it is deposited. Thus the coloring matter of cochineal is easily dissolved in water, and its color is quickly changed by the air; but when united to the oxide of tin, it becomes much brighter, and almost insoluble in water, though it is still easily affected by the air, and by oxygenated muriatic acid; it resists the action of these better, however, when it has formed a triple compound with a woollen stuff. But still it is not to be inferred, that all yellow colors are owing to the carbonaceous part of the coloring substance; very different compounds are capable of producing the same colors; thus, indigo is very different from the blue of our flowers, from that of oxide of copper, and from that of Prussian blue. Berthollet does not even suppose, that oxygen may not unite in a small proportion with some coloring substances, without weakening their color, or changing it to yellow. Indigo becomes green by uniting with an alkali, with lime or a metallic oxide; but resumes its color, and quits these substances, when it recovers a small portion of the oxygen which it had lost. The liquor of the wheel, employed to dye purple, is naturally yellowish; but when exposed to the air, and more especially to the sun, it quickly passes through various shades, and at length assumes the exquisite purple color of the ancients; and which, according to the testimony of Eudocia, derived its lustre and perfection from exposure to the sun's rays.

43. It may then be considered as a general

low color, which is more or less deep, according to the concentration of the acid, its temperature, and the time of immersion; that the must be carefully washed as soon as taken off the acid; that this color possesses considerable brightness; and that it may be made without sensibly weakening the silk, which renders the process really useful. The color also be modified by the use of alkalis. Solutions of calcareous earth and magnesia have no effect upon silk, because they do not form an excess of acid; but the solutions of lime and of all metallic substances, produce more or less deep yellow, because they all form more or less excess of acid, which acts on the silk like uncombined acid.

It appears likewise to have been the acid that dyed the animal substances yellow, in experiments of M. Brunwiser, and not the acid extracted from the wood, as he supposed. The yellow color in these cases owing to what De la Folie supposed; for the purest nitrous acid, which contains no iron, produces it, all as that in which the presence of that acid may be supposed to exist. Silk, when put in concentrated nitrous acid, quickly assumes a yellow color, loses its cohesion, and is dissolved; during this solution, the azote, which enters into the composition of animal substances, is liberated, with a long continued effervescence; if heat be applied, it expels much nitrous gas, and the liquor immediately acquires a deep red and grows brown. At this time, the oxygen of nitric acid combines with the hydrogen which abounds in animal substances, forming water, which is obtained from them by distillation, and which renders them so inflammable. As the acid begins to act, and to render the silk yellow, the same effect should also begin to take place. M. Berthollet therefore supposes, that the yellow color arises from a commencement of combustion; but that this combustion is very slight, does not sensibly weaken the silk, however, the acid be a little too strong, if immersion too long continued, or if the effect of it be not carried off by careful washing, the silk immediately becomes weak, and is dissolved.

It is, therefore, evident why the nitrous acid is preferable in this operation to that which is treated with nitrous gas; for, in the former, the proportion of oxygen being greater, it is better fitted to produce the effects of combustion, and becomes in the state of nitrous acid. The same explanation ought to apply to the action of the oxygenated muriatic acid on animal substances; it diffuses, however, in some essential substances, which are not easily explained.

Silk has been observed to receive a yellow color when the oxygenated muriatic acid is employed, which is much lighter than when the nitrous acid is made use of; the sulphurous discharges it in a great degree, but has no effect on the yellow produced by the diluted nitrous acid. The oxygenated muriatic acid has, however, a much stronger action on the color, it soon weakens, and even dissolves it; and when left for some time in this fluid, the yellow color at first appeared grows lighter, agreeably to what has already been remarked, that oxygen,

by accumulation, is capable of disguising the yellow color occasioned by the combustion, which it had originally induced. Berthollet has endeavoured to explain the effects which the sulphurous acid produces on colors, by the facility with which it gives off its oxygen, and has compared them to those of the oxygenated muriatic acid; but, although it be true that oxygen adheres much more weakly to the sulphurous than to the sulphuric acid, he does not believe that that explanation is founded in truth.

51. It appears from the observation of De la Folie, that roses, whitened by the vapor of burning sulphur, become green in an alkaline lixivium, and red in acids; and M. Berthollet has himself observed, that the sulphurous acid reddened the tincture of turnsole, which has a very fading color, but that it acted only like other acids, on infusions of fustic, Brasil-wood and logwood; and further, that silk which has been exposed to the vapor of sulphur, exhaled the smell of sulphurous acid, when moistened with sulphuric acid, although it could not be perceived before that odor existed. He therefore supposes, that the sulphurous acid commonly unites with the coloring particles, and with the silk, without giving off its oxygen to them, and consequently without producing any combustion; that the product of that combination sometimes loses its color entirely, which is probably owing to the semi-elastic state of the oxygen; but sometimes combustion may, and even commonly should take place by degrees, so that the coloring particles, which have been disguised for some time, ought ultimately to leave a yellow color.

#### OF ASTRINGENTS.

52. Astringents deserve particular attention, not only from their great use in dyeing, but as possessing a property common to many vegetables. Perhaps, says Berthollet, there is no property in vegetables concerning which such vague ideas have been currently received. A slight relation in taste has frequently been deemed enough to rank them in the class of astringents; and every substance has been commonly regarded as astringent, or acerb, which turned a solution of iron black. This effect has been presumed to arise from one identical principle residing in all the bodies that produce it. Experience has subsequently shown, that two species of astringents ought to be admitted, viz. tannin and gallic acid. The gallic acid is obtained from gall-nuts, in which it is found in great plenty.

53. The gall-nut is an excrescence found on the young branches of the oak, and produced by the puncture of an insect. Different kinds of the gall-nut are met with, some inclining to white, yellow, green, brown, or red; others, ash-colored or blackish. They also differ greatly in magnitude, and are either round or irregular, heavy or light, smooth or covered with protuberances. Those which are small, blackish, knotted, and heavy, are the best; and are known by the name of Aleppo galls. These astringent substances are almost totally soluble in water by long ebullition. Sixteen drachms afforded Neumann fourteen of extract; from the remaining two drachms, only four grains could be extracted.

by alcohol. And the same quantity treated first with alcohol, and then with water, afforded twelve drachms and two scruples of spirituous extract, and four scruples of watery extract; the residuum weighed half a scruple more than in the preceding experiment. In the spirituous extract, the taste is more strong and disagreeable than in the watery extract.

54. Many other very interesting observations have been made on astringent substances, by Messrs. Scheele, Monnet, and Berthollet. The latter seems to have proved, that it is not the gallic acid which communicates the astringent properties to the substances that possess it; that the acid itself possesses that property, in a degree inferior to other astringents; and that sumach, treated like the galls, in the manner described by Scheele, affords no gallic acid, though it possesses a high degree of astringency; walnut peels, treated in the same way, do not afford any. The property which the infusion of common galls has, of reddening certain vegetable colors, appears to proceed only from the gallic acid. The infusions of sumach, or of sloe-bark, which very readily produce a black precipitate, that of walnut-tree bark, or of quinquina, did not exhibit this property; and thence it is evident, that the gallic acid does not exist in white galls; for the infusion of these, though it deposit a copious sediment on exposure to the air, is not the gallic acid.

55. If the astringent property were owing to an individual principle distributed in different vegetables, the precipitates obtained by their means, from a solution of iron, would constantly form the same compounds, and exhibit the same appearances and properties; but the precipitate produced by galls is of a blackish blue: that by logwood has a different shade of blue; that by oak is of a fawn color, or blackish brown; that by quinquina, a blackish green. They fall down with different attendant circumstances, and when fixed on stuffs, are discharged by alum and tartar, some much more easily than others; and, probably, by multiplying experiments, many other remarkable differences may be discovered in the properties of these different precipitates. Astringents form with iron different species of compounds, and consequently do not derive their properties from one principle; but there must be a property common to different substances, to enable them to act uniformly on solutions of iron, and to produce precipitates more or less black, and thus appearing of the same nature.

56. The metallic oxides, which unite with the coloring particles, modify their colors; but some metallic oxides, and particularly that of iron, have colors which vary according to the quantity of oxygen they contain. Iron, when united with only a small quantity of oxygen, has a black color. If any substance, by uniting with the oxide of iron, had the property of taking from it a part of the oxygen, which it has when precipitated from its solution in an acid, this would be sufficient to give it a black color; and if the peculiar color of this substance were not predominant, or of itself inclining to black, the compound formed would have a black color; thus ni-

trous gas, either uncombined or with the nitrous acid, renders solutions of iron, and even precipitates the metal, by depriving a portion of its oxygen. By acting in this manner, ammoniac produces a black precipitate with the solutions of iron; in this case, hydrogen of the ammoniac forms water, combining with the oxygen that is dissolved in the oxide of the iron. Galls precipitate silver from their solutions, by reducing their metallic state; they, therefore, possess the property of separating the oxygen from metals, to which it adheres but slightly from others, that portion which is retained in the weakest degree. Any infusion of sumach, readily assumes a deep brown color, by exposure to the air; though it absorbs but a small of vital air. The infusion of sumach, of woods and barks, also acquire a dark color by exposure to the air; so that when upon the oxide of iron, by separating its oxygen, an astringent ought itself to produce a darker color, by which the black should be produced.

57. Various substances, which have different respects different properties, produce black solutions of iron. Among these, some are coloring particles, and employed as such in dyeing. Logwood, and even most kinds of wood, form brown or blackish precipitates with iron. Sometimes the astringent property is not instantaneous; the color of the precipitate at first light; it grows deeper gradually, and darkened in proportion as the iron is exposed to oxygen. The infusion of fustic produces a yellow solution of iron, a yellow precipitate, which grows brown by degrees, and becomes black after a considerable time. But though the property of precipitating solutions of iron does not indicate the presence of the astringent principle in the substances which produce it, there can be no inconvenience in calling the name of astringent, provided by that name meant only a property, which is common to a great number of substances, and which they possess in various proportions.

58. The astringent principle is found to precipitate iron from all acids. The acids of phosphorus and arsenic only have a stronger property than it has for iron. The phosphoric acid is known to have the property of separating iron from the sulphuric acid; but all acids, except acetic, and probably some other vegetable acids, which have not been tried, redissolve the precipitate, and make the color disappear, and are saturated with an alkali. It is not necessary that the astringent principle can unite with metallic oxides, without having the quality of an acid; for animal substances, oils, and lime, have this property. It is said that it is the precipitate composed of iron and the astringent principle, which, by being suspended in the liquor, forms ink.

59. But although chemists consider the astringent principle as always the same, experience shows, that all astringent substances are equally proper for producing a black precipitate; it is of importance to know which of them may be employed with success; it is, however, very difficult.

comparative experiments on this subject with great accuracy, because some substances require much longer boiling than others to extract their astringency; because a difference in their coarseness or fineness, when subjected to ebullition is sufficient to produce differences in the results; and because the coloring particles have more or less disposition to combine with the water, according to the proportion of sulphate of iron that has been made use of. Solutions of the different acids may produce differences in the results, according to the state of oxygenation of the iron in them, according as the proportion of metal is greater or less, and according to the degree of strength which the different acids, when disengaged, are capable of exerting on the iron-formed compound.

In the dyeing of stuffs also some differences will be found to arise from their greater or less attraction for the coloring particles. Dr. Lewis has proved in his excellent observations on the process of making ink, that no iron astringent, not even sumach, can be substituted for gall-nuts. If, says M. Berthollet, a large proportion of sulphate of iron be added to the galls, the ink becomes speedily brown, and then passes to yellow, because the astringent is destroyed by the action of the oxygen which the sulphate of the iron affords, or because it attracts from the atmosphere; for we see that oxygen eventually destroys those coloring substances with which it is combined in great quantities. When this accident happens from age, Dr. Lewis found that an infusion of galls passed over the faded characters restored them. According to Dr. Ure, the best preservative for faded writing is a solution of ferrous sulphate of potash, faintly acidulated, or saturated hydrogen water. Dr. Lewis ascertained, by repeated experiments, that the best proportion for ink is three parts of gall-nuts to one of sulphate of iron; that cherry-gum, and gum-arabic, are as good as gum-arabic for giving the necessary consistence, and for keeping together the black molecules which tend to separate; and that decoction of logwood employed instead of water for the infusion of the galls improves the beauty of the ink.

Mr. Beunie made many experiments to determine the best process for giving cotton a fine black. He first tried what solution of iron gave the finest black to galled cotton; he afterwards combined different solutions, and examined the durability of the blacks which he produced; and made the same experiments on dyed cotton, with other metals and semimetals; employed in like manner a great number of astringents, and tried with them cotton which received different preparations. He found that out of twenty-one species of astringents, oak-bark, the galls of the country, and yellow tobolana, were the only substances which produced a fine black, but which was still neither fine nor so durable as that obtained by the iron galls. He also found that the oak sawdust is preferable to the bark, employed by the dyers of thread, and, being cheaper, may be substituted with advantage.

62. Messrs. Lavoisier, Vandermonde, Four-

croy, and Berthollet, made experiments on galls, oak-bark, raspings of heart of oak, the external part of oak, of logwood, and sumach, for the purpose of forming a comparison of their qualities. To ascertain the portion of astringent principle contained in these different substances, they took two ounces of each separately, which they boiled half an hour in three pounds of water; after the first water they added a second, which underwent a similar ebullition; and continued these operations until the substances appeared exhausted: they then mixed together the decoctions that had been successively obtained. A transparent solution of sulphate of iron, in which the proportions of water and sulphate had been exactly determined, was used. They first estimated the quantity of the astringent principle, by the quantity of sulphate which each liquor could decompose, and afterwards by the weight of the black precipitate which was formed. In order to stop precisely at the point of saturation, they proceeded very slowly in the precipitation, and towards the end added the solution of sulphate only drop by drop, and ceased at the moment when the last added quantity no longer augmented the intensity of the black color. When the liquor is too opaque to allow its shade of color to be distinguished, a small quantity of it is largely diluted with water, and, by adding to this a little of the solution of sulphate of iron at the end of a glass tube, it is discovered whether or not the point of saturation has been attained: if we then wish to get the precipitate which is formed, the whole must be diluted with water very copiously.

63. This operation is an easy and accurate mode for manufacturers to determine the proper proportions of astringents, and solutions of iron. To saturate the decoction of two ounces of galls, three drachms and sixty-one grains of iron were required; the precipitate weighed seven drachms and twenty-four grains, when collected and dried. The color of the decoction of oak bark is a deep yellow; a very small portion of sulphate of iron gives it a dirty reddish color, and a larger one changes it to a deep brown. The quantity of sulphate required to saturate the decoction of two ounces of this bark, was eighteen grains. The precipitate, collected and dried, formed coarser and more compact grains, and weighed twenty-two grains; the inner bark of the oak afforded nearly the same result. But the decoction of the raspings of the heart of oak required for its saturation one drachm and twenty-four grains, and the precipitate weighed one drachm and twenty-four grains; the decoction of the external wood of the oak produced very little precipitate. The decoction of sumach acquired a reddish violet color, when a small quantity of the sulphate of iron was added. The quantity required for its saturation was two drachms eighteen grains. The precipitate exactly resembled that afforded by the galls. And the decoction of logwood became of a sapphire blue color, by the addition of sulphate of iron: if the point of saturation be exceeded, the blue becomes greenish and dirty. The exact quantity required for saturation was found to be one drachm forty-eight grains, and the weight of the precipitate was two drachms twelve

grains. The different precipitations made by oak take place readily; that by logwood, a little more difficultly, but still more easily than that which is effected by galls.

64. It was next ascertained, by trials made with cloth, that the quantity of astringent substances required to give a black color of intensity, to an equal weight of the same cloth, was proportional to the quantities of astringent principle, which had been already estimated in each kind from the foregoing experiments; but the black obtained by the different parts of the oak does not resist proofs of color, nearly so well as that which is produced by galls. Logwood alone seems not capable of producing so intense a black as galls or oak; nor does the color which it produces stand the test of proofs so well as that produced by galls.

65. We shall now consider the astringent principle in regard to its property of combining with vegetable and animal substances, particularly the latter. Silk acquires by galling, which is an operation that consists in macerating a stuff in a decoction of some astringent substance, a weight which cannot be taken from it, or diminished beyond a certain degree, by repeated washing; after which operation the stuff when put into a solution of iron is dyed black, because the astringent principle, decomposing the sulphate of iron, forms a triple compound with the oxide of iron and the stuff which is dyed. A stuff that is galled is likewise capable of combining with other coloring particles, the colors of which thereby acquire fixity, if they do not naturally possess it; so that the astringent communicates its durability to the triple compound, or perhaps the more complex one which is formed; but by this union the color generally becomes of a deeper shade. The astringent principle, by combining with animal substances, renders them incapable of corruption, and tends to render their texture more compact; and in this the art of tanning consists.

66. It may be proper to take some notice here of the substance denominated tannin, which, while it has some properties in common with the gallic acid, differs from it in others. Seguin was the first who showed that astringents contained a peculiar substance, which, in combining with skin, gave it the properties of tanned leather, and that the tanning effect arose from the combination thus formed. Tannin may be procured by digesting gall-nuts, grape-seeds, oak-bark, or catechu, in a small quantity of cold water. The solution, when evaporated, affords a substance of a brownish-yellow color, highly astringent, and soluble in water and in alcohol. According to Mr. Brand, the purest form of tannin appears to be derived from bruised grape-seeds; but even here, he observes, it is combined with other substances, from which it is, perhaps, scarcely separable. I have never, says he, been able to obtain it of greater purity than by digesting powdered catechu in water at  $33^{\circ}$  or  $34^{\circ}$ , filtering and boiling the solution, which, on cooling, becomes slightly turbid, and is to be filtered again, and evaporated to dryness; cold water, applied as before, extracts nearly pure tannin. The most distinctive char-

acter of tannin is that of affording a precipitate when added to a solution of any other animal jelly. On this art of tanning depends, for which is generally employed; but the last of the other trees are frequently employed for other purposes. Professor Proust remarks the precipitation of a decoction of galls by carbonate of potassa, for obtaining a fine greenish-gray flake, which is washed with cold water, and drying them. This precipitate becomes brown on exposure to the air, and is brittle and shining like a resin, and is soluble in hot water. In this state, he says, is very pure. According to Berthollet, tannin consists of hydrogen 4.186, 51.160 + oxygen 44.654.

67. M. Berthollet considers the charcoal as the essential character of the astringent principle; the hydrogen contains only in small quantity, is much disposed partially to combine with oxygen. Hence, when an infusion of galls is in contact with vital air, a small quantity of oxygen is absorbed, and yet the color of the infusion becomes much deeper; for, in cooling, the theory already laid down, the oxygen readily becomes predominant in consequence of the slight combustion, and the color becomes deeper, and becomes brown.

68. Substances which contain much hydrogen, and can undergo only a slight degree of combustion, ought to possess considerable durability, because charcoal does not combine with oxygen in the ordinary temperature of the air; the union being assisted by other attractions, because slight variations of temperature produce no change in the dimensions of charcoal; on the contrary, substances which contain much hydrogen, and in which the particles of hydrogen are in a state of division, are easily decomposed, by the combination of hydrogen with azote or oxygen. The durability of their parts ought to take place in the case of variations of temperature, because they are dilatable by heat, which the carbonaceous particles are not. When, therefore, the astringent principle is combined with an animal substance, it communicates to it the property of durability, derives from the charcoal; the animal substance becomes less liable to change from variations of temperature; instead of being decomposed, it suffers a slight degree of condensation, and the action of the air; for the process of decomposition probably could not go on in a perfect vessel.

69. On examining the analysis of indigo, which may be made of indigo, which may be made of indigo, the coloring matter least liable to change, with which we are acquainted, and which is that this substance leaves, in indigo, a greater proportion of charcoal than in the others themselves. M. Berthollet supposes also that this abundance of charcoal is the chief cause of the durability of the color of indigo, and that the proportion of charcoal is the chief cause of the difference in the durability of colors; but the heat of the sun may also have great influence on the

combines intimately with another substance, ought to form with it a more permanent bond, than one which has only a slight action to unite with it; now the astringent dye possesses a very strong disposition to intimate combinations, especially with metallic substances.

Upon the same principles may be extended the fixity communicated to coloring dyes by alumine, and by those metallic oxides which are not liable to contain different proportions of oxygen, such as the oxide of tin, and some others. The different coloring substances, capable of uniting with metallic oxides, exert an action upon them, analogous to that of acids. The oxides are deprived of more or less of their oxygen, according to the force with which they retain it, the strength of attraction with which the coloring particles tend to unite with them, the proportions in which they meet with each other, and the greater or less action of the coloring particles towards fixation.

The coloring particles also suffer a change in constitution from these circumstances: the solutions of iron render brown all the dyes into which oxide of iron can enter, although it has only a green or yellow color in solution in which it is held in solution by acids, its effect goes on increasing to a certain point; but the alteration of the coloring particles afterwards be carried so far as to spoil the color, and to diminish their tendency to fixation; the oxide of iron is then brought to the yellow color by the oxygen which it contains, and is capable of retaining. The action of metallic oxides and the coloring particles on each other, explains the changes observed in some of the coloring particles, when mixed with metallic solutions. The effect is gradual, and has been shown with respect to fustic. It sometimes happens that the mixture does not grow turbid immediately, but loses its transparency by degrees; the precipitation beneath the sediment is formed; and its color becomes gradually deeper. In producing these effects, light has sometimes a considerable share.

Upon the whole, we may conclude, that the colors should be distinguished from each other, which are peculiar to substances of the vegetable and animal kind: that the colors of the vegetable are modified and changed by oxidation, and that the proportion of oxygen with which they are combined; and that vegetable and animal substances may themselves possess a color, which varies in the different states in which they pass, or they may owe their color to colored particles, either combined, or mixed with them. These are the particular colors which are extracted from different substances, which undergo different preparations, in order to render them proper for the various uses of dyeing. And the coloring particles possess chemical properties which distinguish them from all other substances: the affinities they have for acids, alkalis, earths, metallic oxides, oxygen, wool, silk, cotton, and from the principal of these properties, is attributed to the affinity which the coloring

particles have for wool, silk, cotton, and linen, they unite more or less readily and intimately with them: and thence arises the first cause of variation in the processes employed, according to the nature of the stuff, and of the coloring substance employed. And by the affinity which the coloring particles have for alumine and metallic oxides, they form compounds with these substances, in which their color is more or less modified, and becomes more fixed, and less affected by external agents than before. This compound being formed of principles which have separately the power of uniting with vegetable substances, and more especially with animal substances, preserves this property, and forms a triple compound with the stuff; and the color, which has been again modified by the formation of this triple union, acquires a greater degree of fixity, and of indestructibility, when exposed to the action of external agents.

73. The coloring particles have often so great an affinity for alumine and metallic oxides, that they separate them from acids which held them in solution, and fall down with them; but the affinity of the stuff is sometimes necessary, in order that this separation may take place. The oxides of metals, which combine with the coloring particles, modify their colors, not only by their own, but also by acting upon their composition by their oxygen. The change which the coloring particles thereby suffer, is similar to that occasioned by the air, which injures every color in a greater or less degree. In the two different principles which constitute the air or the atmosphere, it is only the oxygenous gas that acts upon the coloring particles. It combines with them, weakening their color, and rendering it paler; but presently its action is principally exerted on the hydrogen, which enters into their composition, and it then forms water. This effect, continues M. Berthollet, ought to be considered as a true combustion, whereby the charcoal which enters into the composition of the coloring particles becomes predominant, and the color commonly changes to yellow, fawn color, or brown; or the injured part, by uniting with what remains of the original color, causes other appearances of a different kind. The combustion of the coloring particles is increased by light, and frequently cannot take place without its aid; it is indeed in this way that it contributes to the destruction of colors. Heat promotes it also, but less powerfully than light, provided its intensity be not very great. The effects of the nitric acid, the oxygenated muriatic acid, and even the sulphuric acid, when they make the color of the substances upon which they act pass to a yellow and even to black, are to be attributed to a combustion of a similar nature.

74. The effects of combustion may, however, be concealed, by the oxygen combining with the coloring particles, without the hydrogen being particularly acted upon by it. But colors are more or less fixed, in proportion to the greater or less disposition of the coloring particles to suffer this combustion. There are some substances also capable of acting on the color of stuffs, by a stronger affinity, or by a solvent power; and in this consists the action of acids, alkalis, and soat.

A small quantity of these agents, however, may sometimes form supercompounds with the stuff, and its color may be altered in that way. The oxides of metals produce in the coloring particles, with which they unite, a degree of combustion proportioned to the quantity of oxygen which these particles can take from them. Therefore the colors, which the compounds of metallic oxides and coloring particles assume, are the product of the color peculiar to the coloring particles, and of that peculiar to the metallic oxide: but the coloring particles and metallic oxides must be considered in that state to which they have been reduced by the diminution of oxygen in the oxide, and the diminution of hydrogen in the particles that produce the color. It follows from this, that the metallic oxides, to which the oxygen is only slightly attached, are not fit to serve as intermedia for the coloring particles, because they produce in them too great a degree of combustion; instances of this kind are the oxides of silver, gold, and mercury. The oxides which undergo considerable alterations of color, by giving off more or less of their oxygen, are also bad intermedia, particularly for light shades, because they produce changeable colors; examples of this kind are the oxides of copper, of lead, and of bismuth. The oxides which strongly retain their oxygen, and undergo very little change of color by the loss of a proportion of it, are the most suitable for this purpose; such is particularly the oxide of tin, which quits its menstruum easily, which has a strong affinity for the coloring particles, and which affords them a basis that is very white, and proper for giving a brightness to their shades, without altering them by the mixture of another color. The oxide of zinc is possessed of some of these properties in a considerable degree.

75. To account for the colors, which proceed from the union of the coloring particles with the basis which a mordant gives them, we must attend to the proportion in which the coloring particles unite to that basis. Thus the solution of tin, which produces a very copious precipitate with a solution of coloring particles, and which thereby proves that the oxide of tin enters in a large proportion into the precipitate, has a much greater influence on the color of the precipitate, by the whiteness of its basis, than the solution of zinc, or that of alum, which generally produce much less copious precipitates. The precipitates produced by these two last substances retain very nearly the natural tint which the coloring particles afforded. It is therefore necessary to distinguish, in the action of mordants, the combinations that may take place by their means, between the coloring particles, the stuff, and the intermedium; the proportions of the coloring substances and intermedium; the modifications of color, which may arise from the mixture of the color of the coloring particles, and of that of the basis to which they are united; and the changes which the coloring particles may suffer, from the combustion that may be produced by the substance that is employed as an intermedium. It is evident also, that astringents do not differ essentially from coloring particles; but the latter take this name, especially when employed

to produce black with oxide of iron, by bringing this metal to the state of a black by their assuming a dark color from the oxygen.

76. The notion of an astringent, moreover, the property of combining in quantity with animal substances, and thus solidity and incorruptibility; but two properties are most commonly ascribed again are derived from their large absorption, a circumstance in their composition gives them increased tendency to a greater stability.

77. On this ingenious theory of Bancroft, an able writer on dyeing, some remarks that deserve attention, opinion M. Berthollet, in ascribing of vegetable and animal coloring in general, to effects or changes similar to combustion, has gone much farther than isarrantable by facts. It cannot, be this intention, that we should apply the combustion to alterations which are simple addition of oxygen to color, with a destruction or separation of its component parts; though many of the extinctions of these colors arise only from such simple additions of nitric, sulphuric, and other acids; oxygen, have the power not only of but of extinguishing, for a time, many tingent matters; not by any can properly be denominated a color, rather by a change in their several particular rays of light; but none of being destroyed, or carried away. the an alkali, or of calcareous carbon, nerally undo such alteration, and original color, by decomposing and the acid or oxygen which had caused the extinction.

78. Of this numerous instances might it being the case of almost all vegetable coloring matters. It will be mentioned, that ink dropped into a glass of nitric, vitriolic, or other acid, will be and that it may be again restored by a suitable portion of vegetable or animal matter; that this may be done several times on ink, and therefore the change, or loss could not have been the effect of combustion. If, however, this ink had not been fading in the substance either of wool, or cotton, and the substance so dyed dipped into a glass of diluted acid, a considerable part of the coloring matter would be dislodged, and separated from the substance, by its affinity with the oxygen, although no combustion had taken place; color so separated and lost could not be restored without a second dyeing. The color would be similar to what happens to colors from exposure to the air, by which they are gradually weakened, without any other change of color, simple diminution of their original coloring matter; and this continuing of fugitive colors, particularly that of the cloth is soon left as white as before.

about any thing like combustion having a place in it, or in the matter with which it was dyed. It may also be presumed, that colors are not generally impaired by any combustion, from this fact, that there is not one of them which the common muriatic acid does not injure, as much as either the nitric or sulphuric; and as there can be no combustion without oxygen, and as the common muriatic acid contains none, or what it does contain is only combined with it by an affinity too weak to be overcome by any known substance. It follows, that the oxygen (if it contain it) is not liberated so as to act in the way of combustion upon any other matter; and therefore, the common muriatic acid changes or destroys colors, it changes or destroys the affections upon which they depend, by producing a different from those of combustion; and the changes which it produces on colors are very similar to those produced by the sulphuric, and other acids known to combine with colors. It is reasonable to conclude, that the action of oxygen upon colors, by producing other effects than those of combustion.

Sennebier exposed a great variety of colors to the action of the sun and air, and found them very soon affected. The white colors generally became brown, and the red and blue faded either to yellow or black. Guaiacum rendered green; the oak and the cedar turned brown, as were the brown woods generally, which certainly do not resemble combustion, any more than the bleaching of tallow by exposure to the air. It is evident, argues Dr. Bancroft, that the action of each particular substance depends on the particular rays of light; and a disposition to reflect or transmit certain other rays; and in respect it may doubtless suffer very considerable changes from the action or combination of oxygen, without any effects similar to those of combustion. And, indeed, the changes of color which arise from the access of atmospheric oxygen, resemble those which the mere presence of blackness (the supposed natural color of carbon) would produce; though this has not been the case with the coloring matter of unbleached linen, upon which the experiments of M. Berthollet seem principally to have been made. But whether the action of oxygen is the basis, in promoting the decays and changes of color, or whether it is to be denominated a combustion or not, Dr. Bancroft is confident, that at least some colors are liable to be impaired, not so much by the loss of oxygen, as by the loss of its affinity for color in arterial and venous blood. It has been long noticed, and numerous experiments have shown that the fine vermilion color of the former is produced solely by vital air, and is capable of acquiring through bladders, of blood-vessels, &c. And Mr. Hasselmann has proved, that, as this fine red color is gained by a dissolution of oxygen in the blood, so it is lost, and the dark color of the blood restored, by a separation of oxygen, in consequence of its forming a new combination with the hydrogen and carbon of

80. Dr. Bancroft is also of opinion, that the blue color of indigo depends upon a certain portion of oxygen, for he has found that a solution of indigo, by losing its oxygen, may become as pellucid, and, excepting a very slight yellowish tinge, as colorless as water, and afterwards speedily return through all the shades of yellow and green to its original deep blue, by exposure to atmospheric or vital air. Similar to this, he remarks, is the fact long since observed by the abbé Nollet, of the tincture of archil employed to color the spirit of wine used in thermometers, and which after some time loses its color, but recovers it again upon being exposed to atmospheric air. This also happens to the infusion of turnsole, and to syrup of violets, which lose their colors when secluded from air, and regain them when placed in contact with it. He has also observed various animal and vegetable colors, produced solely by the contact of atmospheric air; and some others, which, when given by dyeing or callico-printing to wool, silk, cotton, &c., though unable to sustain a single day's exposure to the sun and air without manifest injury, were found to receive none from the action of strong nitric or sulphuric acids, but, on the contrary, were perceived by being wetted with them, and even with oxygenated muriatic and sulphuric acids. But the same colors, if covered with linseed oil, were found to decay more quickly from exposure to the sun and air, than if uncovered. These colors, therefore, he contends, could not owe their decay to the contact or combination of oxygen, because they were not only unhurt, but benefited by its concentrated powers in the nitric, the oxygenated muriatic, and sulphuric acids; and also because they were soonest impaired when defended from the access of oxygen, by being covered with linseed oil. Probably the decays of these colors were occasioned by a loss of at least some part of the oxygen which was necessary to their existence, and which the linseed oil assisted in depriving them of, by the strong affinity it has with oxygen.

81. Dr. Bancroft further observes, that, in forming systems, we are apt to draw general conclusions from only a partial view of facts. This M. Berthollet seems to have done, not only in ascribing the decays of vegetable and animal colors, exclusively to effects similar to those of combustion, but also in representing the oxygenated muriatic acid, as an accurate test for anticipating, in a few minutes, the changes which these colors are liable to suffer by long exposure to the action of sun and air; for, says he, though it is true, that the oxygenated muriatic acid, in weakening or destroying colors, gives up to them more or less of the oxygen which it had received by distillation from manganese; and that, by this new combination of oxygen, those affinities for particular rays of light, upon which their colors depend, are liable to be destroyed; it is nevertheless true, that the changes of color so produced are no certain indication of those, which the combined influence of light and air will occasion upon colors in general; there being several colors which are very speedily destroyed by the latter of these causes, though they resist the strongest action of the oxygenated muriatic acid, without suffering any degree of

injury or hurt. The Dr. adds, that M. Berthollet well knows, since nobody has contributed more to ascertain, how much the properties of oxygen are diversified by each particular basis to which it unites; and that it does not, therefore, seem warrantable to imagine, that its action will not be modified by a basis so powerful as that of the common muriatic acid, or that the united properties of both should represent or resemble those of atmospheric air upon colors, any more than they do in the lungs by respiration; where, instead of supporting life, they would instantly put an end to it.

82. These observations were made in reference to the manner in which M. Berthollet had expressed himself on the subject in his *Elémens de l'Art de la Teinture*, published in 1791. A new edition of this work was published about the year 1804, in which the author has fully noticed Dr. Bancroft's arguments; refuted some of them; admitted the force of others in part; and, in some respects, has availed himself of the important improvements of Dr. Bancroft.

#### OF THE DIFFERENCES BETWEEN ANIMAL AND VEGETABLE SUBSTANCES.

83. Before we proceed to treat of the practice of dyeing, it will be necessary to consider some of the leading differences that exist between several of the substances to be dyed, and to point out the processes through which they must pass before they will receive the colors required. The following is the substance of M. Berthollet's opinion relative to this subject:—It is now known, that the composition of animal substances is distinguished from that of vegetables, by their abounding in a particular principle called azote, which is found only in small quantities in vegetables, as well as by their containing much more hydrogen, or base of inflammable air, than is found in the other. From these two causes, the differences observed in the distillation of animal and vegetable substances proceed: the former yield a large quantity of ammoniac or volatile alkali; the latter afford very little, and sometimes yield an acid: the former yield a great deal of oil, the predominant principle in which is hydrogen, which is very volatile and disposed to fly off by a small increase of temperature; while the latter sometimes do not yield it in the least sensible quantity.

84. Dr. Ure in a note, p. 151, vol. I. of his translation of Berthollet's treatise, has the following remarks on this theory. Modern researches do not justify this position of M. Berthollet. Sugar and starch, by the analyses of M.M. Gay Lussac and Berzelius, contain about as much hydrogen as fibrin does, and very little less than gelatin and albumen; while, by my analyses, wool and silk contain less hydrogen than cotton and flax. See *Phil. Trans.* for 1822.

I subjoin the results of my analytical experiments on the four principal subjects of dyeing.

	Carbon.	Hydrogen.	Oxygen.	Azote.
Wool	53.70	2.80	31.20	12.30
Silk	50.69	3.94	34.04	11.33
Cotton	42.11	5.06	52.83	
Flax	42.81	5.50	51.70	

The first two, independently of their possessing a marked difference of composition, their excess of carbon and deficiency of azote.

85. In consequence of this animal substances, when set on fire, burn with a bright flame, which breaks out at once, but is soon stifled by the charcoal formed, and which has peculiar properties. Combustion is accompanied with a strong odor, owing to the ammoniac and escape unconsumed; they are liable to putrefaction, in which process ammoniac is evolved, as well as in their distillation, by the union of the azote and hydrogen; vegetable substances, on the contrary, are not so liable to putrefaction, and their fermentation is vinous and acetous. That, as animal substances contain a large quantity of principles disposed to combine in an elastic form, they have less cohesive power in their particles than vegetables, and are in a position to combine with other substances; they are more liable to be destroyed by acids, and are more disposed to combine with coloring particles.

86. The consequence of this action of acids upon animal substances is, that they cannot bear the use of alkalis should be used with great caution in the processes employed for dyeing them, as no danger is to be apprehended from the use of alkalis with substances of the vegetable class. Nitric and sulphuric acids have a powerful action on animal substances: they decompose them, extricate the azote, and form carbonic acid, fixed air, and oxalic acid or the acid of tartar, with a part of the hydrogen and a part of the carbon; the latter extricates the gas, probably azotic gas, and reduces the principles to the state of carbon. Some resemblance to vegetable substances is being less disposed to combine with coloring particles, and by resisting the action of acids more powerfully; which is either from the same principles being more intimately combined in it than in vegetables, or from its containing less hydrogen. But, though the action of acids upon silk be weaker than upon wool, it should still be employed with great caution, as the brightness of color requires it. It appears to depend upon the smoothness of the surface, which should, on that account, be served unimpaired, with every possible care. Cotton withstands the action of acids better than flax or hemp. Even the most powerful acids do not destroy it without great difficulty.

#### OF WOOL.

87. The value of wool, and its uses, are different kinds of manufacture, depend upon the length and fineness of its filaments. It is naturally covered with a kind of grease, which preserves it from moths; so that it may be kept until it is about to be dyed, or forced into a particular form. To scour wool, it is generally put into a quarter of an hour into a kettle of water, with a sufficient quantity of water, more than is required, fourth of putrid urine, heated to about 120° as the hand can just bear, and it is then washed from time to time with sticks. It is then

out to drain, and carried in a large basket running water, where it is moved about the grease is entirely separated, and no renders the water turbid; it is afterwards out, and left to drain. It sometimes loses operation more than a fifth of its weight. operation should be conducted with much since the more correctly it is performed, utter is the wool fitted to receive the dye. In process the ammonia or volatile alkali exists in the urine, readily combines with oil of the wool, and forms a soap, which, soluble in water, is dissolved and carried

Wool is dyed in the fleece before it is when it is intended to form cloths of mixed it is dyed after being spun, when in principally for tapestry: but it is most fully dyed after having been manufactured cloth. If wool be dyed in the fleece, its ents, from being separate, absorb a larger ity of the coloring particles than when it in: for the same reason, woollen yarn takes ore than cloth: but cloths themselves vary erably in this respect, according to their of fineness, or the closeness of their tex-

Besides, the variety in their dimensions, fferent qualities of the ingredients employed eing, and a difference of circumstances in process, prevent us from relying upon the e quantities recommended for the pro-

This ought in all dyes to be attended to. a fact well known to dyers and others, that coarse wool from the thighs and tails of sheep receives the coloring particles with difficulty. The finest cloth is never fully rated with the scarlet dye, hence the in- of the cloth appears always of a lighter when cut, and sometimes almost white. he generality of colors, wool requires to be ed by a bath, in which it is boiled with substances, principally with alum and ; but there are some dyes for which the does not require such a preparation; then ot be well washed in warm water, and g out, or left to drain.

The surface of the filaments of wool or not quite smooth; for, although no rough- inequality can be discovered, yet they to be formed of fine laminae placed over ther in a slanting direction, from the root filament towards the point, resembling the cement of the scales of a fish, which cover ther from the head of the animal to its

This peculiarity of structure is proved by ale experiment. If a hair be held by the a one hand, and drawn between the fingers a other hand, from the root towards the hardly any friction is perceived, and no is heard; but if it be seized by the point, densed in the same manner between the a from the point towards the root, a re- ce is felt, and a tremulous motion is per- le to the touch, while the ear perceives a nance. Thus it appears, that the texture the same from the root towards the point, a from the point towards the root. This is confirmed by another experiment. If a held between the thumb and fore-finger,

and they be rubbed against each other in the longitudinal direction of the hair, it acquires a progressive motion towards the root. This effect depends not on the nature of the skin of the finger, or on its texture, for if the hair be turned and the point placed where the root formerly was, the motion is reversed, that is, it will still be towards the root.

90. On this peculiarity of structure, which was observed by M. Monge, depend the processes of felting and fulling of hair and wool for different purposes. In the process of felting, the flocculi of wool are struck with the string of the bow, by which the filaments are detached, and dispersed in the air. These filaments fall back on each other in all directions, and, when a layer of a certain thickness is formed, they are covered with a cloth, on which the workman presses with his hands in all parts. By this pressure the filaments are brought nearer to each other; the points of contact are multiplied; the progressive motion towards the root is produced by the agitation; the filaments entangle each other; and the laminae of each taking hold of those of the others, which are in an opposite direction, the whole is retained in a state of close contexture.

91. Connected with this operation is that of fulling. The roughness on the surface of the filaments of wool, and their tendency to acquire a progressive motion towards the root, produce great inconvenience in the operations of spinning and weaving. This inconvenience is obviated by covering the filaments with a coat of oil, which fills up the pores, and renders the asperities less sensible. When these operations are finished, the stuff must be freed from the oil, which would prevent it from taking the color with which it is to be dyed. For this purpose it is taken to the fulling-mill, where it is beaten with large beetles, in a trough of water, through which clay has been diffused. The clay unites with the oil, which, being thus rendered soluble in water, is carried off by fresh portions of water, conveyed to it. In this way the stuff is scoured; but this is not the sole object of the operation. By the alternate pressure of the beetles, an effect similar to that of the hands of the workman, in the operation of felting, is produced. The filaments composing a thread of warp or woof, acquire a progressive motion; are entangled with the filaments of the adjoining threads; those of the latter into the next, and so on, till the whole become felted together. The stuff is now contracted in all its dimensions, and, participating both of the nature of cloth and of felt, may be cut without being subjected to ravel; and, when employed to make a garment, requires no hemming. In a common woollen stocking web, after this operation, the stitches are no longer subject to run, and, the threads of the warp and wool being less distinct from each other, the whole stuff is thickened, and forms a warmer covering.

#### OF SILK.

92. Silk in its natural state is coated over with a substance which has generally been considered as a kind of gum or varnish. To this

substance the silk is supposed to owe its elasticity and stiffness. Besides this varnish, the silk usually met with in Europe is impregnated with a substance of a yellow color, and, for most of the purposes for which silk is required, it is necessary to free it from both the varnish and the coloring matter. To effect this, the silk is subjected to the operation of scouring; but it is very obvious that when the silk is to be dyed, the scouring need not be carried so far as is required where it is to remain white. Different colors, also, will require different degrees of scouring; and this difference is generally regulated by the quantity of soap employed: 100 pounds of silk boiled in a solution of twenty pounds of soap, for three or four hours, supplying a little water occasionally because of the evaporation, will be sufficiently prepared to receive the common colors. For blue colors the proportion of soap must be greater; and scarlet, cherry color, &c., require a still greater proportion, because for those colors the ground must be whiter.

93. When silk is to be employed white, it must undergo three operations. The first consists in keeping the hanks of silk in a solution of thirty pounds of soap to 100 of silk: this solution ought to be very hot, but not boiling; when any part of the hanks immersed is entirely free from its gum, which is known by the whiteness it acquires, the hanks are to be shaken over, as the dyers term it, so that the part which was not before immersed, may undergo the same process. They are then taken out and wrung, as the process is finished.

94. In the second operation the silk is put into bags of coarse cloth, each bag containing from twenty-five to thirty pounds. A solution of soap is prepared as in the former case, but with a smaller proportion of soap. In this the bags are boiled for an hour and a half; and that they may not receive too much heat by resting on the bottom of the vessel, they must be constantly stirred during the operation.

95. The third operation is to communicate to the silk different shades, that the white may be rendered more pleasing. These shades are known by different names, as China-white, silver-white, azure-white, or thread-white. For this purpose a solution of soap is also prepared, of which the proper degree of strength is ascertained by its manner of frothing by agitation. For the China-white, which is required to have a slight tinge of red, a small quantity of annatto is added, and the silk is shaken over in it till it has acquired the shade required. In other whites, a blue tinge is given by adding a little blue to the solution of soap. The azure-white is produced by means of indigo. To prepare the azure, fine indigo is well washed in moderately warm water, after which boiling water is poured upon it. It is then left to settle, and the liquid part only, which contains the finer and more soluble parts, is employed.

96. Some use no soap in the third operation, but, when the second is completed, they wash the silks, fumigate with sulphur, and azure them with river water, which should be very pure. But all these operations are not sufficient to give

silk that degree of brightness which is required when it is to be employed in the finer white stuffs. For this purpose it is subjected to the process of sulphuration, in which it is exposed to the vapor of sulphur. The silk which has been thus treated receives colors, and retaining them with its lustre, the sulphur which adheres to it is separated by immersion and agitation in warm water, otherwise the silk is tarnished and greatly injured.

97. It has long been an object of great importance, to deprive silk of its stiffness, without destroying the gum which its stiffness and elasticity depend upon. For this purpose was discovered by Berthollet, as it was not made public, others have been led to it by conjecture and experiment. The process, given by Berthollet, consisted in transpiring concerning this process. The process is made with a small quantity of muriatic acid and alcohol. The muriatic acid is in a state of purity, and entirely free from water, which would give the silk a yellow color. In the mixture thus prepared, the silk is immersed.

98. One of the most difficult operations in the process, especially when large quantities are operated upon, is to produce a uniform whiteness. In dyeing the whitened silk, some difficulty in preventing its curdling is recommended to keep it constant during the drying. The muriatic acid is useful in this process, by softening the silk, and assisting the alcohol to dissolve the particles which are combined with the gum. The alcohol which has been impregnated with coloring matter may be again separated and purified, and may thus serve for several operations, and render the process more economical. This may be effected by distillation in a moderate heat, in glass or stone-ware.

The preparation with alum is a very preliminary operation in the dyeing of silk. Without this process, few colors can be given either beauty or durability. Forty pounds of alum, dissolved in warm water, are put in a vat, with forty or fifty pails of water to prevent the crystallisation of the salt. The vat must be carefully stirred during the operation. The silk being previously washed and wrung out, is immersed in this alum liquor, and after eight or ten hours is wrung out, and washed in a stream of water. Ten pounds of silk may be prepared in this quantity of liquor; but when it begins to be weak, which may be known by its curdling, or twenty-five pounds of alum are added, and the addition repeated till the liquor has an offensive smell. It may then be used for the preparation of silk intended for blue, till its whole strength is dissipated. The preparation of silk with alum must be done in cold; for when the liquor is employed in heat, the lustre is impaired.

#### OF COTTON.

99. Cotton is the down or wool of the pods of the *Gossypium*, a small tree

in warm climates. Cottons differ principally in the length of their filaments, their strength, and color. This substance presents different shades, from a deep yellow to a white. The most beautiful is not always the best; it is necessary to bleach it, by processes similar to those employed in the bleaching of wool.

Or, instead of these, oxygenated muriatic acid may be employed; and a more beautiful whiteness thus produced, than by the ordinary way of bleaching. M. Berthollet succeeded in bleaching the yellow cotton of St. Domingo, which very obstinately retains this bad color. This cotton may be disposed to receive the whiteness it must undergo scouring. Some boil it in water, but more frequently alkaline lie is used; the cotton must be boiled in it for two or three days, and then wrung out; after which it must be passed in a stream of water, till the water runs off clear; it must then be carefully dried. Cotton stuffs, which are to be prepared, must be soaked for some time in water, mixed with at least one-fiftieth of sulphuric acid; after which, they must be carefully washed in a stream of water, and dried. M. Berthollet has observed, that the acid which had been used in this operation had taken up a quantity of calcareous matter and iron, which would have injured the stuff very much. Aluming and galling are commonly employed in the dyeing of cotton and wool.

In the preparation with alum, about four ounces of it are required to each pound of stuff; it must be dissolved with the precautions above-mentioned. Some add a solution of soda in the proportion of one-sixteenth of the alum; others add a quantity of tartar and arsenic. The stuff is well impregnated by working it pound by pound in this solution; it is then put altogether into a vessel, and what remains of the liquor is pressed upon it. This is left for twenty-four hours, and then removed to a stream of water, where it remains for about two hours, to extract the alum, and is then washed. Cotton, after this operation, gains about one-fortieth of its weight.

In the operation of galling, it is usual to use different quantities of galls or other astringents, according to their quality, or the effect required. Powdered galls are boiled for two hours, in a quantity of water proportioned to that of the thread to be galled; the decoction is then allowed to cool to a temperature the hand can bear, after which it is divided into a number of equal parts, that the thread may be soaked pound by pound; and what remains is pressed upon the whole together. It is then left for twenty-four hours, when intended for blue, but for other colors twelve or fourteen hours sufficient. It may then be wrung out, and carefully dried. When stuffs are galled, which have already received a color, the operation is to be performed in the cold, that the color may not be injured. M. Berthollet found that cotton which had been alumed, acquired more weight by galling than that which had not undergone the process; although alum adheres but in a small quantity to cotton, it communicates to it a great power of combining, both with the astringent principle and with the coloring particles of different substances.

#### OF FLAX.

101. Flax must undergo several preparations before it be fit to receive the dye. Of these, the watering is an operation of much consequence, from its influence on the quality and quantity of the product, and from its deleterious effects on the air. In this operation, a glutinous juice, which holds the green coloring part of the plant in solution, undergoes a greater or less degree of decomposition, according to the mode of conducting the operation. This matter seems to resemble the glutinous part, that is held dissolved in the juice procured from green plants by pressure, which is separated along with the coloring particles by a heat approaching to that of ebullition, which becomes putrid, and which affords ammonia by distillation; but it is probable, that water alone cannot sufficiently separate it from the cortical parts: whence the hemp, which has been watered in too strong a current, is deficient in its softness and pliability, &c. But if the water employed be stagnant and putrid, the hemp acquires a brown color, loses its firmness, and emits highly noxious vapors. This process is therefore performed to the greatest advantage, in watering pits situated on the banks of rivers, where the water may be changed often enough to prevent a putrefaction, that would injure the hemp, and be prejudicial to the workmen; yet not so often as to hinder the degree of putrefaction which is necessary to render the water capable of dissolving the glutinous substance. To prepare flax for the dye, it must also be subjected to the operations of scouring, aluming, and galling, in the same manner as cotton.

#### PART II.

##### THE PRACTICE OF DYEING.

102. Before we proceed to give directions for the various processes to be observed in the practice of dyeing, we shall take a brief view of M. Berthollet's observations on dyeing operations in general, which cannot fail to be interesting to the practical dyer.

103. 'It may be regarded,' says he, 'as a general principle, that processes performed in a great manufactory are more advantageous than those which are insulated, since, from the subdivision of labor, each workman, occupied with a single object, acquires celerity and perfection in his employment, by which means the saving of time and labor becomes very considerable.'

104. This principle is particularly applicable to the art of dyeing, as the preparation which remains after one operation may often be advantageously employed in another. A bath from which the coloring matter has been nearly extracted in the first operation may be used as a ground for other stuffs, or, with the addition of a fresh portion of ingredients, may form a new bath. The galls which have been applied to the galling of silk may answer a similar purpose for cotton or wool. From this it is evident that the limitations under which the art of dyeing labors

#### DYEING BLACK.

proceed to give an account of  
nd advantageous processes for  
olors, and begin with the me-  
ck.

It has been justly observed, by an able writer  
on this subject, that absolute black being a com-  
plete privation of all color, can scarcely be  
ascribed to any body in nature, since it must then  
become invisible. The color so named, as com-  
municated by dye-stuffs, is, indeed, rather an  
intense blue or brown, and is generally produced  
by the union of these coloring matters with a  
ferruginous mordant, and hence it may not im-  
properly be termed a compound color. The  
juice of the cashew nut communicates a black  
that will not wash out, and which resists boiling  
with soap or alkalis. The *anacardium occiden-*  
*ale* and the *toxicodendron* afford a durable dye,  
but it is of a brownish hue. The juice of the  
sloe affords a pale tint of a brownish cast, which  
becomes deeper after having been repeatedly  
washed with soap, and afterwards wetted with a  
solution of alkali. On boiling sloes, their juice  
becomes red, and the red tinge, which in that  
state it imparts to linen, is converted by washing  
with soap into a bluish color of some durability.  
But these methods of obtaining a black color  
cannot be employed in dyeing, because these  
substances are not to be obtained in sufficient  
quantity, and the black which they afford is not  
equal to that formed by the common processes.  
All black colors, therefore, are the effects of  
combination. To produce them, the black par-  
ticles formed by the union of the astringent  
principle with the oxide of iron, held in solution  
by an acid, are fixed on the stuff that is intended  
to be dyed.

119. There are very few substances which  
have the property of producing of themselves a  
permanent black color. The juice of some plants  
is found to produce this effect on cotton and  
linen.

120. When the particles are precipitated from  
the mixture of an astringent and a solution of  
iron, they have only a blue color; if they be then  
left exposed to the air, and moistened with water,  
their color becomes deeper, but still the blue is  
distinguishable. The stuff itself then contributes  
to increase the intensity of the black, whether it  
be that in this state of combination it undergoes  
a slight combustion, or that the coloring particles  
undergo a further degree of combustion, from  
presenting a larger surface to the air. Without  
the action of the air, however, a fine black can-  
not be produced; on which account the operations  
are performed at different intervals, during which  
the stuff is taken out of the bath, that it may be  
exposed to the air. M. Berthollet has ascertained,  
that black stuffs placed in contact with pure air  
diminish its volume, and consequently absorb  
a certain portion of it.

121. *Of Dyeing Woollen Black.*—From the  
process described by Hellot, woollen cloth, to be  
dyed black ought to receive the deepest blue tint,  
or mazarine blue, to be washed in the river as soon  
as taken out of the vat, and afterwards cleaned  
by the fulling mill.

For every hundred pounds of stuff, ten pounds  
of logwood, and ten pounds of galls reduced to  
powder, are put into a bag, and boiled with a  
sufficient quantity of water, for twelve hours.  
A third of this liquor is put into another copper,  
with two pounds of verdigris. The stuff is im-

mersed in this, and continually stirred for two hours. The liquor should be kept hot, but it ought not to boil. At the end of two hours the stuff is taken out, and a similar portion of the liquor is put into the copper, with eight pounds of sulphate of iron. During the solution of the coppers, the fire is diminished, and the liquor is allowed to cool for half an hour, stirring it well the whole time. The remainder is then to be added, and, after making this addition, the bair containing the astringent matters should be strongly pressed, to separate the whole. A quantity of sumach, from fifteen to twenty pounds, is now to be added, and the liquor is just raised to the boiling temperature; and when it has given one boil, it is to be immediately stopped with a little cold water. A fresh quantity of sulphate of iron, to the amount of two pounds, is then added, and the stuff is kept in it for another hour, after which it is taken out, washed and aired; it is again put into the copper, and constantly stirred for an hour. It is then carried to the river, well washed, and fulled. To soften the black color, and make it more firm, another liquor is prepared with weld. This is made to boil for a moment, and when it is cooled the stuff is passed through it. By this process, which is indeed somewhat complicated, a beautiful black color is produced.

122. But the methods usually followed for dyeing black, are more simple. Cloth, which has been previously dyed blue, is merely boiled in a vat of galls for two hours. It is then kept two hours, but without boiling, in the vat of logwood and sulphate of iron, and afterwards washed and fulled. According to Hellet's process, a liquor is to be prepared of a pound and a half of yellow wood, five pounds of logwood, and ten pounds of sumach, for every fifteen yards of deep blue cloth; and, the cloth having boiled in this for three hours, ten pounds of sulphate of iron are added; the cloth is allowed to remain for two hours longer, when it is taken out and aired, after which it is again returned to the vat for an hour, and then washed and fulled.

When stuffs are to be dyed at less expense, instead of the blue ground, a brown or root-colored ground may be substituted. This brown or fawn color is communicated by means of the root of the walnut-tree, or green walnut-peels. The stuffs are then to be dyed black, according to some of the methods already described.

123. The proportions of the ingredients employed by the English dyers are, for every hundred pounds of cloth previously dyed a deep blue, about five pounds of sulphate of iron, five pounds of galls, and thirty of logwood. The first step in the process is to gall the cloth, after which it is passed through the decoction of logwood, to which the sulphate of iron has been added.

124. As a substitute for galls, the leaves of the *arbutus, ura ursi*, have been recommended, and employed. The leaves must be carefully dried, so that the green color may be preserved: 100 pounds of wool are boiled with sixteen pounds of sulphate of iron, and eight of tartar, for two hours; the following day the cloth is to be rinsed as after aluming; 150 pounds of the

leaves are then to be boiled for two hours in water, and after being taken out, a quantity of madder is to be added, and the cloth put in the bath at the same time to remain about an hour and a half, taken out and rinsed in water. If it is said, that blue cloth receives a good black, but white cloth becomes deep brown.

125. After the operations for dyeing have been finished, it is washed in a fulling mill, till the water runs off colorless; but it is rather difficult to free the cloth from the soap. After the cloth has been fulling mill, some propose to give it a bath of weld, by which it is said to be and the color better fixed; but, as Lewis, this operation, which in other respects is an advantage, is useless after the cloth has been treated with the soap suds.

126. *Of Dyeing Silk Black.*—In dyeing a black color to silk, different operations are necessary, such as boiling, galling, vat, dyeing, and softening. To give a shade to silk, it is necessary to depose a gummy substance of which we have spoken. This is done by boiling it for hours with one-fifth of its weight of galls, and afterwards beetling and careful fulling. The gummy substance, before which silk in its natural state contains, increases the strength of the silk, which is called raw; but renders it more liable to be taken out, from the stiffness it imparts to it: raw silk takes a black color with less than silk which has been scoured or degummed, that black is much less perfect, the re-actives calculated to dissolve the gummy matter, in a much less forcible manner.

127. In the process of galling, one-fourth of its weight of galls are to be used for three or four hours, but the proportions depend on their quality. After the liquor is allowed to remain at rest for a day, the silk is then put into the bath, and from twelve to thirty-six hours, when taken out, and washed in the river. It is capable of combining with a great deal of the astringent principle, or tan, and receives a considerable increase of strength, allowed to remain for a longer or shorter time, the silk is required to have more or less weight. Hence to communicate to it a heavy black, it is allowed to remain longer in the gall-liquor; the process is often repeated, and the silk is dipped a greater number of times.

128. While silk is preparing for dyeing, the vat is to be heated, and occasionally stirred, that the ground to the bottom may not acquire too much heat. It should always be kept under the same temperature. Gum and solution of iron are used in different proportions, according to different processes. When the gum is dissolved in the liquor near the boiling temperature, to settle for about an hour. The liquor is then previously divided into

which may be successively put into the vat, is immersed in it. Each part is then to be times wrung, and, after each wringing, up to air. The silk, being thus exposed to action of the air, acquires a deeper shade. Operation being finished, the bath is again renewed, with the addition of gum and sulphate of iron, and this is repeated two or three times, until as the black required is light or heavy. When the process is finished, the silk is rinsed in a vessel with some cold water, by turning or wringing it over.

12. Silk, after it has been taken out of the dye, is extremely harsh, to remove which it is submitted to the operation of softening. A solution of three or five pounds of soap for every 100 pounds of silk, is poured through a cloth into a tub of water. The solution being completed, the silk is immersed, and allowed to remain in it about fifteen minutes; it is then to be wrung out and dried.

13. When raw silk is to be dyed, that which has a natural yellow color is preferred. The dyeing operation must be performed in the cold, in order to preserve the whole of the gum, and the elasticity which it gives to the silk; but if only of it is wished to be preserved, the dyeing is to be performed in the warm vat.

14. The dyeing is also performed in the cold. What is necessary is to add the sulphate of iron to the water in which the stuff is rinsed. In this simple process, the black dye is communicated. It is then washed, beetled once or twice, and dried without wringing, that its elasticity may not be destroyed. Raw silk may be dyed by a more speedy process. After galling, it is to be turned or shaken over in the cold bath; thus by alternately dipping and airing the stuff, the operation may be completed. It is then to be washed and dried as before.

15. The method of dyeing velvet at Genoa, which has been simplified and improved in France, is thus described by Macquer. For every 100 pounds of silk, twenty pounds of Aleppo galls, reduced to powder, are boiled in a sufficient quantity of water for an hour. The liquor is allowed to settle till the galls have sunk to the bottom; they are then taken out, and two pounds and a half of sulphuric acid, and two pounds of iron filings, and twenty pounds of gum are put into a copper, pierced with holes in all directions. This vessel is suspended by means of two rods passed through saddles, in the boiler, but so as not to touch the bottom. The gum is left for an hour to dissolve, but must be stirred occasionally. If after this time the gum has not all left the pierced vessel, it is a proof that the liquor is saturated with galls; but if, on the contrary, the whole has cleared, from two to four pounds more may be added. This cullender should remain continued suspended in the boiler, except when the galls are going on, during which time it must be raised. During these operations the boiler is kept hot, but not allowed to boil. The dyeing of the silk is performed with one-third weight of Aleppo galls. The silk is allowed to remain in the liquor for six hours the

first time; then for twelve; and for the rest, *secundum artem*.

133. Dr. Lewis remarks, that though white silk may be dyed a good black, without using either logwood or verdigris, the addition of those two ingredients contributes greatly to improve the color both in silk and in wool. But as the great use of galls in dyeing silk black renders it very expensive, it is of consequence to find some method of diminishing their quantity. M. Anglès proposes the following process:—When the silk has been carefully boiled and washed in the river, it is to be immersed in a strong decoction of green walnut-peels, and left in it till the color of the bath is exhausted. It is then taken out, slightly wrung, dried, and washed in the river. The decoction of walnut-peels is made by boiling a full quarter of an hour, when it is taken from the fire, and suffered to subside before dipping the silk, which has been previously immersed in warm water. A blue ground is next given by means of logwood and verdigris. For every pound of silk, an ounce of verdigris is dissolved in cold water: the silk is left in this solution two hours; it is then dipped in a strong decoction of logwood, wrung out slightly, and dried before it is washed at the river. For light blacks, galling may be altogether omitted; but for a heavy black, half a pound of galls must be employed for every pound of silk intended to be dyed. To prepare the liquor, two pounds of galls and three of sumach are macerated in twenty-five gallons of water over a slow fire, for twelve hours. After straining, three pounds of sulphate of iron, and as much gum arabic are dissolved in it. In this solution the silk is dipped at two different times, leaving it in two hours each time, taking care to air it after the first dipping, and to dry it before giving the second fire, when it is to be again aired and dried: it is then beetled twice at the river; after which a third fire is given it, in the same manner as before, except that it is left in the liquor four or five hours. When drained and dried, it is again beetled twice at the river. The heat during the operation must not exceed 120° of Fahrenheit's thermometer; and before the last two fires, an addition of half a pound of sulphate of iron and as much gum arabic is to be made.

For removing the harshness that silk acquires from the black dye, M. Anglès proposes that a decoction of weld should be preferred to a solution of soap; and observes that if silk be dyed blue with indigo, previous to its being dipped for black, it will take only a mealy black, but that a velvety black will be obtained, if it be prepared with logwood and verdigris; and that green walnut-peels soften the silk.

134. *Of Dyeing Cotton and Linen Black.*—To impart to cotton and linen a deep black dye that will resist the action of soap, is attended with considerable difficulty. Several methods have been proposed as improvements on the old process; the following, practised at Rouen, is thus described by M. d'Apligny. The stuffs are first dyed sky-blue in the usual manner, and are then wrung out and dried. After this they are galled for about twenty-four hours, allowing four ounces

of galls to every pound of stuff; they are then again wrung, and well dried.

The liquor, known among dyers by the name of the black cask, is then poured into a tub, five quarts for every pound of stuff, and in this the stuffs are worked by the hand, in small portions, for about a quarter of an hour, when they are again wrung out and dried. This operation is repeated twice; adding each time a fresh quantity of the black liquor, well scummed. After this it is again aired, wrung out, washed at the river, and dried carefully. For the finishing process, a pound of alder bark for every pound of stuff is boiled for an hour, in a sufficient quantity of water. About half the liquor that was used for the galling, and half as much sumach as alder bark are then added, and the whole boiled together for two hours, and then strained through a sieve. When the liquor is cold, the stuffs are worked through it for some time, occasionally airing them; after which they are suffered to remain immersed in it for twenty-four hours, when they are wrung out and dried.

For softening them, when dry, it is customary to soak and work them in the remains of a weld bath that has been used for other colors, adding to it a little logwood. From this they are taken out and wrung, and instantly put into a tub of warm water, into which has been poured an ounce of olive oil for every pound of stuff. They are then wrung out and dried carefully.

The same author has described another process for imparting to cotton and linen stuffs a fine and durable black. In this process the stuffs are first to be scoured as usual, galled, then alumed, and afterwards dipped in the weld bath. When taken out of this bath, they are to be dyed in a decoction of logwood, to which a quarter of a pound of sulphate of copper has been added for every pound of stuff. After this they must be washed in the river, wrung several times but not too hard; and dyed in a madder bath, in the proportion of half a pound to each pound of stuff. That the black may not be liable to be discharged, the thread must be dipped in a bath of a solution of soap.

135. The following method practised at Manchester is given by Mr. Wilson. A galling is made with galls or sumach; after which the stuff is dyed with the liquor of the bath, consisting of a solution of iron in vegetable acid, frequently composed of alder bark and iron, and then dipped in a decoction of logwood with a little verdigris. This process is repeated till a deep black is obtained; and it is necessary to wash and dry after each of these different operations.

136. Dr. Bancroft, says Berthollet, had announced that the acid of tar was employed at Manchester for black dyes on cotton. Chaptal, in his dyes, used pyrolignous acid; but to Bosc we owe the details of the operation by which he himself obtained a fine black by means of that acid.

137. Fill, says he, a cast-iron boiler with pyrolignous acid; add to it old iron, well oxidised, and boil. The solution of the oxide will take place rapidly. When the iron grows clean, and the solution becomes black as ink, throw the whole into a cask to be employed at need.

Prepare your cotton as usual, by *clinging* it to a ground. Gall; turn the hanks of cotton into a bath of a solution of pyrolignite of iron, diluted with tepid water.

Renew the gallings, and the turnings in the bath of pyrolignite of iron, till you have obtained a deep and brilliant black. Finish by passing cotton through olive oil. This operation is simple. Throw on some tepid water a little oil; pass the cotton through this bath; it sorbs the oil; but it must be worked for a time in the bath to diffuse the oil equably. The process softens and gives suppleness to cotton, as well as a great deal of brilliancy in the shade. The cottons are now of a deep and very durable black. Every time the bath of pyrolignite of iron has been employed, it must be thrown away as useless; the old baths are never to be added to a cask.

Bosc intimates, that the stuffs dyed by means of pyrolignous acid, retain, with much time, the odor of this acid, and that they must be exposed to the air for some time to rid them of it before folding them up for packing.

The application of oil, which heightens black, and imparts softness to the stuff, is given to those which are woven, for example, a velvet, by means of brushes, which are dipped in oil, and then rubbed over the surface.

Hermstadt recommends a process of dyeing which consists in making use for a mordant of a solution of nitrate of lead, in turning the stuff through a solution of glue, and in dyeing it in a bath composed of gall-nuts, logwood, and a plate of iron, for which last the acetate may be substituted.

#### OF DYEING GRAY.

138. Gray colors are properly the plain black from the deepest to the lightest. It may be produced in several ways; the following are the most approved methods.

In the first method a decoction of bruised galls and a solution of sulphate of iron are used. These ingredients must be prepared separately, and then a part of it added to a quantity of water of a sufficient degree of heat, such as the hand can bear; and in this the cloth is to be dipped.

When it has attained the shade desired, it is taken out, and more of the decoction and solution must be added to the same bath. Into the bath the cloth is dipped, to give it a deeper shade. In the same manner the operator proceeds to obtain the deepest shades, always adding more of the liquors: though, for black-gray and other deep shades, it is best to give the cloth previously a blue ground, more or less deep according to circumstances.

139. The second process for dyeing gray is, which is, by Hellot and others, preferred to the preceding, in consequence of the stuff being decoction of galls more firmly, is this:—A quantity of powdered galls as may be required is enclosed in a linen bag and boiled in water for two hours. In this decoction the stuffs must be boiled for an hour and then wrung out. Some solution of iron is then added to the

and the stuff passed through it, so as to give a light shade; more solution of iron is to be added to produce a deeper shade, and on till the stuff acquire the requisite

In this operation we go beyond the mark, for must be darkened as before; but repeating these operations is prejudicial to the stuff, we should endeavour to catch the proper shade at once, by taking it occasionally out of the bath. Care must be taken that the bath do not, and that it be rather warm than too hot. Whatever manner grays are dyed, they must be immediately washed in a large body of water, and the darkest may even require soap to cleanse them. It is sometimes required to give a tint of another color, as a nut, agate, dish cast. In this case, having given a more or less blue according to the object intended, the stuffs are dipped in the remains of the chemical liquor, that has served for dyeing scarlet or violet, adding galls, logwood, &c.; they are then browned more or less with a solution of iron. For the nut gray, nutwood and logwood are added to the galls, the stuff is to be dyed from white.

*Silk* takes all grays, except black-gray, at previous aluming. The bath is composed of fustic, logwood, archil, and sulphate of iron. These ingredients are varied according to the tint to be given. Thus more archil is employed for grays that are to have a red-tint, more fustic for those that should be to a russet or green, and more logwood for those that are to be of a darker gray. For gray logwood and solution of iron are only used. But black-gray requires aluming; which the silk is taken to the river, and dipped in the weld bath. A part of this is thrown away, and its place supplied with cold liquor. When the silk is impregnated with a sufficient quantity of solution of iron added, and, as soon as it has acquired the proper shade, it is to be washed and wrung carefully. If the gray should happen to be too dark, it is dipped in a solution of tartar, and then in warm water; and, if by these means it is weakened too much, the silk is again dipped in a bath of dye that is quite fresh.

*Linen and Cotton* should have a blue imparted to them for black-gray, iron- and slate-gray, but for no other. All the require a galling proportionate to the shade to be produced. Gall baths that have been used for other purposes are often employed.

When the stuff has been galled, wrung, and it is dipped in a vessel of cold water, to which is added a proper quantity of the bath in a black cask, and of a decoction of logwood.

The stuff is worked in separate portions, afterwards washed and dried properly. Two processes for dyeing gray are given by M. d'Apligny, which, according to him, produce more permanent color. They are these.

Yarn is galled, dipped in a very weak solution of the black cask, and then madder: the yarn is dipped in a very hot solution of madder gently and dried. It is then dyed in a decoction of logwood. After this operation

it appears black; but, on working it attentively in warm soap suds, the surplus of the dye is discharged, and it remains of a durable slate-gray.

142. A process, says M. Berthollet, the success of which is known to us, consists in taking a very diluted solution of acetate of iron (it is sufficient to add a little of this acetate to a quantity of water), and a decoction of sumach, also very dilute. The cotton is passed in succession from one liquor to the other, till the wished for shade be attained. The finish is given by passing through a water slightly acidulated by sulphuric acid, otherwise the sumach gives a russet hue. By the same process may be obtained with nutgalls less lively grays; and the alder bark affords an agreeable one, which borders on hazel.

A skilful manufacturer of Rouen has communicated to us the following process, which he makes use of successfully for cotton velvets. A galling is given with an equal quantity of gall-nuts and logwood, after which a bath of cold water is administered, and next another bath of water, in which there has been dissolved a weight of sulphate of iron, equal to the one-half of the preceding ingredients. After working the cotton about a quarter of an hour in this bath, it is rinsed in cold water, and brightened.

For this purpose a bath of tepid water is used, to which one-eightieth of decoction of weld, and a little alum, are added. The cotton is left about twenty minutes in this bath, after which it is washed in cold water, and dried.

By modifying the doses of the ingredients, grays, from pearl-gray to the deepest gray, may be thereby obtained.

For grays on printed goods, the same mordant is impressed as for a clear violet, and sumach or gall-nuts are employed according to the shade that is desired.

#### OF DYEING BLUE.

143. *Of Dyeing Wool Blue.*—There are various processes employed for dyeing wool, silk, &c., of blue color, but the principal coloring matters made use of are indigo and woad. Archil, cochineal, turmeric, and logwood, are occasionally used as auxiliaries. Prussian blue also has, in some cases, been successfully employed in producing some very beautiful but fugitive shades of blue.

The vessels in which blue is dyed are called vats; they were formerly made of wood; in many instances they are still constructed of that material; lead, however, has been found superior, and in modern practice, cast iron is generally used. When the vat is made of wood, the liquor must be raised to the requisite heat in another vessel, and then transferred to it, a process attended with many inconveniences; when made of lead it is surrounded with brick work, of a single brick in thickness, which admits of a fire being placed under it for the purpose of warming the liquor.

144. Some dyers make use of iron vats which are warmed by steam, applied to the exterior of the vat; but the more common method is to use a vessel of cast iron, and to apply a gentle fire under it as occasion may require.

Before the introduction of indigo, blue was dyed with woad, this produced a color which was tolerably permanent, but rather faint; a very rich blue however is now obtained by the union of the two substances. The proportions in which these are used, vary according to the depth of shade required. The following is the process of preparing a vat as given by Quatremere.

145. Into a vat of about seven feet and a half deep, and five and a half in diameter, are thrown two hales of pastel or woad, previously broken, and together about 400 pounds weight; thirty pounds of weld are boiled in a copper for three hours, in a sufficient quantity of water, to fill the vat. To this decoction are added twenty pounds of middler and a basket of bran. The boiling is then continued half an hour longer. This bath is cooled with twenty buckets of water, and after it is settled, and the weld taken out, it is poured into the vat, which must be stirred with a rake all the time that it is running in, and for fifteen minutes longer.

146. The vat is then covered, and allowed to stand for six hours, when it is uncovered, and raked again for half an hour. The same operation must be repeated every three hours. When the appearance of blue streaks is perceived on the surface, eight or nine pounds of quick lime are added; the color then becomes of a deeper blue, and the vat exhales more pungent vapors. Immediately after the lime, or along with it, the indigo, which has been previously ground in a mill, with a small quantity of water, is put into the vat. The quantity is to be regulated by the intensity of the shade required. If, on striking the vat with a rake, a fine blue scum arises, no other preparation is required than to stir it with the rake twice in the space of six hours, to mix the ingredients completely. Great care should be taken not to expose the vat to the air, except during the time of stirring it.

147. Vats of this description are sometimes liable to accidents. A vat is said to be repelled, when, having previously afforded fine shades of blue, it appears black, without any blue streaks; and if on being stirred the black color becomes deeper, the vat at the same time exhales a pungent odor; and the stuff dyed in it comes out of a dirty gray color. These effects are ascribed to an excess of lime.

148. Different means are employed to recover a repelled vat. Some merely reheat it; while others add tartar, bran, urine, or madder. Hellot recommends bran and madder as the best remedy. If the excess of lime be not very great, it is sufficient to leave it at rest five or six hours, putting in a quantity of bran and three or four pounds of madder, which are to be sprinkled on the surface, and then it is to be covered up, and after a certain interval to be tried again. But if the vat has been so far repelled as to afford a blue only when it is cold, it must be left at rest to recover, and sometimes must remain whole days without being stirred with the rake.

149. When it begins to assume a tolerable pattern, the bath must be reheated. In general this revives the fermentation; or it may be excited with bran and madder, and even with a basket or two of fresh pastel.

Hequet d'Orval and Ribaumont are satisfied without raking up, if the vat is slightly thrown back; but if the vat does not make more progress, to put into it some bran enclosed in a bag, and to dip it at the same time three or four times in powder. The bag, after five or six days, begins to float and is withdrawn, and the vat is used. If the vat be not yet restored, the operation is repeated.

Quatremere says, that he has restored a vat which he had thrown back by a lime; and that for this effect he covered the vat with heating twice, and leaving it in repose for two days, after which it was well characterised flower or bloom, and again in repose for three days; and when he raked it for the third time, he found it stored.

150. The second accident, to which a vat is subject, is putrefaction. When this accident occurs, the veins and the bloom disappear, its color becomes russet, the paste on the bottom rises up, the smell becomes offensive.

Quatremere asserts, that, if a vat of blue be plunged into a vat thus decayed, the color becomes several shades lighter, and the operation takes place in a vat, because it is sufficiently furnished with lime. When marks of putrefaction appear, we may correct it, by adding lime and raking; the operation must be repeated till the vat is stored; but great care is required to avoid the opposite extreme.

It appears, adds M. Berthollet, that the distribution of lime is the object which requires most attention in the conduct of a vat. It moderates the fermentation of the paste, and the other substances that serve to give color to the indigo; for this effect, pushed too far, it destroys the coloring particles. But if the action of the lime becomes too great, the vat is therefore proper to wait till the lime disappears, undoubtedly by the formation of carbonic acid, or the fermentation must be increased, or a vat of lime be saturated by a vegetable acid. The use of the lime is to hold in solution the coloring particles of indigo and of the woad, and to disoxygenate. Woad is employed as pastel, but it appears that the preparation, to which both are subject, is essential. We have seen a skilful dyer employ for his vat the plant of woad, dried; and assert that he derived more from it than from ordinary woad.

151. The vat must be raked about twice before dyeing, and to prevent the paste from occasioning inequalities, a kind of lattice formed of large cross, is introduced; and when the vat is dyed in the fleece, a net with small squares is placed over this.

The wool or cloth being thrown into the vat with clear water, a little warm is added, and dipped into the vat, where it is to remain a longer or shorter time, according to the shade required to be more or less deep, and is occasionally to air. The action of

to change the green color given by the a blue. In a rich bath it is difficult to uniform color to light blues: the best method of obtaining such shades, therefore, is to use a nearly exhausted, and of a low temperature. Ind cloth dyed blue, should be washed out care, to carry off the particles not fixed cool, and those which are of a somewhat one, ought even to be carefully cleansed, with soap, which does not alter the color. Those designed to be dyed black, ought to be dyed in the same manner; but it is not necessary for those which are to be green, to be prepared.

The indigo vat is that which contains a pastel nor woad. The vessel used for the preparation is a copper, which, being of a figure, leaves between it and the brick-arch surrounds it, and on which its brim is an empty space sufficient to admit of the fire. Into this copper are poured forty pails of water, in which have been six pounds of salt of tartar, twelve ounces of brimstone, and six pounds of bran. This liquor is put into the vat, grounds and all: six pounds of indigo ground in water are then to be added, and after raking it carefully the vat is covered. A slow fire is to be kept up till twelve hours after it is filled, it is to be stirred a second time; and so on every twelve hours till it become blue, which it will be in eight hours. If the bath be well managed, it will be of a fine green, covered with copper scales, and have a blue scum or flower at the top.

It may be observed, that the theory of the indigo is the same as that of the foregoing, except that the indigo is here dissolved by alkali of lime. When this vat, which is much better managed than that of pastel, is in a state, it may be used for dyeing in the same manner as that described above.

M. Hellot describes two vats in which indigo is dissolved by urine. Madder is dissolved in the one vinegar, in the other in tartar, of each a weight equal to that of indigo. The quantity of urine ought to be considerable. The solution of indigo, de-oxidized by the urine and madder in solution, is due to the ammonia formed in the urine, either by the action of heat or fermentation.

Hellot remarks, that an effervescence takes place on pouring in the solution of alum into the vat, which probably tends to stop the action. These vats are by no means compared with those of pastel, or indigo; much indigo being despatched by them; so that they are adapted only for small dye-houses.

*Of Dyeing Silk Blue.*—Silk is dyed blue by indigo alone, without any proportion of woad. The proportion of indigo mentioned in the preparation of the indigo vat, and sometimes a larger, is to be used, with six pounds of bran, and about four ounces of madder. According to Macquer, a pound of madder for each pound of potassa, makes the vat greener, and produces a more permanent color in the silk. When the vat is come to the proper state, it is to be refreshed with two pounds of potassa, and four ounces of madder; and, after being stirred, in the course of four hours it is fit

for dyeing. The temperature should be so moderated that the hand may be held in it.

155. The silk, after being boiled with soap, in the proportion of thirty pounds of soap to 100 of silk, and well cleaned by repeated beatings in a stream of water, must be dyed in small portions. When it has been turned once, or oftener, in the bath, it is wrung out and exposed to the air, that the green color may change to a blue. When the change is complete, it is thrown into clear water, and afterwards wrung out. Silk dyed blue should be speedily dried. In damp weather, and in winter, it is necessary to conduct the drying in a chamber heated by a stove. The silk should be hung on a frame kept constantly in motion. To dye light shades, some employ vats that are nearly exhausted: but it ought to be observed, that the color thus obtained is less beautiful and less permanent than when fresh vats, containing a smaller quantity of indigo, are employed.

156. Some addition is required to be made to the indigo, to give silk a deep blue. A previous preparation is necessary, by giving it another color or ground. For the Turkey blue, which is the deepest, a strong bath of archil is first prepared. Cochineal is also sometimes used, instead of archil, for the ground, to render the color more permanent. A blue is given to silk by means of verdigris and logwood, but possesses little durability. It might be rendered more permanent, by giving it a lighter shade in this bath, then dipping it in a bath of archil, and, lastly, in the indigo vat.

157. When raw silk is to be dyed blue, such as is naturally white should be selected. Being previously soaked in water, it is put into the bath in separate hanks, as already directed for scoured silks; and, as raw silk combines more readily with the coloring matter, the scoured silk, when it can be conveniently done, should be first put into the bath. If archil, or any of the other ingredients, are required to give more intensity to the color, the mode of application is the same as that directed for scoured silk.

There are various other methods of conducting this part of dyeing, described by M. d'Apligny, Quatremere, Bergman, Scheffer, &c., which we omit as not being of material importance to the practical dyer.

158. *Of Dyeing Cotton and Linen Blue.*—In communicating the blue color to these substances, the principal ingredient employed is indigo; but Prussian blue has been found to answer extremely well. According to Le Pileur d'Apligny, says M. Berthollet, the vat for dyeing cotton and linen is capable of holding about 120 gallons. The quantity of indigo employed is usually from six to eight pounds, finely ground, and boiled in a lee drawn off from double its weight of potassa, with a quantity of lime equal in weight to the indigo. During the boiling, which is to be continued till the indigo is thoroughly penetrated with the lee, the solution must be constantly stirred, to prevent the indigo from being injured by adhering to the bottom of the vessel.

159. During this process, another quantity of quick-lime, equal to the indigo, is to be slaked. Twenty quarts of warm water are added, in which

is to be dissolved a quantity of sulphate of iron, equal to twice the weight of the lime. The solution being completed, it is poured into the vat, which is previously half filled with water. To this the solution of indigo is added, with that part of the lie which was not employed in the boiling. The vat must now be filled up nearly to the top. It must be raked twice or thrice every day till it is completely prepared, which is generally the case in forty-eight hours, and sometimes sooner, as it depends on the temperature of the atmosphere. A small proportion of bran, madder, and woad, is recommended by some to be added to this vat.

160. The process which is followed at Rouen, and described by Quatremere, is more simple. The vats, which are constructed of a kind of flint, are coated within and without with fine cement, and are arranged in one or more parallel lines. Each vat contains four hogsheds of water. The indigo, to the amount of eighteen or twenty pounds, being macerated for a week in a caustic lie, strong enough to bear an egg, is ground in a mill; three hogsheds and a half of water are put into the vat, and afterwards twenty pounds of lime. The lime being thoroughly slaked, the vat is raked, and thirty-six pounds of copperas are added; and, when the solution is complete, the ground indigo is poured in through a sieve. It is raked seven or eight times the same day, and, after being left at rest for thirty-six hours, it is in a state fit for dyeing.

161. In extensive manufactories, it is necessary to have vats set at different times. In conducting the process of dyeing, the stuffs are first dipped in the most exhausted vat, and then regularly proceeding from the weakest to the strongest, if they have not previously attained the desired shade. The stuffs should remain in the bath only about five or six minutes, for in that time they combine with all the coloring matter they can take up. After they have been dipped in a vat, it should not be used again till it has been raked, and stood at least twenty-four hours, unless it has been lately set, when a shorter period is sufficient.

162. After the stuffs have been dipped three or four times in a vat, it becomes black, and no blue or copper-colored streaks are seen on the surface after raking it. It must then be renewed, by adding four pounds of copperas with two of quicklime, after which it must be raked twice. In this way a vat may be renewed three or four times; but the additional quantity of ingredients must be diminished as the strength of the vat is exhausted.

163. A vat which is still more simple and more easily prepared, has been recommended by Bergman. The proportion of the ingredients which he has directed to be employed is the following:—To three drachms of indigo reduced to powder, three drachms of copperas, and three of lime, add two pints of water. Let it be well raked, and in the course of a few hours it will be in a proper state for dyeing.

164. Haussmann employs a still less proportion of indigo. For about 500 gallons of water he takes thirty-six pounds of quick-lime, slaked in about twenty-five gallons of water, with which

the indigo is to be mixed in the vat from ten to twenty pounds, well ground, then dissolves thirty pounds of sulphate of iron in about fifteen gallons of water. The vat is left at rest for fifteen minutes; the vat is then filled, and gently and constantly stirred. If a deeper shade is wanted, and particularly if the linen is to be dyed, the proportion of indigo should be greater; but the shade depends much on the time the stuffs remain in the vat, and the times it has been used. When the vat becomes turbid, the process of dyeing is interrupted, till it has been again raked, and the supernatant liquor become transparent. If the effects of the lime fail, a new quantity is added; and, if the iron cease to produce effect on the indigo, a new portion of copperas is added, observing to have a greater quantity of lime than is necessary to saturate the acid.

165. When the indigo appears to be exhausted, fresh portions are to be added, the vat is raked several times, and allowed to stand till it is again fit for use. In this Haussmann says he preserved a vat for many years; and had it not been for the accumulation of sediment, which prevented the stuffs being immersed to a sufficient depth, the process would have been continued in use for a long time. It is proper to add, that Mr. Baume found, that a pattern of cloth dipped in a solution of indigo in sulphuric acid, immediately it was taken out of the bath, became a deeper blue than a similar pattern exposed to air, or another dipped in river water.

166. A remarkably fine blue is produced by a solution of indigo in sulphuric acid. The name of Saxon blue is given, from the circumstance of its having been discovered at Senhain in Saxony, by counsellor Barth, in the year 1740.

167. The following, according to Haussmann, is the process of preparing this dye by the sulphuric acid.

He employed one part of indigo to one of acid, keeping the mixture in a temperature between  $86^{\circ}$  and  $104^{\circ}$  of Fahrenheit, reckoned that one part of indigo, thus dissolved, was sufficient to give a deep blue color to ten times its weight of wool. Poerner used one part of indigo to four of sulphuric acid. In the wool or cloth for this bath, it is first dyed with alum and tartar. The wool must be the finest as well as fullest color during the first immersion; but lighter, though duller shades may be given to other portions by the same bath, when partially exhausted. The deeper shades are advantageously given by adding fresh portions of indigo to the bath, in successive portions, raising the stuffs on the wench previously to each addition.

#### OF DYEING RED.

168. Red colors are known by different names, according to their degrees of intensity, as scarlet, &c., besides innumerable shades of red under no particular denomination. The substances usually employed in dyeing red are cochineal, madder, kermes, lac, carthamus, sil-wood, archil, and logwood. All of

s which give a red color, are Dr. Bancroft *adjective* colors, from the aid of mordants to give them

**ring Wool Red.**—When woollen dyed, they are first boiled for two with alum and tartar: they are in, slightly wrung out, put into a carried into a cool place, where in for some days. The quantities of the alum and tartar are varied subject of the dyer, and the shade is wanted. Some recommend alum, and one ounce of tartar to wool. By increasing the proportion a certain degree, a deep and person color is produced. This arises tinge induced by the acid on articles of the madder. Others wish the proportion of tartar, and seventh part. In conducting the with madder, the bath should to a boiling heat, because, at that a fawn-colored particles would be a different shade obtained from desired. When the water is at such as the hand can bear, Hellot re-addition of half a pound of grape pound of wool to be dyed. It all stirred before the wool is in must remain for an hour with- apting for a few minutes towards process, that the combination of articles with the stuff may be more

reds are sometimes rosed, as it is and Brasil wood. In this way are beautiful and velvety, but is not permanent. But madder at best, are far inferior to those lac and cochineal, and even to by kermes; but, as the expense is comparatively small, they arearse stuffs.

at authors recommend different madder. Poerner proposes to of the weight of the wool, while the quantity to one-fourth. Poerner alum and tartar a quantity of equal in weight to the tartar, and, boiling, allowed the cloth to reh, which had been left to cool for tys. He then dyed it in the usual ned a fine red. On another occa- d the cloth by the common boil- it in a bath slightly heated, with tion of madder, tartar, and solu- cloth remained twenty-four hours 3, when it had become cold, he ber bath, made with madder only, ined for twenty-four hours. By got a fine red, somewhat brighter on, but inclining a little to yellow. hat he obtained an orange red by h a solution of tin, and one-fourth then dyeing with one-fourth of terry color, says Bergman, is ob- one part of a solution of tin, and r, without previously boiling the

wool. By exposure to the air, this color becomes deeper. By boiling the wool for two hours with one-fourth of sulphate of iron, then washing it, and afterwards immersing it in cold water with one-fourth of madder, and boiling it again for an hour, the result is a coffee color. But if the wool has not been soaked, and if it be dyed with one part of sulphate of iron and two of madder, the color is a brown approaching to red.

172. When sulphate of copper is employed as the mordant, the madder dye yields a clear brown, inclining to yellow; and a similar color may be produced by dyeing the wool simply soaked in hot water, with one part of sulphate of copper, and two of madder. But when this mordant and dye-stuff are used in equal proportions, the yellow is somewhat more obscure, inclining to green; and in both these instances, exposure to the air does not produce a darker color. Berthollet says that he employed a solution of tin in various ways, both in the preparation and the application of the madder; and, by the use of different solutions of tin, he found that, although the tint was a little brighter than what is obtained by the common process, it was always more inclined to yellow or fawn color.

173. *Of Dyeing Silk Red.*—The red color obtained from madder has not been found of sufficient brilliancy for dyeing silks; M. De la Folie, however, has given the following process for employing it for this purpose:—Half a pound of alum is to be dissolved in each quart of hot water, to which two ounces of potassa are to be added; after the effervescence is over, and the liquor has begun to grow clear, the silk must be soaked in it for two hours; it is then to be washed and put into the madder bath. Silk dyed in this way, he says, becomes more beautiful by the application of the soap proof. Another process is described by Mr. Gulichie, of which the following is the substance.—

174. For every pound of silk he proposes a bath of four ounces of alum, and one ounce of solution of tin. When the liquor has become clear, it is decanted, and the silk carefully soaked in it for twelve hours, after which it is to be immersed in a bath with half a pound of madder softened by boiling, with an infusion of galls in white wine. The bath must be kept moderately hot for an hour, and then made to boil for two minutes. The silk, being taken from the bath, is to be washed in a stream of water, and dried in the sun. The color thus produced is said to be very permanent; and, if the galls are omitted, its brilliancy is improved.

175. The color obtained when Brasil-wood is used, is denominated *false crimson*, to distinguish it from that produced by cochineal, which is much more durable, and which is styled *grain crimson*. This very beautiful color is obtained by the following process:—The silk, being well cleansed from the soap, is to be immersed in an alum bath of the full strength, and to remain for a night. It is then to be washed, and twice beetled at the river. The bath is prepared by filling a long boiler two-thirds with water, to which are added, when it boils, from half an ounce to two ounces of powdered white galls for every pound of silk. When it has boiled for a few moments, from two

to three ounces of cochineal, also powdered and sifted, for every pound of silk, are put in, and afterwards one ounce of tartar to every pound of cochineal. When the tartar is dissolved, one ounce of solution of tin is added for every ounce of tartar. In the preparation of this solution of tin, the following proportions are recommended by Macquer. For every pound of nitric acid two ounces of sal ammoniac, six ounces of fine grain tin, and twelve ounces of water are employed. When these ingredients are mixed together, the boiler is to be filled up with cold water, and the proportion of the bath, for every pound of silk, is about eight or ten quarts of water. In this the silk is immediately immersed, and turned on the winch till it appear to be of a uniform color. The fire is then increased, and the bath is kept boiling for two hours, observing to turn the silk occasionally. The fire is afterwards put out, and the silk put into the bath, where it is allowed to remain for a few hours longer. It is then taken out, washed at the river, twice beetled, wrung, and dried.

176. Carthamus, says M. Berthollet, is used for dyeing silk poppy, a bright orange red, cherry, rose color, and flesh color. The process differs according to the greater or less tendency to flame color that is wanted. The following is his account of the preparation of the carthamus bath: The yellow matter of the carthamus having been first extracted, the cakes containing the red coloring matter are broken down and put into a trough of fir-wood, where they are several times sprinkled with finely powdered soda in the proportion of six pounds of soda to every hundred pounds of carthamus. The whole is then put into a small trough lined with closely woven cloth, and having a grated bottom; this small trough is then placed over the larger one, and water is poured on the mixture till the larger trough is full. Fresh water is poured over the carthamus and suffered to run into another trough, and so on successively, adding a little fresh soda till all the red color is extracted. These liquors are then mixed, and lemon-juice is added to give a fine cherry color, which the liquor imparts to the silk that is dipped in it. Poppy-color, given in this way, requires that the silk be immersed in a second bath, and that the colors be brightened by turning the silk several times through a bath of hot water impregnated with lemon-juice. The lighter hues of red are given by the weaker solutions of carthamus, and the lightest shades require the addition of a little soap. In dyeing silk with carthamus the silk, after being scoured, should, for poppy or fire color, receive a ground of annatto. The carthamus bath should be prepared at the time of using, and the process of dyeing should be conducted as speedily as possible.

177. Those who have made the nearest approach towards producing a scarlet on silk, says Berthollet, begin with dyeing the silk crimson. It is then dyed with carthamus, and after that dyed yellow in a cold bath. By this process a fine color is produced, but it is not permanent, as the dye of the carthamus is affected by the action of the air. The following is the process given by Dr. Baucroft in his Philosophy of

Permanent sulphate of water, and, after partially prepared of quercit ing to some body, the solution of brighten the addition is produced and dyed by adding chineal, changes color.

178. Madder red, and colors, by coloring ing. In detail, the may be and diverse color of cotton:

179. are distilled red, is called cause it Levant.

Vogel the subal dyeing by duced the other and of soda 2 Galling 1 astringent instance, kali added stuff has operation der that three-quar stuff.

The raised is about an mersed 1 minutes, and dye the same dyeing, 1 stuff is 1 soap, m two ounce effect of bined e give a 1 mains. drying.

180. madder,

most beautiful: it possesses a brilliancy which can be communicated to cotton by none of the common processes of dyeing, and has, moreover, the property of more effectually resisting the action of the different re-agents, as alkalis, alum, and acids. For many years the use of this color was confined to the east, and to us through our Levant trade only. In the time of the art found its way from India to the western parts of Asia, and to Greece; and from Greece to France, whence it was brought to this country by one of the French dyers, M. Papillon, who settled at Glasgow, where, for a considerable time, he carried on with great success the business of dyeing Turkey-red.

M. Papillon communicated his process to the commissioners and trustees for manufactures in Scotland, to be by them published at the expiration of a certain term of years. For this he received a handsome premium; and his process was made public in the year 1803. We need hardly mention the celebrity of the factory of Messrs. Monteith and Co. of Glasgow, since it is known to the world at large for the excellency and beauty of their cotton fabrics; will not soon be surpassed; the madder-which they dye rival, in brilliancy and intensity, any ever produced at Adrianople; and their figures, distributed over the cloth by the discharging process, surpass in purity, elegance, and precision of outline, the original Bandolines.

The art of dyeing Turkey-red has been described by different writers, who vary a little each other in some particulars, but who agree in the leading features of the process. We are inserting here the account of it as given by Mr. Bancroft, as it affords us an opportunity of showing it up by the insertion of some of the valuable remarks upon the subject in accordance to the process observed at Rouen in France.

The process is very tedious, and is divided by the French into nine different steps.

Step 1. Cleaning. For 100 pounds of cotton require an equal weight of Alicante barilla, twenty pounds of pearl-ashes, and 100 pounds of quick-lime.

The barilla must be mixed with soft water in a deep tub, which has a small hole near the bottom of it, stopped at first with a peg.—The hole is covered in the inside with a cloth supported by two bricks, that the ashes may be filtered from passing through it or stopping it while the lie filters through it.

Under this tub is another to receive the lie; pure water is repeatedly passed through the tub to form lies of different strength, which are kept separate at first until their strength is ascertained. The strongest required for use must be of an egg, and is called the lie of six degrees on the French hydrometer, or peseliqueur. The others are afterwards brought to this strength, passing them through fresh barilla. But a small quantity of the weak, which is of 2° on the hydrometer, is reserved for dissolving the alum and gum, and the salt, which are used in the subsequent parts of the process. This lie of 2° is called the weak barilla liquor, the other is called the strong.

Dissolve the pearl-ashes in ten pails, of four gallons each, of soft water, and the lime in fourteen pails.

Let all the liquors stand till they become quite clear, and then mix ten pails of each.

Boil the cotton in the mixture five hours, then wash it in running water and dry it.

Step 2. Take a sufficient quantity, say ten pails (of four gallons each), of the strong barilla water in a tub, and dissolve or dilute in it two pails full of sheep's dung; then pour into it two quart bottles of oil of vitriol, and one pound of gum arabic, and one pound of sal ammoniac, both previously dissolved in a sufficient quantity of the weak barilla water, and lastly, twenty-five pounds of olive oil, which has been previously dissolved or well mixed with two pails of the weak barilla water.

The materials of this steep being well mixed, tramp or tread down the cotton into it, until it is well soaked; let it steep twenty-four hours, and then wring it hard and dry it.

Steep it again twenty-four hours, and again wring and dry it.

Steep it a third time twenty-four hours, after which wring and dry it, and lastly wash it well and dry it.

Step 3. This part of the process is precisely the same with the last, except that the sheep's dung is omitted in the composition of the steep.

Step 4. Boil twenty-five pounds of galls, bruised, in ten pails of river water, until four or five are boiled away; strain the liquor into a tub, and pour cold water on the galls in the strainer, to wash out of them all their tincture.

As soon as the liquor is become milk-warm, dip your cotton hank by hank, handling it carefully all the time, and let it steep twenty-four hours.

Then wring it carefully and equally, and dry it well without washing.

Step 5. Dissolve twenty-five pounds of Roman alum in fourteen pails of warm water, without making it boil; skim the liquor well, and add two pails of strong barilla water, and then let it cool until it be lukewarm.

Dip the cotton, and handle it hank by hank, and let it steep twenty-four hours, and wring it equally and dry it well without washing.

Step 6. Is performed in every particular like the last; but after the cotton is dry, you steep it six hours in the river, and wash and dry it.

Step 7. The cotton is dyed by about ten pounds at once, for which take two gallons and a half of ox blood, and mix it in the copper with twenty-eight pails of milk-warm water, and stir it well; then add twenty-five pounds of madder, and stir all well together. Then, having beforehand put the ten pounds of cotton on sticks, dip it into the liquor, and move and turn it constantly one hour, during which you gradually increase the heat, until the liquor begin to boil at the end of the hour. Then sink the cotton, and boil it gently one hour longer; and, lastly, wash it and dry it.

Take out so much of the boiling liquor, that what remains may produce a milk-warm heat with the fresh water with which the copper is again filled up, and then proceed to make up a

making an interval, of two days between wringing which the cotton should retain its shape after being slightly wrung from the soap. It should, however, be well dried before it goes into the second.

6. At Rouen, the cotton is dyed in parties of twenty-five pounds each, and the dyeing is of a quadrangular form, containing about four gallons of liquor. One quart of ox-blood is added for each pound of cotton, with two pounds of Provence madder, or one pound of this of Smyrna madder. Some persons, however, think it best to effect the dyeing by separate operations, employing half the above quantity of madder for one dyeing, and half the other; but always taking care not to dry the cotton between the dyeings. There are some persons who give cotton another alum steep in these dyeing operations, employing for the first steep half as much alum as was used for the second, and afterwards washing, &c.

7. For this steep they employ at Rouen the second of the third salt-steep before mentioned, but the application of it is considered as the following step.

8. This constitutes the fourteenth operation, the first set of gray courses at Rouen; after having macerated the cotton with water, they boil it for the space of five hours with six or eight pounds of white soap previously dissolved in 145 gallons of water in a vessel covered at the top, so as to leave only a very small opening for the necessary escape of the steam, which might otherwise occasion an explosion. The effect of this boiling is, to dissolve and separate from the cotton all the yellowish-brown matter of the color which may have been applied to it in the first dyeing operation, and thus to change the cotton from the dull brownish-red which it would otherwise retain, to a bright lively color, nearly that of the finest cochineal scarlet. It is by the singular degree of fixity which the color of the madder acquires, in consequence of the operations just described, that so beautiful a red can be obtained. Such is the stability of the Turkey-red when so dyed, that it is said to sustain boiling with water for thirty-six hours without injury.

In addition to the steps prescribed by M. Rouelle, they employ another at Rouen, which is added to make the red incline more to the blue, and at the same time increase its vivacity.

For this operation, with the former quantity of 100 pounds of cotton they dissolve, in four gallons of water, sixteen or eighteen pounds of white soap, and as soon as the liquor is brought to boil, they add to it from one pound and a half to two pounds of the crystallised madder, previously dissolved in two quarts of water, and mixed with eight ounces of single alum; and having equally dispersed this through the boiling solution of soap, by stirring, &c., the cotton is put in and boiled with the same precautions as in the brightening operation. The desired effect has been obtained, and is to be discovered by frequent examination. Care must be taken not to employ more than one or two ounces of aqua-fortis than the quantity here

mentioned, lest it should decompose the soap, and cause the oil to separate and rise to the surface of the liquor.

183. We cannot leave this truly important branch of dyeing without noticing the ingenious remarks of Mr. Thomson of Glasgow, published in the eighth volume of the *Annals of Philosophy*, on the theory of the Turkey-red process.

He observes that silk and worsted have a natural varnish which cotton does not possess. To supply this defect, the repeated immersions, followed by exposure to the atmosphere, and to the heated air of a stove, may give the oil the proper consistency, by the absorption of oxygen, for forming a varnish, with which the coloring matter unites, and through which it may be said to shine, which causes that superior brilliancy which the goods attain when they are cleared, or, as it may be called, polished. I therefore presume, that the fixedness and brilliancy of the color will depend on the quantity of oil imbibed, as every repetition of drying presents new fibres to be varnished with an additional quantity; for I have always found, that the permanency was in proportion to the number of manipulations in the saponaceous liquor, and a proportionable freedom could also be used in reducing or clearing. The white immersions, omitting the sheep's dung, are just applying successive coats of varnish. Clearing is never attempted from the madder copper, without immersing the goods again in soda and oil, and drying them in a stove, which I consider to be also supplying them with an additional coat.

The alkaline lie occasions a greater separation in the particles of the oil, by which it combines more closely with the fabric of the cloth. The sheep's dung in the first immersions may serve as a covering, to keep the goods moist for a considerable time, that they may more fully imbibe the liquor, by preventing the evaporation from being too quick in the great heat to which they are exposed.

After the frequent immersions the cloth feels like leather, no doubt from a superfluity of liquor. It is then steeped in a lie of carbonate of soda, and afterwards well washed and dried, as a preparation for the galling and aluming. The astringent principle has been long known for darkening and fixing common red colors on cotton, by uniting with the earth of alum, and strengthening the basis. To the use of blood in the madder copper I attribute nothing; as in the rancid and putrid state in which I have seen it used, were it not for the prejudice of the operator, it might be safely dispensed with.

In proof of the above idea, that it is only the oil uniting with the earth of alum that is of use, I may refer to the mode of dyeing that color in the east, quoted by Dr. Bancroft, viz. soaking their cotton in oil (no matter of what description), during the night, and exposing it to the sun and air during the day, for seven successive days, rinsing it only in running water, and then immersing it in a decoction of galls and the leaves of sumach previous to aluming.

I would therefore request the practical dyer, who wishes to arrive at a knowledge of this unaccountable process, to give up the idea of au-

malisation, if by it be meant impregnating the cloth with an animal matter, and by the power of the microscope, or any better method, look for the whole truth from some other source than chemical analysis. I am at present inclined to believe that it is a mechanical operation united to a chemical, and that the frequent immersions in the imperfect soap are equivalent to laying on the first, second, third, &c., coats, preparatory to finishing a fine painting in oil. A very eminent calico manufacturer, whom I consulted on the Turkey-red process, assured me that the only essential mordants are oil and alumina; and that bright and fast reds, equal to any produced by the usual complicated process with sheep's dung, galls, and blood, may be obtained without these articles.

#### OF DYEING SCARLET.

184. Scarlet may be regarded as one of the compound colors arising from a mixture of the red and yellow coloring matters. Scarlet is the finest and most splendid of all the colors, and the great demand for it has excited several chemists of distinction to improve and facilitate the process of producing it. We shall here briefly notice the old method of dyeing scarlet, which is still practised by some dyers, both in this country and on the continent, and then give the improved method proposed by Dr. Bancroft in his excellent treatise already mentioned.

185. We cannot, says M. Berthollet, expect to obtain the desired shade from the doses prescribed in the processes, from variations in the quantity of the coloring particles contained in the different kinds of fine cochineal, and particularly from the solutions of tin that are used differing considerably from each other; but the just proportions of the ingredients to be employed may be readily determined by trials in the small way, so as to obtain the shade called for; and, if the pieces which are dyed be above or below this shade, it is not difficult to find the suitable proportions.

186. In the process of dyeing scarlet two operations are observed, viz. the boiling, and the reddening. The first or boiling operation is thus conducted:—For 100 pounds of cloth, a quantity of soft water is heated in a tinned boiler, till it be rather more than lukewarm, after which six pounds of cream-of-tartar are dissolved in it. When the water is a little warmer, half a pound of finely powdered cochineal is added and well mixed with the solution of tartar. Immediately after, five pounds of very clear solution of tin are poured in, and carefully mixed. When the bath begins to boil, the cloth is put in, and rapidly turned two or three times with the winch, then more slowly, and is left to boil for two hours, after which it is taken out, drained, exposed to the air, and washed in the running stream.

187. In preparing for the second bath the boiler must be emptied, filled again with fresh water, and, when this is near the boiling heat, five pounds and three quarters of powdered cochineal are put in and carefully mixed, and when, on ceasing to stir the liquor, a crust forms on the surface, and begins to break, thirteen or fourteen pounds of solution of tin are poured in.

Sometimes, after this, the liquor begins to boil above the brim of the boiler, when it is prevented by putting in some cold water. The solution is well mixed in the bath, the cloth is immersed, taking care to turn it rapidly for the first two or three hours, and then to be boiled for about an hour, and down as often as it rises to the surface, till this it is taken out, exposed to the air, and washed in the stream, and dried.

188. On examining the proportions of the material and of solution of tin, used either in boiling, or in the reddening, it appears that they are by no means fixed. There are many who, according to Hellot's account, employ well by putting two-thirds of the cochineal, and a fourth of the cochineal, into the bath, and the remaining third of the compound is the remaining three-fourths of the compound in the reddening. He also asserts that it is no harm to use tartar in the reddening, more of it than half the weight of tin, may be put in; and he thinks, that it will make the color more permanent. Some dyers take the cloth out of the boiling, but wash it fresh to make the reddening in the bath, by pouring in an infusion of cochineal, which they have made apart, and with which they mixed the proper quantity of compound in this way they save time and fast; and affirm that the scarlet is equally fine.

189. Different authors recommend different proportions of the materials used in the process. Scheffer prescribes one part of tin for ten parts by weight of cochineal, an equal quantity of starch and of tartar solution. He remarks, that the starch will make the color more uniform, and recommends to throw into the water, when the solution of tin is added,  $\frac{1}{2}$  lb of cochineal; to agitate well, and the wool boil in it for an hour, and then to wash it. He prescribes next, the boiling for half an hour in the bath, which serves for the reddening,  $\frac{1}{2}$  lb of starch,  $\frac{1}{2}$  lb of solution of tin,  $\frac{1}{2}$  lb and  $\frac{1}{2}$  lb of cochineal.

It appears, that Scheffer employs a smaller quantity of solution of tin than others, but what he does employ contains more tin.

190. Poerner describes three processes, according as the shade is to be less deep, or more or less of an orange, which he wishes to give to the scarlet. He gives the proportions of the solution of tin, cochineal, and tartar, or omits the last ingredient.

For conducting the process of the dyeing in the most beneficial manner, and for its results, according to the end in view, of each of the ingredients employed, it is to be ascertained. We need not however, with a detail of processes which have been superseded by others that are from experience to be much superior; we shall therefore notice the important improvements in this branch of dyeing made by Dr. Bancroft, which have obtained the approbation of eminent chemists, British and foreign.

191. Dr. Bancroft was struck with the fact that for a whole century the impact

made in the art of dyeing scarlet. On this he seems to have fixed his mind, and, about 1786, he instituted a set of experiments were attended with the most gratifying

Having, by frequent affusions of boiling water, extracted the whole of the coloring matter from powdered cochineal, he found that the addition of a little potash to the sediment, and a quantity of boiling water, extracted a new quantity of coloring matter, equal to about one-fourth of what had been given out to the pure

He repeatedly extracted this coloring matter by means of potassa, and afterwards dyed pieces of cloth scarlet with it, which he found similar to others dyed with cochineal. It was the course of these enquiries that he perceived scarlet to be a compound color, consisting of three-fourths of pure crimson, and one-fourth of pure bright yellow. He conceived, therefore, that when the natural crimson of the wool is made scarlet, by the usual process, it must be a change produced, equivalent to the conversion of one-fourth of the coloring matter of cochineal from its natural crimson to a low color. From this he concluded that it might be a great saving of cochineal, by substituting a cheaper substance, which, at the same time, might yield a better yellow color. He therefore has his object to combine with this low or rose color, a suitable portion of a golden yellow, capable of being permanently fixed, and reflected by the same basis. Dr. Bancroft found in quercitron bark, and ascertained that it possessed the advantage of being not only the cheapest, but the best of all the yellows he had tried.

For the purpose of diminishing the quantity of cochineal employed in producing a scarlet dye, Dr. Bancroft made a number of experiments under the authority of government. In these experiments, the mordant used was the common dyers' spirit, or the nitro-muriatic of tin; he found that they were not attended with the effects which he expected. In some of his experiments, he remarks, that the solution of tin by means of sulphuric acid destroys the natural color, and this led him to reject the use of muriatic acid, till accident brought him to dissolve tartar of tin in muriatic acid, combined with sulphuric acid. The application of this solution in dyeing, was not accompanied with the corrosive effects of the muriatic and tartaric which he had employed in the experiments, and which proved unsuccessful. Varying different proportions of these acids, he found the following to answer best. In a mixture of two pounds of sulphuric acid of the ordinary strength, and about three pounds of tartaric acid, he dissolved about fourteen ounces of tin. The muriatic acid is first poured upon a quantity of granulated tin in a suitable vessel, the sulphuric acid is added by degrees, the solution is more quickly effected by means of heat; it is perfectly colorless, and may be kept for years without precipitation. It has the power of the common dyers' spirit; it produces at about one-third of the expence

VOL. VII.

It also raises the colors more than even the tartarate of tin; and does not incline the cochineal crimson to the yellow shade.

194. In using this solution as a mordant, to produce the compound scarlet color, Dr. Bancroft advises the following process. Nothing, says he, is necessary, but to put the cloth, suppose 100 pounds, into a proper tin vessel, nearly filled with water, in which has been mixed eight pounds of the murio-sulphuric solution of tin; and, having brought the mixture to a boiling heat, about 100 pounds of cloth are immersed and turned through it as usual, by the wheel, for a quarter of an hour. Then the cloth is removed, and four pounds of cochineal and two pounds and a half of quercitron-bark, both powdered are introduced and well mixed. After this, the cloth is returned into the bath, the liquor is made to boil, and the cloth is turned as usual for fifteen or twenty minutes, by which time, in general, the color will be properly raised and the bath exhausted, when the cloth is taken out and rinsed in the ordinary way.

By this method the time, labor, and fuel, necessary for filling and heating the boiler a second time are saved, the process finished much sooner than in the common way, and there is a saving of all the tartar, as well as of two-thirds of the cost of spirit, or nitro-muriatic solution of tin, which, for dyeing 100 pounds of wool, commonly amount to ten shillings, whereas eight pounds of the murio-sulphuric solution cost only about three shillings. There is, besides, a saving of at least one-fourth of the cochineal usually employed, and the color produced does not prove inferior in any respect to that dyed with much more expence and trouble in the ordinary way.

195. When a rose color is wanted, it may be readily obtained in this way, only omitting the quercitron bark, instead of the complex method of first producing a scarlet, and then changing it to a rose by the volatile alkali contained in stale urine, set free by potash or by lime; and should any one still choose to continue the practice of dyeing scarlet without the quercitron bark, it is only necessary to employ the usual proportions of tartar and cochineal, with a suitable quantity of the murio-sulphate of tin, which, while it is cheaper, is much more effectual than the dyers' spirit.

196. The scarlet, produced from cochineal crimson and quercitron, is also attended with this advantage, that it may be dyed upon wool and woollen yarn, without any danger of its being changed to a crimson color by the process of fulling, which always happens to scarlet dyed in the common way. Indeed, this last is nothing but a crimson or rose color, rendered yellow by some particular action of the tartaric acid; and is hence liable to be reduced to crimson by many chemical agents, especially by soap, alkaline salts, salts of lime, &c. But where the coloring matter of cochineal is applied and fixed merely as a crimson or rose color, and is rendered scarlet by adding a very permanent yellow, capable of resisting the strongest acids and alkalis, when used with solutions of tin, no such

2 R

pear exactly of the same shade; but, if they be afterwards compared together by candle-light, the former will appear at least several shades higher and fuller than the latter;—a circumstance of some importance, when it is considered how much this and other gay colors are worn and exhibited by candle-light, during a considerable part of the year.

197. To illustrate more clearly, continues Dr. Bancroft, the effects of the murio-sulphuric solution of tin with cochineal in dyeing, I shall state a very few of my numerous experiments therewith: observing, however, that they were all several times repeated, and always with similar effects.

1st, I boiled 100 parts of woollen cloth in water, with eight parts of the murio-sulphuric solution of tin, during the space of ten or fifteen minutes; I then added to the same water four parts of cochineal, and two parts and a half of quercitron bark in powder, and boiled the cloth fifteen or twenty minutes longer; at the end of which time it had nearly imbibed all the color of the dyeing liquor, and received a very good, even, and bright scarlet. Similar cloth dyed of that color at the same time in the usual way, and with a fourth part more of cochineal, was found upon comparison to have somewhat less body than the former; the effect of the quercitron bark in the first case having been more than equal to the additional portion of cochineal employed in the latter, and made yellow by the action of tartar.

2d. To see whether the tartrate of tin would, besides yellowing the cochineal crimson, contribute to raise and exalt its color more than the murio-sulphate of that metal, I boiled 100 parts of cloth with eight parts of the murio-sulphuric solution, and six parts of tartar, for the space of one hour; I then dyed the cloth, unrinsed, in clean water, with four parts of cochineal, and two parts and a half of quercitron bark, which produced a bright aurora color, because a double portion of yellow had been here produced, first by the quercitron bark, and then

of tin, for about ten minutes. I then added four parts of cochineal, by ten or fifteen minutes, and produced a fine crimson. This equal parts, one of which I rendered scarlet by boiling it for five tenths of its weight of tartar, the other, by boiling it with weight of quercitron bark, and of murio-sulphuric solution; in this last case there was no coloring matter from the bark, nor no such addition took place, necessary for producing the color wholly gained by a change in the cochineal crimson; and I compared with each other, it rendered scarlet by an additional yellow, was, as might have been expected, several shades fuller than the former.

4th, I dyed 100 parts of cloth scarlet, by boiling it first in a solution of parts of murio-sulphate of tin, and parts of tartar, for ten minutes, and then in a solution of parts of cochineal, and continuing fifteen minutes. This scarlet was equally, and made one part of it with a little ammoniac in which I again rendered it scarlet in clean water, with a fortieth part of quercitron bark, and the same weight of phosphate of tin; and this last, being the other half to which no quercitron had been applied, was found to be of a color, as might have been expected, the cloth, which had been dyed with cochineal and quercitron bark, and ammoniac, being at the same time in water with ammoniac, did not differ like that dyed scarlet without it.

In this way of compound dyeing, cochineal and quercitron bark are all times be able, with the addition of tartar, to produce every possible shade of red, orange, and yellow colors, by the

bl than the quercitron bark. By sufficient I have satisfied myself that the cochineal dyed with the murio-sulphuric solution are in every respect at least as durable as such can be dyed with any other preparation of that metal; and they even seem to find the action of boiling soap lie some longer, and therefore I cannot avoid recommending its use for dyeing rose and cochineal colors, as well as for compound-carlet with the quercitron bark.

### OF DYEING CRIMSON.

The different processes employed for obtaining the various shades of crimson, from the lightest, may be reduced to two. If the shade of crimson required is given to previously dyed scarlet, or the cloth is already dyed crimson. Alum, salts with earthy and fixed and volatile alkalis, have the property of changing the color of scarlet to crimson, which is the natural color of cochineal. It is more, therefore, necessary, than to dye scarlet for about an hour in a bath of alum, proportioned in strength to the shade of the color desired. But as other earthy bases have the same property, and contain more or less of these salts, it gives a proportionate rosy tinge to the scarlet passed through it, particularly if it be the quantity of alum necessary to obtain the shade required. The quantity of alum varies according to the nature of the earthy base employed; and, when well charged with alum, it will answer the purpose of itself, without the addition of alum. If a piece of cloth has any defects, it is most convenient to dye it into a crimson.

Hellot says, that he has tried soap, soda, and crude potassa; that all these substances produced the crimson desired, but sad-ly, and gave it less lustre than alum. Ammonia, on the contrary, produced a very good color, but, as it evaporates quickly, a considerable quantity must be put into the bath a little less warm, a little ammoniacal muriate, or moriac, and common potash. By this the cloth instantly took a very bright color. He thinks that it heightens the color so much as to render less cochineal necessary. But M. Poerner, who gives the same process, directs the scarlet to be left twenty-four hours in a cold solution of potassa and ammoniacal muriate.

To dye crimson at once, a solution of  
ices and a half of alum, and one ounce  
half of tartar, to every pound of cloth, is  
the boiling: and the cloth is afterwards  
with an ounce of cochineal. Solution of  
commonly added, but in less proportion  
scarlet. The processes employed vary  
according as the shade required is deeper  
or, more or less distant from scarlet.  
Salt is also used for the boiling by some

For saddening crimsons, and giving more bloom, archil and potassa are fre-  
quently used, but the bloom thus imparted is  
transient. Sometimes the boiling for  
is made after a scarlet reddening, by  
alum: and it is said, that the

wine soup color has more bloom, if both its boiling and reddening be made after scarlet, than when it is dyed in a fresh bath. For these colors the wild cochineal may be used instead of the fine, but in greater quantity. The reddening which has been used for crimson may also be employed for purples, and other compound colors.

Both scarlets and crimsons in half-grain are made by substituting madder for half the quantity of the cochineal, giving the same boiling as for scarlet in grain, and following in other respects the processes for reddening the scarlet or crimson. Other proportions of madder may be used instead of half, according to the effect desired. The common madder red also acquires a greater lustre, when its boiling is made<sup>a</sup> after a reddening for scarlet.

201. In silk the grain crimson, produced by cochineal, is distinguished from false crimson, which is obtained by Brasil-wood. Silks that are intended to be dyed crimson with cochineal, should not be boiled with more than twenty pounds of soap to 100 pounds of silk, as the slight yellow cast which silk has, when only so far scoured, is advantageous to the color. After the silk has been well cleansed from the soap, it is to be put into an alum liquor of the full strength. In this it is commonly left from the evening till the next morning; it is then washed, and twice beetled at the river. In preparing the bath, an oblong boiler is filled with water, to about one-half or two-thirds; and, when the water boils, white galls powdered are thrown in, from half an ounce to two ounces for every pound of silk. After boiling a few moments, from two to three ounces of cochineal, powdered and sifted, for every pound of silk, according to the shade required, are put in, adding afterwards an ounce of tartar, to every pound of cochineal; and, when the tartar is dissolved, an equal quantity of the solution of tin. This solution ought to contain more tin than that used for scarlet, otherwise the colors will be too bright. Macquer directs this solution to be made with sixteen parts of nitric acid, two of ammoniacal muriate, as much fine grain tin, and twelve of water. These ingredients are mixed and the boiler is filled up with cold water. In this the silk is immediately dipped, and turned on the skein sticks till it appears to be of a uniform color. The fire is then increased, and the bath made to boil for two hours, turning the silk from time to time. After this the fire is put out, and the silk put into the bath, where it is kept a few hours longer. The silk is afterwards washed at the river, twice beetled, wrung and dried. When crimsons are to be browned, they must be passed, after having been washed, through a solution of sulphate of iron, more or less strong according to the shade required. If it should have a yellow tinge, the solution must be charged with a greater or less proportion of decoction of fustet or Venus's samach. White galls should be chosen, because black ones would dull the color of the crimson; and even too large a quantity of the white will produce the same effect. Macquer says, that the galls see only to increase the weight of the silk: yet their general effect is to render colors

few circumstances, for dyeing silk rose and poppy colors by solution of tin, used cold, that its action on the silk might not be too powerful.

202. Brasil-wood is used for dyeing silk what is called false crimson, to distinguish it from that produced by cochineal, which is much more permanent. For this process the silk should be boiled with soap, in the proportion of twenty pounds of the latter to 100 pounds of the former, and afterwards alumed. Less aluming is required for this than for grain crimson. Having washed it in running water, it is dipped in a bath, more or less charged with Brasil juice, according to the shade to be given. In the preparation of the bath hard water is preferable to soft, as it produces with the dye-stuffs a fuller crimson. Washing the silk in hard water will produce nearly the same effect. In order to make false crimson deeper, or dark red, a decoction of logwood is added to the Brasil bath, after the silk has been impregnated with the latter. A little alkali may also be put in according to the shade required. But to imitate poppy or fire color, the silk must have an anotta ground, even deeper than when it is to be dyed with carthamus: after which it is washed, alumed, and dyed with the decoction of Brasil-wood, to which a small portion of soap is generally added. We might here enumerate several other processes for imparting the crimson color, but the above, with what we have said respecting the dyeing of reds in general, and of scarlet in particular, render it unnecessary to enlarge.

#### OF DYEING YELLOW.

203. *Of Dyeing Wool Yellow.*—The yellow communicated to wool by weld has little permanency, if the wool be not previously prepared by some mordant. For this purpose alum and tartar are used, by means of which this plant gives a very

of the shade intended to be given. Common salt be added to the water, its color richer and deeper: alum, gypsum, also deepens it: but soda is paler and more lively; and Sulphate of iron or vitriol gives a brown.

205. According to Scheele, the wool stuff for two hours with one pound of a solution of tin, and then with tartar, and then washing it for about a quarter of an hour in a solution of weld, it will assume a yellow; however, will not penetrate the cloth.

206. Poerner recommends that used in dyeing scarlet the color is brighter and more permanent.

207. Since the introduction of quercitron bark, the process has been much simplified, and the following directions of Linnæus on the subject. He proposes that the wool be boiled with about its own weight of alum, in a suitable liquor for about ten minutes.

208. The substances to be dyed are scoured, and then immersed in the liquor serving to give the higher shades; afterwards the paler straw color, and expeditious process, color wanted to be of a full or bright yellow obtained. The color may be heightened by passing the wool three times through hot water, to which powdered chalk, in the proportion of one pound and a half for every pound of wool has been previously added. The wool, in dyeing, being first reduced to a thin linen bag, the liquor, so that it may be passed through it, to diffuse the color.

ried up in a bag, as that of the alum employed in the preparation. The stuff is then to be turned as usual through the boiling liquor, the color appears to have acquired sufficient purity. One pound of clean powdered chalk every 100 pounds of stuff is then to be mixed in the dyeing bath, and the operation continued for eight or ten minutes longer, for the sake of raising and brightening the color.

20. To communicate a beautiful orange yellow to woollen stuffs, ten pounds of quercitron bark, tied up in a bag, for every hundred pounds of stuff, are to be put into the bath with hot water. At the end of six or eight minutes, an equal weight of murio-sulphate of tin is to be added, and the mixture well stirred for two or three minutes. The cloth, previously scoured, thoroughly wetted, is then immersed in the dyeing liquor, and quickly turned for a few minutes. By this process the coloring matter on the cloth so effectually, that, after the water begins to boil, the highest yellow may be obtained in less than fifteen minutes.

21. High shades of yellow, similar to those obtained from quercitron bark by the above process, are frequently given with young fustic dyers' spirit; but this color is much less durable and permanent, while it is more expensive than what is obtained from the bark.

22. A fine bright, or golden yellow is obtained by employing ten pounds of quercitron bark for each 100 pounds of cloth, the bark is first boiled a few minutes, and then added to seven or eight pounds of murio-sulphate of tin with about five pounds of alum. The cloth is to be dyed in the same manner as in the process for the orange-yellow. Bright yellows of body are produced by employing a smaller quantity of bark, as well as by diminishing the quantity of murio-sulphate of tin and alum. Indeed every variety of shade of pure yellow may be given by varying the proportions of the ingredients.

23. The lively delicate green shades, so much admired, are produced by the addition of tartar to the other ingredients. The tartar is to be added in different proportions, according to the shade which is wanted. For a full yellow, delicately inclining to green, it is proper to employ eight pounds of bark, murio-sulphate of tin, with six of alum, and four of tartar. An additional proportion of tartar renders the yellow more delicate and inclines it more to the green shade; when this lively green shade is wanted in the highest perfection, the ingredients must be used in the following proportions. The delicate green lemon shades are seldom required to have much body. Ten pounds of bark, with an equal quantity of the other ingredients, are to be used to dye 300 or 400 pounds of stuffs.

24. *Of Dyeing Silk Yellow.*—Weld is seldom used to give a yellow dye to silk, but when desired, the process differs a little from that for wool. The silk being scoured, alumed, and dyed in the manner usual for dyeing bright yellow, the bath is prepared, by boiling weld in water, the proportion of double the weight of weld for a quarter of an hour, and straining

off the liquor into a vat, where it is suffered to cool till the hand can be held in it. Then the silk is dipped and turned, till the color is found uniform. While this is going on, the old weld is boiled with a fresh quantity of water, and, after the silk has been dipped, one half of the exhausted bath is taken out, and the vat filled up with the second decoction. The temperature of the fresh bath may be a little higher than that of the former, but should not be too great, lest the color already fixed be dissolved. The stuff is to be turned as before, and then taken out of the bath. Some soda is to be dissolved in a part of the second decoction, and a larger or smaller quantity of the solution is to be added to the bath, according to the intensity of the shade wanted. The color is examined by taking out a skein, and wringing it.

215. To produce shades having more of a gold color, anotta is added in proportion to the depth of color required. Lighter shades, such as pale lemon color, are obtained by previously whitening the silk, and regulating the proportion of the ingredients of the bath by the shade required. To give a yellow, with a green tinge, a little indigo is added to the bath, if the silk has not been previously azured; to prevent the greenish shade being too deep, the silk should be more slightly alumed than usual.

216. Dr. Bancroft informs us that all the shades of yellow can be given at a cheaper rate by quercitron bark than by weld. To dye with this bark, a quantity of it powdered, and enclosed in a bag, in proportion to the shade wanted, from one to two pounds for every pound of silk, is put into the vat while the water is cold. Heat is applied, and when the bath is rather more than blood-warm, or of the temperature 100°, the silk, after being first alumed, is immersed and dyed in the usual way. A deeper shade may be given by adding a small quantity of chalk or pearl-ashes towards the end of the operation. To produce a more lively yellow, a small portion of murio-sulphate of tin may be employed, but it should be used cautiously, as it is apt to diminish the lustre of the silk.

217. To dye silk of an aurora or orange color, after having been properly scoured, it may be immersed in an alkaline solution of anotta, the strength of which is to be regulated by the shade required. The temperature of the bath should be between that of tepid and boiling water. When the desired shade is obtained, the silk is to be twice washed and beetled, to free it from the superfluous coloring matter, which would injure the beauty of the color. When raw silk is to be dyed, that which is naturally white should be selected, and the bath should be nearly cold; for otherwise the alkali, by dissolving the gum of the silk, destroys its elasticity. Silk is dyed of an orange color by anotta, but if a redder shade be wanted, it is procured by alum, vinegar, or lemon juice. These colors are beautiful, but do not possess permanency.

218. *Of Dyeing Cotton and Linen Yellow.*—The process commonly observed in dyeing cotton and linen yellow, is by scouring it in a bath prepared in a lie with the ashes of green wool. It is afterwards washed, dried, and alumed, with

one-fourth of its weight of alum. After remaining in twenty-four hours, it is taken out of the aluming and dried, but not washed. The cotton is then dyed in a weld bath, in the proportion of one pound and a quarter of weld for each pound of cotton, and turned in the bath till it has acquired the desired color.

219. After being taken out of the bath, it is soaked for an hour and a half in a solution of sulphate of copper, in the proportion of one-fourth of the weight of the cotton, and then immersed, without washing, for nearly an hour, in a boiling solution of white soap, after which it is well washed and dried.

220. A deeper yellow is communicated to cotton, by omitting the process of aluming, and employing two pounds and a half of weld for each pound of cotton. To this is added a drain of verdigris, mixed with part of the bath. The cotton is then to be dipped and worked till the color become uniform. It is then taken out of the bath, and a little solution of soda added, after which it is returned, and kept for fifteen minutes. It is then wrung out and dried.

221. Other shades of yellow may be obtained by varying the proportion of ingredients. Thus, a lemon color is dyed by using only one pound of weld for every pound of cotton, and by diminishing the proportion of verdigris, or using alum as a substitute.

222. Dr. Bancroft recommends a superior process, and less expensive. He also objects to the use of salts of copper, as deepening the yellow. One pound of acetate of lead, and three pounds of alum, are to be dissolved in a sufficient quantity of warm water. The cotton or linen, after being properly rinsed, is to be soaked in this mixture, heated to the temperature of  $100^{\circ}$ , for two hours. It is then taken out, moderately pressed over a vessel, to prevent the waste of the aluminous liquor. It is then dried in a stove heat, and, after being again soaked in the aluminous solution, it is wrung out and dried a second time. Without being rinsed, it is to be barely wetted with lime water, and afterwards dried; and if a full, bright, and durable yellow is wanted, it may be necessary to soak the stuff in the diluted aluminous mordant, and, after drying, to wet it a second time in the lime water. After it has been soaked for the last time, it should be well rinsed in clean water, to separate the loose particles of the mordant, which might injure the application of the coloring matter. By the use of the lime-water, a greater proportion of alumina combines with the stuff, besides the addition of a certain proportion of lime.

223. In the preparation of the dyeing bath, from twelve to eighteen pounds of powdered quercitron bark are enclosed in a bag, for every 100 pounds of stuff, varying the proportion according to the depth of shade required. The bark is put into the water while it is cold; and, immediately after, the stuff is immersed and turned for an hour, or an hour and a half, during which the water should be gradually heated, and the temperature raised to about  $120^{\circ}$ . At the end of this time the heat is increased, and the dyeing liquor brought to a boiling temperature; but at this temperature the stuff must remain in

We have already dwelt at suf- he explanation of this phenome- he general properties of astrin- affords of itself a fawn-color n; but it communicates to cot-

ton stuffs several very permanent colors, when they are combined with mordants.

229. Sanders, or sandal-wood, is also employed for the purpose of giving a fawn-color. There are three kinds of this wood, the white, the yellow, and the red. The last only, which is a compact heavy wood, brought from the Coromandel coast, is used in dyeing. By exposure to the air it becomes of a brown color; when employed in dyeing, it is reduced to fine powder, and it yields a fawn-color with a brownish shade, inclining to red.

The quantity of coloring matter, however, which it yields of itself is small, and it is said that it gives harshness to woollen stuffs. When it is mixed with other substances, as sumach, walnut-peels, or galls, the quantity of coloring matter is increased; it gives a more durable color, and produces considerable modifications in the coloring matter with which it is mixed. Sandal-wood yields its coloring matter to brandy, or diluted alcohol, more readily than to water.

230. Soot communicates to woollen stuffs a fawn or brown color, of a lighter or deeper shade, in proportion to the quantity employed; but the color is fading, and its affinity for wool is not great; and, besides leaving a disagreeable smell, it renders the fibres harsh. In some manufactories, it is employed for browning certain colors, and it produces shades which could not otherwise be readily obtained.

231. In dyeing with walnut-peels, a quantity proportioned to the quantity of stuff, and the intensity of shade wanted, is boiled for fifteen minutes in a copper. All that is necessary in dyeing with this substance is, to moisten the cloth or yarn with warm water, previously to their immersion in the copper, in which they are to be carefully stirred till they have acquired the proper shade. This is the process, if the aluminous mordant be not employed. In dyeing cloth, it is usual to give the deepest shades first, and the lighter ones afterwards; but, in dyeing woollen yarn, the light shades are given first, and the deeper ones afterwards. A fresh quantity of peels is added each time.

232. Berthollet made a number of experiments to ascertain the difference of color obtained from the simple decoction of walnut-peels, and the addition of metallic oxides as mordants. The oxide of tin, he informs us, yielded a clearer and brighter fawn-color than that of the simple decoction. The oxide of zinc produced a still clearer color, inclining to ash or gray. The color from oxide of lead had an orange cast, while that from oxide of iron was of a greenish brown.

233. A fawn-color, which has a shade of green, is obtained from sumach alone; but to cotton stuffs, which have been impregnated with printers' mordant, or acetate of alumina, sumach communicates a good and durable yellow.

234. Vogler employed the tincture of sanders-wood for dyeing patterns of wool, silk, cotton, and linen, having previously impregnated them with a solution of tin, and afterwards washing and drying them. Sometimes he used the solution unmixed, and at other times added six or ten parts of water, and in whatever way he em-

present in a dyeing bath, we might determine with precision the shade that ought to result from the mixture of two other colors, or of the ingredients which afford these colors separately: but the chemical action of the mordants, and of the liquor of the dye bath, often changes the results; theory, however, may always predict these effects to a certain degree.

It is not the color peculiar to the coloring matters which is to be considered as the constituent part of compound colors, but that which they must assume with a certain mordant, and in a certain dye bath. Hence, our attention ought to be principally fixed on the effects of the chemical agents employed.

It is in this department of dyeing that the intelligence of the operator may be most useful, by enabling him to vary his processes, and to arrive at the proposed end by the simplest, shortest, and least expensive way.

The processes for compound colors are very numerous. We shall mention only those which most merit attention, and shall establish the principles on which they ought to be conducted by particular examples.

236. *Of Dyeing Wool Green.*—Green is obtained by the mixture of yellow and blue; and it is distinguished into many different shades; but it requires experience to obtain this color uniform and without spots, especially in the light shades. It is possible to produce green by beginning either with the yellow or the blue dye; but the first method is attended with some inconveniences; for the blue soils the linen, and a part of the yellow being dissolved in the vat, changes and makes it green; the second method is, therefore, preferable. It is common to employ the pastel vat, but for some kinds of green, solution of indigo in the sulphuric acid is used; and then the blue and yellow are either dyed separately, or all the ingredients are mixed together, to dye by a single operation.

237. *Solutions of copper with yellow sub-*

remain a shorter time in the shades, care should be taken not to boil. A browning with sulphate of iron is given to the

The green obtained by means of indigo in sulphuric acid is Saxon green, from its having been first discovered in Saxony. We shall here direct by Dr. Bancroft for the

239. The most beautiful Saxon green, from its having been produced very cheaply and combining the lively yellow of quercitron bark, murio-sulphuric acid, with the blue afforded in sulphuric acid, as for dyeing

To produce this combination, the dyer, for a large quantity, should put into the vessel about eight pounds of powdered indigo, and every hundred pounds of cloth require a proportion of water as soon as the liquor is warm; and when it begins to boil, add about six pounds of murio-sulphuric acid, with the usual precautions, after about four pounds of alum have been boiled together five or six hours. The liquor should be added, so as to be reduced down to what the bath requires. Immediately after this, as much indigo is to be added, as will give the shade of green intended to be dyed; to mix it thoroughly with the liquor by stirring, &c.; and this being done, the cloth being previously scoured and washed, be expeditiously put into the vat, and very briskly through it for a short time, in order that the color may be brought to every part, which it will do by being worked with proper care. By this method, full, even, and beautiful green may be dyed in half an hour; and, in order to keep the liquor from becoming too strong, it is best to keep the liquor at a boiling heat. — *Mem. de chimie*

ble, that the greens composed therewith, prove greatly superior to any which can remove the dull muddy yellow of old fustic; at a point of expense, it is certain that the bark, sulphate of tin, and alum, necessary to dye a quantity of cloth in this way, will cost less than the much greater quantity (six or eight more) of fustic, with the alum necessary for it in the common way, the sulphate of tin being the same in both cases. But in dyeing with the bark, the vessel is only to be heated once; and the cloth, without previous preparation, may be completely dyed in half an hour; whilst in the common way of producing Saxon greens, the copper is to be melted; and to this must be joined the fuel for an hour and a half's boiling and dyeing the cloth, in the course of preparation, nearly as much boiling in another vessel to fix the color of the fustic; and after all, the same process remains to be performed, which will be equal in time and trouble to the process of producing a Saxon green with the bark; so that this color obtained with the bark will not only prove superior in beauty, but in cheapness, to that dyed with old fustic.

*Of Dyeing Silk Green.*—In communicating to silk the green color, it requires very much caution to prevent the stuff from being mottled and striped. Silk intended for greens is washed as for the ordinary colors; for light greens, however, it should be boiled thoroughly in blue.

Silk is not first dyed blue like cloth; but, after being alumed, it is washed slightly in the blue and distributed into small hanks, that it may take the dye equally; after which it is carefully round the sticks, through a bath of blue. When it is thought that the ground is nearly deep, a pattern is tried in the vat, to see the color has the wished-for tone; if it is not ground enough, decoction of weld is added, and, when it is ascertained that the color has reached the proper degree, the silk is taken from the bath, and passed through the blue for blue.

To render the color deeper, and at the same time to vary its tone, there are added to the blue bath, when the weld has been taken out, decoction of Brasil-wood, decoction of fustic, and so on.

For the very light shades, such as pale green and celadon-green, a much weaker solution of blue is given than for the other colors. For the light shades, if not for sea-green, it is proper to dye yellow in baths which have already been used, but in which there is no Brasil-wood or fustic, because the silk, perfectly alumed, does not rapidly in fresh baths, and is thence liable to take an uneven color. Dr. Bancroft recommends the following process for producing green at one operation, as the most common and certain:—

A bath is prepared of four pounds of iron bark, three pounds of alum, and two pounds of murio-sulphate of tin, with a sufficient quantity of water. The bath is boiled ten or fifteen minutes, and when the liquor is in temper, till the hand can bear it, it is fit for use. By adding different proportions of sul-

phate of indigo, various and beautiful shades of green may be obtained, and the color thus produced is both cheap and uniform. Care should be taken to keep the bath constantly stirred, to prevent the coloring matter from subsiding. Those shades which are intended to incline most to the yellow, should be dyed first; and, by adding sulphate of indigo, the green, having a shade of blue, may be obtained.

242. To produce what is called an English green, and which is more beautiful than the ordinary greens, and more durable than Saxon green, Gubliche recommends the following process:—He gives the silk, first of all, a clear blue in the cold vat; he steeps it in hot water; washes it in running water; passes it through a weak solution of alum; prepares a bath with the sulphuric solution of indigo, a little of the solution of tin, and a tincture of Avignon berry, made with a vegetable acid. He keeps the silk in this bath till it has assumed the wished-for shade; he then washes and dries in the shade. The lighter hues may be dyed in the sequel. The shades may be varied with more or less blue, or more or less yellow, by the proportions of the indigo solution, and of the yellow substance. When it is wished to give a gossamer-green to silk, a light blue is communicated to it, either in the hot vat or in the cold; it is passed through hot water, washed in running water, and while moist it is passed through a bath of anotta.

243. *Of Dyeing Cotton and Linen Green.*—To give a green color to linen and cotton yarns, it is proper to begin with scouring them well; then they must be dyed in the blue vat, cleansed in water, and passed through the weld process.

The strength of the blue and the yellow is proportioned to the color that is wanted. As it is difficult to give uniformity to the cotton velvets in the ordinary blue vat, they are usually dyed yellow with turmeric, and the green is produced with solution of indigo in sulphuric acid.

244. To dye beautiful greens upon cotton, Chaptal recommends that it be first dyed of sky-blue color with indigo, dissolved by potassa and orpiment, then macerated in a strong solution of sumach, then dried and soaked in a solution of acetate of alumina, dried again, rinsed, and finally dyed with quercitron bark, in the proportion of twelve pounds to every fifty pounds of cotton. The quercitron is preferred to weld for this purpose, because the color of the former combines better with that of sumach.

245. M. D'Apligny recommends a method of dyeing cotton and linen of a fine sea or apple-green by means of a single bath; it is in substance as follows:—The liquor is prepared by mixing verdigris with a sufficient quantity of vinegar, and keeping the mixture in a bottle well stopped for fifteen days in the heat of a stove, and adding to it, about four hours before using it, a solution of potassa equal in weight to that of the verdigris, keeping it still hot. The cotton goods are first soaked in a warm solution, made by dissolving one ounce of alum in five quarts of water for every pound of cotton. The goods are again taken out, and, after adding the verdigris mixture, they are returned, and passed through the bath till sufficiently dyed.

Linen is dyed of the shades of olive and drake's neck green, by first giving it a blue ground, then galling and dipping it in a bath of acetate of iron; afterwards passing it through a bath of weld, combined with verdigris; and through another containing sulphate of copper, finally brightening the color by immersion in a solution of soap.

246. The green, says M. Berthollet, obtained by giving a yellow color to a stuff which has been previously dyed blue, and afterwards washed, presents nothing obscure. The color inclines more or less to yellow, or to blue, according to the tint of blue given, and the strength of the yellow bath. The intensity of the yellow is increased by alkalis, by sulphate of lime, by ammoniacal salts. It is diminished by acids, alum, and solution of tin. The shades vary likewise from the nature of the yellow substance employed.

These different effects will be obtained with the same ingredients in the formation of the Saxon green, according to the process adopted. If the Saxon blue be first dyed, and the yellow color be next given separately, the effects will be analogous to those just mentioned. But if solution of indigo be mixed with the yellow ingredients, the results are not the same, because the sulphuric acid acts in this case on the coloring particles, impairing the intensity of the yellow. If a succession of shades be dyed in a bath composed of yellow and the solution of indigo, the last approach more and more to yellow, because the particles of indigo become attached to the stuff in preference to the yellow ones, which therefore become predominant in the bath.

#### OF DYEING VIOLET COLOR, &c.

247. *Of Dyeing Wool Violet, &c.*—From the mixture of red and blue are obtained violet, purple (columbine), dove-color, pansy, amaranth, lilac, mallow, and a great many other shades, determined by the nature of the substances, whose red color is combined with a blue color, of which one becomes more or less predominant over the other, according to the proportions of the ingredients, and the other circumstances of the process. Hellot observes, that stuff which has been dyed scarlet, takes an unequal color when blue is to be united with it. The blue is therefore given first, which, even for violet and purple, ought not to be deeper than the shade distinguished by the name of sky-blue; a boiling is given with alum mixed with two-fifths of tartar; the stuff is then dipped in a bath composed of nearly two-thirds as much cochineal as for scarlet, to which tartar is always added.

248. The circumstance which distinguishes the process for purple from that for violet, is that for the former a lighter blue ground is given, and a larger proportion of cochineal is employed. These colors are frequently dyed after the red-dyeing for scarlet, such quantities of cochineal and tartar being added as are necessary; the operation is managed in the same way as for scarlet. But lilacs, pigeon's necks, &c., are commonly dipped in the boiling, which has served for violet, after alum and tartar have been added to it: the blue ground having been proportioned

to the shade required, the quantity of cochineal is also adjusted in a similar manner. A solution of tin is added for some delicate shades such as peach blossom. It is to be observed, that, though the quantity of cochineal is varied according to the lightness of the shade required, the quantity of tartar is not so that the proportion of it, compared with the cochineal, is so much the greater as the color required is lighter.

249. M. Poerner is of opinion, that the colors composed of red and blue, are more apt to fade, and is therefore cautious to employ the solution of sulphuric acid, because a great variety of shades may thus more easily be obtained, and the process is so long or expensive. But the colors obtained are less durable than when cochineal is employed. He says, however, that sufficient permanence, if a solution of tartar be used to which some alkali has been added.

The effects may be easily varied, by preparing the stuff with different proportions of alum and tartar, or with solution of indigo, or by dyeing with different proportions of cochineal and solution of indigo.

250. A process for dyeing wool of a violet color is given by M. Berthollet, as he has communicated to him by Descrouz. It is this:—If it be wool in the fleece which is to be dyed, one-third of its weight of mordant is required; if it be a woven stuff, only a quarter is necessary. A bath is prepared at a temperature in which the hand can bear; the mordant is mixed with it; and the wool or stuff is immersed. It is to be properly agitated, and the same degree of heat is to be kept up for twenty-four hours, which may be even increased towards the end. It is then lifted out, and very well washed. A new bath of the same heat is prepared; a sufficient quantity of violet wood is added to it; the stuff is then steeped down, and agitated; and the heat is kept up to the boiling point, at which it is maintained for a quarter of an hour. The stuff is then raised, and carefully rinsed. The process is completed. If a decoction of one pound of violet wood has been used for three pounds of stuff, and proportionately for the stuff which is dyed, a smaller dose, a beautiful violet is obtained, to which a sufficient quantity of Brazil wood may be added to give the shade known by the name of pearly violet.

251. The ingenious author from whom we quote the above, thus endeavours to improve the process:—

If we may venture an opinion, we may make direct experiments on a composition, such as that communicated by M. Berthollet, and which is still employed in some manufactories with modification. If we do not know, we would suggest the following plan.

The muriate of soda is decomposed by sulphuric acid, and the muriatic acid liberally dissolves the tin.

A portion of the tin is precipitated by tartaric acid, whence the deposit is raised. But a portion which remains in solution is to modify the effect, as we have seen

The oxide of copper, present in iron, forms blue with the coloring matter indigo; the oxide of tin with red gives violet, and red with the matter of Brasil-wood.

*Dyeing Silk Violet, &c.*—There are violet colors given to silk, these are, writers on dyeing, distinguished into the false. The fine violet may be tinging the silk with cochineal, and tasing it through the indigo vat. ion and dyeing of the silk with cochineal same as for crimson, with the tartar and solution of tin, by means color is heightened. The quantity made use of is always proportioned to shade; but the usual proportion of stuff is two ounces of cochineal and of silk. When the silk is dyed, at the river, twice beetled, dipped in length proportioned to the depth of dye, and then washed and dried with similar to those which all colors red-dyed in a vat. If the violet is to strength and beauty, it is usual to give the archil bath, a practice which, lately abused, is not to be dispensed with shades, which would otherwise be

if a silk has been dyed with cochineal, dyed, a very light shade of blue must be added. Only the deepest shades require a weak vat. For those which old water is had recourse to, into the vat of the blue vat is put, because they contain so much blue in the vat itself, how may be. The light shades of this color, pink, gridelin, and peach-blossom, are dyed in the same manner, with a diminution of cochineal.

*Spurious violets are given to silk in the following manner.* The most beautiful, and those which are prepared with archil. The archil bath is proportioned to the color: the silk, to which a beetling has been given on its coming out of the vat, is dipped through it round the skein sticks. The color is thought to be deep enough, when on a pattern in the vat, to see if the violet that is wanted. If it is found weaker pitch, a beetling is given to the river, and it is passed through the vat of the violets. Less blue, or less archil, being as the violet is wished to incline to blue.

A violet color may be imparted to silks by dipping them in water impregnated with a substitute for aluming, and then in a bath of logwood, in which they receive the color; which is converted into a permanent color by dipping them in a weaker solution of alum, or by adding it to the bath to impart a red shade to the color of the logwood. This violet possesses beauty, or permanence, but if the silk be immersed in a bath of Brasil-wood next in a bath of archil after washing it, a color is obtained possessing a great degree of beauty and intensity.

M. Decroizilles' process, above related, for dyeing wool, was found to succeed equally well, according to his account, in communicating a violet color to silk.

256. *Of Dyeing Cotton and Linen Violet, &c.*—The process in most common use for dyeing cotton and linen of the violet colors is the following:—The stuffs have first a blue ground communicated to them in the indigo vats according to the shade required; they are then dried. After this they must be galled in the proportion of three ounces of galls to a pound: they are left for twelve or fifteen hours in the gall bath, after which, they are wrung and dried again. They are then passed through a decoction of logwood, and when well soaked are taken out, and two drachms of alum, and one of dissolved verdigris, for each pound of stuff are added to the bath; the skeins are then redipped on the sticks, and turned for a full quarter of an hour, when they are taken out to be aired; after which they are again completely immersed in the bath for a quarter of an hour, then taken out and wrung. The vat which has been employed is then emptied; half of the decoction of logwood which had been reserved is poured in; two drachms of alum are added, and the stuff dipped afresh, until it is brought to the shade required. The decoction of logwood ought to be stronger or weaker according to the shade required; this violet stands the action of the air tolerably well, but is not so durable as that obtained by madder.

257. Permanent purple and violet colors may be given to cotton stuffs that have been dyed a Turkey-red, by adding to the alum steep a proportion of sulphate of iron suited to the shade required. Cotton also that has been dyed a light blue with indigo, may be changed to purple or violet by passing the stuff through a bath prepared with the aluminous mordant, and dyeing with madder.

#### OF DYEING ORANGE.

258. *Of Dyeing Wool Orange.*—Orange colors are produced by the mixture of red and yellow; and, by varying the proportions of the ingredients, an almost endless variety of shades may be obtained.

Poerner describes a great many varieties which he obtained by employing weld, saw-wort, dyers' broom, and some other yellow substances; as also by introducing into the preparation of the cloth, or into the bath, tartar, alum, sulphate of zinc, or sulphate of copper.

Different colors may in like manner be procured from the madder, which is associated with yellow substances. It is thus that the mordores and the cinnamons are dyed; colors commonly formed in two baths. The maddering is first given, preceded by a bath of alum and tartar as for ordinary maddering; and then a bath of weld is employed.

For cinnamon a weaker maddering is given, and commonly a bath is used which had served for the mordore. The proportions are varied according as the red or the yellow is wished to predominate. Sometimes nut-galls are added, and sometimes the color is deepened by a brown-tinge.

Occasionally the sole object is to give a reddish tone to the yellow; the stuff just dyed yellow may, in this case, be passed through a bath of madder, more or less charged according to the intention.

Brasil-wood is likewise employed along with the yellow substances, and sometimes it is associated with cochineal and madder.

When, instead of weld or other yellow substances, root of walnut, walnut-peels, or sumach, are used, tobacco, snuff, chestnut, musk colors &c., are produced.

**259. Of Dyeing Silk Orange.**—Morrone, cinnamons, and all the intermediate shades are given to silk, by logwood, Brasil, and fustic: a bath is prepared by mixing decoctions of these three woods made separately; the proportion of each is varied according to the shade required, but that of fustic ought to prevail; the bath should be of a moderate temperature; and the silk, after being scoured and alumed in the usual manner, is immersed in it. The silk is turned on the skein sticks in the bath, and when taken out, if the color be uniform, it is wrung and dipped in a second bath of the three ingredients, the proportions of which are regulated according to the effect of the first bath, in order to obtain the shade required.

For some colors blue is united to red and yellow, it is thus olives are produced: a blue ground is first given, then the yellow dye, and lastly, a slight maddering. Olive may be dyed without using the blue vat, by dipping the silk in a very strong weld bath, after being first alumed; to this a decoction of logwood is afterwards added, and, when the silk is dipped, a little solution of alkali is put in, which turns it green, and gives the silk the olive color. The silk is repeatedly dipped in this bath until it has acquired the proper shade.

**260.** For the color termed russet olive, or rotten olive, fustic and logwood, without alkali, are added to the bath after the welding. If a more reddish color be wished for, only logwood is added. A kind of reddish olive is also made by dyeing the silk in a bath of fustic, to which more or less sulphate of iron and logwood are added.

**261. Of Dyeing Cotton and Linen.** The usual combinations of shades are produced with difficulty. The late Bancroft remarks, that, as cochineal as mordant cannot be advantageously employed on dye linen or cotton, it is necessary to resort to other substances solely to rely on the aluminous mordant, and to select the red coloring matter to dye stuffs, especially from madder, or the yellow of weld, quercitron bark, &c. may be combined in such proportions as to be sufficient for the required color. Mr. Bancroft gives some processes for colors, which, as mixtures of red and yellow, though they may more properly be considered as greens. The various shades of green are given to cotton, by first galling, and then immersing it in a bath of acetate of iron, formed by pyroligneous acid, and afterwards in a bath of verdigris, after which it is dyed in a bath of madder, and sometimes with the addition of soda. It is then completely washed, passed through a strong madder bath; then dipped in a solution of sulphate of copper; and, lastly, through a bath containing soap.

**262.** The shades cinnamon and gray are thus given: the stuffs are first dyed in a bath of verdigris and weld, then dipped in a solution of sulphate of iron, out of which they are wrung and dried. After this they are allowed three ounces of galls to each pound of stuff, again dried, alumed, and passed through a strong madder bath. They are then washed in a warm soap lye, through which they are turned till the color is sufficiently gray.

**263.** The shades of color usually denominated grays, have already been treated of, and the processes for dyeing them need not here be repeated.

**264.** Several highly respectable persons have done great justice to the subject, and have connected with their treatises on dyeing a view of the process of calico printing: they have followed their example in the present instance, had we not considered the state, at present highly improved, to which the art has attained, which will be found manifest in our work. See PRINTING, CALICO.

John), the son of Robert Dyer, Esq. sector, was born in 1700. He passed Westminster school under the care of , and was then called home to be in- his father's profession. His genius, d him a different way; for, besides, le for poetry, having a passion no less igh, he determined to make painting n. With this view, having studied

awhile under his master, he became an itinerant painter in South Wales, and about 1727 printed Grongar Hill. He then made the tour of Italy, where, besides the usual study, he often spent whole days in the country about Rome and Florence, sketching those picturesque prospects with facility and spirit. Images from hence naturally transferred themselves into his poetical compositions: the principal beauties of The Ruins of

Rome are perhaps of this kind; and the various landscapes in *The Fleece* have been particularly admired. On his return to England he published *The Ruins of Rome*, 1740. As his turn of mind was rather serious, he was advised to enter into holy orders; and he found no difficulty in obtaining them. He was ordained by the bishop of Lincoln. About the same time he married a lady of Coleshill named Ensor, whose grandmother was a Shakespeare, descended from a brother of the great Shakespeare. His ecclesiastical provision was, for a long time, but slender. His first patron, Mr. Harper, gave him, in 1741, Calthorp in Leicestershire, of £80 a year, on which he lived ten years; and in April 1751 exchanged it for Belchford in Lincolnshire, of £95 which was given him by lord chancellor Hardwicke. His condition now began to mend. In 1752 Sir John Heathcote gave him Coningsby, of £140 a year; and in 1756, when he was LL.B. without any solicitation of his own, obtained for him from the chancellor, Kirkby on Bane, of £110. In 1757 he published *The Fleece*, his greatest poetical work; but a consumptive disorder, with which he had long struggled, carried him off in 1758. Mr. Dyer's character, as a writer, has been fixed by three poems, *Grongar Hill*, *The Ruins of Rome*, and *The Fleece*; wherein a poetical imagination, perfectly original, a natural simplicity connected with and often productive of the true sublime, and the warmest sentiments of benevolence and virtue, have been universally observed and admired. These pieces were published separately in his lifetime; but, after his death, they were collected and published in one volume 8vo. in 1761, with a short account of him prefixed.

**DYER** (Sir James), an eminent English lawyer, chief judge of the court of common pleas in the reign of queen Elizabeth. He died in 1581, and, about twenty years after, was published his large collection of Reports, which have been highly esteemed for their succinctness and solidity. He also left other writings behind him relative to his profession.

**DYNAMICS**, from *δυναμις*, power, that branch of mechanics which has for its object the action of forces on solid bodies, when the result of that action is motion; and in which, since all motion occupies some portion of time, we introduce time into our investigations. See **MECHANICS**.

**DYNASTY**, *n. s.* *Δυναστία*. Government; sovereignty.

Some account him fabulous, because he carries up the Egyptian *dynasties* before the flood, yea, and long before the creation. *Hale's Origin of Mankind*.

Greece was divided into several *dynasties*, which our author has enumerated under their respective princes.

*Pope.*

I was detained repairing shattered thrones,  
Marrying fools, restoring *dynasties*,  
Avenging men upon their enemies,  
And making them repent their own revenge.

*Byron.*

**DYNASTY**; from *δυνατης*, Gr. a sovereign; among ancient historians, signifies a race or succession of kings of the same family. Such were the *dynasties* of Egypt. The Egyptians reckon thirty *dynasties* within the space of 36,525 years;

but most chronologers look upon this as fabulous.

**DYRRACHIUM**, in ancient geography, a town on the coast of Illyricum, between Epidamnus, or Epidamnos, and Brundisium; Romans to Dyrrachium; a name also given to a peninsula on which it stood. It was built by the Corcyreans, and, according to some, was a Roman colony. It is famous for its port answered to that of Brundisium; the passage between them was very rapid and treacherous. It was also a very celebrated port for the people of the Adriatic; and the mission of strangers contributed much to its greatness.

**DYSÆ**, in the Saxon mythology, goddesses, messengers of Woden, whom it was to convey the souls of such as died in battle to his abode, called Valhalla, a hall of slaughter; where they were to drink and their other gods, cerevisia, a kind of liquor, in the skulls of their enemies; conveyed those who died a natural death to the goddess of hell, where they were to live with hunger, thirst, and every kind of misery.

**DYSART**, a royal borough in the county of the same name, on the north shore of the Firth, three miles east of Kinghorn, north of Edinburgh. Its charter is about the beginning of the sixteenth century is mentioned, at that time, as one of the trading towns in Fife. Before the eighteenth century, however, its trade declined, and it only began to revive in the last century. The church is very ancient, and is now been built by the Piets. The harbour and the trade considerable; employ thirty-six vessels in the coal and salt trade. So early as 1483 salt was manufactured and exported to Holland. The ship-builders employ a considerable number of hands. Dysart has a weekly market, and fairs on June, August, and November.

**DYSCRASY**, *n. s.* *Δυσκρασία*. A mixture of elements in the blood; a juice; a distemperature, when some quality abounds in the body.

In this pituitous *dyscrasy* of blood, the off the pituita, and purge upon internally.

*Flager on the*

**DYSENTERY**, *n. s.* *Fr. dysenterie*. A looseness, wherein the humors flow off by stool, and are attended with blood.

From an unusual inconstancy of the wind from various causes, it produces several different epidemical *dysenteries*.

**DYSENTERY**, **DYSENTERIA**; from *δυσεντερία*, and *εντερία*, the bowels. The flux. A disease in the class pyrexia, and ordered in Cullen's Nosology. It is known by tenesmus; mucous stools, some with blood, the natural faeces being voided in small hard acyphala, tenesmus, and nausea. It occurs chiefly in autumn, and is often occasioned by a quick succession of intense heat in the perspiration is suddenly checked, a cause which most usually gives rise to it.

putation; and when it once makes its way, it not unfrequently spreads with facility. A peculiar disposition in the rectum seems often to predispose, or give rise to dysentery, in which case it prevails locally. The disease, however, is much rarer in warm climates than in cold, when the symptoms produce great loss of strength, and are accompanied with a putrid and a fetid involuntary discharge, the disease terminates fatally in the course of a few days; but when they are more moderate, it is protracted to a considerable length of time, and goes off at last by a gentle perspiration. The disease is of long standing, and has been habitual, it seldom admits of an easy cure, when it attacks a person laboring under the advanced stage of scurvy, or pulmonary consumption, or whose constitution has been much weakened by any other disorder, it is sure to prove fatal.

**DIAPYCNIA**; from *δύς*, bad, and *ὥψ*, an eye. Sight, requiring certain light, particularly at night, or one position. A genus of disease in the class *locales*, and order *dysæsthesiæ* of sensation, containing the five following species:—1. *D. nyctis*, requiring objects to be placed in a dark light. 2. *D. luminis*, in which objects are only discernible in a weak light. 3. *D. diurnæ*, in which distant objects are not seen. 4. *D. proximorum*, in which objects near are not perceived. 5. *D. lateralis*, in which objects are not seen, unless placed in an oblique position.

**DYSPEPSIA**, or **DYSPEPSY**, from *δύς*, bad, and *πέψω*, to concoct. Indigestion. Dr. Cullen has placed this genus of disease in the class *neuroses*, and order *dynamidæ*. It chiefly arises in persons of a sedentary and forty years of age, who lead a very sedentary or irregular life.

**DYSPEPSIA**, *n. s.* *Δυσπepsia*. A difficulty of digestion, occasioned by an ill disposition of the stomach.

**DYSPEPSIA**, *n. s.* *Δυσπepsia*. A difficulty of breathing; straitness of breath.

**DYSPEPSIA**; from *δύς*, difficult, and *ἔσθω*, to eat. Difficulty and pain in discharging the contents of the stomach. A genus of disease in the class *locales*, and order *dysæsthesiæ* of sensation, containing six species.

1. *D. ardens*, a sense of heat, without any disorder of the bladder. 2. *D. dysenterica*, from *δύς*, bad, and *ἔσθω*, to eat. 3. *D. compressionis*, a mechanical compression of the neighbourhood of the stomach. 4. *D. phlogistica*, from violent inflammation. 5. *D. calculosa*, from stone in the bladder. 6. *D. mucosa*, from an abundant secretion of mucus.

**DYSPEPSIA**, *n. s.* *Δυσπepsia*. A difficulty in urination.

**DYSPEPSIA**, *n. s.* *Δυσπepsia*. A difficulty in urination, arising from a dysentery, pains of the hæmorrhoids, or any of the lower parts, diarrhoea, or a hot dysentery, difficulty of urination.

**DYSPEPSIA**, the water-beetle, in zoology, a genus of insects of the order of the coleoptera. The water-beetles are slender and setaceous; the water-beetles are hairy, and formed for swimming.

There are 147 species, distinguished by their antennæ, the color of the elytra, &c. The larvae of the dytiscus are often met with in water. They are oblong, and have six scaly feet. Their body consists of eleven segments. The head is large, with four filiform antennæ, and a strong pair of jaws. The last segments of their body have rows of hairs on the sides; and the abdomen is terminated by two spines charged with the like hairs, forming a kind of plumes. These larvae are frequently of a greenish variegated brown: they are lively, active, and extremely voracious: they devour and feed upon other water insects, and often tear and destroy each other. The perfect insect is little inferior to its larvae in voraciousness, but it can only exercise its cruelty on the young larvae; the perfect larvae, like himself, being sheltered by the kind of scaly cuirass with which they are armed. This creature must be touched cautiously; for, besides its power of giving a severe gripe with its jaws, it has under the thorax a long sharp spine, which it will drive into the fingers by the effort it makes to move backwards. The eggs of the dytisci are rather large, and are inclosed in a kind of silky dusky cod, of a strong and thick texture, in form round, and terminated by a long slender tail, of the same substance. These cods are often found in the water, and from them are brought forth the eggs and larvae of the dytisci. The strength of these cods serves the insect to defend their eggs from the voraciousness of several other aquatic insects, and even from that of their fellow dytisci. Many species of the perfect insect are common in stagnated waters, which they quit in the evening to fly about. They swim with incredible agility, using their hinder legs as oars. The elytra of the females are in general furrowed, and those of the males plain. When they first arrive at their perfect state, their elytra are almost transparent, and in many species of a beautiful dun color, mingled with shades of a greenish-brown. The best method of catching them is with a hand-net, or sieve; for they are so nimble, and exercise their defensive weapons so often, and with such painful success to those who endeavour to catch them, that they are very often obliged to let them escape; the easiest way to kill them, is to let them fall into boiling hot water, which instantly destroys them.

**DYVOUR**, or **bare-man**, in Scots law, a person who, being involved in debt, and unable to pay, to avoid imprisonment, makes cession of his effects in favor of his creditors; and does his devoir and duty to them, proclaiming himself bare-man and indigent, and becoming debt-bound to them of all he has. The word is used in the same sense as **BANKRUPT**: see that article.

**DZIDZA**, a town of Albania, situated on the declivity and top of a barren mountain. The Albanian Christians have a monastery and several churches here. The arable land in the neighbourhood is laid out in vineyards, and the situation being warm, very fine wine is produced, but there is a scarcity of fresh water. It is eighteen miles from Delvinaki.

## E.

E, the fifth letter of the Hebrew, Phœnician, Syriac, Samaritan, Sanscrit, Greek, Latin, Armenian, Coptic, Georgian, German, Italian, Spanish, French, and English languages, is derived, say Ainsworth and Minsheu, from the Heb. א, turned, and the small line fixed to the foot; but it seems more naturally deduced from the Phœnician ג, altered by the Greeks to Ε? Ε has two sounds; long, as scene, and short, as mēn. It is the most frequent vowel in the English language; for it not only is used like the rest in the beginning or end of words, but has the peculiar quality of lengthening the foregoing vowel, as cān, cāne; mān, māne; gāp, gāpe, &c. Yet it sometimes occurs final, where yet the foregoing vowel is not lengthened; as gōne, knowledge, edge, give. Anciently almost every word ended with e, as for can, canne; for year, yeare; for great, greate; for need, neede; for flock, flocke. It is probable that this e final had at first a soft sound, like the female e of the French; and that afterwards it was in poetry either mute or vocal, as the verse required, till at last it became universally silent. Ea has the sound of e long: the e is commonly lengthened rather by the immediate addition of a than by the apposition of e to the end of the word; as mēn, mēan; sēl, sēal; mēt, mēat; nēt, nēat.

EACH, *pron.* Goth. *eilih*; Sax. *aelch*; Dut. *elch*; Scot. *ilk*; Gr. *eka*; from Heb. *אֶחָד*, aish, each.—Minsheu. Either of two; every one of a number; corresponding with other.

Woo to you farisees that tithen mynte and ruwe and ech cerbe; and leeuén doom and the charite of God: for it bihoſte to do these thingis and not to leeué tho.

*Wiclif. Luke xi.*

Let *each* esteem other better than themselves.

*Phil. ii. 3.*

But wel I wote he lied right in dede;  
Of cursing ought *eche* gilti man him drede,  
For curse wol slo right as ascoiling saveth,  
And also ware him of a significavit.

*Chaucer. Prol. to Cant. Tales.*

'Tis said they eat *each* other.

*Shakspeare. Macbeth.*

Now I feel by proof,  
That fellowship in pain divides not smart.  
Nor lightens ought *each* man's peculiar load.

*Milton.*

Wise Pluto said, the world with men was stored,  
That succour *each* to other might afford. *Denham.*  
Go, dear; *each* minute does new danger bring.

*Dryden.*

Loveliest of women! heaven is in thy soul;  
Beauty and virtue shine for ever round thee,  
Bright'ning *each* other! Thou art all divine.

*Addison's Cato.*

They are in such small spheres as to repel *each* other; that is, they are applied to *each* other by such very small surfaces, that the attraction of the particles of *each* drop to its own centre is greater than its attraction to the surface of the drop in its vicinity.

*Darwin.*

Whate'er of wonder Reynolds now may raise,  
Raphael still boasts contemporary praise:  
*Each* dazzling light and gaudies bloom subdued,  
4th undiminished awe his works are viewed.

His Numidian genius  
Is well disposed to mischief, were he prompt  
And eager on it; but he must be spurred.

Addison's Cato.

Joba lives to catch  
That dear embrace, and to return it too,  
With mutual warmth and eagerness of love.

Id.

Detraction and obloquy are received with as much  
eagerness as wit and humour. Id. Freetholder.

The things of this world, with whatever eagerness  
they engage our pursuit, leave us still empty and un-  
satisfied with their fruition. Rogers.

A vulgar man is captious and jealous; eager and  
impetuous about trifles. He suspects himself to be  
slighted, thinks every thing that is said moant at him:  
if the company happens to laugh, he is persuaded  
they laugh at him: he grows angry and testy, says  
something very impertinent, and draws himself into  
a scrape, by showing what he calls a proper spirit,  
and asserting himself. Chesterfield.

Snatch not eagerly at every advantage offered by  
his unskilfulness or inattention; but point out to him  
kindly, that by such a move he places or leaves a  
piece in danger and unsupported. Franklin.

To all places of general resort, where the standard  
of pleasure is erected, we run with equal eagerness,  
or appearance of eagerness, for very different reasons.  
Johnson.

She sees a world stark blind to what employs  
Her eager thought, and feeds her flowing joys:  
Though Wisdom hail them, heedless of her call,  
Plies to save some, and feels a pang for all;  
Herself as weak as her support is strong,  
She feels that frailty she denied so long. Cooper.

As eager runs the market-crowd,  
When, 'Catch the thief!' resounds aloud;  
So Maggie runs, the witches follow,  
Wi' mony an eldritch shriech and hollow.

Burns.

Then came his fit again, which to o'ercome,  
As eagerly the barred-up bird will beat  
His breast and beak against his wry dome  
Till the blood tinge his plumage, so the heat  
Of his impeded soul would through his bosom eat.

Byron.

EA'GLE, n. s. } Fr. *aigle*; Ital. and  
EA'GLE-EYED, *adj.* } Lat. *aquila*; Port.  
EA'GLE-SIGHTED, } *aguia*. Etymologists  
EA'GLE-SPEED, n. s. } have sometimes trac-  
EA'GLE-STONE, } ed this name to the  
EA'GLET, } acuteness of its sight;  
EA'GLE-WINGED, *adj.* } sometimes to its

swift flying (*acutè videndo aut volando*, Fest.)  
and again to its acute beak and claws (*ab acu-  
mine rostri et unguium*. Id.) But Ainsworth says  
more probably from *aquilus*, dun-colored, i. e.  
from *aqu*, water; either because of a common  
color or the habits of this bird. A bird of the  
falcon genus. The first three compounds are  
obvious in their meaning. For eagle-stone, see  
ÆTITES, and the extract. An eaglet is a young  
eagle.

If you stop the holes of a hawk's tail it will make  
no ring, but a flat noise or rattle; and so doth the  
scutes, or eaglestone, which hath a little noise in with  
it. Bacon.

This treason of his sons did the king express in an  
emblem, wherein was an eagle with three eaglets ty-  
ring on her breast, and the fourth pecking at one of  
her eyes. Davies.

The snake each year fresh skin resumes,  
And eagles change their aged plumes;  
The faded rose each spring receives.  
A fresh red tincture on her leaves:  
But if your beauties once decay,  
You never know a second May.

Carew.

As he was quick and perspicacious, so was he in-  
vitably eagle-eyed, and versed in the humours of his  
subjects.

Howel.

Every one is eagle-eyed to see

Another's faults and his deformity.

Dryden.

There is a lust in man no charm can tame,

Of loudly publishing his neighbour's shame;

On eagles' wings immortal scandals fly;

While virtuous actions are but born and die.

Harvey.

The eaglestone contains, in a cavity within it, a small loose stone, which rattles when it is shaken; and every fossil, with a nucleus in it, has obtained the name. The analogy between a stone, thus containing another within it, or, as the fanciful writers express it, pregnant with another, and a woman big with child, led people to imagine that it must have great virtues and effects in accelerating or retarding delivery; so that, if tied to the arm of a woman with child, it prevents abortion; and if to the leg, it promotes delivery. On such idle and imaginary virtues was raised all the credit which this famous fossil possessed for many ages.

Hill's *Materia Medica*.

Art still followed where Rome's eagles flew.

Pope.

Abrupt, with eaglespeed she cut the sky,

Instant invisible to mortal eye.

Id.

Draw forth the monsters of the' abyss profound,  
Or fetch the' aerial eagle to the ground.

Id.

Eagles are said to be extremely sharp-sighted, and when they take flight, spring perpendicularly upward, with their eyes steadily fixed upon the sun.

Calmat.

The moles and bats in full assembly find,  
On special search, the keen-eyed eagle blind.

And did they dream, and art thou wiser now?

Prove it—if better, I submit and bow.

Cowper.

It has been said (I believe by D'Alembert), that the highest offices in church and state resemble a pyramid, whose top is accessible to only two sorts of animals, eagles and reptiles. My pinions were not strong enough to pounce upon its top, and I scorned, by creeping, to ascend its summit.

Bp. Watson.

The EAGLE, in antiquity, was borne by way of ensign by several nations. The first who seem to have assumed the eagle are the Persians, according to Xenophon. It was afterwards assumed by the Romans; who, after a great variety of standards, at last fixed on the eagle, in the second year of the consulate of C. Marius. Till that time, they had used indifferently wolves, leopards, and eagles, according to the humor of the commander. The Roman eagles were not painted on a cloth or flag; but were figures in relief, of silver or gold, borne on the tops of pikes: the wings being displayed, and frequently a thunderbolt in their talons. Under the eagle on the pike, were piled bucklers, and sometimes crowns. Thus much we learn from the medals. Constantine is said to have first introduced the eagle with two heads, to intimate that, though the empire seemed divided, it was yet only one body. This is proved by an eagle with two heads noted by Lipsius, on the Antonine column; as well as by the eagle having only one head on the seal of the golden bull of Charles IV. F. Menestrier

maintains that, as the emperor of the East there were two on the throne at the same time, he struck their coins with the impression of an eagle with a double traverse, which each held in one hand, they did the same with the West, but, instead of doubling it, represented two heads; in which they were imitated by the emperors of the West. F. Papebrooke declines to think the use of the eagle's heads to be merely arbitrary; though it is probable, that it was first introduced on the occasion of two emperors at the same time, as an eagle on medals, according to M. Spon, a symbol of divinity and providence, being common to all other antiquaries, of emperors and princes on whose medals it is not found are, the Ptolemies, and the Seleucids of Syria. An eagle with the word CONCORDIA expresses the apotheosis of an emperor.

EAGLE, in ancient Irish coinage, a gold money, current in Ireland in the time of Edward I., about A. D. 1272; named after the lionines, rosades, and many other coins of the same period, from the figures with which they were impressed. The current coin of Ireland was then a composition of copper and silver in a certain proportion, but so much inferior to the standard of England that they were reckoned as being worth quite half so much. Edward imported out of France and other countries. When Edward was established in Ireland he set up mints in Ireland for coinage, and decreed the use of the eagle for the other kinds of base coins; making a composition of effects, to import and melt them.

EAGLE, in architecture, is a figure anciently used as an attribute, or ornament, of Jupiter, in the capital and frieze of temples consecrated to that god.

EAGLE, in astronomy, a constellation in the northern hemisphere, having its right side contiguous to the equinoctial. See *ALDEBARAN*. There are also three stars in the constellation, among the Arab astronomers, i. e. eagle, viz. 1. Nasr sohaiil, the eagle's head; called also sitareh jemen, the eagle's eye; 2. Nasr althair, the flying eagle; and 3. Nasr alveke, the resting eagle.

EAGLE, in heraldry, is accounted one of the most noble bearings in armory; and is never given to none but such as greatness of mind, generosity and courage, or who have done great services to their sovereigns; in which case it may be allowed a whole eagle, or only the head, or only the head and other parts in proportion to their exploits.

EAGLE, in ornithology. See *FALCON*.

EAGLE, BLACK, an order of knighthood, instituted in 1701, by the elector of Brandenburg, on his being crowned king of Prussia. The knights wear an orange colored riband, to which is suspended the annexed cross.

**EAGLE**, *WHITE*, a Polish order of knighthood, instituted in 1325 by Vladislaus V. on marrying Casimir with a daughter of the great Duke of Lithuania. The badge of this order, by the knights, is a gold cross of eight points, enamelled gules, bordered argent, canopied with flames of fire; charged in the middle with a white eagle, bearing on his breast a cross gules, same, environed with the arms and trophæum of the electorate of Saxony; and on the side is a cypher of the king's name, with motto, *PRO FIDE, REGE, LEGE*. The whole surmounted with a small crown of diamonds. The star is composed of golden eagles, crowned and armed. On all days, besides state days, knights wear the cross at the extremity of a blue riband scarf-wise. They have it also embroidered on the left side of their cloaks and

**EAGLE**, *RED*, a very ancient order in Bavaria, of which the margrave is sovereign. It is bestowed both for military and civil persons, and is generally conferred on officers who have obtained the rank of lieutenant-general. The badge is a medal of gold, of a diamond form, enamelled white, upon which is an eagle displayed red. It is worn scarf-wise, and is attached to a broad red ribbon, edged with gold.

**EAGLE**, *SPREAD*, signifies an eagle with two heads as the example. But it is heraldic to say, an eagle with two heads displayed. According to Pomey, the reason of the emperor of Germany having an eagle with two necks, is: on the union of the empire of Romania, now a province of Turkey in Europe, with the empire of the East, which were an eagle displayed sable, the same as those of the emperor, were joined into one body, leaving it two necks as they are.

**EAGLE ISLAND**, an island on the South Pacific Ocean, on the coast of New Holland, visited by Captain Cook in his first voyage, is principally inhabited by a monstrous kind of bird, the nest of which measured no less than twenty-six feet in circumference and two feet eight inches in height. In the Philosophical Transactions, vol. 35, there is an account of one of these nests still existing. But the bird to which it belonged was not seen. That which our navigators saw was built of mud, and lay upon the ground.

**EAGLE**, *SEE* **FRUIT**.

**EARE**, *n. s.* *Æger*, in Runic, is the ocean; in Icelandic, is to agitate; to move. A falling above another tide, observable in the River Severn. But Dryden himself says he called the eagle in the Trent, and this term, we now, expresses, as a provincialism, in other parts of England, the first coming in of the tide.

*Dissembled Hate or vanquished Love,  
Its more than common transport could not hide,  
But like an eagle rides in triumph o'er the tide.*

*Dryden.*

**EALDERMAN**, *n. s.* Sax. *ealderman*, a Saxon magistrate; an **ALDERMAN**, which see.

**EALLANGHEIRRIG**, a small island in Argyleshire, situated at the mouth of Loch Riddon, in the parish of Inverchaolain, memorable in the annals of the seventeenth century. In 1685, when the duke of Monmouth attempted an invasion of the country, the unfortunate Archibald, earl of Argyle, having collected an army of 3000 men, retired to this island, which he fortified very strongly, and here deposited his spare arms and ammunition. Soon after, upon the appearance of some ships of war, the garrison surrendered, and the whole ammunition falling into the hands of the royal party, put an end to any further hostile operations on the part of that unfortunate nobleman, who with his party, found means to escape, but was soon afterwards taken, tried for high treason, and beheaded.

**EAME**, *n. s.* Sax. *eam*; Dut. *com*, uncle: a word still used in the wilder parts of Staffordshire.

*Daughter, says she, fly, fly; behold thy dame  
Foreshows the treason of thy wretched name!*

*Fairfax.*

**EAR-WITNESS**.

*Sax. eare; Goth. eyr and auso; Dan. ore or ours; Swed. are; Teut. ahr, ohr; Fr. oreille; Ital. orecchio; Lat. auris. Junius derives the Gothic verb hausjan, to hear, from the above (auso) noun, and both from the Greek oug. The organ of hearing; and sometimes*

the prominent part of that organ only; also the handle or prominent part of a vessel. Attention to a suit or person; the power of ascertaining sounds or harmony: also the spike of corn, or that part which contains the seed. To be, to fall, or go together by the ears, is to quarrel or scuffle, in which those organs sometimes obtain rough treatment. To set by the ears is to excite to strife or quarrelling. To be up to the ears is to be deeply immersed. Ear-bored is, marked in the ear; sometimes to be so marked was a token, as among the Jews and Romans, of servitude. Ear-deafening is stunning. To ear-mark, to mark (cattle, generally) on the ear. Ear-shot is the reach or compass of the ear, with regard to hearing sounds: ear-wig, a species of scuricula, imagined to creep into the ear. Ear-witness, one who has heard what he attests. Earless, without ears.

*And he began to say to them, for in this day this scripture is fulfilled in your ears. Wisl. Luke iv.*

*In that time Jesus went in corns in the Sabbath day, and his disciples hungred and began to pluck the ears of corn, and to eat. Id. Matt. xiv.*

*His ears are open unto their cry. Psalm cxlv. 15.*

*His master shall bore his ear through with an awl.*

*Isaiah.*

The freeze armed,  
But I suppose,  
Amazed was his head,  
He shake his *ears*  
And from grate fears,  
He thought hym well yfed.

*Sir T. More.*

Poor naked men laboured one another with shagged sticks, or dully fell together by the *ears* at fusty-cuffs.

*More.*

Sir J. Perrot ordered the Irish to mark all their cattle with pitch or *ear-mark*, on pain of forfeiture.

*Cur. Hist. Ireland.*

For feare lest we like rigurs should be reputed And for *care-marked* beasts abroad be bruited.

*Spenser.*

All present were made *earwitnesses*, even of each particular branch of a common indictment. *Hooker.*

With gold and silver they increase his store,  
And gave the precious *earrings* which they wore.

*Sandys.*

Their warlike force was sore weakened, the city beaten down about their *ears*, and most of them wounded.

*Knolles.*

An unworthie councillor is a wicked charme in the king's *care*, a sword of terror in the aduice of tyranny. *Bretton. 1616.*

You have heard of the news abroad : I mean the whispered ones; for they are yet but *ear-hissing* arguments.

*Shakespeare.*

The burst  
And the *eardeafening* voice of the oracle,  
Kin to Jove's thunder.

*Id.*

O, farewell!—

The spirit-stirring drum, the *ear-piercing* fife,  
The royal banner; and all quality,

Pride, pomp, and circumstance of glorious war! *Id.*

What fire is in my *ears*? Can this be true!  
Stand I condemned?

*Id. Much Ado.*

Aristippus was earnest suitor to Dionysius for some grant, who would give no *ear* to his suit: Aristippus fell at his feet, and then Dionysius granted it.

*Bacon's Apophthegms.*

Himself he on an *earwig* set;  
Yet scarce he on his back could get,  
So oft and high he did curvet. *Drayton's Nymphiad.*

Princes, that will but hear, or give access  
To such officious spies, can order be safe:  
They take in poison with an open *ear*,  
And, free from danger, become slaves to fear.

*Ben Jonson.*

Nor can I bide to pen some hungry sentence  
For thick-skin *eares*, and undiscerning eyne.

*Bp. Hall. Satires.*

O age well thriven and well fortunate,  
When eeh man hath a muse appropriate;  
And shée like to some servile *earr-boared* slave,  
Must play and sing when and what he would have.

*Id.*

This gold is now grown to a calf; let no man think that form came forth casually out of the melted *earrings*: this shape was intended by the Israelites, and perfected by Aaron. *Id. Contemplations.*

There are some vessels, which, if you offer to lift by the belly or bottom, you cannot stir them; but are soon removed, if you take them by the *ears*.

*Taylor's Rule of Holy Living.*

He laid his sense closter, and in fewer words, according to the style and *ear* of those times. *Denham.*

The leaves on trees not more,  
Nor bearded *ears* in fields, nor sands upon the shore.

*Dryden.*

Gomez, stand you out of *earshot*.—I have some thing to say to your wife in private.

See ANATOMY, Index, and DEAF, the structure of this important organ is developed. Suetonius mentions the beauty of Augustus's ear; and Elian, describing the ears of Aspasia, observes she had short ears. Martial also ranks large ears among defects. Among the Athenians, it was a mark of nobility to have the ears bored or perforated: among the Hebrews and Romans it was a mark of servitude. Several naturalists and physicians have held, that cutting off the ear renders persons barren and unprolific; and this notion was what first occasioned legislators to cut off the ears of thieves, &c., to be cut off, they should produce their like.

In botany, is usually called *spica*. The ears and seeds of wheat, rye, barley, lavender, &c. are in ears. The stem of the ear means a stalk or straw; the knot of the ear, the lobes or therein the grains are enclosed, &c.

In music. See MUSIC. In music we are universally to acknowledge a kind of insensibility, distinct from the external one of sight; which we call a good ear. And the distinction we should probably acknowledge in regard to our other senses, were our senses of the differences equally clear. Some like this is universally acknowledged with regard to a critical and accurate perception of the objects of sight; though, in familiar metaphor, these sensations are referred to a sense that has no connexion with sight. Thus a greater capacity of perceiving the beauties of painting, architecture, &c. is called a fine taste.

*u. a. & v. n.* Norm. Fr. *care*; Sax. *caran*, adj. *erian*; Brit. *acren*; Germ. *er*, adj. *eren*; Goth. *arian*; Lat. *aro*, *n. s.* *aro*. Earth, says Mr. H. (Divisions of Purley n. 417, 8), is that which creth, or eareth, i. e. plougheth; the person of the indicative *erian*, *erare*, to ere, or plough, *Erd*, i. e. *ered*, *er'd*, that which is eared; the past tense of the same verb. *er*; to plough; to shoot into ears. Earable origin of our modern word *ARABLE*, which signifies a plowing of land.

*vacuities*; instruments used by persons who are deaf, to strengthen the sensation of hearing. They are of various forms, and are intended to compensate for the want of the external ear to augment its power when the internal ear performs their functions but imperfectly. The purpose of the external ear, both in men and women, is to collect, by its funnel form, all the sound (if we may be allowed the expression) and conduct them to the internal organs, and of the sense of hearing. All the artificial instruments, then, ought to resemble, in form, the natural ear. In ancient times, they were made of trumpet, of moderate size, and usually provided with handles, by which they might be held to the ear. They were so fitted that the smaller end entered the ear, and the wider was directed to the quarter from which the sound was to come. But these instruments were soon found inconvenient, both on account of their size and the necessity of continually holding them to the ear. Another objection was, that they did

not sufficiently conceal the defect they were designed to remedy, and therefore they were soon thrown aside. New instruments were made without these defects. One resembles a small silver funnel, with a long winding channel in its interior, which terminates at the beginning of the auditory passage. On the broad, bent rim there are holes, with ribbons passing through them, to fix the machine to the external ear. A second form consists of a lacerated tin tube, with numerous windings, having the narrow end communicating with the auditory passage, and the exterior, wider end made fast to the external ear. In the same way, two of these instruments might be connected by an elastic hoop, and fitted, at the same time, to both ears. A third instrument consists of a sort of hollow tin case, curving so as to fit the head, having a broad aperture in the middle of the front surface, and terminated by two tubes bent inwards. This hoop is so fixed under the hair, that the aperture in the middle is exactly over the upper part of the forehead, and the lateral tubes communicate with the right and left auditory passages. The great advantage of this last instrument is, that it receives directly sounds which come from before.

**EARL**, *n. s.* } Sax. *eorl*, which Spelman and others have }  
**EARLDOM**, } thought synonymous with  
**EARL-MARSHAL**, }  
caldorman; but see Turner's Anglo-Sax. vol. ii. 233. Wachter thinks earl a diminutive of *arc*, Sax.; Belg. *cer*; Ger. *er* (ere, English): hence seniority and priority. A nobleman who ranks next to a marquis is an earl-marshal is a superintendant of high or military solemnities.

An **EARL** ranks between a marquis and a viscount. The title is so ancient, that its original cannot be clearly traced out. It is, however, certain, that among the Saxons they were called ealdormen, quasi elder men, signifying the same with senior or senator among the Romans: and also schiremen, because they had each the civil government of a division or shire. On the irruption of the Danes they changed their names to eorles, which, according to Camden, signified the same in their language. In Latin they are called comites from being the king's companions and associates. After the Norman conquest they were for some time called counts, from the French; but they did not long retain that name, though their shires are thence called counties, and their wives countesses, to this day. It is now become a mere title: their lordships have no official connexion with the government of the county; which is now entirely devolved on the sheriff, the earl's deputy, or vicecomes. An earl is created by cincture of sword, mantle of state put upon him by the king himself, a cap and a coronet put upon his head, and a charter in his hand. An earl's coronet is composed of eight pearls raised upon points, with small leaves between, above the rim, as in the diagram annexed.

**EARL MARSHAL**. See **MARSHAL**.

The frere arose,  
 But I suppose,  
 Amazed was his bed,  
 He shook his ears  
 And from great fears,  
 He thought hym well yfled.

*Sir T. More.*

Poor naked men laboured one another with shagged  
 sticks, or dully fell together by the ears at sixty-cuffs.

*More.*

Sir J. Perrot ordered the Irish to mark all their  
 cattle with pitch or ear-mark, on pain of forfeiture.

*Cox. Hist. Ireland.*

For feare hat we like regnes should be reputed  
 And for earve-marked beasts abroad be bruited.

*Spenser.*

All present were made earwitnesses, even of each  
 particular branch of a common indictment. *Hooker.*

With gold and silver they increase his store,  
 And gave the precious earrings which they wore.

*Sandys.*

Their warlike force was sore weakened, the city  
 beaten down about their ears, and most of them  
 wounded. *Knolles.*

An unworthie counsellor is a wicked charme in the  
 king's ears, a sword of terror in the aduice of tyranny.

*Breton. 1616.*

low, abject; and this term, in composition, frequently expresses the idea of low, or grovelling: earth-flax is a fibrous, flaxy-looking fossil: earthing an inhabitant of earth; a mortal: earthnut, a pignut, or root of the appearance of a nut. The other compounds seem to require no explanation.

Nile ye deme that I came to sende pees into *erth*:  
I cam not to sende pees, but sword.

Wiclif. Matthew 10.

I saigh whanne he hadde opened the slate seel,  
and lo a greet *erthomouynq* was maad.

Id. Apocalips 6.

The whole *earth* was of one language. Gen. xi. 1.

Whereby he [Virgil] would insinuate that there is an igneous, luminous, or ethereal vehicle alwaies intimately adhering to the soul, though it be much slaked or damped with the gross and crude moisture of the body during this *earthly* peregrination.

More. App. to Def. of Phil. Cab. fol. 134.

Our common necessities, and the lack which we all have as well of ghostly as of *earthly* favours, is in each kind easily known.

Hooker.

Great grace that old man to him given had,  
For God he often saw, from heaven bight,  
All were his *earthly* eyen both blunt and bad.

Spenser.

All the world by thee at first was made,  
And daily yet thou dost the same repair:  
Ne ought on *earth* that merry is and glad,  
Ne ought on *earth* that lovely is and fair,  
But thou the same for pleasure didst prepare.

Id.

Nought so vile that on the *earth* doth live,  
But to the *earth* some special good doth give.

Shakespeare.

About his shelves  
Green *earthen* pots, bladders, and musty seeds  
Were thinly scattered.

Id.

Long mayest thou live in Richard's seat to sit,  
And soon lie Richard in an *earthly* pit.

Id.

Teach me, dear creature, how to think and speak;  
Lay open to my *earthly* gross conceit,  
Smothered in errors.

Id.

They can judge as sily of his worth,  
As I can of those mysteries which heaven  
Will not have *earth* to know.

Id. Coriolanus.

But I remember now  
I'm in this *earthly* world, where to do harm  
Is often laudable; to do good, sometime  
Accounted dangerous folly.

Id. Macbeth.

Who can impress the forest, bid the tree,  
Unfix his *earthbound* root?

Id.

You have scarce time  
To steal from spiritual leisure a brief span,  
To keep your *earthly* audit.

Id. Henry VIII.

If you be born so near the dull-making cataract of Nilus, that you cannot hear the planet-like music of poetry, if you have so *earth-crawling* a mind that it cannot lift itself up to look to the sky of poetry;  
\* \* \* \* \* Thus much curse I must lend you in the behalf of all poets, that while you live, you live in love, and never get favour for lacking skill of a sonnet.

Sir P. Sidney.

But from this *earth*, this grave, this dust,  
My God shall raise me up I trust.

Raleigh.

The great winding-sheets that bury all things in oblivion are two, deluges and earthquakes.

Bacon.

Worms are found in snow commonly, like *earthworms*, and therefore it is not unlike that it may likewise put forth plants.

Id. Nat. Hist.

It is heaven upon *earth* to have a man's mind move in charity, rest in providence, and turn upon the poles of truth.

Lord Bacon.

Such *earth-fed* minds  
That never tasted the true beams of love.

These tumults were like an earthquake, the very foundations of all, than which a *earth* world hath more of horror.

Peasants:—*earth-bred* worms!  
*Earthly* greatness is a nicer thing, and much chariness in the managing, as the use of it cannot require.

There is many a rich stone laid up in the *earth*, many a fair pearl laid up in the sea, that never was seen, nor never shall.

Bp. Hall. Quene

*Earth* up with fresh mould the roots of the culas which the frost may have uncovered.

Ecloga

We should affirm, that all things were as that heaven were but *earth* celestialised, and heaven terrestrialised; or that each part abode once upon its affinity below.

Brousses' Virgil

Nor is my flame  
So *earthly*, as to need the dull material form Of eyes, or lips, or cheeks.

Dante

Wherefore did Nature pour her bounty With such a full and unwithdrawing hand, Covering the *earth* with odours, fruits, and Thronging the seas with spawn innumerable But all to please and sate the curious taste?

When faith and love, which parted never,  
Had ripened thy just soul to dwell with Meekly thou didst resign this *earthly* land

Of death, called life  
By the *earthshaking* Neptune's name,  
And Tethy's grave majestic pace.

Him lord pronounced, be, O indignity Subjected to his service angel-wings,  
And flaming ministers to watch and wait Their *earthly* charge.

Id. Par

The master saw the madman rise;  
His glowing cheeks, and ardent eyes;  
And, while he heaven and *earth* defied,  
Changed his hand and checked his pride.

In ten set battles we have driven him These heathen Saxons, and regained him As *earth* recovers from the ebbing tide,  
The wounds I make but sow new seeds Which, from their blood, like *earthworms* rise

Was it his youth, his valour, or success These might perhaps be found in other  
'Twas that respect, that awful homage That fearful love which trembled in him,  
And with a silent earthquake shook him.

Those *earthly* spirits black and evil I'll call up other gods of form more fair

The fox is *earthed*; but I shall over-riars in after him.

Id. W

This solid globe we live upon is called which word, taken in a more limited sense, such parts of this globe as are capable, to the air, to give rooting and nourishment so that they may stand and grow in it.

Where there are *earthworms* in it though the roots lie deep in the ground stalks be dead, the swine wall by them where they grow.

Upon a shower, after a drought, a land swarms innumerable come out of places.

season of its vast caverns and sub-  
sane been miserably torn by earth-  
whole face of it is quite changed.

EARTH, in ancient philosophy. See CURWIS-  
TRY and ELEMENT.

The EARTH, in astronomy, is one of the primary  
planets. See ASTRONOMY. 'Although the rela-  
tive densities of the earth and most of the other  
planets have been known a considerable time, it  
is but very lately that we have come to the  
knowledge of the absolute gravity or density of  
the whole mass of the earth. This, says Dr.  
Hutton, I have calculated and deduced from the  
observations of Dr. Maskelyne, astronomer royal,  
at the mountain Schiehallen in the years 1774, 5,  
and 6. The attraction of that mountain on a  
plummet, being observed on both sides of it, and  
its mass being computed from a number of sec-  
tions in all directions, and consisting of stone; these  
data being then compared with the known attrac-  
tion and magnitude of the earth, gave by propor-  
tion its mean density; which is to that of water  
as nine to two, and to common stone as nine to  
five; from which very considerable mean density,  
it may be presumed, that the internal parts con-  
tain great quantities of metals. From the den-  
sity now found,' adds this writer, 'its quantity of  
matter becomes known, being equal to the pro-  
duct of its density by its magnitude.'

Mr. Boyle suspected that there are great,  
though slow, internal changes, in the mass of the  
earth. He argues from the varieties observed in  
the change of the magnetic needle, and from the  
observed changes in the temperature of climates.  
But as to the latter, there is reason to doubt that  
he could not have diaries of the weather sufficient  
to direct his judgment. *Boyle's Works, Abr.*  
Vol. I. p. 292, &c.

Respecting the figure of the earth, the ancients  
had various opinions: some, as Anaximander  
and Leucippus, held it cylindrical, or in the  
form of a drum: but the most general opinion  
was, that it was flat; that the visible horizon was  
the boundary of the earth, and the ocean the  
boundary of the horizon: that the heavens and  
earth above this ocean were the whole visible  
universe: and that all beneath the ocean was  
Hades. Of this opinion were some of the Chris-  
tian fathers, as Lactantius, St. Augustine, &c.  
Such of the ancients, however, as understood any  
thing of astronomy, and especially the doctrine of  
eclipses, must have been acquainted with the cir-  
cular figure of the earth; as the ancient Babylo-  
nian astronomers, who had calculated eclipses  
long before the time of Alexander, and Thales  
the Grecian, who predicted an eclipse of the sun.  
It is now indeed agreed on all hands, that the form  
of the teraqueous globe is globular or very nearly  
so. See ASTRONOMY. This is equally evident  
from the eclipses of the sun and of the moon;  
in all of which the earth's shadow appears circu-  
lar upon the face of those bodies, what way  
soever it be projected, whether east, west, north,  
or south; and howsoever its diameter vary,  
according to the greater or less distance from the  
earth. The spherical figure of the earth is also

evinced from the rising and setting of the sun, moon, and stars; all which happen sooner to those who live to the east and later to those living to the west, and that more or less so, according to the distance. So also, going or sailing to the north, the north-pole and northern stars become more elevated, and the south-pole and southern stars more depressed; the elevation northerly increasing equally with the depression southerly; and either of them proportionably to the distance gone. The same thing happens in going to the south. Besides, the oblique ascensions, descensions, emersions, and amplitudes of the rising and setting of the sun and stars, in every latitude, are agreeable to the earth's spherical form: all which could not happen if it were of any other figure. The globular form of the earth is farther confirmed by its having been often sailed round: the first of these important voyages was made in 1519, by Ferdinand Magellan, who accomplished it in 1124 days. In 1557 Sir Francis Drake performed the same voyage in 1036 days: in 1586 Sir Thomas Cavendish performed it in 777 days; Simon Cordes, of Rotterdam, in 1590, in 1575 days: in 1598 Oliver Noort, a Hollander, in 1077 days; Van Schouten, in 1615, in 749 days; Jacob Heremites and John Huygens, in 1623, in 802 days. Many others have since performed it, particularly Anson, Bougainville, and Cook; sometimes sailing round by the east sometimes by the west, till at length they arrived again in Europe, whence they set out; and, in the course of their voyage, observed that all the phenomena, both of the heavens and the earth, correspond to, and prove this spherical figure.

The natural cause of this form of the globe is, according to Sir Isaac Newton, the great principle of attraction, with which the Creator has endued all the matter in the universe; and by which all bodies, and all the parts of bodies, mutually attract one another. This is also the cause of the sphericity of the drops of rain, quicksilver, &c. The inequality of the surface of the earth, by mountains and valleys, is nothing considerable; the highest eminence being scarcely equivalent in its proportion to the bulk of the earth to the minutest protuberance on the surface of an orange. Its difference from a perfect sphere, however, is more considerable in another respect, by which it approaches nearly to the shape of an oblate spheroid; being a little flattened at the poles, and raised about the equatorial parts, so that the axis from pole to pole is less than the equatorial diameter. What gave the first occasion to the discovery of this important circumstance was, the observations of some French and English philosophers in the East Indies, and other parts, who found that pendulums, the nearer they came to the equator, performed their vibrations slower: whence it follows, that the velocity of the descent of bodies, by gravity, is less in countries nearer to the equator; and consequently that those parts are farther removed from the centre of the earth, or from the common centre of gravity. See the History of the Royal Academy of Sciences, by Du Hamel, p. 110, 156, 206; and L'Histoire de l'Académie Roy. 1700 and 1701. These observations having established the fact also stimulated M. Huygens and Sir Isaac Newton to in-

vestigate the cause of this phenomenon, and they attributed to the revolution of the earth about its axis. If the earth were in any state, its rotation round its axis would soon make it put on such a figure, because the centrifugal force being greatest towards the equator, the fluid would there rise and swell, so that its figure really should be so round and necessary, to keep the sea in the equinoctial, from overflowing the earth about the poles. See this curious subject well treated by Newton in his discourse De Causâ Gravitationis, where he states the ratio of the polar diameter to that of the equator, as 577 to 578. And Newton, in his Principia, first published in 1687, demonstrates from the theory of gravity, that the figure of the earth must be that of an oblate spheroid, generated by the rotation of a circle about its shortest diameter, provided the parts of the earth were of a uniform density taken out; and that the proportion of the polar to the equatorial diameter of the earth, would be that of 689 to 692, or nearly that of 223 to 224, as  $9956522$  to  $1$ . This proportion of the diameters was calculated by Newton in the following manner: having found that the centrifugal force at the equator is  $\frac{1}{230}$  of gravity, he assumes, as an hypothesis, that the earth is a sphere, the diameter of the equator as 100 to 100, and thence determines what must be the centrifugal force at the equator to give the earth its form, and finds it to be  $\frac{1}{230}$  of gravity, and by proportion, if a centrifugal force equal to  $\frac{1}{230}$  of gravity would make the earth higher at the equator than at the poles by  $\frac{1}{230}$  of its height at the poles, a centrifugal force that  $\frac{1}{230}$  of gravity will make it higher by a proportion excess, which by calculation is  $\frac{1}{230}$  of the height at the poles; and thus he discovered, that the diameter at the equator is to the diameter at the poles, or the axis, as 230 to 229. But this computation supposes the earth to be every part of a uniform density; whereas if we suppose it more dense near the centre, then bodies at the poles will be more attracted by this denser matter being nearer; and therefore the ratio of the semi-diameter of the equator to the semi-axis, will be different. According to the proportion between the two diameters, he farther computes, from the different degrees of a degree, that the equatorial diameter exceeds the polar by thirty-four miles and  $\frac{1}{2}$ . Afterwards, Messrs. Cassini, both father and son, made two measurements of the earth, the first in 1701, and the other in 1712, and to prove, in the Memoirs of the Royal Academy of Sciences, that the earth was an oblate spheroid, and in 1718, M. Cassini again undertook his observations, to show that, on the contrary, the longest diameter passes through the poles. This gave occasion for Mr. John Bernoulli to publish an *Essai d'une Nouvelle Physique* at Paris in 1735, to triumph over the philosopher, apprehending that these observations would invalidate what Newton had demonstrated. And in 1720 M. De Maillet advanced arguments, supposed to be strengthened by astronomical demonstrations, farther to confirm the assertions of Cassini. But in 1735 several of the mathematicians were employed, one in the northern, and another for a southern equator.

ult of whose observations and measurements proved that the earth was flattened at the poles. The proportion of the equatorial diameter to the polar, as stated by the gentlemen engaged on the northern expedition for measuring a degree of the meridian, is as 1 to 0.9891; Spanish mathematicians as 266 to 263, or 0.99624; by M. Bouguer as 179 to 173, or 0.99441. As to all conclusions, howsoever deduced from the length of pendulums in different places, it is to be observed, that they are upon the supposition of the uniformity of the earth, which is a very improbable supposition; as justly observed by Dr. Horsley after to captain Phipps: 'you finish your argument by concluding, relating to the pendulum, that these observations give a figure of the earth nearer to Sir Isaac Newton's computation, than any others that have hitherto been made; and then you state the several figures as you imagine, by former observations, to be your own. Now it is very true, that, if the meridians be ellipses, or if the figure of the earth be that of a spheroid generated by the rotation of an ellipsis, turning on its shorter axis, a particular figure, or the ellipticity of the generating ellipsis, which your observations are nearer to what Sir Isaac Newton saith it to be, if the globe were homogeneous, than it can be derived from former observations. It is not what you imagine. Taking the length of the pendulum in latitude  $79^{\circ} 50'$  exactly as it is, the difference between the equatorial and the polar diameter is about as much as the Newtonian computation makes it, if the hypothesis of homogeneity would require you to reckon it, to be greater. The proportion of 212 to 211 should indeed, according to your observations, be the proportion of the force which acts upon the pendulum at the poles to that which acts upon it at the equator. But this is not the same with the proportion of the equatorial diameter to the polar. If the globe were homogeneous the equatorial diameter would exceed the polar by  $\frac{1}{10}$  of the length of the latter: the polar force would also exceed the equatorial force by the like part. But, if the difference between the polar and equatorial force be greater than  $\frac{1}{10}$ , which may be the case in an heterogeneous earth, and seems to be the case in ours, then the difference of the diameters should, according to theory, be less than  $\frac{1}{10}$ , and vice versa. I am persuaded this is by no means obvious, at first sight; for otherwise, that the mistake, which we have fallen into, was once very general, and that the best mathematicians were misled by an implicit reliance upon the authority of Newton, who had certainly confined his investigations to the homogeneous spheroid, and had not considered the heterogeneous only in a loose general way. The late Mr. Clairault was the first to set the matter right, in his elegant and treatise on the figure of the earth. That treatise has now been many years in the hands of mathematicians, among whom I imagine there are few who have considered the subject attentively, and do not acquiesce in the author's conclusions. In the second part of that treatise, it is said, that putting  $p$  for the polar force,  $\Pi$  for the equatorial,  $\delta$  for the true ellipticity of the

earth's figure, and for the ellipticity of the homogeneous spheroid,

$$\frac{p - \Pi}{\Pi} = 2\epsilon - \delta: \text{therefore } \delta = 2\epsilon - \frac{p - \Pi}{\Pi}$$

and, therefore, according to your observation,  $\delta = \frac{1}{10}$ . This is the just conclusion from your observations of the pendulum, taking it for granted that the meridians are ellipses: which is an hypothesis upon which all the reasonings of theory have hitherto proceeded. But, plausible as it may seem, I must say that there is much reason from experiment to call it in question. If it were true, the increment of the force which actuates the pendulum as we approach the poles, should be as the square of the sine of the latitude: or, which is the same thing, the decrement, as we approach the equator, should be as the square of the cosine of the latitude. But whoever takes the pains to compare together such of the observations of the pendulum in different latitudes, as seem to have been made with the greatest care, will find that the increments and decrements do by no means follow these proportions; and, in those which I have examined, I find a regularity in the deviation which little resembles the mere error of observation. The unavoidable conclusion is, that the true figure of the meridians is not elliptical. If the meridians are not ellipses, the difference of the diameters may indeed, or it may not, be proportioned to the difference between the polar and the equatorial force; but it is quite an uncertainty, what relation subsists between the one quantity and the other; our whole theory, except so far as it relates to the homogeneous spheroid, is built upon false assumptions, and there is no saying what figure of the earth any observations of the pendulum give.' Dr. Horsley then lays down the following table, which shows the different results of observations made in different latitudes; in which the first three columns contain the names of the observers, the places of observation, and the latitude of each; the fourth column shows the quantity of  $p - \Pi$  in such parts as  $\Pi$  is 100,000, as deduced from comparing the length of the pendulum, at each place of observation, with the length of the equatorial pendulum as termed by M. Bouguer, upon the supposition that the increments and decrements of force, as the latitude is increased or lowered, observe the proportion which theory assigns. Only the second and the last value of  $p - \Pi$  are concluded from comparisons with the pendulum at Greenwich and at London, not at the equator. The fifth column shows the value of  $\delta$  corresponding to every value of  $p - \Pi$ , according to Clairault's theorem:

Observers.	Places.	Lat.	$p - \Pi$ .	$\delta$
Bouguer	Equator	$0^{\circ} 0'$		
Bouguer	Puerto Bello	9	34 741.8	$\frac{1}{10}$
Gouan	Orabasco	17	29 563.2	$\frac{1}{10}$
Bouguer	San Domingo	18	27 591.0	$\frac{1}{10}$
Abbe de La Caille	Cape of Good Hope	33	55 731.5	
- - -	Paris	48	50 585.1	$\frac{1}{10}$
The Academies	Pello	66	48 505.9	$\frac{1}{10}$
Capt. Phipps	- - -	79	50 471.2	$\frac{1}{10}$

and published by Mr. Robertson, serves to find the proportion between the axis and the equatorial diameter, from measures of a degree of the meridian in two different latitudes, supposing the earth an oblate spheroid. Let  $A P p$  (PLATE II. MISCELLANIES) be an ellipse representing a section of the earth through the axis  $Pp$ ; the equatorial diameter, or the greater axis of the ellipse, being  $Aa$ ; let  $E$  and  $F$  be two places, where the measure of a degree has been taken; these measures are proportional to the radii of curvature in the ellipse at those places; and if  $CQ$ ,  $CR$ , be conjugates to the diameters whose vertices are  $E$  and  $F$ ,  $CQ$  will be to  $CR$  in the subtriplicate ratio of the radius of curvature at  $E$  to that at  $F$ , by Cor. 1, Prop. 4, part 6, of Milnes's Conic Sections, and therefore in a given ratio to one another; also the angles  $QCP$ ,  $RC P$ , are the latitudes of  $E$  and  $F$ ; so that, drawing  $QV$  parallel to  $Pp$ ,  $QXYW$  to  $Aa$ , these angles being given, as well as the ratio of  $CQ$  to  $CR$ , the rectilinear figure  $CVQXR Y$  is given in species; and the ratio of  $VC^2 - ZC^2 (= QX \times XW)$  to  $RZ^2 - QV^2 (= RX \times XS)$  is given, which is the ratio of  $CA^2$  to  $CP^2$ ; therefore the ratio of  $CA$  to  $CP$  is given. Hence, if the sine and cosine of the greater latitude be each augmented in the subtriplicate ratio of the measure of the degree in the greater latitude to that in the lesser, then the difference of the squares of the augmented sine, and the sine of the lesser latitude, will be to the difference of the squares of the cosine of the lesser latitude, and the augmented cosine, in the duplicate ratio of the equatorial to the polar diameter. For  $Cq$  being taken in  $CQ$  equal to  $CR$ , and  $qv$  drawn parallel to  $QV$ ,  $Cv$ , and  $vg$ ,  $CZ$  and  $ZR$  will be the sines and cosines of the respective latitudes to the same radius; and  $CV$ ,  $VQ$ , will be the augmentations of  $Cv$  and  $Cq$  in the ratio named. Hence, to find the ratio between the two axes of the earth, let  $E$  denote the greater, and  $F$  the lesser of the two latitudes,  $M$  and  $N$  the respective measures taken in each; and

let  $P$  denote  $\sqrt{\frac{M}{N}}$ : then

$$\sqrt{\frac{\cos.^2 F - P^2 \times \cos.^2 E}{P^2 \times \sin.^2 E - \sin.^2 F}} \text{ is } = \frac{\text{less axis}}{\text{greater axis}}$$

It also appears from the above problem, that when one of the degrees measured is at the equator, the cosine of the latitude of the other being augmented in the subtriplicate ratio of the degrees, the tangent of the latitude will be to the tangent answering to the augmented cosine, in the ratio of the greater axis to the less. For, supposing  $E$  the place out of the equator, then, if the semi-circle  $P l m n p$  be described, and  $IC$

cos.  $E^2 \sqrt{N}$  Then  $\frac{M}{N}$

But  $M$ , or the length of actual mensuration in degrees from the following table:

Name.	
Maupertuis, &c.	60
Cassini and	40
La Caille	40
Roscovich	42
De la Caille	33
Juan and Ulloa	9
Bouguer	9
Condamine	20

Now, by comparing the following ones; the second following; and in like manner fifth, with each of the foregoing obtained twenty-five results of the axes or diametrical means of all of which 1 to 0.9951989. If the meridian line drawn through  $49^\circ 22'$ , and of  $45^\circ$  meridian line drawn through northern and southern equator with those of Maupertuis the north, and that of Bouguer there will result six different of the two axes: the arc which, is that of 1 to 0.9951989 considered as the ratio of less: which is as 230 to 214, or very near the ratio of 1 to 0.9951989. Now the magnitude of the earth, that is, the diameters, may be deduced from this problem. For, as half the greater axis  $Aa$  is the radius, it is given in magnitude measured there, and thence the circumference of the circle equal to the radius being 51 number be multiplied by the sine of a degree at the equator, stated it, the product will be the radius of the greater axis; and this is the ratio of the less axis to the greater axis is 0.9953467 to 1; whence the difference is 6564366 toises, or 77 miles; and the difference about thirty-seven miles.

vol. ii. p. 206, &c. Suite des Mem. de 1713, p. 247, and Maclaurin's Fluxions book i. chap. xiv. And very nearly the  $g$  is deduced from the lengths of pendulibrating in the same time, in different  $\lambda$ ; provided it be again allowed, that the  $g$  are real ellipses, or the earth a true  $\lambda$ , which, however, can only take place in  $g$  of a uniform gravity in all parts of the

Thus, in the new Petersburg Acts, for 1789, are accounts and calculations of  $g$ ents relative to this subject, by M. Kraft. Experiments were made at different times various parts of the Russian empire. This an has collected and compared them, and he proper conclusions from them: thus,  $\lambda$ , that the length  $x$  of a pendulum that seconds in any given latitude  $\lambda$ , and in a ture of  $10^\circ$  of Reaumur's thermometer determined by this equation:

$439.178 + 2.321 \sin^2 \lambda$ , lines of a French

$39.0045 + 0.206 \sin^2 \lambda$ , in English in the temperature of  $53$  of Fahrenheit's meter. This expression nearly agrees, not th all the experiments made on the pen- in Russia, but also with those of Mr. in England, and those of Mr. Lyons in N. lat., where he found its length to be lines. It also shows the augmentation of from the equator to the parallel of a given  $\lambda$ : for, putting  $g$  for the gravity under stor,  $G$  for that under the pole, and  $y$  for for the latitude  $\lambda$ , M. Kraft finds

$+ 0.0052848 \sin^2 \lambda g$ ; and therefore  $G$   $52848 g$ . From this proportion of gravity different latitudes, the same author infers, case the earth is a homogeneous ellipsoid, atness must be  $\frac{1}{11}$  instead of  $\frac{1}{12}$ ; ought to be the result of this hypo- but on the supposition that the earth is a porous ellipsoid, he finds its oblateness, ded from these experiments, to be ch agrees with that resulting from the ment of some of the degrees of the me-

This confirms an observation of M. De  $g$ , that if the hypothesis of the earth's bot- ty be given up, then the theory, the mea- of degrees of latitude, and experiments pendulum, all agree in their result with in the oblateness of the earth. See Me- de l'Acad. 1783, p. 17. In the Philos. or 1791, p. 236, Mr. Dalby has given calculations on measured degrees of the  $\lambda$ , from whence he infers, that those de- measured in middle latitudes, will answer to an ellipsoid whose axes are in the ratio  $1$  by Newton, viz. that of 230 to 229. To the deviations of some of the others, wards the poles and equator, he thinks caused by the errors in the observed ce- res.

cosmogony, or knowledge of the original of the earth, the materials of which it imposed, and by what means they were id in the order in which we see them, is a  $g$ , which, though perhaps beyond the reach an sagacity, has exercised the ingenuity mophers in all ages. To enter into the

various theories that have been formed upon this subject, would, however, not only swell this article beyond our bounds, but be fatiguing to many readers. As far as human industry has hitherto penetrated, it has been found that the substances of which the earth is composed are neither ranged in a regular series, according to their specific gravities, nor yet thrown together in total disorder, as if by accident or chance. But the depth of the earth, from the surface to the centre, is nearly 4000 miles; and yet the deepest mine in Europe, that at Cotteberg, in Hungary, is not more than 1000 yards deep; so that little is as yet known of its interior parts. From what has been discovered, however, of those parts which lie most contiguous to our observation, naturalists have compared the structure of the earth to the coats of an onion, or the leaves of a book. And indeed, except in some of those immense mountains which have existed from the creation, or at least from the deluge, where the matter, from whatever cause, is more homogeneous, the earth is found to consist of various strata or layers, which differ according to the circumstances of climate and situation. The surface generally consists of a confused mixture of decayed animal and vegetable substances and earths rudely united together but, upon digging below this surface, the materials of the globe are found arranged in a more regular manner. Heaps of stone are indeed frequently found, which do not consist of layers, but are confused masses of unequal thickness and are called rocks. The strata are generally extended through a whole country, and perhaps, with some interruptions and varieties, through the globe itself. When the country is flat, these extensive bodies are found most regular, being in that case nearly parallel to the horizon, though often dipping downwards in a certain angle; in many places the beds have a wave, as where the country consists of gently waving hills and vales; and here also they in general dip. In passing over the ground the soil is found, perhaps to the extent of a mile, mostly composed of sand; and perhaps for another it consists chiefly of clay: which is occasioned by the edges of the different strata lying with an obliquity to the horizon. By a similar projection, mountains, or ridges of mountains, are produced which commonly have what is called a back and a face, the former smoother, and the latter more rugged. It is generally found, also, that the ascent is more gradual on the one side of a mountain than on the other; and this is occasioned by the strata, which have risen above the general level of the country, being abruptly broken off. The order, number, situation with respect to the horizon, depth, interfections, fissures, color, consistence, &c., of these strata have been considered by Dr. Woodward with great attention. The origin and formation of them all is ascribed by him to the deluge. He supposes that, at that dreadful revolution, all sorts of terrestrial bodies had been dissolved and mixed with the waters, forming altogether, a chaos or confused mass; and he also supposes, that this mass of terrestrial particles, intermixed with water, was at length precipitated to the bottom; and that, in general, according to the order of gravity, the

The notion of the magnetism of the earth was started by Gilbert; and Boyle supposes magnetic effluvia moved from one pole to the other. Vol. 1. p. 285, 290. Dr. Knight also thinks that the earth may be considered as a great loadstone, whose magnetical parts are disposed in a very strong irregular manner; and that the south pole of the earth is analogous to the north pole in magnets, that is, the pole by which the magnetical stream enters. See MAGNET. He observes that all the phenomena attending the direction of the needle, in different parts of the earth, in a great measure correspond with what happens to the needle, when placed upon a large terrella; if we make allowances for the different dispositions of the magnetical parts, with respect to each other, and consider the south pole of the earth as a north pole with regard to magnetism. The earth might become magnetical by the iron ores it contains, for all iron ores are capable of magnetism. The globe might, notwithstanding, have remained unmagnetical, unless some cause had existed capable of making that repellent matter producing magnetism move in a stream through the earth. Now, the doctor thinks that such a cause does exist; for, if the earth revolves round the sun in an ellipsis, and the south pole of the earth is directed towards the sun, at the time of its descent towards it, a stream of repellent matter will thence be made to enter at the south pole, and issue out at the north. And he suggests, that the earth's being in its perihelion in winter may be one reason why magnetism is stronger in this season than in summer. This cause for the earth's magnetism must continue, and perhaps improve it from year to year. Hence, the doctor thinks it probable, that the earth's magnetism has been improving ever since the creation, and that this may be one reason why the use of the compass was not discovered sooner. See Dr. Knight's *Attempt to Demonstrate*, that all the phenomena in nature may be explained by Attraction and Repulsion, prop. 87.

The magnitude of the earth has been variously determined by different authors, both ancient and

and who added 25,000 stadia. Eratosthenes. Ptolemy. Cicero, next measured the altitudes of a star, and meridian; and he concluded at 240,000 stadia, according only at 180,000 according to in his Geography, says that the geographer, attempted some kind; and, in lib. 1. cap. 2, he himself had tried to perform way different from any other by means of places under but he does not say how number, for he still made which had been found out professor of mathematics at the Arabian geographer Al about A. D. 1300, that about mon, an Arabian king, having some skilful mathematicians, to find out the circumference cordingly they chose the field where they measured under from north to south, till the one degree lower; which is equal to fifty-six miles, or so that, according to them, earth is 20,160 or 20,340 after this before any more At length, however, the about A. An EARTHQUAKE is a sudden and violent concussion of the earth, generally accompanied with strange noises under ground, or in the air; often destroying whole cities at once, throwing down rocks, altering the course of rivers, and producing the most terrible devastations. Though there is hardly any country known, in which shocks of an earthquake have not at some time or other been felt, yet there are some much more subject to them than others. Northern countries, in general, are less subject to earthquakes than those situated near the equator, or in the southern latitudes; but this does not hold universally. The islands of Japan, which are situated pretty far north, are nevertheless, exceedingly liable to these dreadful convulsions. Islands, in general, are also more subject to them than continents; but neither does this hold without exceptions. Particular parts of continents, and particular islands, are more subject to them than others lying in the neighbourhood, and differing little from them in external appearance. Portugal is more subject to earthquakes than Spain, and the latter much more than France; Mexico and Peru more than the other countries of America, and Jamaica more than the other Caribbee islands. Earthquakes are frequent, though not often violent, in Italy; but in Sicily they are often terribly destructive. Asia Minor has been remarkably subject to them from the remotest antiquity; and the city of Antioch in particular has suffered more from earthquakes than any other in that country. The same phenomena are said also to occur very frequently in the extremities of Asia, even in very high latitudes.

Although no natural phenomenon is more calculated to impress the human mind with terror, and consequently to be well remembered and taken notice of, than an earthquake, yet the philosophy of them is but lately arrived at any degree of perfection; and, even at this day, the history of earthquakes is incomplete. The destruction occasioned by them engrosses the mind too much to admit of philosophical speculations at the time they happen; the same thing prevents the attentive consideration of the alterations that take place in the atmosphere after the earthquake is over, and which might probably throw some light on the causes which produced it; and the suddenness of its coming on prevents an exact attention to those slight appearances in the earth or air which, if carefully observed, might serve as warnings to avoid the destruction. From the observations that have been made, however, the following phenomena may be deduced, and reckoned pretty certain. 1. Where there are any volcanoes or burning mountains, an earthquake may reasonably be expected more frequently than in other countries. 2. If the volcano has been long quiet, a violent earthquake is to be feared, and vice versa. But to this there are many exceptions. 3. Earthquakes are generally preceded by long droughts, but they do not always come on as soon as the drought ceases. 4. They are also preceded by electrical

riages; sometimes a rushing noise like wind, and sometimes explosions, like the firing of cannon, are heard. Sometimes the ground heaves perpendicularly upwards, and sometimes rolls from side to side. Sometimes the shock begins with a perpendicular heave, after which the other kind of motion commences. A single shock is but of very short duration, the longest scarcely lasting a minute; but they frequently succeed each other at short intervals for a considerable length of time. 8. During the shock, chasms are made in the earth; from which sometimes flames, but oftener great quantities of water, are discharged. Flame and smoke are also emitted from places of the earth where no chasms can be perceived. Sometimes these chasms are but small; but, in violent earthquakes, they are often so large, that whole cities sink down into them at once. 9. The water of the ocean is affected even more than the dry land. The sea swells up to a prodigious height; much more than we could suppose it raised by the mere elevation of its bottom by the shock. Sometimes it is divided to a considerable depth, and great quantities of air, flames, and smoke, are discharged from it. The same irregular agitations happen to the waters of ponds, lakes, and even rivers. 10. The shock is felt at sea as well as on land. Ships are affected by a sudden stroke, as if they had run aground or struck upon a rock. 11. The effects of earthquakes are not confined to one particular district or country, but often extend to very distant regions; though no earthquake has yet been known extensive enough to affect the whole globe at one time. In those places also where the shock is not felt on dry land, the irregular agitation of the waters above mentioned, is perceived very remarkably. All these positions are verified by the account of those earthquakes which have been particularly described by witnesses of the best character.

A terrible earthquake happened at Calabria in 1638, which affords an exception to the second general position above laid down. In Italy there had been an eruption of Mount Vesuvius five years before; and in Sicily there had been an eruption of Aetna only two years before this earthquake. The event, however, plainly showed that the cause of the earthquake, whatever it was, had a connexion not only with Mount Aetna, which lies in the neighbourhood, but also with the volcano of Stromboli, which is sixty miles distant. 'On the 24th of March,' says Kircher, 'we launched, in a small boat, from the harbour of Messina, in Sicily, and arrived the same day at the promontory of Pelorus. Our destination was for the city of Euphemia, in Calabria; but, on account of the weather, we were

out even the shores from together with the dreadful noxious stench, which was strong me with apprehensions that a calamity was impending. To wear a very unusual appearance have seen a lake in a violent covered over with bubbles, of its agitations. My surprise by the calmness and serenity a breeze, not a cloud, which to put all nature thus into warned my companion that approaching; and, after some the shore with all possible distance Tropicæ. But we had scarcely a college in that city, when with a horrid sound, resembling a number of chariots driving the wheels rattling, and the Soon after this, a most dreadful, so that the whole town stood seemed to vibrate, at scale of a balance that continued motion, however, soon growing being no longer able to be thrown prostrate upon the ground time, finding that I remained general concussion, I reached safety, and running as fast as the shore. I did not scarcely found the boat in which I had companions also. Leaving the town, we prosecuted our voyage and the next day came to be landed, although the earth still lent agitations. But we were our inn, when we were once turn to our boat; and in about saw the greatest part of the in which we had set up, and burying all its inhabitants. Proceeding onward in our length landed at Lopizium, tween Tropicæ and Euphemia we were bound. Here, with eyes, nothing but scenes of appeared; towns and castles by Stromboli, though at sixty ing forth flames in an uncessant a noise which I could distinguish attention was quickly turned to contiguous danger. The an approaching earthquake, we were grown acquainted with the consequences. It every grow louder, and to approach place on which we stood

ly; so that, being unable to stand, my sons and I caught hold of whatever shrub lay at us, and supported ourselves in that manner.

After some time, the violent paroxysm was again stood up, in order to prosecute the voyage to Euphemia, which lay within the mean time, while we were preparing for this purpose, I turned my eyes towards the city, but could see only a frightfully bad, that seemed to rest upon the place. It more surprised us, as the weather was serene. We waited, therefore, till the day passed: then turning to look for the city was totally sunk, and nothing but a disgusting putrid lake was to be seen where it

In the year 1692 an earthquake happened in Sicily, attended with almost all the terrible phenomena above stated. In two minutes it swallowed the town of Port Royal, and sunk the city in a gulf of forty fathoms deep. It was attended with a hollow rumbling noise, like that of the streets rose like the waves of the sea, lifting up the houses, and then immediately throwing them down into deep pits. All the water discharged their waters with the most violent agitation. The sea burst over its bounds, and engulfed all that stood in its way. The shaking of the earth were in some places so great, that the streets appeared twice as broad as before. In many places it opened and again, and continued this agitation for several days. Of these openings great numbers were seen at one time. In some the people were allowed up at once; in others, the earth opened beneath them, and crushed them to pieces, while others, more fortunate, were thrown up in one chasm, and thrown out into another. Other chasms were large enough to swallow up whole streets; and others, more formidable, spouted up immense quantities of water, drowning such as the earthquake reached. The whole was attended with a most offensive smell, the noise of falling stones at a distance, &c.; and the sky suddenly turned dull and reddish, like a glowing sunset, greatly as Port Royal suffered, more were left standing in it, than on the whole island. Scarcely a planting-house, or house, was left standing in all Jamaica. A great part of them were swallowed up, houses, trees, and all in one gap: in lieu of which, there appeared great pools of water; which, rising up, left nothing but sand, without that ever tree or plant had grown there. Although the shock was so violent, that houses were thrown some yards out of their places, yet they continued standing. A Mr. had his plantation removed half a mile from the place where it stood, without any alteration. All the wells in the island, except those of Port Royal, from one fathom to seven deep, threw their water out at the great violence. Above twelve miles from the sea the earth gaped and spouted out, with prodigious force, vast quantities of water into the air; yet the greatest violence was in the mountains and rocks; and it is a maxim, that the nearer the mountains

the greater the shock; and that the cause thereof lay among them. Most of the rivers were stopped up for twenty-four hours, by the falling of the mountains; till, swelling up, they formed new channels, tearing up, in their passage, trees, &c. After the great shock, those people who escaped got on board ships in the harbour, where many continued above two months: the shocks all that time being so violent, and coming so thick, sometimes two or three in an hour, accompanied with frightful noises, like a rushing wind, or a hollow rumbling thunder, with brimstone blasts, that they durst not come ashore. The consequence of the earthquake was a general sickness, from the noisome vapors belched forth, which swept away above 3000 people.

In 1693 an earthquake happened in Sicily, which may justly be accounted one of the most terrible of which we have any account. It shook the whole island, and even Naples and Malta shared in the shock. It was impossible for any body in this country to keep on their legs on the dancing earth; nay, those that lay on the ground were tossed from side to side, as on a rolling billow: high walls leaped from their foundations several paces, &c. The mischief it did is amazing; almost all the buildings in the country were thrown down; fifty-four cities and towns, besides an incredible number of villages, were either destroyed or greatly damaged. Catania, one of the most famous, ancient, and flourishing cities in the kingdom, had the greatest share in the tragedy. Anthony Serrovita, being on his way thither, at the distance of a few miles, observed a black cloud, like night, hovering over the city, when there arose from the mouth of Mount Gibello great spires of flame, which spread all around. The sea all of a sudden began to roar and rise in billows; and there was a blow as if all the artillery in the world had been at once discharged. The birds flew about, the cattle ran crying, and the horses stopped short, trembling; so that he and his companions were forced to alight. They were no sooner off, but they were lifted from the ground above two palms; when looking towards Catania, he with amazement saw nothing but a thick cloud of dust in the air. Of that magnificent city, there was not the least footstep to be seen. S. Bonajutus assures us, that of 18,900 inhabitants, 18,000 perished therein.

The great earthquake, however, which happened on the 1st of November, 1755, at Lisbon, affords the clearest example of all the phenomena above mentioned, having been felt violently in many places both on land and at sea, and extended its effects to the waters in many other places where the shocks were not perceived. At Lisbon, in Portugal, its effects were most severe. In 1750 there had been a sensible trembling of the earth felt in this city: for four years afterwards there had been an excessive drought: in so much that some springs, formerly very plentiful of water, were dried, and totally lost. The predominant winds were north and north-east, accompanied with various, though very small, tremors of the earth. The year 1755 proved very wet and rainy; the summer cooler than usual; and for forty days before the earthquake

the city, so that many buildings instantly fell. Then, with a pause scarcely perceptible, the nature of the motions was changed, and the houses were tossed from side to side, with a motion like that of a waggon violently driven over rough stones. This second shock laid almost the whole city in ruins, with a prodigious slaughter of the people. The earthquake lasted in all about six minutes. At the moment of its beginning, some persons on the river, nearly a mile from the city, heard their boat make a noise as if it had run aground, though they were then in deep water; and at the same time they saw the houses falling on both sides of the river. The bed of the river Tagus was in many places raised to its surface. Ships were driven from their anchors, and jostled together with great violence; nor did their masters know whether they were afloat or aground. A large new quay sunk to an unfathomable depth, with several hundreds of people upon it; nor was one of the dead bodies ever found. The bar was at first seen dry from shore to shore; but suddenly the sea came rolling in like a mountain; and about Belem Castle the water rose fifty feet almost in an instant. About noon there was another shock, when the walls of several houses that yet remained opened from top to bottom more than a quarter of a yard, and afterwards closed again so exactly, that scarce any mark of the injury was left.

At Colares, about twenty-nine miles from Lisbon, and two miles from the sea, on the 31st October the weather was clear, and uncommonly warm for the season. About four o'clock P.M. there arose a fog from the sea, which overspread the valleys, a thing very unusual at that season. Soon after, the wind changing to the east, the fog returned to the sea, collecting itself, and becoming exceedingly thick. As the fog retired, the sea rose with a prodigious roaring. On the 1st November the day broke with a serene sky, the wind continuing at east; but about nine o'clock the sun began to grow dim; and about half an hour after was heard a rumbling noise like that of chariots, which increased to such a degree, that it became equal to the explosions of the largest cannon. Immediately a shock of an earthquake was felt, which was quickly succeeded by a second and third; and at the same time several light flames of fire issued from the mountains, resembling the kindling of charcoal. In these three shocks the walls of the buildings moved from east to west. In another situation, from whence the sea coast could be discovered, there issued from one of the hills called Fojo, a great quantity of smoke, very thick, but not very black. This increased with the fourth shock,

stant the earth began to shake a minute or two the river rose six feet, and continued to do so. It ran up at first with so much force, that it broke a ship's hawser. In an hour it opened, and seemed to discharge a great quantity of air: and the agitation in the bay, about a league beyond the bar, was supposed to have been discharged. Ube's, a sea-port town about thirty miles from Lisbon, was entirely swallowed up by repeated shocks and the violence of the sea. Huge pieces of rock were dislodged from the promontory at Ube's, which consists of a mountain containing fine jasper of different colors. The same earthquake was felt over all the provinces of Catalonia, Arragon, and Valencia (near where the Gulf of Cadiz is), a little before 11 o'clock. On the 1st November, the earthquake was immediately preceded by a great noise. Here the shocks continued for fifteen minutes, damaged buildings, throwing down some, and irreparably shattered. In an hour after, the sea and river overflowed their banks with water, under water all the coasts of the bay, to the city, and flowing into the bay, water came on in vast black waves, with foam at the top, and destroyed one-half of a tower at the bar. In the adjacent straits every thing was irreparably lost; for all that was over the beach became a sea, without the least appearance of what it was before. Many of the ships, though they went aboard, were part of these foundered; and many of the ships, out to sea, the unhappy passengers perished, that they threw the ships overboard. The day was serene, and not stirring. At Cadiz, some time after the earthquake began, and lasted for several minutes. The water of the city rushed backwards and forwards, and a great froth arose. At ten minutes after the earthquake was seen coming from the sea, at least sixty feet high, and dashed against the west part of the city, which is very rocky. Though the violence of its force, it at last beat in the breast work of the building, of eight or ten feet of the distance of forty or fifty yards. The wave was gone, some parts of the water were left quite dry, and

came violence with which it came. At four after eleven came a second wave, per that four other remarkable ones; the ten minutes before twelve, the second hour before one; the third ten minutes; and the fourth ten minutes before two. waves, but smaller, and gradually lessened with uncertain intervals till the

earthquake began at 10 A.M. and lasted ten or

twelve minutes. The sea came up to the walls

(a thing never heard of before), and went down

immediately with the same rapidity with which

it arose, leaving a great quantity of fish behind

it. These commotions were repeated eighteen

times, and lasted till 6 P.M. At Tetuan the

earthquake began at the same time it did at Tan-

gier, but lasted only seven or eight minutes.

There were three shocks so extremely violent,

that it was feared the whole city would be de-

stroyed. In the city of Funchal, in the island of

Madeira, a shock of this earthquake was first

perceived at thirty-eight minutes past 9 A.M.

It commenced with a rumbling noise in the air,

like that of empty carriages passing hastily over

a stone pavement. The observers felt the floor

immediately after move with a tremulous motion,

vibrating very quickly. The shock continued

more than a minute; during which space the

vibrations, though continual, were weakened and

increased in force twice very sensibly. The in-

crease after the first remission of the shock was

the most intense. The noise in the air accom-

panied the shock during the whole of its con-

tinuance, and lasted some seconds after the mo-

tion of the earth had ceased; dying away like

a peal of distant thunder rolling through the air.

At three quarters past ten, the sea, which was

quite calm, it being a fine day and no wind

stirring, retired suddenly some paces; then rising

with a great swell, without the least noise, and

as suddenly advancing, overflowed the shore, and

entered the city. It rose fifteen feet perpendi-

cular above the high water mark, although the

tide, which flows there seven feet, was then at

half ebb. The water immediately receded; and

after having fluctuated four or five times between

high and low water mark, it subsided, and the

sea remained calm as before. In the northern

part of the island the inundation was more vio-

lent, the sea there retiring above 100 paces at

first, and suddenly returning, overflowed the

shore, forcing open doors, breaking down the

walls of several magazines and storehouses, leav-

ing great quantities of fish ashore, and in the

streets of the village of Machico. All this was

the effect of one rising of the sea, for it never

afterwards flowed high enough to reach the high-

water mark. It continued, however, to fluctuate

here much longer before it subsided than at Fun-

chal; and in some places farther to the westward,

it was hardly, if at all, perceptible.

Such were the phenomena with which this re-

markable earthquake was attended in those places

where it was violent. The effects of it, however,

reached to an immense distance; and were per-

ceived chiefly by the agitations of the waters,

or some slight motion of the earth. The utmost

boundaries of this earthquake to the south are

unknown; the barbarity of the African nations

rendering it impossible to procure any intelli-

gence from them, except where the effects were

dreadful. On the north, however, we are as-

sured, that it reached as far as Norway and

Sweden. In the former, the waters of several

rivers and lakes were violently agitated. In the

latter, shocks were felt in several provinces, and

all the rivers and lakes were strongly agitated, especially in Dalecarlia. The river Dala suddenly overflowed its banks, and as suddenly retired. At the same time a lake three miles distant, which had no communication with it, bubbled up with great violence. At Fahlun, a town in Dalecarlia, several strong shocks were felt.

Shocks of this great earthquake were felt in several places of France: commotions of the waters were observed at Angoulesme, Bleville, Havre de Grace, &c.; but considerable shocks were felt at Bayonne, Bourdeaux, and Lyons. In many places of Germany its effects were also very perceptible, and throughout the duchy of Holstein. In Brandenburg, the water of a lake called Libsec, ebbed and flowed six times in half an hour, with a dreadful noise, the weather being then perfectly calm. The same agitation was observed in the waters of the lakes Muplgast and Netzo; and at this last place they emitted an intolerable stench. In Holland, the agitations were more remarkable. At Alphen on the Rhine, between Leyden and Woerden, in the afternoon of November 1st, the waters were agitated to such a degree, that buoys were broken from their chains, large vessels snapped their cables, smaller ones were thrown out of the water upon the land, and others lying on land were set afloat. At Amsterdam, about 11 A. M., the air being perfectly calm, the waters were suddenly agitated in the canals, so that several boats broke loose; chandeliers were observed to vibrate in the churches; but no motion of the earth, or concussion of any building was observed. At Leyden also, between half an hour after 10 and 11 A. M., the waters rose suddenly in the canals, and made several perceptible undulations. Round the island of Corsica, the sea was violently agitated, and most of the rivers of the island overflowed their banks. Throughout the Milanese, shocks were felt; at Turin there was felt a very violent one, and in Switzerland many rivers turned suddenly muddy without rain. The lake of Neuchâtel swelled near two feet above its natural level for a few hours. An agitation was also perceived in the waters of the lake of Zurich. At the island of Antigua, there was such a sea without the bar as had not been known in the memory of man; and after it the water at the wharfs, which used to be six feet deep, was not two inches. At Barbadoes, about 2 P. M. the sea ebbed and flowed in an unusual manner; ran over the wharfs and streets into the houses, and continued thus ebbing and flowing till ten at night.

This agitation of waters was perceived in various parts of Great Britain. At Barlborough, in Derbyshire, between 11 and 12 A. M., in a boat house on the west side of a large body of water called Pibley dam, was heard a surprising and terrible noise; a large swell of water came in a current from the south, and rose two feet on the sloped dam-head at the north end of the water. It then subsided; but returned immediately, though with less violence. The water was thus agitated for three quarters of an hour; growing gradually weaker and weaker every time, till it entirely ceased. At Bushbridge and

Cobham in Surry, at Dunstable in Bedfordshire, Dorbysire, and near Durham, at half after ten in the evening, like phenomena are recorded to have appeared. At Eyam-bridge, in the Peak of Derby, an overseer of the lead mines, sitting in his room about eleven o'clock, felt a sudden shock which raised him from his chair, and dislodged plaster from the sides of the room. The room was so violently shaken, that he imagined an engine shaft had been falling in. At this time two miners were employed in carting, or drawing along the drifts of the mines, the one and the other fifty yards or upwards. The more distant end of the drift had just loaded his cart, and was drawing it along; when he was surprised by a shock, which terrified him from his employment, and while he was consulting with the low-workmen what means they should take for their safety, they were surprised by a second shock more violent than the first. The miner who worked about twelve yards told them that the violence of the second shock had been so great, that it caused the wheels to grind upon one another. His account was interrupted by a third shock, which, after an interval of four or five minutes, was succeeded by a fourth; and, about the same space of time after, by a fifth; none of which were more violent than the second. They heard, after every one of a loud rumbling in the bowels of the earth, which continued about half a minute, gradually subsiding, or seeming to remove to a greater distance. At White Rock in Glamorganshire, near the ebb of the tide, and near three quarters after 6 P. M., a vast quantity of water rose with a prodigious noise; floated two large boats, the least of them above 200 tons; broke their moorings, drove them across the river, and almost overset them. The whole rise and fall of this extraordinary body of water did not last more than ten minutes, nor was it felt in any other part of the river, so that it seemed to have sprung out of the earth at that very place. At Lomond in Scotland, about half an hour after 9 A. M., all of a sudden, without the least notice of wind, the water rose against its banks with great rapidity, but immediately subsided. It was as low as any person then present had ever seen it in the greatest summer drought. It then returned towards the shore, and in five minutes rose again as high as before. The agitation continued at the same rate till fifteen minutes after 10 A. M. taking five minutes to rise, and five to subside. From fifteen minutes after eleven, the height of every rise came short of that immediately preceding, and in five minutes to flow, and as many to subside. The water was entirely settled. The greatest peculiar height of this swell was two feet and six inches. A still more remarkable phenomenon attending the earthquake in this lake was, a large stone lying at some distance from the shore but in water so shallow that it could be seen, was forced out of its place, and upon dry land, leaving a deep furrow

all along the way in which it had moved. At Ness, about half an hour after nine, a great agitation was observed in the water. Then the river Oich, which runs on the side of Fort Augustus, into the head of the loch was observed to swell very much, and run to from the loch with a pretty high wave, two or three feet higher than the ordinary level.

The motion of the wave was against the current, and it proceeded rapidly for about 200 paces to the river. It then broke on a shallow, raised three or four feet on the banks, after which it returned gently to the loch. It continued flowing in this manner for about

and the effects of this earthquake were to remarkable agitations of the water, above those already described.

Above are the most striking phenomena which the earthquake of November 1st, 1755, produced on the surface of the earth. Those which happened below ground cannot be known, but the changes observed in springs &c., which in many places very remarkable. At Colares, in the afternoon of the 31st of October, the water in the fountain was greatly decreased: on the morning of the 1st of November it ran very muddy; after the earthquake, returned to its usual clearness as to quantity and clearness. On the mountains of rocks were split; and there were several rents in the ground, but none considerable. In some places where formerly there was no water, springs burst forth, which began to run. Some of the largest mountains in Portugal were impetuously shaken from their foundation; most of them at their summits, split and rent in a peculiar manner, and huge masses of them were thrown down into the subjacent valleys. The rock Alvidar, near the hill Fojo, a parapet was broken off, which was torn from its foundation into the sea. At Macau, on the river Macaus, during the earthquake many springs of water burst forth, some up eighteen or twenty feet, throwing up various colors, which remained on the surface.

A mountainous point, seven or eight miles from St. Ube's, cleft asunder, and threw down vast masses of rock. In Barbary a hill was rent in two; the two halves fell in different ways, and buried two large towns. In one place, a mountain burst open and a stream issued from it as red as blood. At Tanel, the fountains were dried up, so that there was no water to be had till night. A remarkable change was observed in the medicinal baths of Toplitz, a village in Bohemia famous for its baths. These waters were discovered in the year in which time the principal spring of Toplitz had constantly thrown out hot water in the same quantity, and of the same quality. On the morning of the earthquake, between 11 and 12 A. M. the principal spring cast forth a quantity of water, that in half an hour the bath was run over. About half an hour after this, the spring had flowed turbid and muddy; then, having stopped entirely for a moment, it broke forth again with prodigious violence, driving before it a considerable quantity

of reddish ochre. After this it became clear and flowed as pure as before. It still continues to do so; but the water is in greater quantity, and hotter, than before the earthquake. At Angoulême in France, a subterraneous noise like thunder was heard; and presently after the earth opened, and discharged a torrent of water mixed with red sand. Most of the springs in the neighbourhood sunk in such a manner, that for some time they were thought to be quite dry. In Britain no considerable alteration was observed in the earth, except that, near the lead mine in Derbyshire, a cleft was observed about a foot deep, six inches wide, and 150 yards in length.

The shocks of this earthquake were felt most violently at sea. Off St. Lucar, the captain of the Nancy frigate felt his ship so violently shaken, that he thought she had struck the ground; but, on heaving the lead, found he was in a great depth of water. Captain Clark from Denia, in N. lat. 36° 24', between 9 and 10 A. M., had his ship shaken and strained as if she had struck upon a rock, so that the seams of the deck opened, and the compass was overturned in the binnacle. The master of a vessel bound to the American Islands, being in N. lat. 25°, W. long. 40°, and writing in his cabin, heard a violent noise, as he supposed, in the steerage; and shortly after the ship seemed as if she had been suddenly jerked up and suspended by a rope fastened to the mast head. Coming on deck, he found a violent current crossing the ship's way to the leeward. In about a minute, this current returned with great impetuosity, and, at a league distant, three craggy-pointed rocks appeared throwing up water of various colors resembling fire. These phenomena, in two minutes, ended in a black cloud, which ascended very heavily, and after it had risen above the horizon, no rocks were to be seen. Between 9 and 10 A. M. another ship, forty leagues west of St. Vincent, was so strongly agitated, that the anchors, which were lashed, were thrown up. Immediately after this, the ship sunk in the water as low as the main chains. The lead showed a great depth of water, and the line was tinged of a yellow color and smelt of sulphur. The shock lasted about ten minutes, but they felt smaller ones for twenty-four hours. Such were the phenomena of this very remarkable and destructive earthquake, which extended over a tract of at least 4,000,000 of square miles.

The earthquakes, which in 1783 ruined a great part of Italy and Sicily, though much more confined in their extent, than that of 1755, seem to have been not at all inferior in violence. Sir William Hamilton thus states their effects, 'If on a map of Italy, and with your compass on the scale of Italian miles you measure off twenty-two miles, says this writer, and then fixing the central point in the city of Oppido, form a circle, the radius of which will be twenty-two miles; you will include all the towns, villages, &c., that have been utterly ruined, the spots where the greatest mortality happened, and where there have been the most visible alterations on the face of the earth: then extend your compass on the same scale to seventy-two miles, preserving the same centre, and form another circle, you will include the

headed between 31° and 32° of N. lat.; that the greatest force of the earthquake had been exerted from the foot of those mountains of the Apennines called Dijo, Sacro, and Caulene, extending west to the Tyrrhene sea; that the towns, villages and farm-houses nearest these mountains, situated either on the hills or the plain, were totally ruined by the shock of the 5th of February about noon; that even the more distant towns had been greatly damaged by the subsequent shocks of the earthquakes, and effectually by those of the 7th, 26th, and 28th, of February, and that of the 1st of March; that from the first shock of the 5th of February, the earth had been in a continual tremor; and that the motion of the earth had been either whirling like a vortex, horizontal, or by pulsations, or by beatings from the bottom upwards. This variety of motions increased the apprehensions of the miserable inhabitants, who expected every moment that the earth would open under their feet, and swallow them up. These phenomena had been attended with irregular and furious gusts of wind: and from all these causes, the face of that part of Calabria comprehended between 28° and 39° was entirely altered. See CALABRIA. The number of lives lost was estimated at 32,367; but Sir William Hamilton is of opinion, that, including strangers, it could not be less than 40,000. The fate of the inhabitants of Scilla was extremely affecting. On the first shock of the earthquake, February 5th, they had fled to the sea-shore, where they hoped for safety; but in the night a furious wave overflowed the land for three miles, sweeping off in its return 2473 of the inhabitants, among whom was the prince himself, who were at that time either on the strand, or in boats near the shore.

Sir William Hamilton landed on the 6th of May at Pizzo in Calabria Ultra. This town is situated on a volcanic tufa, and had been greatly damaged by the earthquake of February 5th, but completely ruined by that of the 28th March. He was told that the volcano of Stromboli, which is in full view of the town, though distant about fifty miles, had smoked less and thrown up a

down: but that they gave no sensible of its approach. 'I have observed, that, in the suffered most by earthquakes, the neighing of a horse, goose, always drove people, and was the occasion of many Ave Marias being repeated, shock.' From Monteleone in plain, passing through many which had been more or less their vicinity to the plain. had not a house left standing he saw Soriano, and the D heap of ruins. Passing thro of St. Pietro, in his way to distant view of Sicily and which then sent forth a con before his arrival at Rosarno swampy plain, in many p shown small hollows in the an inverted cone. They w as was the soil near them that, during the earthquake fountain of water, mixed driven up from each of th deable height. Before th the river was dry; but so overflowed its banks. The had been constant with resp in the plain, during the drea of February. In the other nomenon had been exhibit always low and rushy. Be Rosarno they passed the strong timber bridge, 700 cracks made in the banks o river by the earthquake, it in one part; and, the level were placed having been bridge had taken an undula rail on each side was curious separated parts having been then passable. The town of It of Monteleone's palace, wa

ents had quitted. Their course down the was sufficiently rapid to prove that it had been a perfect level. The earthquake, he says, had opened some depositories of rain in the clay hills which surround the valley; water, mixed with the loose soil, taking course suddenly through the undermined surrounding it up with the large olive and mulberry trees, and a thatched cottage, floated the piece of ground, with all its vegetation, a mile down the valley, where it then lay with most of the trees erect. These two were about a mile long and half a mile wide. 'I travelled,' says he afterwards, 'four miles in this plain, in the midst of such misery as has been described. The force of the earthquake was so great, that all the inhabitants of the towns were buried, alive or dead, in the ruins of their houses in an instant. The town of Oppido was large, but ill situated between two ravines that were subject to overflow: 2100 out of 2500 lost their lives here on the fatal 5th of February.' At Casal Nuova the princess Gerace, with 4000 of her subjects, perished on the same day by the explosion. Some who had escaped alive out of the ruins, told our author, they had felt their houses fairly lifted up without having the least previous notice. An inn at Casal Nuova was at that moment overlooking the plain; when, feeling the ground turning round, instead of the town he saw a thick cloud of white dust like smoke, the mortal effect of the crushing of the buildings, and mortar flying off. Casal Nuova was so completely destroyed by this dreadful shock, that not a house nor street remained, but all lay in a confused heap of ruins. Castillace, and Milite, were both in the same situation. Terra Nuova, situated in the same plain, stood between two ravines, which, with the torrents from the mountains, had cut deep and wide chasms in the sandy clay soil of which it is composed. At Oppido the ravine is not less than 500 feet deep, and three quarters of a mile broad. 'Here, at the great depth of the ravine, and the violent motion of the earth, two huge portions of matter, on which a great part of the town stood, consisted of some hundred houses, had been heaved into the ravine, and nearly across it, at the distance of half a mile from the place where they formerly stood; and what is very extraordinary, many of the inhabitants who had taken a singular leap in their houses, were nevertheless dug out alive, and some unhurt.' Sir William's guide there, who was both a priest and a doctor, having been buried in the ruins of his house by the first shock, was immediately blown off it and delivered by the second. There are many well attested instances of the same phenomenon having happened in different parts of Calabria. Part of the rock on which the city of Oppido was detached, with several houses, into the ravine: 'But that,' says Sir William, 'is a trifling circumstance in comparison of the very great tracts of land, with plantations of vines and olives, which had been detached from one side of the ravine to the other, at the distance is more than half a mile.' It is well attested, that a countryman, who was

ploughing his field in this neighbourhood with a pair of oxen, was transported with his field and team clear, from one side of a ravine to the other, and that neither he nor his oxen were hurt. Having walked over the ruins of Oppido, I descended into the ravine, and examined carefully the whole of it. Here I saw indeed the wonderful force of the earthquake, which has produced exactly the same effects as those described in the ravine at Terra Nuova, but on a scale infinitely greater. The enormous masses of the plain, detached from each side of the ravine, lie sometimes in confused heaps, forming real mountains, and having stopped the course of two rivers, one of which is very considerable, great lakes are already formed; and if not assisted by nature or art, so as to give the rivers their due course, must infallibly be the cause of a general infection in the neighbourhood. Sometimes I met with a detached piece of the surface of the plain, of many acres in extent, with the large oaks and olive trees, with corn or lupins under them, growing as well and in as good order at the bottom of the ravine as their companions, from whence they were separated, do on their native soil, at least 500 feet higher, and at the distance of about three quarters of a mile. I met with whole vineyards in the same order in the bottom, that had likewise taken the same journey. As the banks of the ravine, from whence these pieces came, are now bare and perpendicular, I perceived that the upper soil was a reddish earth, and the under one a sandy white clay, very compact, and like a soft stone. The impulse these huge masses received, either from the violent motion of the earth alone, or that assisted with the additional one of the volcanic exhalations set at liberty, seems to have acted with greater force on the lower and more compact stratum, than on the upper cultivated crust: for I constantly observed, where these cultivated lands lay, the under stratum of compact clay had been driven some hundred yards farther, and lay in confused blocks; and, as I observed, many of these blocks were in a cubical form. The under soil, having had a greater impulse, and leaving the upper in its flight, naturally accounts for the order in which the trees, vineyards, and vegetation fell, and remain at present in the bottom of the ravine. In another part of the bottom of the ravine, there is a mountain composed of the same clay soil, and which was probably a piece of the plain detached by an earthquake at some former period: it is about 250 feet high, and 400 feet diameter at its basis. This mountain, as is well attested, has travelled down the ravine near four miles; having been put in motion by the earthquake of the 5th of February. The abundance of rain which fell at that time, the great weight of the fresh detached pieces of the plain, which I saw heaped up at the back of it, the nature of the soil, of which it is composed, and particularly its situation on a declivity, account well for this phenomenon; whereas the reports which came to Naples, of a mountain having leaped four miles, had rather the appearance of a miracle. I found some single timber trees also, with a lump of their native soil at their roots, standing upright in the bottom of the ravine, and which

had been detached from the bottom of the plain above-mentioned. I observed also, that many confused heaps of the loose soil, detached by the earthquake from the plains on each side of the ravine, had actually run like volcanic lava (having probably been assisted by the heavy rain) and produced many effects much resembling those of lava, during their course down a great part of the ravine. At Santa Cristina, near Oppido, the like phenomena have been exhibited, and the great force of the earthquake of the 5th of February seems to have been exerted on these parts, and at Casal Nuova, and Terra Nuova.' At Reggio the shock had been much less violent than in the places he had hitherto visited; and 'though there was not a house in it inhabited or habitable, yet' says he, 'after having been several days in the plain, where every building is levelled with the ground, a house with a roof, or a church with a steeple, was to me a new and refreshing object.' In this place he had an account from the archbishop of the earthquakes of 1779 and 1780, which obliged the inhabitants, in number 16,400, to remain in barracks for several months, without having done any considerable damage to the town. He was informed also, that all animals and birds are in a greater or less degree much more sensible of an approaching shock of an earthquake, than any human being; but that geese, above all, seem to be the soonest and most alarmed at the approach of a shock; if in the water, they quit it immediately; and will not be driven into it for some time after. The shock which damaged Reggio came on gently, so that the people had time to make their escape, and only 126 were killed; but in the plain this shock was as instantaneous as it was violent and destructive. On the 14th of May, Sir William Hamilton left Reggio, and set sail for Messina. He found that the shock, though very violent there, had been far inferior to what he had seen the effects of in other places. Many houses, even in the lower part of the town, were standing, and some little damaged; but, in the upper and more elevated situations, the earthquakes seemed to have scarce had any effect. 'A strong instance (says our author) of this is, that the convent of Santa Barbara, and that called the Novitiato de Gesniti, both on an elevated situation, have not a crack in them; and that the clock of the latter has not been deranged in the least by the earthquakes, which have afflicted this country for four months past, and which still continue in some degree.' Notwithstanding this comparative mildness, the shock at Messina had been very terrible. All the beautiful front of the palazzate, which extended in very lofty uniform buildings, in the shape of a crescent, had been in some parts totally ruined, in others less; and there were cracks in the earth of the quay, a part of which had sunk above a foot below the level of the sea. During the earthquake, fire had been seen to issue from the cracks of the quay; but our author is persuaded that this was only a vapor charged with electrical fire, or inflammable air. Here also he was informed, that the shock of the 5th of February had been from the

bottom upwards; but the subsequent motion was generally horizontal or vorticeous. A remarkable circumstance was observed at Messina, through the whole coast of Calabria, which had been most affected by the earthquake, viz. small fish called cicirelli, resembling the white bait, but larger, and which usually live at the bottom of the sea buried in the mud, ever after the commencement of the earthquake, to the time this account was written, were to be taken near the surface, and in such abundance as to be common food for the poor of the people; whereas before the earthquake this fish was rare, and reckoned among the greatest delicacies. Fish of all kinds were taken in greater abundance on these coasts, after the commencement of the earthquake, than before; which our author supposes to have been occasioned either by the volcanic matter heated the bottom of the sea, or by the continual tremor of the earth had forced them out of their retreats. At Messina, Sir William told that on the 5th of February, and for several days following, the sea, about a quarter of a mile from the citadel, rose, and boiled in an extraordinary manner, and with a most dreadful alarming noise; the water in other parts of the strait being perfectly calm. 'This, our author seems to point out exhalations or eruptions of cracks at the bottom of the sea, which probably have happened during the shocks of the earthquakes; all of which I am persuaded have here a volcanic origin.'

In various parts of South America, earthquakes have been equally tremendous and frequent. It is remarkable that the city of Lima, the capital of Peru, situated in about 12° of S. although scarcely ever visited by hurricanes, and equally unacquainted with rain, snow, and lightning, has been singularly exposed to the fury of earthquakes, which happen frequently, that the inhabitants are under constant apprehensions of being, from their situation, and violence, buried in the ruins of their houses: yet these earthquakes, though so dreadful, have their presages; one of the most common which is a rumbling noise in the bowels of the earth, about a minute before the shock comes; that seems to pervade all the adjacent contiguous part; this is followed by loud baying of the dogs, who seem to perceive the approaching danger. The beasts of the city, passing the streets stop, and by a sudden start spread open their legs, thus bettering themselves from falling. On these occasions terrified inhabitants fly from their houses, the streets with such precipitation, that if it happens in the night, they appear quite regardless of the urgency of the danger at once, without any sense of delicacy or shame. Thus the streets exhibit such odd and singular figures, that they afford matter of diversion, were it possible to be diverted in so terrible a moment. The concourse is accompanied with the cries of the children waked out of their sleep, mingled with lamentations of the women, whose prayers to the saints increase the confusion and confusion. The men are also in

to refrain from giving vent to their rage, so that the whole city exhibits a dreadful consternation and horror.

Earthquakes that have occurred at the West of Spanish America are very numerous. Since the establishment of the Spaniards in 1532; but the damage was much less than in some of the succeeding years. After, Lima was again visited by an earthquake, so dreadful, that it is still commemorated every year. In 1609 was a third, which overturned many

On the 27th of November, 1690, such damage was done in the city by an earthquake, that, in acknowledgment of its not being entirely demolished, a festival on the 1st is annually celebrated. Twenty-four days afterwards, on the 3rd of November, the principal edifices in the city, and a great number of houses, were destroyed by a similar shock; but the inhabitants retiring, few perished. Another dreadful percussion occurred in 1678; but one of the most terrible was the 28th of October, 1687. It began at the morning, and destroyed many of the public buildings and houses, in which a number of the inhabitants perished; but this was more than a prelude to what followed, for two hours afterwards the shock was, with such impetuous concussions, that the city lay in ruins, and the inhabitants felt themselves happy in being only spectators of the devastation by having saved their lives, with the loss of all their property. This second shock the sea, retiring consequently, and then returning in mountainous waves, entirely overwhelmed Callao, which is at a distance from Lima, and all the adjacent country, together with the miserable inhabitants. From this time six other earthquakes occurred at Lima previous to that of 1746, on the 1st of October, at half an hour after ten at which the concussions began with such violence, that, in little more than three minutes, almost part, if not all the buildings in the city were destroyed, burying under their ruins inhabitants who had not made sufficient provision for the streets and squares, the only place of safety. At length the horrible effects of the first shock ceased; but the tranquillity of short duration, the concussions swiftly following each other. The fort of Callao also lay in ruins; but what it suffered from the earthquake in its building was inconsiderable, compared to the dreadful catastrophe allowed; for the sea, as is usual on such occasions, receding to a considerable distance, lay in mountainous waves, foaming with violence of the agitation, and suddenly inundated Callao and the neighbouring country in it. This, however, was not entirely prevented by the first swell of the waves; for the sea, returning further, returned with still greater violence, and covered both the walls and buildings of the place; so that what even escaped the first inundation, was totally swallowed by those succeeding mountainous waves. Twenty-three ships and vessels, great and small, were then in the harbour, nineteen of

which were sunk, and the other four, among which was a frigate named *St. Fermin*, were carried by the force of the waves to a considerable distance up the country. This terrible inundation and earthquake extended to other parts on the coast, and several towns underwent the same fate as the city of Lima; where the number of persons who perished, within two days after it began, amounted, according to the bodies found, to 1300, beside the maimed and wounded, many of whom lived only a short time in great torture.

Various theories have been invented to explain the phenomena of earthquakes. Till lately, the hypotheses of modern philosophers were much the same with those of the ancients. Anaxagoras supposed the cause of earthquakes to be subterranean clouds bursting out into lightning, which shook the vaults that confined them. Others imagined that the arches, which had been weakened by continual subterranean fires, at length fell in. Others derived these double convulsions from the rarefied steam of waters heated by some neighbouring fires (an hypothesis revived in modern times by M. Dolomieu); whilst some, among whom was Epicurus, and several of the Peripatetics ascribed them to the ignition of certain inflammable exhalations. This last hypothesis has been adopted by many of the most celebrated moderns, as Gassendus, Kircher, Schottus, Varenus, Des Cartes, Du Hamel, Honori-rius, Fabri, &c. The philosopher last mentioned, indeed supposed, that waters prodigiously rarefied by heat, might sometimes occasion earthquakes. The others supposed, that there are many and vast cavities under ground, which have a communication with one another: some of which abound with waters; others with vapours and exhalations, arising from inflammable substances, as nitre, bitumen, sulphur, &c. These combustible exhalations they supposed to be kindled by a subterranean spark, or by some active flame gliding through a narrow fissure from without, or by the fermentation of some mixture; and when this happens, that they may necessarily produce pulses, tremors, and ruptures at the surface, according to the number and diversity of the cavities, and the quantity and activity of the inflammable matter. This hypothesis they illustrated by a variety of experiments, such as mixtures of iron filings and brimstone buried in the earth, gun-powder confined in pits, &c., by all which a shaking of the earth will be produced. Dr. Woodward suggests another hypothesis. He supposes that the subterranean heat or fire, which is continually elevating water out of the abyss, which, according to him, occupies the centre of the earth, to furnish rain, dew, springs, and rivers, may be stopped in some particular part. When this obstruction happens, the heat causes a great swelling and commotion in the waters of the abyss; and at the same time, making the like effort against the superincumbent earth, that agitation and concussion of it is occasioned which we call an earthquake. M. Amontons, supposing the atmosphere to be about forty-five miles high, and that the density of the air increases in proportion to the absolute height of the superincumbent column of fluid,

creases the spring of the air above what it has in its natural state, in our climate, by a quantity equal to a third of the weight wherewith it is pressed. Whence we may conclude, that a degree of heat, which on the surface of the earth will only have a moderate effect, may be capable of a very violent one below. And, as we are certain that there are in nature degrees of heat much greater than that of boiling water, it is possible there may be some whose violence, further increased by the immense weight of the air, may be sufficient to break and overturn this solid orb of 43,528 fathoms; whose weight, compared to that of the included air, would be but a trifle.

In March, 1749, an earthquake was felt at London and several other places in Britain. Dr. Stukely, who had been much engaged in electrical experiments, began to suspect that phenomena of this kind ought to be attributed not to vapors or fermentations generated in the bowels of the earth, but to electricity. In a paper published by him on this subject, he rejects all the above hypotheses for the following reasons:—1. That there is no evidence of any remarkable cavernous structure of the earth; but that, on the contrary, there is reason to presume that it is in a great measure solid, so as to leave little room for internal changes and fermentations within its substance; nor do coal-pits, when on fire, ever produce any thing resembling an earthquake. 2. In the earthquake at London, in March 1749, there was no such thing as fire, vapor, smoke, smell, or an eruption of any kind observed, though the shock affected a circuit of fifty miles in diameter. This consideration alone, of the extent of surface shaken by an earthquake, he thought sufficient to overthrow the supposition of its being owing to the expansion of any subterraneous vapors. For, as small fire-balls hursting in the air propagate a sulphureous smell to the distance of several miles, it cannot be supposed that so immense a force, acting instantaneously on that compass of ground, should never break the surface of it;

cept electricity. So in Asia must have been 300 miles in base, and 200 in the axis of gun-powder that has been motion of it, much less any far below the surface, could A subterraneous explosion in the manner in which ships, even fish, are affected during subterraneous explosion, gradual swell, and not give to the water as would make From these circumstances it that an earthquake was a shock as those in electrical experiments hypothesis was confirmed, attending earthquakes, partly and 1750, which gave rise. The weather, for five or six been uncommonly warm; south-west, without rain; have been in a state peculiar electrical shock. Before London, all vegetables had been and electricity is well known. The aurora borealis about that time; and, just had been twice repeated never been seen before. T southerly, contrary to what land; so that the Italians, and earthquakes were frequent, earthquake. The year had fire-balls, lightning, and com are meteors of an electrical circumstances, nothing, produce an earthquake, but non-electric body; which from the atmosphere. Hence non-electric cloud discharge part of the earth, in that an earthquake must necessarily charge from an excited tubation in the human body, so electric matter from many miles

(shakes) he thought could be accounted for by electrical principles; for, in a subterranean eruption, the direct contrary would happen. Arses and sulphureous smells, which are often observed in earthquakes, might, he thought, be more easily accounted for on the supposition of their being electrical phenomena, than their being occasioned by eruptions from the bowels of the earth. So also the suddenness of the concussion, felt at the same instant over such a large surface, and the little distance also which earthquakes generally occupy, sufficiently point out what sort of motion is not a convulsion of the bowels of the earth, but a uniform vibration along its surface, like that of a musical string, or a glass, when vibrated on the edge with one's finger. The circumstance of earthquakes chiefly affecting the low, marshy places along rivers, &c., is a further argument of their being electrical phenomena. It is illustrated by a particular account of the earthquake in which the earthquake was conveyed. The argument he uses is taken from the effects it had on persons of weak constitutions, who for a day or two after it happened, troubled with pains in the back, rheumatism, hysterics, and other disorders; just in the same manner as could have been after an actual electrical discharge to some, these disorders proved fatal. The hypothesis was advanced by Signior Becchi, without knowing any thing of Dr. Stukely's series.

Priestley, in his History of Electricity, observes, upon these theories, that a more probable hypothesis may be formed out of them both. 'Now,' says he, 'the electric matter to be accumulated in one part of the surface of the earth, is in account of the dryness of the season not able to diffuse itself; it may force its way into the higher regions of the air, forming clouds in the passage out of the vapors which float in the atmosphere, and occasion a sudden shower, which may further promote the passage of the electric fluid. The whole surface, thus unloaded, will be subject to a concussion, like any other conducting surface, on parting with, or receiving, a quantity of the electric fluid. The rushing noise will be swept over the whole extent of the country. And upon this supposition also the lightning in its discharge from the country, will naturally follow the course of the rivers, and also the advantage of any eminences to facilitate the ascent into the higher regions of the air.' Dr. Stukely, making experiments with a battery on the passage of the electrical fluid over different conducting substances, and, among these, over water, and remarking a resemblance between the passage over the surface of the water, and the manner in which Dr. Stukely supposed to sweep the surface of the earth, when a considerable quantity of the electric fluid is discharged to the clouds during an earthquake, immediately suspected that the water which it passed, and which was visibly set into a tremulous motion, must receive a motion resembling that which is given to the surface of the sea on such occasions. To try this, he himself, and others present, put their hands into the water at the time that the electric flash passed over its surface; and they felt a sudden

concussion given to them, exactly like that which affects ships at sea during an earthquake. This percussion was felt in various parts of the water, but was strongest near the place where the explosion was made. 'This similarity in the effect,' he says, 'is a considerable evidence of a similarity in the cause. Pleased with this resemblance of the earthquake, I endeavoured to imitate that great natural phenomenon in other respects: and, it being frosty weather, I took a plate of ice, and placed two sticks about three inches high on their ends, so that they would just stand with ease; and upon another part of the ice I placed a bottle, from the cork of which was suspended a brass ball with a fine thread. Then, making the electrical flash pass over the surface of the ice, which it did with a very loud report, the nearer pillar fell down, while the more remote stood; and the ball which had hung nearly still, immediately began to make vibrations about an inch in length, and nearly in a right line from the place of the flash. I afterwards diversified this apparatus, erecting more pillars, and suspending more pendulums, &c.; sometimes upon bladders stretched on the mouth of open vessels, and at other times on wet boards swimming in a vessel of water. This last method seemed to answer the best of any; for the board representing the earth, and the water the sea, the phenomena of them both during an earthquake may be imitated at the same time; pillars, &c., being erected on the board, and the electric flash being made to pass either over the board, over the water, or over them both.' The last three hypotheses, though somewhat differing, yet agree in the main; but, if a particular solution of the phenomena is required, every one of them will be found deficient: nor does the theory of this subject appear to have been sufficiently understood to be worth pursuing much further; we only therefore add that the late Dr. Mason Goode attempts to account for the phenomena of earthquakes by the old theory of subterraneous fires.

That fires to an enormous extent, and produced by various causes, may exist at different depths beneath the surface of the earth, must, he thinks, be clear to every one who has attentively considered the subject: and he quotes a curious series of experiments, lately conducted by Sir James Hall, to prove that where the substances in which such fires occur lie profound, and are surmounted by a very deep and heavy superincumbent pressure; and, more especially, where they, at the same time, contain large portions of elastic gases; the effects of such fires will be prodigiously greater, and more diversified, than where these circumstances are absent.

Earthquakes and volcanoes may be reckoned, for the most part, as this writer supposes, among the most powerful and extraordinary of these effects; and, as resulting from those chemical changes which the agency of fire principally produces in the interior of the solid crust of the globe. They have, probably, little further connexion with electricity, he says, than as causes that occasionally destroy the equilibrium; for although some authors have inferred, from the great velocity with which the shock of an earthquake is transmitted from place to place, that its

nature must be electrical; yet others have, with greater probability, attributed the rapid succession of the effects to the operation of a single cause, acting like subterranean heat, at a great distance below the earth's surface. There are, however, some circumstances which indicate such a connexion between the state of the atmosphere and the approach of an earthquake, as cannot easily be explained by any hypothesis. The shocks of earthquakes, and the eruptions of volcanoes, continues Dr. G., are in all probability modifications of the effects of one common cause; the same countries are liable to both of them; and, where the agitation produced by an earthquake extends farther than there is any reason to suspect a subterraneous commotion, it is probably propagated through the earth nearly in the same manner as a noise is conveyed through the air. See VOLCANO.

**EARWAX.** See ANATOMY.

**EARWIG,** in zoology. See FORFICULA.

**EASDALE,** a small island of the Hebrides, annexed to Argyshire, about one mile and a half in diameter. It is famous for having afforded a great quantity of slate (*ardesia tegularis*). This, indeed, occupies the whole island, which is also traversed in many places with basaltic veins, and thin layers of quartzose and calcareous stones.

Reflects the tints of many a peak

Caught by the laughing tides that lave

These Edens of the *eastern* wave. *Byron. Bride of Abydos.*

EAST, one of the four cardinal points of the  
 world; being that point of the horizon where  
 the sun is seen to rise when in the equinoctial.

In Italy, and throughout the Mediterranean, the  
 east wind is called the levante: in Greek ανατολη  
 and ανατολης, because it comes from the side of  
 the sun, ανατολη; in Latin, *orient*.

EA'STER, n. s. Sax. eartne; Dut. ooster;  
 Germ. ostern. The day on which the Christian  
 church commemorates our Saviour's resurrection.

See below.

Didst thou not fall out with a taylor for wearing his  
 new doublet before *Easter*? *Shakespeare. Romeo and Juliet.*

Victor's unbrother-like heat towards the *Eastern*  
 churches, in the controversy about *Easter*, lamented  
 that difference into a schism. *Decay of Poetry.*

EASTER is called by the Greeks, Πάσχα, and  
 by the Latins Pascha, from פֶּסַח, a Hebrew word  
 signifying passage, applied to the Jewish feast of

the passover. It is called Easter in English, from the Saxon goddess Eostre, whose festival was held in April. The Asiatic churches kept their Easter upon the very same day that the Jews observed their passover, and others on the first Sunday after the first full moon in the new year. This controversy was determined in the council of Nice; when it was ordained that Easter should be kept upon one and the same day, which should always be Sunday, in all Christian churches in the world. But though the Christian churches differed as to the time of celebrating Easter, yet they all agreed in showing particular respect and honor to this festival. On this day, prisoners and slaves were set free, and the poor liberally provided for. The eve or vigil of this festival was celebrated with more than ordinary pomp, which continued till midnight, it being a tradition of the church that our Saviour rose a little after midnight; but in the east the vigil lasted till cock-crowing. It was in conformity to the custom of the Jews, in celebrating their passover on the fourteenth day of the first month, that the primitive fathers ordered that the fourteenth day of the moon, from the calendar new moon which immediately follows the 21st of March, at which time the vernal equinox happened upon that day, should be deemed the paschal full moon, and that the Sunday after should be Easter-day; and it is upon this account that the English rubric has appointed it upon the first Sunday after the first full moon immediately following the 21st day of March. Whence it appears that the true time for celebrating Easter, according to the intention of the council of Nice, was to be the first Sunday after the first full moon following the vernal equinox, or when the sun entered into the first point of Aries; and this was pope Gregory's principal design in reforming the calendar, to have Easter celebrated according to the determination of the council of Nice. For finding Easter, see CHRONOLOGY.

EASTER ISLAND, an island in the South Sea, thought to have been first discovered, in 1686, by one Davis an Englishman, who called it Davis's Land. It was next visited by commodore Roggewein, a Dutchman, in 1722, who gave it the name of Easter Island, and published many fabulous accounts concerning the country and its inhabitants. It was also visited by a Spanish ship in 1770, the captain of which gave it the name of St. Carlos. The most authentic account of this island, however, which has appeared, is that of captain Cook and Mr. Forster, who visited it in March 1770. According to them, the island is about ten or twelve leagues in circumference, and of a triangular figure; its greatest length from north-west to south-east is about four leagues, and its greatest breadth two. The hills are so high that they may be seen at the distance of fifteen or sixteen leagues. The north and east points of the island are of a considerable height; between them, on the south-east side, the shore forms an open bay, in which captain Cook thinks the Dutch anchored in 1722. He himself anchored on the west side of the island, three miles north from the south point. This, he says, is a good road with easterly winds, but a dangerous one when the wind blows from the contrary quarter,

as the other on the south-west, with easterly winds: so that there is no occasion to be had for shipping in this island. The island is extremely barren, and bears evident marks not only of a country that has been not very long ago ruined by an eruption. As they approached the south point, Mr. Forster informed them of several broken rocks, whose appearance, and black and ferruginous texture, to indicate that they had been the seat of a terraneous fire. Two detached rocks, at a quarter of a mile off this point, were singular on account of their shape, one a huge column; and both were inhabited by multitudes of sea-fowls. On landing into the country, they found the ground strewn with rocks and stones of all sizes, which seemed to have been exposed to a great fire, and to have acquired a black and rough texture. Several shrivelled stones grew among these stones, and of a late appearance of the country. As they advanced, the more ruinous the country seemed to be. The rocks were rugged, and filled with heaps of stones, among which the Europeans could pass in any way but with the greatest difficulty. They leaped from one stone to another with surprising agility and ease. As they went along the island, they found the stones still of the same nature; till at last a large rock of black melted lava, was seen to contain some iron, and on which there was no soil nor grass, nor any mark of vegetation, notwithstanding this general barrenness there are several large tracts of cultivated soil, which produces potatoes of a yellow color, as sweet as carrots, and sugar-canes. The soil is a dry one, and the inhabitants use the grass between the stones in other parts of the island, and for preserving their children from the heat of the sun. The most remarkable curiosity belonging to this island is a number of colossal statues of a very few remain entire. These statues are only on the sea-coast. On the interior of the island were seen the ruins of the stone work, on each of which had been these large statues; but they were broken from two of them, and one from three. The largest of these statues were broken or defaced by the sea. One that had fallen measured fifteen feet in height, and six broad over the shoulders: each of its head a large cylindric stone, and wrought perfectly round. Others that measured nearly twenty-several of eight feet over the shoulders. The largest one was seen standing, the diameter of which was sufficient to shelter all the people of nearly fifty persons, from the sun. The workmanship is rude, but the features of the face all formed long, according to the distortion of the country, and the bodies have each a human figure about them. The island is in general brackish, but the water is well perfectly fresh, which is to

of a brown color and middle size. They are rather thin; go entirely by punctures on their bodies, and to all the inhabitants of the islands. Their greatest singularity is in their ears, the lobe of which is so that it almost rests on their shoulder; with a very large hole, capable of four or five fingers with ease. The for their ears are the white downy rings made of the leaf of the sugarcane, elastic, and for this purpose like a watch-spring. Some were the same cloth used in Otaheite, light orange color with turmeric. A surprising circumstance with respect to them, is the apparent scarcity of them. The nicest calculation that never brought the number of inhabitants to be above 700, and of these bore no proportion in number. Either they have but few females, or they were restrained from appearing on the ship. Those who appear a very loose description. The natives are in general low, small, and scarcely capable of persons; but there are some of constructed in the form of an infantry or sixty feet long, and ten or fifteen several entrances on one side; these exceed three feet in height. In addition they have also a kind of swellings. Their canoes are few, and of carrying above four men: fit to vessels, they support them by means of sugar-canes, neatly covered in feet and a half long by fifteen. The workmanship is tolerably good. Voyagers have found them active. Fish are not plentiful on the island, and sea birds are far from numerous, the only quadruped that has been seen. Easter Island is thirty-six miles long.  $109^{\circ} 46' W.$ , lat.

that part of Labrador, or New Brunswick eastward of James's Bay. Riven, a river of Canada, also which enters James's Bay, in lat.  $78^{\circ} 45' W.$

COMPANY. See INDIA.

Town of the United States, in the capital of Talbot county, formerly Court-House. It is seated on the Tappan Bay, near the branches of the Tappan, twelve miles above its confluence with the Hudson; five miles south by the river; fifty south-east by south and 118 south-west of Philadelphia. Easton, a township of Massachusetts county, famous for its manufactures of iron and steel, and a manufacture of iron is seated near the head of the river, six miles north-west of the city and twelve west of Bridgewater. It is of New York, in Washington county, Pennsylvania, the capital of the county, seated at the mouth of

the Lehigh, on the west side of the Delaware. Twelve miles north-east of Bethlehem, and seventy north of Philadelphia.

EAST RIVER, a river, or channel, of North America, between Long Island and New York Island, and between the state of Connecticut and Long Island. It is often called Long Island Sound. 2. A river of West Florida, which runs into Pensacola Bay, in long.  $86^{\circ} 50' W.$ , lat.  $30^{\circ} 34' N.$  3. A river of America, which runs into the West River, in the province of Maine, in long.  $67^{\circ} 20' W.$ , lat.  $44^{\circ} 46' N.$

EAT, *v. a. & v. n.*

EATABLE, *adj. & n. s.*

EATER, *n. s.*

EATING,

EATING-HOUSE.

Sax. *etan*; Belg. *etian*; Goth. *etan*, or *etan*; Sw. *etan*; Erse. *etan*; Lat. *edere*; Gr. *phagein*. To take food; masticate and swallow food; devour; hence, generally, to gnaw; consume; wear or waste away; corrode. Eatable means that may be, or any thing that is, eaten.

And alle *eten* the same spiritual mete, and alle drunken the same spiritual drynk, that drunken of the same spiritual stoon folewyng beem, and that stoon was Crist.

Wiclif. 1 Cor. x.

Locusts shall eat the residue of that which is escaped from the hail, and shall eat every tree which groweth.

Ezekiel x. 4.

The righteous *eateth* to the satisfying of his soul, but the belly of the wicked shall want.

Prov. xiii. 25.

And will not suffer hem by non assent,

Neyther to ben ybered ne ybrent,

But maketh boundes etc hem in despyte.

Chaucer. Cant. Tales.

And as of old time God decreed his wondrous benefits of the deliverance of his people, to be kept in memory by the *eating* of the passover, with his rites and ceremonies.

Homilies of the Church.

Thou art past the tyrant's stroke;

Care no more to cloath and eat.

Shakespeare. Cymbeline.

Thou best of gold art worst of gold;

Other less fine in carat is more precious,

Preserving life in medicine potable:

But thou, most fine, most honored, most renowned,

Hast eat thy bearer up. Id. Henry IV.

A knave, a rascal, an eater of broken meats. Id.

The difference between a rich man and a poor man is this—the former *eats* when he pleases, and the latter when he can get it. Sir W. Raleigh.

Other states cannot be accused for not staying for the first blow, or for not accepting Polyphemus's courtesy, to be the last that shall be eaten up.

Bacon's War with Spain.

The Caribbees and the cannibals, almost all, are *eatens* of man's flesh. Ashmole's Description of the World.

They cannot hold, but burst out those words which afterwards they are forced to eat.

Hakewell. On Providence.

As if the lotus grew only here, the virtue of whose fruit is to cause the *eatens* an oblivion of all other evils.

Huvel.

As riches increase, says Solomon, so do the mouths that devour them. The master's mouth has no more than before. The owner, methinks, is like Oonon in the fable, who is perpetually winding a rope of hay, and an ass at the end perpetually eating it. Cowley.

If the taste of this fruit maketh the *eatens* like gods, why remainest thou a beast?

Brown's Vulgar Errors.

Racing races,

Lydian airs.

Milton.

Credit were not to be lost  
By a brave knight-errant of the post,  
That *eats*, perfidiously, his word,  
And swears his ears through a two inch board.

*Hudibras.*

They entail a secret curse upon their estates, which  
does either insensibly waste and consume, or *eat* out  
the heart and comfort of it.

*Tillotson.*

An hungry traveller steeped into an eating-house for  
his dinner.

*L' Ettrange.*

If you all sorts of persons would engage,  
Suit well your *catables* to every age.

*King's Art of Cookery.*

EATH, *adj. & adv.* Sax. *eað*. Easy; not  
difficult. An old word.

EATON, or ETON, a town of England, in  
Buckinghamshire. See ETON.

EATAW, a small river of South Carolina,  
which runs into the Santee. Near the source of  
this river, in 1781, a battle was fought between  
the British, under colonel Stuart, and the Ame-  
ricans under general Greene; in which the former  
had 500 men killed and wounded; both sides  
claiming the victory.

EAU DE COLOGNE, or water of Cologne,  
a fragrant water, made originally, and in most  
perfection, in Cologne. Formerly many won-  
derful powers were ascribed to this water, but it  
was probably never so much in demand as at  
present, in Europe and America, and number-  
less recipes have been given for its manufacture.  
It was invented by a person named Farina, in  
whose family the secret, as they say, continues to  
be preserved, since chemistry has not been able,  
as yet, to give the analysis of it. It is imitated,  
however, every where. The consumption of this  
perfume has increased much ever since the seven  
years' war; and there exist, at present, fifteen  
manufactories of it in Cologne, which produce  
several millions of bottles yearly; much, also, is  
manufactured at Paris, in Saxony, and other  
places. One of the many recipes to make eau  
de Cologne is the following:—

Alcohol, or spirit of wine, at 30°, two pints.

Oleum neroli	} 24 drops.
— de cedro	
— de cedrat	
— cort aurant	
— citri	
— bergamot	
— rosmarin	

Seed of small cardamum, two drachms.

Distil it in the Mary-bath, until three-fourths of  
the alcohol have evaporated.

EAU DE LUCE, a fragrant alkaline liquor which  
was some years ago in great repute. We are told  
by Mr. Nicholson, in his Journal, that, having  
learned from a philosophical friend that the com-  
mon recipes for making this compound did not  
succeed, and that the use of mastic in it had  
hitherto been kept a secret, he made the follow-  
ing experiments to procure a good eau de luce.  
One dram of the rectified oil of amber was  
dissolved in four ounces of the strongest ardent  
spirit of the shops; its specific gravity being 840  
at 60° of Fahrenheit. A portion of the clear  
spirit was poured upon a larger quantity of  
fine powdered mastic than it was judged could  
be taken up. This was occasionally agitated

without heat; by which means the part  
for the most part gradually dissolved. Of  
the oily solution was poured into a glass  
to this was added one part of the mastic.  
No opacity or other change. Four parts of strong caustic potash  
then poured in and immediately the  
fluid was of a dense opaque white, giv-  
ing a slight ruddy tinge when the light  
through a thin portion of it. In a m-  
ture, four parts of the alkali were added  
of the solution of mastic; it appeared  
dense and more yellowish white than  
mixture. More of the gum resin  
was then poured in; but it still ap-  
opaque than that mixture. It con-  
transmitted light. The last experi-  
repeated with the oily solution into  
mastic. The white was much less  
either of the foregoing compounds, the  
site opacity was not given by any  
dose of the oily solution. No reddish  
remarkable appearance was seen by  
light. These mixtures were left for  
two days; no separation appeared.  
the compounds containing mastic  
pound, consisting of the oily solution  
became paler by the separation of the  
top. In a subsequent number of the  
we find the following recipe by  
author's correspondents, who had  
proved its value by experience. Twelve  
grains of the whitest piece of  
selected for this purpose and poured  
ounces of alcohol; and, when nearly  
add twenty grains of elemi. When  
resins are dissolved, add ten or fifteen  
rectified oil of amber, and fifteen  
essence of bergamot: shake the  
together, and let the fumes subside.  
tion will be of a pale amber color.  
added in very small portions to the  
ammonia pure, until it assumes a  
ness, shaking the phial well after each  
as directed by Macquer. The  
causticity of the ammonia are of no  
sequence. If, upon the addition of  
drop or two of the tincture, a  
coagulated precipitate is formed,  
unlike that which appears on drop-  
tion of silver into water slightly  
with common salt, it is too strong,  
diluted with alcohol. A considerable  
of the tincture, perhaps one to four  
employed to give the liquor the  
of opacity.

EAVES, *n. s. plur.*

EAVES'DROP, *v. n.*

EAVES'DROPPER, *n. s.*

the descrip-  
ing part  
old Fr. *min.*, *cue*, was also water  
a roof; and, colloquially, the water  
from them. To eavesdrop is to  
what comes from the eaves, or  
windows.

Under our tents I'll play the eaves-dropper  
To hear if any mean to shrug from me

His tears run down his beard like eaves-drops  
From eaves of reeds.

very night he comes  
all sorts, and songs composed  
hiness : it nothing stands us  
from our caves ; for he persists,  
ay on't.

*Id. All's Well that Ends Well.*

ping of winter the drops of the caves  
more slowly down than they use, it  
d and frosty winter.

to tide of fortune left their shore,  
later than it flowed before.

*Id. Absol.*

Thus all the treasure of our flowing years,  
Our ebb of life for ever takes away. *Roscommon*  
But oh, he ebbs the smiling waves decay!  
For ever lovely stream, for ever stay! *Hallifax*

Hither the seas at stated times resort,  
And shove the loaden vessels into port;  
Then with a gentle ebb retire again,  
And render back their cargo to the main.

*Addison on Italy.*

What is it he aspires to?

Is it not this? To shed the slow remains,  
His last poor ebb of blood in your defence.

*Id. Cato.*

I do not think a philosopher obliged to account for  
every phenomenon in nature, or drown himself with  
Aristotle for not being able to solve the ebbing and  
flowing of the tide.

*Swift.*

Games of chance are traps to catch school boy  
novices and gaping country squires, who begin with a  
guinea, and end with a mortgage; whilst the old  
stagers in the game keep their passions in check,  
watch the ebb and flow of fortune, till the booby they  
are pillaging sees his acres melt at every cast.

*Cumberland.*

EBBSFLEET, anciently Wyppedsfleet, a  
hamlet of the Isle of Thanet, Kent, at the mouth  
of the river Stour, where the Saxons landed in  
447 under Hengist and Horsa. In 461 a cele-  
brated battle was fought in this vicinity between  
the Britons and Saxons, when the former were  
defeated. The Saxon leader Wypped, who is  
said to have fallen on this occasion, gave name to  
this hamlet.

EBENEZER, (Heb. the stone of help), the  
name of a field where the Philistines defeated  
the Hebrews, and seized on the sacred ark; and  
where afterwards, at Samuel's request, God dis-  
comfited the Philistines with thunder and hail,  
and gave the Hebrews a noted deliverance. On  
this occasion Samuel set up a stone, and gave it  
this designation, to mark that the Lord had  
helped them; and from it the whole field adja-  
cent received its name. It is said to have been  
about forty miles south-west of Shiloh. *1 Sam.*  
*iv. 1., and vii. 12.*

EBENEZER, a town of the United States, in  
Georgia, the capital of Effingham county, seated  
on the south-west bank of Savannah River.  
Twenty-five miles N.N.W. of Savannah, seventy-  
five south-east of Louisville, and 860 south-west  
of Philadelphia.

EBENUS, the ebony tree. See AMERIMMUM.

EBERSBERG, a town of Upper Austria,  
situated on the river, and in the circle of the  
Traun, which is here divided into many branches,  
and crossed by a bridge of great length. Here  
is a castle said to have been built in the year  
900, and in the neighbourhood was fought a  
severe action between the Austrians and French  
in May, 1809. It is eight miles north-west of  
Ens.

EBERSDORF, a small town of Lower Aus-  
tria, on the right bank of the Danube, where  
Buonaparte had his head-quarters previous to the  
battle of Aspern in May, 1809. Inhabitants  
1165. Eight miles E.S.E. of Vienna.

EBERSTHAL, or EBERSTAT, a town of Ger-  
many, in the circle of the Lower Rhine, and  
electorate of Mantz, two miles south of Krau-  
them; but on which side of the Rhine, and

consequently whether annexed to the French republic or not, we cannot discover, as neither of these towns is to be found in the maps.

EBION, the author of the heresy of the Ebionites, was a disciple of Cerinthus and his successor. To the errors of his master, he had added new opinions of his own. He began his preaching in Judea; he taught in Asia, and even at Rome. His tenets infected the Isle of Cyprus. St. John opposed both Cerinthus and Ebion in Asia; and it is thought that he wrote his gospel, in the year 97, particularly against this heresy.

EBIONITES, ancient heretics, who rose in the very first age of the church, and formed themselves into a sect in the second century, denying the divinity of Jesus Christ. Epiphanius gives a long and exact account of the origin of the Ebionites, making them to have risen after the destruction of Jerusalem, when the first Christians, called Nazarenes, went out of it to live at Pella. The Ebionites seem to have been a branch of Nazarenes: Origen distinguishes two kinds of Ebionites; the one believing that Jesus Christ was born of a virgin, and the other that he was born after the manner of other men. The first were orthodox in every thing, except that to the Christian doctrine they joined the ceremonies of the Jewish law, with the Jews, Samaritans, and Nazarenes; together with the traditions of the Pharisees. They differed from the Nazarenes, chiefly as to what regards the authority of the sacred writings; for the Nazarenes received all for scripture contained in the Jewish canon; whereas the Ebionites rejected all the prophets, and all St. Paul's epistles. They received nothing of the Old Testament but the Pentateuch; which should intimate them to have descended rather from the Samaritans than from the Jews. They agreed with the Nazarenes in using the Hebrew gospel of St. Matthew, otherwise called the Gospel of the Twelve Apostles; but they had corrupted their copy in many places; and, particularly, had left out the genealogy of our Saviour, which was preserved entire in that of the Nazarenes, and even in those used by the Cerinthians. Some, however, have made this gospel canonical, and of greater value than our present Greek gospel of St. Matthew: See NAZARENES. Besides the Hebrew gospel of St. Matthew, the Ebionites had adopted several other books, under the names of St. James, John, and the other apostles; they also made use of the Travels of St. Peter, which are supposed to have been written by St. Clement.

EB'ON, *n. s.* Also formerly written EREN. *עֲבוֹן*, Lat. *ebenus*; Fr. *ebene*, of Gr. *εβενος*, ab Heb. *הָבֵן*, *Minsheu*. A particularly hard, black, and heavy wood: hence any thing remarkably black or dark.

If the wood be very hard, as *ebony*, or *lignum vitae*, they are to turn, they use not the same tools they do for soft woods. *Moxon's Mech. Esser.*

Of't by the winds extinct the signal lies,

Ere night has half rolled round her *ebon* throne.

*Gay.*

rapidity into the Mediterranean, about below Tortosa. Of its two mouths the south is artificial, and of easier access than the other, which is nearly choked. The stream is in general very rapid, adapted for navigation, being full of rapids: it is, however, useful in supplanting canals of Arragon with water. It is said to have been less obstructed in former times.

**EBULLIENCY, n. s.** } Lat. *ebullitio*, of *bullia*,  
 vt, adj. } a bubble. Rising or  
 OS, n. s. } boiling up in bubbles of effervescence or swelling.

The ebullition of gold and silver disagree; so that there is there a great ebullition, darkness, and precipitation of a black powder. *Bacon*.

*Qua furis*, will fall into ebullition with iron; as also a crasse and fuming exhalation from the combat of the sulphur of iron and nitrous spirits of aqua fortis.

*Brounne's Vulgar Errors.*

*Aqua fortis*, or spirit of vitriol, poured upon iron, dissolves the filings with a great heat, but is not the heat and ebullition effected by the action of the parts; and does not their that the acid parts of the liquor rush out of the metal with violence, and run through the pores, till they get between its outmost and the main mass of the metal? *Newton*.

Heat, as well as heat, may be produced in iron, for if sal ammoniac, or any pure acid, dissolved in water, be mixed with an iron, with a greater degree of cold, *Arbutnot on Aliments*.

It was the ebullition of that passion which mentioned school business. *Burns*.

In ancient geography, the greater of islands called Pityusæ, in the Mediterranean east coast of Spain, south-west of the straits of Gibraltar.

Famous for its pastures and for the export of ivory.

**EC, or MECASTOR**, in antiquity, an invocation of Castor was invoked. It was a custom never to swear by Castor, nor the goddess Pollux.

**EC, in ancient geography**, the royal capital of Media, built by Deioces.

**EC, Medes**, according to Herodotus: by Seleucus; but that could not be, as mentioned by Demosthenes. It was on a gentle declivity, twelve stadia from the Orontes, and was in compass 150 stadia. It stood the royal treasury and tombs. It was an unwall'd town, but had a very high wall, encompassed with seven walls rising above each other. The extent of the city was equal to the whole extent of the island. According to Herodotus; the situation of the city, as being a gentle ascent, all was of a different color.

**EC, FRIC, adj. & n. s.** } Fr. *eccentric*,  
 EC, FRIC, adj. & n. s. } *que*; Ital. *Span.*

**EC, CITY, n. s.** } and Port. *eccen-*  
 EC, CITY, n. s. } *eccentricus*; Gr. *εκαρτερικος*, i. e. *εκα-*  
 EC, CITY, n. s. } *τηρος*, centrum. Without, or deviating from the centre; hence, metaphorically, irregular. Eccentricity is oddity; habit different from established rules or methods.

Whatever affairs pass such a man's hands, he crooketh them to his own ends; which must needs be often eccentric to the ends of his master.

*Bacon's Essays.*

Astronomers, to solve the phenomena, framed to their conceits *eccentrics* and epicycles, and a wonderful engine of orbs.

*Bacon.*

The duke at his return from his eccentricity, for so I account favorites abroad, met no good news.

*Wotton.*

This motion, like others of the times, seems *eccentric* and irregular.

*King Charles.*

In regard of eccentricity, and the epicycle whereon it moveth, the motion of the moon is unequal. *Brounne.*

They build, unbuild, contrive,

To save appearances: they gird the sphere

With centrick and eccentric, scribbled o'er,  
 Cycle, and epicycle, orb in orb. *Milton.*

By reason of the sun's eccentricity to the earth, and obliquity to the equator, he appears to us to move unequally.

*Holder.*

A character of an eccentric virtue, is the more exact image of human life, because it is not wholly exempted from its frailties.

*Dryden.*

Then from what's or we can to sense produce,

Common and plain, or wondrous and abstruse,

From nature's constant or eccentric laws,

The thoughtful soul this general inference draws,

That an effect must presuppose a cause. *Prior.*

How few are found with real talents blest!

Fewer with nature's gifts contented rest.

Man from his sphere eccentric starts astray;

All hunt for fame, but most mistake the way.

*Churchill.*

Whence is it that planets move all one and the same way in orbs concentric, while comets move all manner of ways in orbs very eccentric?

*Newton's Opticks.*

Eccentricity of the earth is the distance between the focus and the centre of the earth's elliptical orbit.

*Harris.*

But on examining it more nearly, you find much eccentricity and confusion. It is not a monarchy in strictness.

*Burke.*

Try now the merits of this blessed exchange

Of modest truth for wit's eccentric range. *Cowper.*

**ECHELLENSIS** (Abraham), a learned Maronite, employed in the Paris edition of the Polyglott Bible. He, however, quarrelled with two of his coadjutors, and was then employed in making an Arabic translation of the Scriptures, at Rome. While he was professor of the Oriental languages at Rome, he was chosen by the great duke Ferdinand II., to translate from Arabic into Latin, the fifth, sixth, and seventh of Apollonius's Conics, in which he was assisted by John Alphonso Borelli, who added commentaries to them. He died at Rome, in 1664.

**ECCHYMOISIS, n. s.** *Εκχυμωσις*. Livid spots or blotches in the skin, made by extravasated blood.

*Ecchymosis* may be defined an extravasation of the blood in or under the skin, the skin remaining whole. It is accompanied with tumour and ecchymosis.

*Wicseman.*

**ECCHYMOISIS**; from *εκχω*, to pour out, or from *εκ*, out of, and *χυμα*, juice; an effusion of humors from their respective vessels under the integuments; or, as Paulus Ægineta says, 'When the flesh is bruised by the violent collision of any object, and its small veins broken, and the blood is gradually discharged from them.' This blood,

when collected under the skin is called an ecchymosis, the skin in the mean time remaining entire; sometimes a tumor is formed by it, which is soft and livid, and generally without pain. If the quantity of blood is not considerable, it is usually resorbed; if much, it suppurates; it rarely happens that any farther inconvenience follows; though, in a very bad habit of body, a mortification may be the result.

**ECCLESHALL**, a market town of Staffordshire, pleasantly situated on a branch of the river Sow, seven miles and a half north-west of Stafford, and 148 north-west from London. The houses are neat, and there is a good church and charity school. It is supposed to be named from the Latin word *ecclesia*, the bishop of Litchfield having formerly had a palace here. In the civil war it was garrisoned for the king, but, being afterwards taken by the parliamentary forces, it was nearly destroyed; after which it was rebuilt by bishop Lloyd. Market on Friday.

**ECCLESIASTES**, a canonical book of the Old Testament, the design of which is to show the vanity of all sublunary things. It was composed by Solomon; who enumerates the several objects on which men place their happiness, and then shows the insufficiency of all worldly enjoyments. The Talmudists make king Hezekiah to be the author of it; Grotius ascribes it to Zorobabel, and others to Isaiah; but the generality of commentators believe this book to be the produce of Solomon's repentance, after he had experienced the pleasures, follies, and vanities of life.

**ECCLESIASTIC**, *adj.* & *n. s.* } Lat. *ecclesiasticus*; of, or relating to, the church.

Is discipline an ecclesiastical matter or civil? If an ecclesiastical, it must belong to the duty of the ministers. *Hooker.*

The ambition of the ecclesiasticks destroyed the purity of the church. *Burnet's Theory.*

Clergymen, otherwise little fond of obscure terms, yet in their sermons are liberal of those which they find in ecclesiastical writers. *Swift.*

A church of England man has a true veneration for the scheme established among us of ecclesiastical government. *Id.*

It was justly so called; being thus distinguished, not only from the religion of Moses, the sanctions whereof related to the present life, but also from every human scheme of moral, political, or ecclesiastical legislation. *Beattie.*

**ECCLESIASTICAL COURTS**. In the time of the Anglo-Saxons, there was no distinction between the lay and the ecclesiastical jurisdiction; the county court was as much a spiritual as a temporal tribunal; the rights of the church were ascertained and asserted at the same time, and by the same judges, as the rights of the laity. For this purpose the bishop of the diocese, and the alderman, or the sheriff of the county, sat together in the county court, and had there the cognizance of all causes, as well ecclesiastical as civil; a superior deference being paid to the bishop's opinion in spiritual matters, and to that of the lay judges in temporal: and thus the presence of the bishop added weight and reverence to the sheriff's proceedings. But it soon became an established maxim in the papal system of

of the English law having broken through the yoke imposed on it by its clerical character and asserted the doctrines of judicial as well as civil liberty,) continued till the middle of the eighteenth century, to be upheld by the courts; when the legislature was obliged to pose, to teach them a lesson of similar kind. By the statute of 13 Car. II. cap. 11. is enacted, that it shall not be lawful for a layman, or ecclesiastical judge, to administer to any person the oath usually called the oath of office, or any other oath whereby he may be bound to confess, accuse, or purge himself of any criminal matter, whereby he may be liable to censure or punishment. When all the evidence and proofs are concluded, they are referred to the consideration, not of a jury, but of a judge; who takes information by hearing witnesses on both sides, and thereupon forms a declaratory decree, or definitive sentence, at his discretion: from which there generally is an appeal to the several stages mentioned in the articles above referred to; though, if the same appeal be made from by him in fifteen days, it is by the statute 25 Hen. VIII. cap. 19.

**ECCLIASTICAL STATE**, in geography, a name given to the pope's dominions in Italy. It consisted before the late revolutions of the empire of Campagna, St. Peter's Patrimony, Ancona, Urbino, Romagna, Bologna, &c. The first five of these were erected by the French into the Roman republic; the last three into the Cisalpine. Avignon, and Venaissin, France, became included in the French empire. See **PAPAL STATES**.

**ECCLIASTICUS**, an apocryphal book, so called from its being read in the church, ecclesia, or assembly, of piety and instruction, but not of civil authority. The author was a Jew, Jesus, or Joshua, the son of Sirach. The title is the Wisdom of the son of Sirach.

**ECOPROTICKS**, *n. s.* *Ex* and *κοπρω*. Medicines as gently purge the belly, so as to carry away no more than the natural excrement lodged in the intestines.

The body ought to be maintained in its daily excretion by such means as are *ecoprotick*.

*Hurree on the Plague.*

**ECOMIN**, a river of Lower Canada, rising in the mountains to the southward of the St. Lawrence, into which it falls, two miles above the mouth. The margin is a flat rock, with only a thin covering of soil. But there is some good soil in its neighbourhood.

**ECENEIS**, the remora, in ichthyology, a fish belonging to the order of thoraenici. The body is flat, naked, depressed, and marked with a series of transverse ridges; it has ten rays in the anal membrane, and the body is covered with a bony scale.

There are three species, of which the most worthy of note is:—*remora*, the sucking fish with a forked tail, sixteen stripes on the head. This species is found adhering so strongly to the sides of ships and other great fish, by means of the suck of its head, as to be got off with difficulty. It was believed, by all the ancients, to possess wonderful powers, and to be able, by its suction, to arrest the motion of a

ship in its fullest course; and, in love affairs, to deaden the warmest affections of both sexes.

**ECHEVIN**, in the old French and Dutch polity, a magistrate elected by the inhabitants of a city or town, to take care of their common concerns, and the decoration and cleanliness of the city. At Paris, before the revolution, there were a *prevôt* and four *echevins*; in other towns, a mayor and *echevins*. At Amsterdam there were nine *echevins*; and at Rotterdam, seven. In France they took cognizance of rents, taxes, the navigation of rivers, &c. In Holland they judged of civil and criminal causes; and, if the criminal confessed himself guilty, they could see their sentence executed without appeal.

**ECHINADES**, otherwise called the Nisia Islands, a group of islets at the entrance of the gulf of Lepanto, which they almost seem to close on the side of Epirus.

**ECHINITES**, in natural history, the name by which authors call the fossil centronia, frequently found in our chalk pits. See **CENTRONIA**.

**ECHINOPHORA**, in botany, a genus of the digynia order, and pentandria class of plants; natural order forty-fifth, umbellate. The male florets are lateral, with the central one hermaphrodite: seed one, sunk into an indurated involucre. Species two, found on the south coast of Great Britain.

**ECHINOPS**, in botany, a genus of the polygymia segregata order, and syngenesia class of plants; natural order forty-ninth, composite: cal. uniflorous; cor. tubulated, and hermaphrodite; receptacle bristly; pappus indistinct. Species six, natives of the Levant, and south of Europe.

**ECHINORINCHUS**, a genus of the vermes intestina: the body is round, proboscis cylindrical, retractile, and crowned with hooked prickles. They are found fixed firmly to the viscera of various animals, generally the intestines; and often remain on the same spot during the whole life of the animal; they are mostly gregarious, and are easily distinguished from the tænia by their round inarticulate body. There are forty-eight species, infesting the mammals, birds, reptiles, and fish.

**ECHINUS**, *n. s.* } Lat. A hedge-hog; a shell-fish set with prickles:  
**ECHINATE**, *adj.* }  
**ECHINATED**. } In botany, the prickly head, cover of the seed, or top of any plant: in architecture, a member or ornament, taking its name from the roughness of the carving, resembling the prickly rind of a chestnut, or the thorny coat of a hedge-hog. Echinated is bristled, or full of prickles. This ornament is used by modern architects in cornices of the Ionic, Corinthian, and Composite orders; and generally set next to the abacus, being carved with anchors, darts, and ovals or eggs.

An echinated pyrites in shape approaches the echinated chrysolite balls. *Woodward on Fossils.*

Many nodules of flint resemble in colour as well as in form the shells of the *echinus* or sea-urchin; others resemble some coralloids both in form and color.

*Darwin.*

**ECHINUS**, in zoology, a genus of insects belonging to the order of vermes mollusca. The body is roundish, covered with a bony crust, and

often beset with moveable prickles; and the mouth is below and consists of five valves. There are 108 species, all natives of the sea.

1. *E. esculentus*, or eatable echinus, is of a hemispherical form, covered with sharp strong spines above half an inch long, commonly of a violet color, moveable, adherent to small tubercles elegantly disposed in rows. These are their instruments of motion by which they change their place. This species is taken in dredging, and often lodges in cavities of rocks just within low-water mark. They are eaten by the poor in many parts of England, and by persons of rank abroad. Anciently they were a favorite dish. They were the first dish in the famous supper of Lentulus, when he was made flamen Martialis, or priest of Mars.

2. *E. lacunosus*, or oval echinus, is of an oval depressed form; on the top it is of a purple color, marked with a quadrefoil, and the spaces between tuberculated in waved rows; the lower side studded, and divided by two smooth spaces. Length four inches. When clothed it is covered with short thick-set bristles, mixed with very long ones.

3. *E. marinus*, the sea urchin, has an arched shell varying in its figure in different individuals: and, besides a great number of protuberances, has two remarkable apertures for the mouth and the anus.

**ECHINUS TERRESTRIS**, the land urchin. See **ERINACEUS**.

**ECHITES**, in botany, a genus of the monogynia order, and pentandria class of plants; natural order thirtieth, contorta. There are two long and straight foliicles: seed pappous; cor. funnel-shaped, with the throat naked.

**ECHITES CORYMBOSEA**, a species of this genus, is said to yield the caoutchouc, or elastic gum according to Jacquin. See **GUM, ELASTIC**.

**ECHIU**, viper's bugloss, in botany, a genus of the monogynia order, and pentandria class of plants; natural order forty-first, asperifolia: cor. is irregular, with the throat naked. Species twenty-seven; none of them have any remarkable property except the *E. vulgari*, or common bugloss, the flowers of which are very grateful to bees. It is a native of many parts of Britain. The stem is rough with hairs and tubercles. The leaves are spear-shaped, and rough with hair. The flowers come out in lateral spikes. They are first red, afterwards blue; sometimes purple or white. Cows and sheep are not fond of the plant; horses and goats refuse it.

**ECHO**, *n. s.*, *v. n.*, & *v. a.* Span. *echo*, *eco*; Fr. and Port. *echo*; Lat. *echo*; Gr. *ηχo*. A resounding or giving again of the voice or any sound. The sound returned. As a neuter verb, to resound; be sounded back: as a verb active to send back, return, what has been uttered.

At the parting

All the church echoed.

Shakespeare. *Taming of the Shrew.*

Babbling echo mocks the hounds,

Replying shrilly to the well-tuned horns,

As if a double hunt were heard at once. *Id.*

Wilt thou hunt?

Thy hounds shall make the welkin answer them,

And fetch shrill echoes from their hollow earth. *Id.*

veral causes sufficiently whimsical. The pretended it was a person of that name proposed, and that she affected to take up hide in particular places, for they found he was not to be met with every where. Moderns, who know sound to consist in tremor or vibration in the sonorous communicated to the contiguous air, and means to the ear, give a more consistent of echo. See ACOUSTICS. A tremulous striking on another solid body, may be repellent destroying or diminishing its tremor; consequently, a sound may be redoubled by reflection of the tremulous body to the air. Simple reflection on the sonorous air is enough to solve the echo; for then every surface of a solid hard body, being fit to a voice or sound, would redouble it; we find does not hold. To produce an echo, therefore, it should seem, that a kind of iteration or vaulting were necessary, to and, by collecting, to heighten and to, and afterwards reflect the sound; as it is the case in reflecting the rays of light, where a concave mirror is required. In fact, often as a sound strikes perpendicularly on a wall, behind which is any thing of a vault, or even another parallel wall, so often it is reverberated in the same line, or other lines. For an echo to be heard, there is necessary that the ear be in the line of reflection; for the person who made the sound and its echo, it is necessary he be perpendicular to the place which reflects it: and, for a single or tautological echo, it is necessary there be a number of walls, and vaults or cavities placed behind or fronting each other. In an arch or concavity, &c., can scarcely ever reflect all the sound; but, if there be a proper disposition behind it, part of the sound, propagated thither, being collected and reflected as before, will present another echo: there be another concavity, opposed at a distance to the former, the sound reflected to one upon the other will be tossed back by this last, &c. Any sound, falling diagonally on any dense body of a smooth surface, whether plain or arched, is reflected, in, more or less. The surface must be smooth, otherwise the air, by reverberation, will be out of its regular motion, and the sound broken and extinguished. Echoes may be varied with different circumstances. For, the obstacle reflects the sound back in its original direction and loudness, allowance being made for proportionable decrease of the sound, according to its distance. 2. A convex obstacle reflects the sound somewhat smaller and somewhat weaker though weaker, than otherwise it would be. 3. A concave obstacle echoes back loud, bigger, slower, and also inverted; but according to the order of words. 4. The body being removed farther off, it reflects the sound than when nearer; which is why some echoes repeat but one syllable or one word, and some many. 5. Echoes may be so contrived and placed, as reflecting the sound from one to the other, directly and mutually, or obliquely and by

succession, out of one sound, a multiple echo or many echoes shall arise. A multiple echo may be made by so placing the echoing bodies at unequal distances, that they may reflect all one way, and not one on the other, by which means a manifold successive sound will be heard; one clap of the hands like many; one laugh like a laughter; one single word like many of the same tone and accent; and so one viol, like many of the same kind, imitating each other. Lastly, echoing bodies may be so ordered, that, from any one sound given, they shall produce many echoes different both as to tone and intention: by which means a musical room may be so contrived, that not only one instrument playing therein shall seem many of the same sort and size, but even a concert of different ones, only by placing certain echoing bodies so that any note played shall be returned by them in thirds, fifths, and eighths.

ECCHO is also used for the place where the repetition of the sound is produced or heard. In echoes, the place where the speaker stands is called the *centrum phonicum*; and the object or place that returns the voice, the *centrum phonocampticum*. Echoes are distinguished into two kinds; viz. single and tautological, or multiple.

ECCHO, in architecture, a term applied to certain kinds of vaults and arches, most commonly of the elliptic and parabolic figures used to redouble sounds, and produce artificial echoes.

ECCHO, in poetry, a kind of composition wherein the last words or syllables of each verse contain some meaning, which, being repeated apart, answers to some question or other matter contained in the verse; as in this beautiful one from Virgil:—

*Crudelis mater magis, an puer, improbus ille?*

*Improbus ille puer, crudelis tu quoque mater.*

The elegance of an echo consists in giving a new sense to the last words; which reverberate, as it were, the motions of the mind, and by that means affect it with surprise and admiration.

ECCHO, in mythology, a daughter of Aer and Tellus, who chiefly resided in the vicinity of the Cephissus. She was once one of Juno's attendants, and became the confidant of Jupiter's amours. Her loquacity, however, displeased Jupiter, and she was deprived of the power of speech by Juno, and only permitted to answer the questions which were put to her. Pan had formerly been one of her admirers, but he never enjoyed her favors. Echo, after she had been punished by Juno, fell in love with Narcissus: but being despised by him pined to death, having nothing left but her voice.

ECHOMETER, among musicians, a kind of scale or rule, with several lines thereon, serving to measure the duration and length of sounds, and to find their intervals and ratios.

ECILIA, or EXILIA, a considerable town of Spain, in the province of Seville, beautifully situated on the Xenil, and surrounded with small hills, which make it the warmest place of Andalusia. Wool and hemp are its chief riches; but tanning and the manufacture of leather, employ a portion of its inhabitants, who, altogether, amount to 28,000. This town is the Colonia Augusta Firma of the ancients, and many Roman antiquities have been discovered here. It

is said to have been formerly of great importance; at present it contains six churches, sixteen convents, and fifteen hospitals; it has also a large square with a piazza. The Xenil is crossed by a neat modern bridge; and there is along the left bank a delightful public walk, composed of alleys, ornamented with statues. Fifty-five miles E. N. E. of Seville.

ECKHIEL (Joseph Hilary), a learned Jesuit, was born at Entzesfeld in Austria in 1737. Becoming a member of the society of St. Ignatius, he was appointed keeper of the imperial cabinet of medals, and professor of archaeology at Vienna. He may be regarded as the modern founder of the science of Numismatics, the principles of which are fully developed in his treatise *Doctrina Veterum Nummorum*. 8 vols. fol. He died in 1798.

ECKIUS (John), a learned divine, professor in the university of Ingoldstadt, memorable for his opposition of Luther, Melancthon, Carolostadius, and other leading Protestants in Germany. He wrote many polemical tracts; and among the best, a *Manual of Controversies*, printed in 1535, in which he discourses upon most of the heads contested between the Protestants and Papists. He was a man of great learning and zeal, and died in 1543.

ECKDALA, or AKDALA, an ancient, but now ruined fortress of the district of Dacca, Bengal, situated on the banks of the Luckya River, which, during the rainy season, surrounds it with water. In 1353 Ilyas Haji, the second independent king of Bengal, of the Mahommedan dynasty, took refuge in this place from the army of the emperor of Hindostan, and defended it, till the setting in of the rains compelled the enemy to raise the siege, and the sultan Seyd Hussein made it his constant residence from the year 1499 to 1520, although Pundua was his political capital.

ECLAIRCISSEMENT, *n. s.* Fr. Explanation; the act of clearing up an affair by verbal expostulation.

The *eclaircissement* ended in the discovery of the informer. *Clarendon.*

ECLAT, *n. s.* Fr. Splendor; show; lustre. Not English, says Dr. Johnson.

Nothing more contributes to the variety, surprise, and *eclat* of Homer's battles, than that artificial manner of gaging his heroes by each other.

*Pope's Essay on Homer.*

ECLECTIC, *adj.* ἐκλεκτικός. Selecting; choosing at will. See below.

Cicero was of the *eclectic* sect, and chose out of each such positions as came nearest truth.

*Watts on the Mind.*

ECLECTICS, ancient philosophers, who, without attaching themselves to any particular sect, chose what they judged good and solid from each. Laertius says, that they were also denominated Analagetic; but that they call themselves Philalethes, i. e. lovers of truth. The founder of the Electici was one Potamon of Alexandria, who lived under Augustus and Tiberius; and who, weary of doubting of all things with the Sceptics and Pyrrhonians, formed the Eclectic sect; which Vossius calls the Elective.

*s. adj. & n. s.* *Gr. οικονομία*.

*s. adj.* Sometimes written,

*n. s.* ten, from its derivation, econo-

*s.* not a diphthong in English, says

The management, or government, since frugality, order, regulation,

or disposition, of affairs; system of management generally. Economic is used in the same particular and general way: an economist is a good or frugal manager.

In the Greek poets, as in Plantas, we see the economy and disposition of poems better observed than in Terence.

*Ben Jonson.*

Her quickening power in every living part,

Doth as a nurse, or as a mother serve;

And doth employ her economic art,

And busy care, her household to preserve.

*Darwin.*

Some are so plainly economical, as even to desire that the seat be well watered, and well swelled.

*Wotton's Architecture.*

All the divine and infinitely wise ways of economy that God could use towards a rational creature, oblige mankind to that course of living which is most agreeable to our nature.

*Hammond.*

By St. Paul's economy the heir differs nothing from a servant, while he is in his minority; so a servant should differ nothing from a child in the substantial part.

*Taylor.*

If this economy must be observed in the minutest parts of an epic poem, what soul, though sent into the world with great advantages of nature, cultivated with the liberal arts and sciences, can be sufficient to inform the body of so great a work?

*Dryden's Dedication to the Æneid.*

I have no other notion of economy than that it is the parent of liberty and ease.

*Swift.*

In economical affairs, having proposed the government of a family, we consider the proper means to effect it.

*Watts.*

The regard one shows economy, is like that we show an old aunt, who is to leave us something at last.

*Shenstone.*

Economy is the parent of integrity, of liberty, and of ease; and the beauteous sister of temperance, of cheerfulness, and health.

*Adams.*

And from the many heavy taxes required from them by the necessities of the state, have surely reason to be economical.

*Franklin.*

Mere parsimony is not economy. It is separable in theory from it; and in fact it may, or it may not, be a part of economy, according to circumstances. Expense, and great expense, may be an essential part in true economy. If parsimony were to be considered as one of the kinds of that virtue, there is however another and an higher economy. Economy is a distributive virtue, and consists not in saving, but in selecting.

*Burke.*

The age of chivalry is gone, and one of calculators and economists has succeeded.

*Id.*

From this outline a philosopher may catch a glimpse of the general economy of nature; and like the mariner cast upon an unknown shore, who rejoiced when he saw the print of a human foot upon the sand, he may cry out with rapture, 'A God dwells here.'

*Darwin.*

ECOUEN, a well-built town of France, on the side of a hill, containing a number of villas belonging to the citizens of Paris, from which it is about twelve miles distant. On an eminence towards the west extremity stands a noble castle, built in the reign of Francis I., and now belonging to the prince of Conde. Inhabitants about 1200.

ECUPHRACTICKS, *n. s.* *Gr. εὐ and φραγναι*. Such medicines as render rough humors more thin, so as to promote their discharge.

Procure the blood a free course, ventilation, and transpiration, by suitable purges and euphractick medicines.

*Marry.*

ECSTASY, *n. s.* } *Fr. extase*; *Ital. Span.*  
*Ecstasien, adj.* } and *Port. ectasi*; *Lat. ec-*  
*Ecstasie*, } *stasis*; *Greek, ekstasis*, ab-

ECSTATICAL. } *ekstasis, extendo*. Any pas-  
 sion by which the thoughts are absorbed, and in  
 which the mind is for a time lost. The adjectives  
 all mean rapt or absorbed in passion or enthu-  
 siasm.

Follow them swiftly,  
 And hinder them from what this ecstasy  
 May now provoke them to.

*Shakespeare. Tempest.*

Now see that noble and most sovereign reason,  
 Like sweet bells jangled out of tune, and harsh,  
 That unmatched form, and feature of blown youth,  
 Blasted with ecstasy. *Id. Hamlet.*

Return, my soul! from this *ecstasie*  
 And meditation of what thou shalt be  
 To earthly thoughts, till it to thee appear  
 With whom thy conversation must be there.

*Donne.*

Would she but shade her tender brows with bay,  
 That now lye bare in careless willful rage;  
 And trance herself in that sweet *ecstasy*,  
 That rouseth drooping thoughts of bashful age.

*Bp. Hall.*

He loved me well, and oft would beg me sing;  
 Which when I did, he on the tender grass  
 Would sit, and hearken even to *ecstasy*. *Milton.*

There doth my soul in holy vision sit,  
 In passive trance, and anguish, and *ecstatick fit*. *Id.*

When one of them, after an *ecstatical* manner, fell  
 down before an angel, he was severely rebuked, and  
 bidden to worship God. *Stillington.*

These are as common to the inanimate things as to  
 the most *ecstasied* soul upon earth. *Norris.*

'T may be

No longer joy there, but an *ecstasy*. *Suchling.*  
 Whether what we call *ecstasy* be not dreaming with  
 our eyes open, I leave to be examined. *Locke.*

The religious pleasure of a well-disposed mind  
 moves gently, and therefore constantly: it does not  
 affect by rapture and *ecstasy*; but is like the pleasure  
 of health, still and sober. *South.*

Each delighted, and delighting, gives  
 The pleasing *ecstasy* which each receives.

*Prior.*

A pleasure, which no language can express;  
 An *ecstasy* that mothers only feel,  
 Plays round my heart. *Philips's Distressed Mother.*  
 In trance *ecstatick* may thy pangs be drowned;  
 Bright clouds descend, and angels watch thee round.

*Pope.*

The very kind that gambol at high noon,  
 The total herd receiving first from one,  
 That leads the dance, a summons to be gay,  
 Though wild their strange vagaries, and uncouth  
 Their efforts, yet resolved with one consent,  
 To give such act and utterance as they may  
 To *ecstasy* too big to be suppressed. *Corrier.*  
 Wakes from his trance, alarmed with young Desire,  
 Finds his new sex, and feels *ecstasy* fire;  
 From flower to flower with honeyed lip he springs,  
 And seeks his velvet loves on silver wings.

*Darwin.*

And let not this seem strange; the devotee  
 Lives not in earth, but in his *ecstasy*;  
 Around him days and worlds are heedless driven;  
 His soul is gone before his dust to heav'n. *Byron.*

ECSTATICI, *Ekstasikoi*, from *ekstasis*, I am  
 entranced; in antiquity, a kind of diviners who  
 were cast into trances or ecstasies, in which they

properly called the Edda : and the kind of art of poetry, and called the most ancient Edda was compiled by Snorri Sturleson, surnamed the learned, in Iceland about A. D. 1057. This was rendered more intelligible, afterwards, in the form of a dialogue, by Otto Sturleson, who was supreme in 1215 and 1222. He added part in the form of a dialogue, of different events transacted among the gods. The only three pieces that are of the more ancient Edda of Snorri Sturleson, the Havamaal, and the Voluspá, the Voluspá, or prophecy of the gods, appears to be the text, on which comment. It contains, in 200 lines, the whole system of mythology, and may be compared to the Edda, on account of its laconic and its imagery and obscurity. It is a revelation of the decrees of the gods, and the actions and operations of the gods. It describes the chaos, the formation of the world, with its various inhabitants, the gods, their most signal adventures with Loke, or Lak, their quarrels with Loke, or Lak, their and the vengeance that ensued ; with a long description of the final destruction, its dissolution and conflagration of the inferior deities, and the renovation of the world, the good, and the punishment of the evil. The Havamaal, or Sublime Disputations to the god Odin, who is supposed to have given these precepts of wisdom to the poet, comprised in about 120 stanzas, is a book of Proverbs. The Runes are a short system of ancient magic, of the enchantments wrought by the Runes characters. A manuscript of the Edda of Snorri is preserved in the University of Upsal ; the first part was published with a Swedish and Latin version by M. Coranson. The Latin version is a supplement to M. Mallet's edition. The first edition of the Edda was published by Resenius, professor at Uppsala, in a large 4to. volume, in 1665, consisting of the Edda, a Latin translation, and a Danish version, differing from different MSS. M. Coranson has given an English translation of the Edda, accompanied with remarks, from which the Edda teaches the doctrine of the Supreme, called the Universal Father, who lives for ever, governs all things, directs the great things, as well as formed the heaven, earth, and sea, and gave him a spirit or soul, and after the body shall have perished ; and then all the just shall rise in Odin or Vingolf, the ship ; but wicked men shall go to Hel, and from thence to Nisheim, the wicked, which is below in the earth ; it incutates also the belief of seeds and goddesses, the chief of which are Frey, &c. Frey, meaning

hereby the earth, who was the spouse of Odin or the Supreme God ; whence we may infer that, according to the opinion of these ancient philosophers, this Odin was the active principle or soul of the world, which, uniting itself with matter, had thereby put it into a condition to produce the intelligences or inferior gods, and men and all other creatures. The Edda likewise teaches the existence of an evil being called Loke, the calumniator of the gods, the artificer of fraud, who surpasses all other beings in cunning and perfidy. It teaches the creation of all things out of an abyss or chaos ; the final destruction of the world by fire ; the absorption of the inferior divinities, both good and bad, into the bosom of the grand divinity, from whom all things proceeded, as emanations of his essence, and who will survive all things ; and the renovation of the earth in an improved state.

EDDER, *v. a. & n. s.* Probably from edge. To bind or interweave a fence. Not in common use.

To add strength to the edge, *edder* it ; which is, bind the top of the stakes with some small long poles, on each side. *Mortimer's Husbandry.*

In lopping and felling, *save edder* and stake. Thine hedges, as needeth, to mend or to make.

*Tusser.*

EDDY, *n. s., adj. & v. n.* Icel. *ida* ; but it is better derived from Goth. *idga*, to agitate : Sax. *ed*, backward, again, and *ea*, water. Water that runs contrary to the main stream : whirl. It is used also as a verb active.

My praises are as a bulrush upon a stream ; if they sink not, 'tis because they are borne up by the strength of the current, which supports their lightness ; but they are carried round again, and return on the eddy where they first began. *Dryden.*

And chaff with eddy winds is whirled around, And dancing leaves are lifted from the ground.

*Id. Virgil.*

The wild waves mastered him, and sucked him in. And smiling eddies dimpled on the main. *Dryden.*

So, where our wide Numidian wastes extend, Sudden the impetuous hurricanes descend, Wheel through the air, in circling eddies play, Tear up the sands, and sweep whole plains away.

*Addison's Cato.*

'Tis thine to cherish and to feed The pungent nose-refreshing weed : Which, whether pulveriz'd it gain A speedy passage to the brain, Or whether, touch'd with fire, it rise In circling eddies to the skies, Does thought more quicken and refine Than all the breath of all the Nine. *Conspire.*

Through her fine limbs the mimic lightnings dart, And flames innocuous eddy round her heart ; O'er her fair brow the kindling lustres glare, Blue rays diverging from her bristling hair. *Darwin.*

The sea-tide's opposing motion, In azure column proudly gleaming, Beats back the current many a rod In curling foam and mingling flood, While eddying whirl, and breaking wave, Roused by the blast of winter, rave. *Byron.*

EDDYSTONE ROCKS, the name of some rocks in the English Channel, so called from the great variety of contrary currents in their vicinity. They are situated nearly S.S.W. from the middle of Plymouth Sound, their distance from the port

The Voluspá, or prophecy of the gods, appears to be the text, on which comment. It contains, in 200 lines, the whole system of mythology, and may be compared to the Edda, on account of its laconic and its imagery and obscurity. It is a revelation of the decrees of the gods, and the actions and operations of the gods. It describes the chaos, the formation of the world, with its various inhabitants, the gods, their most signal adventures with Loke, or Lak, their quarrels with Loke, or Lak, their and the vengeance that ensued ; with a long description of the final destruction, its dissolution and conflagration of the inferior deities, and the renovation of the world, the good, and the punishment of the evil. The Havamaal, or Sublime Disputations to the god Odin, who is supposed to have given these precepts of wisdom to the poet, comprised in about 120 stanzas, is a book of Proverbs. The Runes are a short system of ancient magic, of the enchantments wrought by the Runes characters. A manuscript of the Edda of Snorri is preserved in the University of Upsal ; the first part was published with a Swedish and Latin version by M. Coranson. The Latin version is a supplement to M. Mallet's edition. The first edition of the Edda was published by Resenius, professor at Uppsala, in a large 4to. volume, in 1665, consisting of the Edda, a Latin translation, and a Danish version, differing from different MSS. M. Coranson has given an English translation of the Edda, accompanied with remarks, from which the Edda teaches the doctrine of the Supreme, called the Universal Father, who lives for ever, governs all things, directs the great things, as well as formed the heaven, earth, and sea, and gave him a spirit or soul, and after the body shall have perished ; and then all the just shall rise in Odin or Vingolf, the ship ; but wicked men shall go to Hel, and from thence to Nisheim, the wicked, which is below in the earth ; it incutates also the belief of seeds and goddesses, the chief of which are Frey, &c. Frey, meaning

to all appearance, quite smooth, and its surface unruffled by the slightest breeze, the growing swell or under current, meeting the slope of the rocks, the sea often rises above the lighthouse in a magnificent manner, overtopping it as with a canopy of froth. Notwithstanding this tremendous swell, Mr. Henry Winstanley, in 1696, undertook to build a lighthouse on the principal rock, for the rest are under water; and he completed it in 1700. This ingenious mechanic was so confident of the stability of his structure, that he declared his wish to be in it during the most tremendous storm that could blow. Unfortunately he obtained his wish, for he perished in it during the dreadful storm which destroyed it, on the 27th November, 1703. In 1709 another lighthouse was erected of wood on this rock, but on a different construction, by Mr. John Ruddyard. It stood till 1755, when it was burnt. A third one, of stone, begun by the late celebrated Mr. John Smeaton, on the 2d of April, 1757, was finished 24th August, 1759; and has withstood the rage of all weathers ever since. The rock which slopes towards the south-west is cut into horizontal steps; into which are dove-tailed, and united by a strong cement, Portland stone and granite, for Mr. Smeaton discovered that it was impossible to make use of the former entirely, as there is a marine animal that can destroy it; and that he could not use the latter solely, as the labor of working it would have been too expensive. He therefore used the one for the internal, and the other for the external, part of the structure. Upon the principle of a broad base and accumulation of matter, the whole, to the height of thirty-five feet from the foundation, is a solid mass of stones engrafted into each other, and united by every kind of additional strength. The lighthouse has four rooms, one over another, and at the top a gallery and lantern. The stone floors are flat above, but concave below, and are kept from pressing against the sides of the building by a chain let into the

and entering into the tent print, on two plates, from under entering into the tent by P. Drevet, from Peter died in 1707, in an advance Royal, in the Gobelins, when ment. His brother John was graver, but died young.

**EDEMATOSE**, *adj.* full of humors: commonly

A serosity obstructing the g edematose, and schirrous, according to the humour.

**EDEN**; from Heb. עֵדֶן. i. try with a garden, in which mankind were settled by God be endless to recount the variety to its situation, some of which extravagant. Moses says that of Eden to water the garden, was parted and became into river is supposed to be the c the Euphrates and Tigris, after which parted again below the different channels, so that the fore, and the other two after constitute the heads mentioned will determine the situation have been in the south of Babylon. EDGCOMB, a county of Halifax district  
North Carolina, bounded on the south by Pitt  
county; on the south-west by Wayne county  
and Tar River, which affords it communication  
with several counties in the state, on the west by  
Nash county, and on the east by Martin and  
Halifax counties.

EDGE, n. s., v. a. & v. n.	} Sax. <i>ecge</i> ; Goth. <i>egg</i> , or <i>ag</i> ; Teut. <i>cche</i> ; Swed. <i>egg</i> ; Lat. <i>aries</i> , of Gr. <i>arg.</i>
EDGING, n. s.	
EDGELESS, adj.	
EDGE'LOO, n. s.	
EDGE'WISE, adv.	

The sharp part of a blade or cutting instrument;  
termination of two sloping sides; brink; margin;  
applied, also, to acuteness of intellect. The  
verbs are derived from the noun, and the active  
verb is used to signify putting forward edgewise;  
and, metaphorically, to exasperate; inflame.  
Edging, as a substantive, means that which  
forms, or covers, the edge: bordering.

'Tis slander,

Whose edge is sharper than the sword.

*Shakespeare. Cymbeline.*

Abate the edge of traitors, gracious Lord!

That would reduce these bloody days again.

*Id. Richard III.*

To-morrow in the battle . . . . .

And fall thy *edgewise* sword; despair and die. *Id.*

A harsh grating tune setteth the teeth on edge.

*Bacon.*

We find that subtle or *edged* quantities do prevail  
over blunt ones. *Dryden on Hodies.*

He that will a good edge win,

Must forge thick, and grind thin. *Proverb.*

There sat she rolling her alluring eyes,

To edge her champion's sword, and urge my ruin.

*Dryden.*

I must edge upon a point of wind,

And make slow way. *Id. Cleomenes.*

Silence and solitude set an edge upon the grins,  
and cause a greater application. *Id. Dufermay.*

The garland which I wove for you to wear,

And bordered with a rosy edging round, *Dryden.*

There must be no playing with things sacred, nor  
jesting with *edgetools*. *L'Estrange.*

Nurses from their children keep *edgetools*. *Dorset.*

*Edging* by degrees their chairs forwards, they  
were in a little time got up close to one another.

*Locke.*

Should the flat side be objected to the arcum,  
it would be soon turned *edgewise* by the force of it.

*Ray.*

A woman branches out into a long dissertation  
upon the edging of a petticoat. *Addison's Spectator.*

They are *edgewise* weapons it hath to encounter.

*Decay of Piety.*

But when long time the wretches' thoughts refused,  
When want had set an edge upon their mind,  
Then various cares their working thoughts employed  
And that which each invented all enjoyed.

*Greesh's Muml.*

The rays which pass very near to the edges of any  
body, are bent a little by the action of the body.

*Newton's Opticks.*

We have, for many years, walked upon the edge of  
a precipice, while nothing but the slender thread of  
human life has held us from sinking into endless  
misery. *Rogers.*

Yes, the last pen for freedom let me draw,

When truth stands trembling on the edge of law.

*Pope.*

Some harrow their ground over, and then plow it  
upon an edge. *Mortimer's Husbandry.*

I shall exercise upon steel, and its several sorts;  
and what sort is fittest for *edgetools*, which for springs.

*Moron.*

It is with wits as with razors, which are never so apt to cut those they are employed on, as when they have lost their edge.

*Swift.*

However, if in general it be not easy to determine concerning the lawfulness of such devious proceedings, which must be ever on the *edge* of crimes, it is far from difficult to foresee the perilous consequences of the reanimation of such a power in the people.

*Burke.*

*Edge* over *edge* expands the hardening scale,  
And sheaths his slimy skin in silver mail. *Darwin.*

But see him on the *edge* of life,  
With cares and sorrows worn;  
Then age and want, Oh! ill-matched pair!  
Show man was made to mourn.

*Burns.*

LADY TEA. Nay, I allow even that's better than the pains Mrs. Prim takes to conceal her losses in front. She draws her mouth till it positively resembles the aperture of a poor's box, and all her words appear to slide out *edgewise*, as it were.

*Sheridan.*

And you, ye crags, upon whose extreme *edge*,  
I stand, and on the torrent's brink beneath  
Behold the tall pines dwindled as to shrubs  
In dimness of distance; when a leap,  
A stir, a motion, even a breath, would bring  
My breast upon its rocky bosom's bed  
To rest for ever—wherefore do I pause?

*Byron.*

EDGEFIELD, a county of South Carolina, the southernmost in the district of Ninety-Six, bounded on the north by Saluda River, which divides it from Newbury county, on the south-west by Savannah River, which separates it from the state of Georgia, on the east by Orangeburg district, and on the west by Abbeville county. The ridge of elevated land, which divides the waters of Saluda from those of Savannah River, passes nearly through the middle of the county. Edgefield county is about thirty-four miles long, and twenty-four broad.

EDGEFIELD, a town in the above county, with a court house and post office: forty miles from Abbeville; twenty-five from Augusta, and sixty from Colombia.

EDGEHILL, a village in Warwickshire, near Kenton; memorable for the first battle fought between the forces of king Charles I., and those of the parliament in 1642. It is fourteen miles south of Warwick. See ENGLAND, HISTORY.

EDGEWARE, a town of England, in the county of Middlesex, on the borders of Hertfordshire. It is eight miles north-west of London.

EDGEWORTH (Abbé), was born at Edgeworth's town in Ireland in 1745; but his father, who was a clergyman, having become a catholic, he settled with his family at Toulouse. After studying at Paris, the abbé Edgeworth entered the fraternity of Les Missions Étrangères. He was confessor to the princess Elizabeth, and thus becoming known to the unfortunate Louis XVI, he attended him to the scaffold. He made his escape in disguise afterwards, and came to England, whence he went to Mittau to attend upon Louis XVIII, and died there of an hospital fever in 1807. His letters and life were published in 1818.

EDGORTH (Richard Lovell), a literary gentleman of considerable talents, was born in 1744 at Bath, and of the same family as the foregoing.

After an edon and Corpus C ple, but, meegaging his att with Dr. Dari pursuits; in f telegraph, who use. the greatest fool upon earth.

Franklin.

is an order or instrument, signed by a prince, to serve as a law to his kind frequent mention of the edicts in the Roman law. In the civil law, the edicts were of several sorts, importing new laws or regulations; the institution of new offices; establishments, rents, &c.; and sometimes articles of peace. In despotic governments, an edict is the same as a proclamation is with us; but the difference, that the former has the force of a law from the power which issues it, whereas the latter is only a declaration which it refers, and has no power in itself. In England, an edict cannot exist in Britain, because the legislative power is lodged in the parliament. In despotic governments, the king. Edicts are all sealed with the sign of their being perpetual and

Fr. *edifier* ; Span. and

is no more than edifieth, is undeser-  
ed for much speaking. *Hooker.*

ed when either their understanding  
is whereof, in such actions, it be-  
comes consider, or when their hearts are  
affection suitable thereunto. 14.

There was a holy chapel edified,  
Wherein the hermit went to say  
His holy things each morn and eventide.

1997

My love was like a fair house built on another man's ground ; so that I have lost my edifice by mistaking the place where I erected it.

Shakspeare. *Merry Wives of Windsor.*

You shall hardly edify me, that those nations might not, by the law of nature, have been subdued by any nation that had only policy and moral virtue.

### Bacon's Holy War.

God built

So spacious, and his line stretched out so far,  
That man may know he dwells not in his own;  
An edifice too large for him to fill. Milton.

**An exercise so beneficially edificatory to the church\***

*В. Нолл.*

Our blessed Saviour told us, that we must account for every idle word, not meaning that every word not designed for edification, or less prudent, shall be reckoned for a sin.

Life is no life, without the blessing of a friendly  
and an edifying conversation. *L'Étranger.*

He gave, he taught; and edified the more,  
Because he shewed, by proof, 'Twas easy to be poor.

*Dryden.*

## Men have edified

**A lofty temple, and perfumed an altar to thy name.**

Chapman.

Out of these magazines I shall supply the town with what may tend to their edification.

Addison's Guardian.

As Tuscan pillars owe their original to this country, the architects always give them a place in edifices raised in Tuscany. *Id. On Italy.*

He must be an idiot that cannot discern more strokes of workmanship in the structure of an animal than in the most elegant edifice. Bentley.

As in order to the edification of the church, the spirit of God at first conferred upon the ministers of it a great variety of spiritual gifts, *Mason.*

It is with infinite caution that any man ought to venture upon pulling down an edifice which has answered in any tolerable degree for ages the common purposes of society, or on building it up again, without having models and patterns of approved utility before his eyes.

Some decent in demeanour while they preach,  
That task performed, relapse into themselves  
And, having spoken wisely, at the close  
Grow wanton, and give proof to every eye,  
Whoe'er was edified, themselves were not.

Lower.

So far as in that dreadful hour,  
When injured Truth exerts her power,  
Some new phenomenon to raise,  
Which, bursting on his frightened gaze,  
From its proud summit to the ground,  
Proves the whole edifice unbound.

EDILE, *n. s.* Lat. *edilis*. The title of a magistrate in old Rome, whose office seems in some particulars to have resembled that of our justices of peace.

'The rule, ho ! let him be apprehended.

**SECRET.**

theatre, in which, on elevated, though less lofty, ground, stands this flourishing city. It is said, with considerable propriety, to stand on three hills, which run in a direction from east to west; and hence its natural division into the southern, middle, and northern districts.

The origin of its name, like that of most other cities, is very uncertain. Some imagine it to be derived from Eth, a king of the Picts; others from Edwin, a Saxon prince of Northumberland, who over-ran the whole or greatest part of the territories of the Picts about A. D. 617; while others derive it from the Gaelic words Dun Edin, signifying the face of a hill. The name Edinburgh, however, seems to have been unknown in the time of the Romans. The most ancient title by which we find this city distinguished is that of Castell Mynyd Agned; which, in the British language, signifies 'the fortress of the hill of St. Agnes.' Afterwards it was named Castrum Puellarum, because the Pictish princesses were educated in the castle (a necessary protection in those barbarous ages) till they were married. The most plausible derivation of the present name of the city seems to be that of the Northumbrian prince above mentioned. Simeon of Durham calls it Edwinesburgh, and notices it as existing in the middle of the eighth century.

The most ancient part of the city, or Old Town, as it is called, stands on the middle or central ridge of the three eminences above mentioned, which is terminated on the west by a lofty and almost inaccessible rock, on which is placed the castle; the New Town occupies an elevated plain on the north; and the southern district is situated on a rising ground in the opposite direction. The hill on which the Old Town is built is separated from the other two districts by a valley on each side, that upon the northern side having been formerly a lake. In the progress of improvement, however, this lake having been drained, and streets and bridges having also been formed, these valleys are no impediment to a complete and ready communication from one district to another.

street, though lofty, are less of the High Street. From to the loch on the north, and the south, run narrow streets called wynds and closes, and the abrupt descent of the steep and difficult of passage, not at all remedied by the rarely more than six feet.

The origin of this city is in obscurity. The most accounts have been given; and, without sharing the monkish writers, not to its remote annals. Still the country which formed of Valentia, and which, the subject of wars and del impossible to trace its found believe our earliest historians was built by Camelon king A. A. C. 330. It was in the Saxons, from the invasion 452, till the defeat of Egbert in 685 by the Picts, themselves of it. The Saxons reconquered it in 956, when it was given up to Scotland. In 1093 it was by the usurper Donald III. David I. founded the abbey for certain canons regular, charter, in which he styled de Edwinesbergh, my baron. In 1174 the castle was surrendered of England, to purchase the liam I. who had been the English. But William III. an alliance with Henry, and Ermengarde; upon which it as part of the queen's dowry.

James II. in 1450 first community the privilege of free

cast was connected with the buildings on the north side of the High Street, at the original Netherbow Port; but after the battle of Flodden in 1547 the city was extended. It now began on the south-east side of the rock on which the castle was built. From thence it descended obliquely to the West Port; it then ascended part on the other side called the High Riggs; thence it ran east with but little alteration of course, to the Bristo and Potter Row ports, and thence to the Pleasance. Here it took a westerly direction, which it kept from thence to the Cowgate port, after which the enclosure was completed to the Netherbow by the houses of Mary's wynd. For 250 years the city of Edinburgh occupied the same space of ground. In the middle of the sixteenth century, it is deemed to have extended in length about an Italian mile and about half as much in breadth. This space of ground, however, was not at that time occupied in the manner it has been since. The houses of the Old Town were neither so high nor so crowded upon each other as they are now. The consequences of the number of inhabitants increasing, which occasioned the raising of houses to such a height, as perhaps is unparalleled.

The castle of Edinburgh stands on a high rock, which is only on the east side. On all others it is very steep, and in some places perpendicular. It is about 300 feet high from its base, and 383 feet above the level of the sea. The entrance to this castle is defended by an outer barrier of palisades; within this is a dry ditch, draw-bridge, and the whole is commanded by a half moon battery, defended by two batteries which flank the entrance. Beyond these are two towers, the first of which is very strong, and is called the portcullis. Immediately beyond the portcullis, on the right hand, is a battery called the gun battery, carrying balls of 12 and 24 weight. On the north side are a mortar battery and the gun batteries. The upper part of the castle contains a half-moon battery, a chapel, a hall for exercise, and a number of houses in the form of a square, which are laid out in barracks for the officers. There are also other barracks sufficient to contain 1200 men; a powder magazine, bomb-proof; a grand arsenal, capable of holding 8000 stand of arms; and other magazines which can contain full 22,000 more. On the east side of the square were formerly the apartments; in one of which king James was born. In this quarter, immediately to the south of the square tower, is the apartment called the crown room, wherein are deposited the Scottish regalia, consisting of the crown, sceptre, and orb of state, which were placed here on the 10th of March, 1707. It was long doubted whether these ensigns of royalty had not been destroyed; but in 1818, when commissioners were appointed by his present majesty, then king George III. to search for them, a large oak chest in which the crown room was forced open, and the regalia of the Scottish monarchy were discovered. They were found in a state of the most perfect preservation, and have since been open to the inspection of the public. The crown room was neatly fitted up for the exhibition of

them; and two persons, in the dress of the wardens of the tower, attended to show them to visitors. The governor of the castle is generally a Scottish nobleman; and there is a deputy governor, who resides in the garrison; also a fort-major, a store-keeper, master gunner, and chaplain. In its present improved state this castle can accommodate 2000 men; but its natural strength of situation was not sufficient to render it impregnable, even before the invention of artillery, much less would it be capable of securing it against the attacks of a modern army provided with cannon.

St. Giles's church is a beautiful Gothic building, measuring in length 206 feet. At the west end, its breadth is 110 feet, in the middle, 129; and at the east end, seventy-six. It is adorned with a lofty square tower, from the sides and corners of which rise arches of figured stone work; these, meeting with each other in the middle, complete the figure of an imperial crown, the top of which terminates in a pointed spire. The whole height of this tower is 161 feet. This is the most ancient church in Edinburgh, and its tutelary saint was St. Giles, a native of Greece. It was at first simply a parish church, of which the bishop of Lindisfarne or Holy Island, in the county of Northumberland, was patron. In 1466, it was erected into a collegiate church by James III. At the Reformation it was divided into several parts. The four principal divisions form as many churches appropriated to divine worship; the smaller ones to other purposes. At the same time the religious utensils belonging to it were seized and sold by the magistrates; part of the money being applied to its repair, and the rest added to the funds of the corporation. In the steeple are three ancient bells: there is also a set of music bells, upon which tunes are played by the hand. The principal division is called the High Church, in which the general assembly sits. The church is fitted up with seats for all the great officers of the assembly; and there is a throne for his majesty's commissioner. In this church is a monument to the celebrated Napier, inventor of logarithms; another to the regent Murray; and a third to the great marquis of Montrose. The names of the four churches, into which St. Giles's is divided, are, the New, or High Church, above described; the Old Church; the New North Church, or Haddow's Hole, so named from the Laird of Haddow having been for some time imprisoned in it; and the Tolbooth Church. The Tron Church is an elegant structure, erected in 1641, with a spire, and stands on the south side of the High Street, between the north and south bridges. The spire was burnt down in 1824, having accidentally caught fire from the burning embers blown by the wind from the great tenements on the west. Lady Yester's Church is situated nearly opposite to the Royal Infirmary. The Old and New Gray Friars churches are situated on the top of the south side, east of Heriot's Hospital, nearly in the middle of the ancient gardens belonging to the Gray Friars. These churches are both under one roof, and have one common porch; but are separated by a partition wall. The Old Gray Friars was

founded about 1612, and had once a steeple. Trinity College Church was founded by queen Mary, wife of king James II. in 1461, at the same time with the Trinity Hospital. It is situated at the east end of the north loch.

Canongate Church stands near the middle of the north side of the street called the Canongate, and was founded in 1688. It is a Gothic building, in the form of a cross, and was erected at the cost of about £2400, being the accumulated principal and interest of 20,000 marks, bequeathed by a Mr. Thomas Moodie, for the pious purpose of building a church. In the cemetery lie the remains of the celebrated author of the *Wealth of Nations*, Dr. Adam Smith; and a simple stone, erected at the expense of Burns, marks the burial place of his fellow-bard Ferguson. St. Cuthbert's Church, or the West Kirk, stands at the western extremity of the valley which divides the New from the Old Town, near the base of the castle rock. Its architecture is by no means elegant, but a handsome spire atones for the homely appearance of the church itself. It is deemed the largest place of worship in Edinburgh. St. Andrew's Church stands on the north side of George's Street, in the New Town, surmounted with a fine spire 168 feet in height. A portico, supported by four columns of the Corinthian order, projects a few feet into the street. In the spire there is a chime of eight bells. The whole is elegantly finished, and has fine appearance. St. George's Church stands on the west side of Charlotte Square, and forms the terminating object of George's Street, from which it is seen along its whole extent. The front to the square consists of a portico, or vestibule, with four columns and two pilasters of the Ionic order, elevated on a flight of steps sixty-eight feet in width. Behind the portico rises a dome, intended as a miniature representation of that of St. Paul's, London. The whole building, with the exception of the dome, which is seen to advantage in almost every direction round the city, has a heavy appearance, and it has often been regretted that the original design of the celebrated architect, Adam, was abandoned merely with a view to economy. The building, as it stands, cost £33,000; but it has since been ascertained that, according to Mr. Adam's plan, the expense would have been considerably under that sum. This church was opened for public worship in 1814, and is calculated to contain 1600 people. The other churches of Edinburgh, remarkable for the elegance of their architecture, are St. Mary's Church, situated in Bellevue Crescent, opened for worship, in 1825; St. Paul's Chapel, on the north side of York Street, finished in 1818, at an expense of £12,000; St. John's Chapel, situated a little to the south of the western extremity of Prince's Street, also finished in 1818, at an expense of £15,000. St. George's Chapel, in York-place, built from a design by Robert Adam, in 1794; the Roman Catholic Chapel, at the head of Leith-walk, built from a design by Gillespie in 1813, possessing a very fine organ, and a beautiful altar-piece, painted by Vandyke; the Methodist Chapel, in Nicholson's-square, built in 1814, at an expense of £5000;

Dr. Jameson's Chapel, at the south end of Nicholson-street, founded in 1819, and finished in 1820; Dr. Hall's Chapel, terminating the end of Broughton Street. Mr. Paston's Infirmary Street; and the Relief Cowgate. The architecture of the places of worship in Edinburgh, is not such as to require them to be particularly noticed on account. Till of late years, the plainest and most homely accommodation was all that was aimed at in the erection of places of worship. Besides the churches and chapels already mentioned, however, there are various other places of worship in this city of great importance, either for the convenience of the congregations which they contain, or for the celebrity and talents of their pastors. The Scottish Episcopal Church alone has no less than six places of worship. There are also the Free Church, the Presbytery's Chapel, and the Gaelic Chapel. In the latter the service is performed in the Gaelic language, for the benefit of the Highlanders. The High Church was erected in 1769, and stood on the site of the castle; but the congregation was removed in 1815 to a more commodious place at the head of the Horse-Wynd. A great number of places for divine worship exist in Edinburgh and Leith, distinguishing themselves by their various persuasions, is as follows: Established Churches, 16; Chapels of Ease, 9; Scottish Episcopal, 6; Cameronians, 1; United Associate & Secession, 9; Associate Synod, 1; Burgher, 1; Original Antiburgher, 6; Independents, 3; Baptists, 4; Methodist, 2; Roman Catholics, 2; Glasites, 1; Friends, 1; Bereans, 1; New Jerusalem, 1; Unitarians, 1; Jews, 1; in all 101. The regular established clergy of Edinburgh are twenty-five. The number of parishes is sixteen; nine of which are collegiate charges, or have two ministers joined in the discharge of the pastoral duties. Besides these there are, under the care of the established church, seven of the chapels as they are called; two of which are the Canongate, one in the old part of the city, and the other in the southern district, one at Stockbridge, and one in Leith.

In 1215 this city was first distinguished by having a parliament and provincial assembly held in it; but it does not appear to have been upon as the capital of Scotland till the middle of the fifteenth century, when it began to be held in it regularly, and the various institutions succeeded to the rule of anarchy, which had previously prevailed. The improvements which were introduced into the kingdom at that period, Scotland was indebted to her amiable and enlightened monarch James I., who unfortunately fell a victim to the jealousy entertained by the nobles of the measures he projected in favor of the people. In 1329 the town of Leith, with its harbor, mills, had been bestowed upon Robert I.; and his grandson, Robert II., conferred upon all the burghs the privilege of building houses in the city, on the sole condition that they should be of good fame. From the middle of the fifteenth century, its privileges continued to be

various causes. In 1482 the citizens had opportunity of liberating king James III. from the oppression of his nobles, by whom he had been imprisoned in the castle. On this occasion the provost was by that monarch made high sheriff within the city, an office he continues still to enjoy. The council, at the same time, were invested with the power of making laws and statutes for the government of the city; and the trades, as a testimony of their grateful gratitude for their loyalty, received the banner known by the name of the *Blanket*, which still exists, and is kept by the provost of the trades for the time. By the death of James IV., at the battle of Flodden, Edinburgh was overwhelmed with grief, the monarch having been attended in his unfortunate expedition by the earl of Angus, then at the head of the magistracy, and a number of the principal inhabitants, most of whom perished in the battle. The inhabitants, for the safety of their city, enacted that every fourth man should keep watch at night; the fortifications of the town were renewed, and the walls extended, as we have before mentioned. Thus, the inhabitants were gradually relieved from the trouble of watching at night, by a number of militia being appointed to preclude disturbances. About this period, the city almost depopulated by a dreadful plague; to stop if possible, the progress of the disease, all houses and shops were shut up for ten days; and some, where infected persons died, were pulled down altogether. In the tract of ground, called the *Burroughs*, which was totally overgrown with wood, and it was largely enacted by the town-council, that whoever would purchase as much as was sufficient to make a new front for his house, should extend it seven feet into the street. Thus, in a short time, the city was, in many instances, narrowed fourteen feet.

In 1542 an English fleet of 200 sail entered the Forth; and, having landed their forces, they made themselves masters of the towns of Leith and Edinburgh. They next attacked the castle, but were repulsed from it with loss; and this was so enraged, that they not only besieged both towns, but laid waste the country in every great way round. In 1547 Leith was burned by the English after the battle of Pinkie, but Edinburgh was spared. Several disturbances happened in the capital at the time of the Reformation, of which an account will be given under the article *SCOTLAND*; but none of these greatly affected the city till 1570, when the war took place on account of queen Mary's resignation. The city was then sometimes in the hands of one party, and sometimes of another, during which the inhabitants, as may be imagined, suffered extremely. The earl of Morton, when regent, in 1573, built two bulwarks across the High Street, nearly opposite to the North, to defend the city from the fire of the

A treaty was at last concluded between the leaders of the opposite factions; but Kirkcaldy refused to be comprehended in it. The city therefore solicited the assistance of queen

Elizabeth, and Sir W. Drury was sent into Scotland with 1500 foot, and a train of artillery. The castle was now besieged in form, and batteries raised against it in different places. The governor defended himself with great bravery for thirty-three days; but finding most of the fortifications demolished, the well choked up with rubbish, and all supplies of water cut off, he was obliged to surrender. The English general, in the name of his mistress, promised him honorable treatment; but the queen of England shamefully gave him up to the regent, by whom he was hanged. Soon after, the most violent religious commotions of Scotland took place, in which the king was insulted and railed at by the clergy, seconded by the magistrates of Edinburgh, as well as the citizens. This led to various severe measures against the city and ministers, which will be detailed under the article *SCOTLAND*. A reconciliation, however, at length took place, which appears to have been satisfactory to all parties, as the king not only allowed the clergy, some of whom had been degraded, to be replaced, but in 1610 conferred various marks of his favor on the town. Another invasion from England being apprehended in 1558, the city raised 1450 men for its defence, among whom there are said to have been 200 tailors.

In the beginning of the reign of Charles I., a perfect harmony seems to have subsisted between the court and the city: for in 1627 that monarch presented the city with a new sword and gown, to be worn by the provost. Next year he paid a visit to this capital, and was received by the magistrates in a most loyal manner. When this prince attempted to introduce Episcopacy into Scotland, his first step was the erection of the three Lothians, and part of Berwick into a diocese, Edinburgh being the episcopal seat, and the church of St. Giles the cathedral. Much disturbance was occasioned in 1637, by the first attempt to read the prayer-book there, and next winter the neighbouring people resorted to town in such multitudes, that the privy council thought proper to publish two acts; by one of which they were commanded, under severe penalties, to leave the town in twenty-four hours; and by the other, the court of session was removed to Linlithgow. The bishops on some of these occasions narrowly escaped with their lives. Notwithstanding these disturbances, however, the king again visited Edinburgh in 1641, and was entertained by the magistrates at an expense of £12,000 Scots. It does not appear that after this the city was in any way particularly concerned with the commotions which followed, either throughout the remainder of the reign of Charles I., the Commonwealth, or the reign of Charles II. In 1680 the duke of York, with his duchess, the princess Anne, and the whole court of Scotland, were entertained by the city in the Parliament House, at the expense of £15,000 Scots. At this time, it is said, that the scheme of building the bridge over the North Lough was first projected by the duke. An act passed in 1621, that the houses, instead of being covered with straw or boards, should have their roofs constructed of slate, tiles, or lead. This

tween the two kingdoms, when it was designed to unite, and on that occasion Edinburgh became a scene of the most violent disturbances, of which an account will be found under ENGLAND. During the time the act was passing, it was found necessary for the guards and four regiments of foot to do duty in the city. The disturbances were augmented by the disagreement of the two parties in parliament; and, notwithstanding the victory gained by the court, Sir Patrick Johnson, the provost, who voted for the union, was obliged afterwards to leave the country. In 1715 the city remained faithful to the royal cause; the city guard was increased, and 400 men raised at the public expense. The rebels, however, made themselves masters of the citadel of Leith; but, fearing an attack from the duke of Argyle, abandoned it in the night. A scheme was laid for their becoming masters of the castle of Edinburgh; but, being discovered, it failed, and a serjeant was hanged over the place where he had attempted to introduce the rebels. The loyalty of the city was equally remarkable in 1725, when disturbances were excited in Glasgow, and all parts of the kingdom, concerning the excise bill; for all remained quiet in Edinburgh, and government returned thanks to the magistrates for their vigilance. In 1736, however, the city fell under the royal displeasure, in the following singular manner:—Two smugglers having been condemned to be hanged, were conducted, as usual, each Sunday to the Tolbooth church, guarded by three soldiers. Having arrived there on one of these occasions before the congregation, one of the prisoners suddenly seized the guards, one in each hand, and the other in his teeth, calling out to his companion to fly, which he immediately did, and was never heard of afterwards. The smuggler who had thus saved the life of his companion without regard to his own, now became an object of general compassion; and the guard, who led him to execution, were severely pelted by the mob. Some of the soldiers were certainly wounded in the affair, and captain Porteous, who commanded the guard, was

from the prison. The popular affair were most disorderly at other point most orderly they had not brought a broke open a shop where be had; and having taken upon the table, retired p allowed the unhappy Po to pray and sing psalm The English government deeply. from the High Street to the Cowgate, and destroyed all the buildings of Parliament Square, except those connected with the parliament house. Fortunately the loss of life was not great. Four individuals only were killed, and twelve carried to the infirmary severely hurt. The calamity to the unfortunate persons who were rendered houseless, was also greatly lessened by a prompt and liberal public subscription on their behalf. Another fire took place in the High Street in February, 1825, which at its commencement threatened similar devastations, but the flames were happily subdued after the destruction of one large old tenement, and a few smaller houses adjoining it. Edinburgh, like London, partook of the general mania which prevailed in 1825 for speculating in Joint Stock Companies. Stock-jobbing, for the first time, became a business or profession in the Scottish metropolis; and schemes, as wild as the celebrated South Sea Bubble in England, or Mississippi scheme in France, promised to triumph over the characteristic prudence and proverbial caution of the people. The number and the variety of the public companies, which were either set a-going or projected within the short space of six months, excited astonishment for a time, but latterly they became the subject of ridicule; and, when some of the London bubbles fortunately burst, the delusion became so apparent, that all further undertakings in the joint-stock line immediately ceased. That some of the companies which were established at that time may turn out productive to the parties who embarked in them it would be unfair to doubt; but many of them will eventually prove sad lessons to individuals of the folly of rash and ill-timed speculation.

The charitable institutions and general improvements of Edinburgh will now engage our more distinct attention. I. Of the former, the most important is Heriot's Hospital, finely situated on a rising ground to the south of the Castle Hill. It owes its foundation to George Heriot, goldsmith to James VI., who at his death, after having provided for his relations, left to the

hospital, with an endowment of £10 annually for five boys going out as apprentices, leaving of their apprenticeship number of boys is 160. The is vested in a treasurer, appraisers of Edinburgh, under-governor, house-keeper, and different branches of learning Hospital; so named from James Watson, who, dying a bachelor, left £12,000 for the maintenance of the children and grand-children of the Merchants' Company. The scheme, however, was not carried into effect till 1738, when the sum of £120,000 was then erected, in which was maintained and educated. On the side of the city, a little to the west of the Hospital; and was erected in 1730. It is under the management of a master, assistants, and treasurer. The Company, four old bairns, and the two ministers of the parish. The Merchants' Maiden Hospital, established by voluntary contributions of merchant burghesses of Edinburgh, were erected into a body in 1707. The endowment is £3000. About eighty girls are educated; the majority of whom, when they leave the house, receive £3 6s. 8d. In the management of merit, those who are recommended to the generality in the acquisition of knowledge, are allowed £8 6s. 8d. The Maiden Hospital was founded in 1707, on the incorporation of Edinburgh, of the daughters of decayed families, similar to that of the former. The late James Marr, a widow gentleman, contributed so liberally to the hospital, that the governors styled joint-

some building, consisting of a body and two wings, with a neat spire, furnished with a clock and two bells. The philanthropic Mr. Howard made this institution one of the most useful in Europe, and a pattern for all others of the kind. VI. The Trinity Hospital was founded in 1461, by the queen of James II. At the dissolution it was stripped of its revenues; but was afterwards bestowed upon the provost of Edinburgh. The hospital was after this re-edified, and appointed for the reception of old burghesses, their wives, and unmarried men, not under fifty years of age. It is situated at the foot of Leith Wynd, and comfortably maintains about forty of both sexes, who each have a room for themselves. There is a library for their amusement, and they have plain. About 100 out-pensioners have £6 per year each. The funds are under the management of the town council. VII. The Charity House was erected in 1743, by voluntary contributions. It is a large plain building, situated in the south district of the city. The permanent fund for defraying the expense of the establishment is a tax of two per cent. on the valued rents of the city. The rest is derived from collections at the church doors and voluntary contributions; but, as these always fall short of what is requisite, recourse is frequently had to extraordinary collections. In 1813 it was found necessary to raise the assessment on the valued rents from two per cent. to five. The rate at the present time is at the rate of three and a half per cent. The number of inmates, men, women, and children, including about twenty lunatics, average from 800 to 900, and the average expense of maintaining each person is 2s. 5½d. per annum. There are two other workhouses in the suburbs, much on the same plan with that now described; one in the Canongate, and the other in St. Cuthbert's or St. Kirk parish. VIII. Gillespie's Hospital, founded about 1796 by James Gillespie, Esq., a lawyer, famous as a manufacturer of snuff in Edinburgh. Besides supporting a considerable number of aged persons of both sexes, this institution educates 100 boys gratis in a school appointed for that purpose.

The Edinburgh Royal Infirmary was first projected in 1721, but, the proposals which were made not receiving encouragement from the public, the design was dropped till it was again taken up by the College of Physicians in 1725. After considerable difficulty and delay, £2000 was raised, and a small house was opened for the reception of the sick poor in 1729. At length, the sum having increased to £3000, a royal charter was obtained to erect the subscribers into a body corporate, and in 1738 the foundation of the present structure was laid, and the building speedily completed. From that time forward donations were constantly received in aid of its funds; some of princely munificence. This establishment is attended by two physicians, chosen by the managers, who visit their patients daily, in the presence of the students. The members of the College of Surgeons also used to attend in rotation according to seniority, but that plan has been altered, and the patients are com-

mitted to the care of particular surgeons, chosen annually by the managers. The building consists of a body and two wings, each three stories high, with an attic story, and very elegant front. The body is 210 feet long, and thirty-six broad in the middle. The wings are seventy feet long and twenty-four broad. In the different wards, 228 patients may be accommodated, in distinct beds. There are cold and hot baths for the patients, and also for the citizens; but, to these last the patients are never admitted. The theatre will hold upwards of 200 spectators. There is also a military ward, in consequence of which a small guard is always kept at the infirmary. From 3000 to 4000 patients are now admitted annually; and the yearly revenue of the establishment is £5000.

The first public Dispensary of Edinburgh was founded by Dr. Duncan in 1776, for the poor whose diseases are of such a nature as to render their admission into the infirmary either unnecessary or improper. Here the patients receive advice gratis four days in the week: a register is kept of the diseases of each, and of the effects produced by the medicines employed. All patients, not improper for dispensary treatment, are admitted on the recommendation of the elder or church-warden of the parish where they reside. A similar establishment was founded in 1815, called the New Town Dispensary, for the accommodation of the poor in the northern parts of the city. It has also a midwifery department, under the superintendence of an able physician. Both Institutions afford gratuitous vaccine inoculation. The expense of the medicines and the support of the general establishment at each are defrayed by voluntary subscription. A donation of one guinea, annually, entitles the contributor to recommend patients, and to be a governor for two years; and five guineas confers the same privilege for life. Dispensaries for diseases of the eyes and ears were also established in 1822, and institutions of the same kind for other maladies exist in different quarters of the city.

The charitable institutions thus particularised are, in point of antiquity and importance, the most remarkable in the Scottish metropolis; but there are others, also, of a very valuable nature, the mere enumeration of which will demonstrate that this city is as distinguished for humanity and benevolence, as it has long been for science and literature, and all the arts that tend to improve and adorn life. The following flourish vigorously at the present time:—1. The Lying in Hospital. 2. The Asylum for the Blind. 3. The Lunatic Asylum. 4. The Magdalen Asylum. 5. The Institution for educating Deaf and Dumb Children. 6. The Repositories. 7. The Ministers' Widows Fund. 8. The Society for the Sons of the Clergy. 9. The Society for Relief of the Destitute Sick. 10. Horn's Charity. 11. Watson's Bequest. 12. Thomson's Bequest. 13. Dr Robert Johnson's Bequest and Strachan's Legacy of Crangecook. 14. The Society for the Suppression of Begging. 15. Savings Banks. 16. The Institution for the Relief of Incurables. 17. The Association for the Relief of Imprisoned Debtors. 18. The House of Industry. 19. The Society for Clothing

course of people ever remembered in Edinburgh. In 1756 the High Street was cleared by the removal of the cross; which many regretted, as it was a very ancient and elegant building. In 1763 the first stone of the north bridge was laid; and in 1767 an act of parliament was obtained, for extending the royalty of the city over the fields to the northward, where the New Town is now situated. In 1774 the foundation of the Register Office was laid; and so rapidly did improvements proceed for several years, that we find in 1778 St. Andrew's Square, and the streets immediately connected with it, on the original plan of the New Town, were nearly completed. In 1784 the project for rendering the access to the town equally easy on both sides was begun to be put in execution, by laying the foundation of the South Bridge. At the same time a great improvement was made, by reducing the height of the street several feet, all the way from the place where the cross stood to the Netherbow. The street was farther cleared by the removal of the town guard-house, which had long been complained of as an incumbrance. The great earthen mound across the north loch, connecting the new and old town to the west of the North Bridge, was commenced about the same period. In 1789 the new buildings of the University were begun, but, being on a scale far beyond the means possessed for completing them, they stood for many years unfinished; and it was not till 1815, when the exertions of Mr. John Marjoribanks, then lord provost and M. P., procured £10,000 in aid of the undertaking from parliament, and a recommendation to grant the same sum annually for seven years, that plans for its completion were adopted. The next improvement undertaken was the alteration in the old Parliament House, which was begun by the erection of a court-room and apartments for the Barons of Exchequer, and an open arcade in the front of the old building. The original plan included, also, an additional room for the second division of the court, a library room for the advocates and writers to the signet, and a court-

Tolbooth and Crook's land, of the range, were taken down. Weigh-house followed them. A canal was begun at the west end, to be carried westward till it joined the Clyde canal about a mile beyond the city. The undertaking was finished in 1790, and passage boats in 1791. The expense was £240,500, which was repaid by shares of £50 each. The depth was five feet, and its width at the bottom contracting to twenty-two feet. Few of the recent improvements have been so beneficial to the city and country as this. It has already had the effect of raising the price of coals to a third. Besides these improvements, many other improvements have been made at the same time, which a volume would not describe with accuracy. I mention the following, as having been completed since 1813. Two elegant chapels, George's Church in Charlotte Square, a new merchants' meeting-house, a new madhouse, a new observatory, a new monument in St. Andrew's Church, a house for the deaf and dumb, and the Edinburgh Dispensary, numerous streets and ranges of buildings, to the north of Queen's Street, and the city in that direction to the westward and eastward towards the town.

The Northern District, or the new town, consists of two divisions: the one is laid off for building in 1791, and consists of all the additional buildings erected or erected since that time, and north of the former. The other division of the first division are George's Street, and Queen's Street, running in straight lines, and forming a square, which is intersected at right angles by a street running north and south. This square comprehends various elegant buildings, and the first public building

ed plan, this division has not, perhaps, its in the world. When the whole of the is now comprehended in what is called the town, are added to the southern and mid- tracts, the circumference of Edinburgh, is eight miles.

tribunals of Edinburgh have, in general, ed accommodations. The judges of the ses- sionary and exchequer courts hold their e within the buildings called the parlia- house, in the great hall of which the Scot- arliament used to meet previous to the

eters to the signet, stands a magnificent hall, the plan of which was taken from the finest models of antiquity, the temple theueu, in the Acropolis of Athens. The

nal entrance is taken from the Choragic ent of Thrasyllus. The interior of this eg is laid out in a large hall, a court room, antee room, and, in the principal floor, use of the freeholders of the county. The

doors are occupied as offices for the sheriff, clerks, &c. The expense of its erection

splendid, are generally as commodious as those we have thus described.

The North Bridge, which forms the main pas- sage of communication between the Old and New Towns, was founded in 1763, but the contract for building it was not signed till August 21st, 1765.

The architect was Mr. William Myline, who agreed with the town council of Edinburgh to finish the work for £10,140, and to uphold it for ten years. It was also to be finished before Martinmas 1769;

but on the 8th of August that year, when the work was nearly completed, the vaults and side walls on the south fell down, and nine people were bur- ied in the ruins. The bridge was repaired, by pulling down some parts of the side walls; after- wards rebuilding them, and strengthening them with chain bars. The whole was supported at the south end by very strong buttresses and counterforts on each side; but on the north it has only a single support. The length of the

bridge, from the High Street in the Old Town to Prince's Street in the New, is 1125 feet; the total length of the piers and arches is 310 feet. The width of the three great arches is seventy-two feet each; of the piers thirteen feet and a half; and of the small arches, each twenty feet.

The height of the great arches from the top of the pa- rapet to the base, is sixty-eight feet; the breadth of the bridge within the wall over the arches is forty feet, and the breadth at each end fifty feet. The communication betwixt the two towns by this

bridge, though very complete and convenient for such as lived in certain parts of either, was yet found insufficient for those who inhabited the western districts. Another bridge being there- fore necessary, it was proposed to raise an earthen mound, by filling up the valley with the rubbish dug out in making the foundations of

houses in the New Town; and so great was the quantity, that this was accomplished so as to be fit for the passage of carriages in less than five years. Whilst the mound was forming it sunk at different periods above eighty feet on the west side, and was again filled up: 1800 cart-loads of earth were, upon an average, laid upon this mound every day. It has been said, with justice, to be a work unrivalled by any but Alexander the

Great's at Tyre.

The South Bridge is directly opposite to the North, so as to make but one street, crossing the High Street almost at right angles. It consists of twenty-two arches of different sizes; but only one of them is visible, viz. the large one over the Cowgate; and even this is small, in comparison with those of the North Bridge, being no more than thirty feet wide and thirty-one feet high.

This bridge was erected with a design to give an easy access to the great number of streets and squares on the south side, as well as to the coun- try on that quarter from which the city is supplied with coals. So great was the rage for purchas- ing ground on each side of it for building, that the areas sold by auction at £50 per foot in front. They sold higher than ever was known in any city.

Regent Bridge terminates Prince's Street, the southern boundary of the New Town, at the east. This bridge, in connexion with the adjoining buildings, is one of the most splendid of the

to open up the communication to the city by this bridge cost £52,000, and the building areas sold for the immense sum of £35,000. The street along the bridge is called Waterloo Place, as it was founded in the year on which that memorable battle was fought, and was intended to commemorate the event.

The observatory is seated on the top of the Calton hill, and is furnished with all the instruments necessary for astronomical observations. The scheme for the erection of it was first adopted in 1736; and the earl of Morton and Mr. M'Laurin, professor of mathematics, each contributed to its erection. The foundation stone was laid by provost Stodart, on the 25th of August 1776. But Mr. Adam the architect, conceiving the idea of giving the whole the appearance of a fortification, accordingly a line was marked out for enclosing the limits of the observatory, and of having Gothic towers at the angles. Thus the money designed for the work was totally exhausted, and the observatory long remained unfinished. In 1792, however, the building was completed by the magistrates. But it was not till 1812, when the astronomical institution was founded, that it was furnished with a set of philosophical instruments. In 1818 a new observatory was built a little to the east of the old one. It is now under the most superior scientific management, and while we write we observe a public announcement of his majesty's having bestowed £2000 upon it to purchase instruments.

The palace of Holyrood House, is the only royal habitation in Scotland, that is not in ruins. It is a handsome square of 230 feet in the inside, surrounded with piazzas. The front, facing the west, consists of two double towers joined by a beautiful low building, adorned with a double balustrade above. The gateway in the middle is decorated with double stone columns, supporting a cupola in the middle, representing an imperial crown, with a clock underneath. On the right hand is the great staircase, which leads to the council chamber and the queen's

this palace is two stories but at each end the front is ornamented with circular towers; the building is much higher than was burnt by Cromwell's army, repaired and altered into its present appearance during the Restoration. The fabric was executed by Robert Mylne, and the plan of the palace afford an opportunity for the creditors; and adjoining to it is Anne's Yards; beyond which is a extensive park, called the King's Park, the Duke's Walk, and the King's Salisbury Crags, and St. Leonard's, within the privilege of the abbey church, built by David I. has been long in ruins. Since the year 1795 some of the palace were fitted up for the part of the royal family of Scotland, and exiled from the

Edinburgh is divided into which there are nine in the town: the nine oldest churches, besides the Canon's, or West Kirk parish, and North Leith; in all the public enumerations. It has a weekly general market, and an annual Fair, in November, which markets of Edinburgh are with all sorts of provisions, as well as fowl and fish, and no city can be better supplied with such provisions with which Edinburgh was observed in 1781, when all of them in want of need, to the amount of having on board at least increased consumption of food, and the

of profit and emolument at the disposal of the town council, may be estimated at not less than £30,000.

The Theatre stands nearly opposite to the Town Office, in Shakspeare Square. The building is exceedingly plain externally, its only decorations being a statue of Shakspeare, and allegorical figures of tragedy and comedy on the front. But it is elegantly fitted up within. The building was first opened as a place for theatrical performances in 1769; after much opposition from the clergy, who, for many years, displayed the greatest hostility to every amusement of the kind. It was originally let by patent from the crown; and the prices of admission were then, three shillings for the pit, and two shillings for the first gallery, one shilling for the second or upper gallery. The rates the house could hold with ease were £140. But the box seats were afterwards raised to four shillings, and subsequently in 1815 to five shillings. The seats in the pit and galleries remain at the old rate. In 1809 the patent was acquired by Mr. Henry Siddons, who was at that time manager, and who continued to conduct the theatre till he died in 1815. It has since been under the management of Mr. Murray, his brother-in-law, who, in addition to a regular company of theatrical performers, presents the public at intervals with all the actors and actresses of eminence who appear on the boards of Drury Lane and Covent Garden.

Musical Entertainments, on a scale of great extent and in the highest perfection, have been frequent in Edinburgh, and the records of them go back as far as 1695. In 1672 a music hall was erected at the foot of Niddry Street, in the model of the great Opera Theatre in Paris. This institution flourished for about thirty years, and was a favorite resort of the amiable society of Edinburgh during the latter part of that time. Admission was obtained by special tickets, not transferable, and was always gratis, except when benefits were given for the emolument of professional performers. The society, however, at length broke up, and the entertainments began to be totally neglected. The hall was then disposed of for other purposes, and, after being some time used as a Baptist meeting-house, it was seized in 1812 by the Grand Lodge, and has been known by the name of Freemasons' Hall.

After the weekly concerts of this society discontinued, subscription concerts were held in the Assembly Rooms, George's Rooms, and at Corri's Rooms, formerly the Circus, and the Caledonian Theatre. Musical festivals of a plan similar to that of the Oratorios in Paris, have also thrice taken place in Edinburgh, for the benefit of the public charities.

Assembly Rooms were erected in George's Square, not unsuitable to the general elegance of the other buildings in the New Town, in 1787. The principal hall is ninety-two feet long, forty feet wide, and forty feet in height. There are also a Tea Room, two Card Rooms, and a Saloon. Two Assemblies are held weekly in the winter, the one a dancing, the other a card assembly. The card parties are rather se-

lect than numerous; but the dancing assemblies are well frequented. The Caledonian, a minor theatre, is the only other place of public amusement which our limits will permit us to particularise. This building was originally erected for equestrian exhibitions, and called the Royal Circus. It was subsequently converted into a place of worship, but after various changes, was fitted up as a minor theatre, in 1822.

No city in the world affords greater security to the inhabitants in their persons and properties than Edinburgh. Robberies are rare, and street murder hardly known; so that a person may walk out at any hour of the night in perfect security. This, in former times, was, in a great measure, owing to the vigilance of a town-guard. In 1700 it consisted of 126 men. From that time it continued embodied till the year 1805, when a new system of police was adopted. It was then reduced to an officer and thirty men, as a guard to the lord provost; and this last remnant was finally disbanded in 1817, when the old Tolbooth was taken down, the lower part of which had been occupied as their guard-room. The arms of this ancient body of men were the same as those used by the king's forces in general, but, in their capacity of night watchmen, they used a weapon called a lochaber axe, the use of which had long been discontinued in every other place. In addition to the town-guard, there was also a body of Militia, called the Trained Bands, consisting of 1600 men; but they have also been long dissolved. The officers, however, are still elected annually, and the provost, *ex officio*, bears the title of colonel as their commander.

In 1805, the town-guard being found inadequate to preserve the peace of the city and protect the inhabitants in its extended state, an act of parliament was applied for, and under its sanction a new system of police was established. By this statute the city was divided into wards, and commissioners were appointed for each ward, for the purpose of assessing the inhabitants in the expense of the establishment, and for other duties. A court was also established, with a judge of police and clerk, for the trial of offences; and the judge was empowered to punish by fine and compensation for damages, by imprisonment in jail, or by commitment to Bridewell. The examination of the offender and witnesses was taken *instanter* and *viva voce*, and the sentence pronounced was immediately executed. After an experiment of nearly seven years, this system was found not to answer in consequence of the extravagant powers which had been given to the court. A new bill was accordingly brought into parliament, and an improved system was established in 1812, the office of judge of police being abolished. The city was divided into twenty-six wards, with three resident commissioners for each; the sheriff of the county and the magistrates of the city were appointed judges; and various enactments provided for the cleansing, watching, and paving of the streets, and for other matters of general police. This statute was further amended in 1822. In addition to the superintendent there are now three lieutenants and a clerk. The expense of the establishment for the year 1824 was £20,292 6s. 3d.

levied at the rate of one shilling in the pound on a rental of £373,736.

The town council of Edinburgh has the direction of all public affairs. The ordinary council consists of twenty-five persons; the extraordinary, of eight, making in all thirty-three. The whole is composed of merchants and tradesmen, whose respective powers and interests are so interwoven, that a sort of balance is preserved between the two bodies. The members of the town-council are partly elected by members of the fourteen incorporations, partly by their predecessors in office. These incorporations are, the companies of the surgeons (also erected into a royal college), goldsmiths, skinnners, furriers, hammarmen, wrights, masons, tailors, bakers, fleshers, cordiners (or shoemakers), weavers, waukers, bonnet-makers, dyers, and merchants'. The lord-provost of Edinburgh, who is styled right honorable, is high sheriff, coroner, and admiral, within the city and its liberties, and the town, harbour, and road of Leith. He has also a jurisdiction in matters of death, now in desuetude. He is preses of the convention of royal boroughs, colonel of the trained bands, commander of the city guard and of the Edinburgh jail; has the precedency of all the great officers of state and of the nobility, walking on the right hand of the king, or of his majesty's commissioner, and has a sword and mace carried before him. Under him are four magistrates called bailies, whose office is much the same with that of the aldermen in London, excepting that they continue in office only one year. There is also a dean of guild, who has the charge of the public buildings, and without whose warrant no house or building can be erected within the city. He has a council to consult with a nominal treasurer, who formerly had the keeping of the town's money, which is now given to the chamberlain. These seven magistrates are elected annually; and with the seven of the former year, three merchants' and two trades' counsellors, and fourteen deacons, making in all thirty-three, form the council of the city, and have the sole management and disposal of the city revenues. Formerly the provost was also an officer in the Scottish parliament. The magistrates are sheriffs depute and justices of the peace; and the town council are patrons of all the churches of Edinburgh, patrons of the University, and electors of the city's representative in parliament. They have besides a very ample jurisdiction both civil and criminal, are superiors of the Canongate, Portsburgh, and Leith, and appoint over these certain of their own number, who are called baron bailies; but the person who presides over Leith has the title of admiral, because he has there a jurisdiction over maritime affairs. The baron bailies appoint one or two of the inhabitants of their respective districts to be their substitutes. These are called resident bailies, and hold courts in absence of the baron bailies, for petty offences, and discussing civil causes of small moment.

In a paper communicated by the Rev. Dr. Blair to Sir John Sinclair containing an enumeration of families and examinable persons in the parishes of the city, in 1722, the total number of

has been immortalised by the author of *Everley* novels, under the title of the Heart of Lothian. It was built in 1561, but, having become inadequate for modern purposes, it was pulled down in 1817. The great entrance door has a massive lock and ponderous key, and a considerable part of the circular tower in which it is placed, were, upon the demolition of the building, carefully removed to Abbotsford, the residence of Sir Walter Scott, where it has re-assumed its venerable appearance, and forms an entrance to a beautiful but singular structure. The old Tolbooth is said originally to have been occupied as a parliament house as well as a prison. The Scottish parliament at which majesty is pretended, was held in this Tolbooth, immediately after the coronation of Charles I. in 1633. The Bridewell establishment of Edinburgh, on Calton Hill, said to be one of the best of the kind in Europe, was founded in 1791.

The *Exchange* is a large and elegant building, with piazzas on the north side, and a court of about 100 feet square in the middle but the merchants never made use of it to meet in, still obstinately using the open street as formerly. The back of the building is used for the city chambers and dependent offices for the different departments, which the access is by a hanging stair sixty feet high. The Scottish Mint is kept up in the building to the articles of the union, with the offices belonging to it, though no money is struck here. It stands in the lane called the Close, but is in a ruinous state, though inhabited by several of the different officers, and has all free houses. The bell-man's office, however, is not a sinecure, for he regularly rings the bell. This place, as well as Holyrood House, is an asylum for debtors, but only for 24 hours. There are three banking companies in Edinburgh, established by statute, and by royal charters. These are the Bank of Scotland, commonly called the Old Bank; the Bank of Scotland, and the British Linen Company. 1. The Bank of Scotland, commonly called the Old Bank, was erected by act of parliament A.D. 1695. By the statute of 1707, the company was empowered to raise its stock of £1,200,000, afterwards increased to £1,500,000 sterling, for the purpose of carrying on a public bank. The smallest sum any person could hold was declared to be 1000 Scots; and the largest sum for which he was allowed to subscribe was £20,000 of the same money. £8,000 are declared to be a qualification necessary to entitle any person to be elected governor; and £3000 for each director. The management of the affairs of the company was vested in a governor, deputy-governor, and twenty-four directors; and, among these managers, each proprietor was allowed to have a vote for every £1000 of stock he held. The office of this company prior to 1707 was kept down a narrow lane, at the north side of that part of the High Street called the Cowmarket; but they have since erected for accommodation an elegant building to the westward of the High Street, in full view of the Cowmarket Street. This bank has branches in every considerable town in Scotland. The

original shares of this company, amounting to £83 6s. 8d., sold in 1763 at £119; in 1791 at £180; and in 1827 at £187. 2. The Royal Bank was established in 1727. The stock of this company originally consisted of the equivalent money which was due to Scotland at the union. Proprietors of these sums to the extent of £111,000 were the original subscribers. But, this stock being found insufficient, a second charter was obtained in 1738, by which they were empowered to raise their stock to £150,000 sterling; and, subsequently, to £1,000,000. The business is managed by a governor, deputy-governor, directors, and extraordinary directors. The amount of the company's stock is at present £1,500,000 sterling; and each £100 of stock in the market sells for £170. The Royal Bank is situated in St. Andrew's Square, New Town. 3. The British Linen Company, with a capital of £100,000, was incorporated by royal charter in 1746, with a view to encourage the linen manufacture in Scotland. By the constitution of this company, its affairs are under the management of a governor, deputy-governor, and five directors. It carries on the business of banking, and promissory notes, like the two former companies; and the office is situated in St. Andrew's Square. The Commercial Bank was established in 1810, and the National Bank in 1825. These two last are upon the joint stock principle, and have a very numerous proprietary, and extensive capitals. The business of each is conducted like that of the other three old companies, by a board of directors. All these banks issue promissory notes for various sums not under £1 sterling, payable on demand in cash, or Bank of England notes. Two private Banking-houses also issue notes in the same way, viz. those of Sir William Forbes and Co., and Ramsay's, Bonnar, and Co. But besides these there are several banking-houses of great reputation in Edinburgh, which do not issue small notes, but which carry on the other branches of the banking trade, by transmitting money, discounting bills, and accommodating individuals with cash accounts.

The Custom-house used to be at the back of the Royal Exchange; but some years ago the establishment removed to Bellevue House in the New Town, which forms the eastern termination of Great King Street. The board consists of one resident, and two assistant-commissioners, under whom are a secretary, and various other officers. Some recent arrangements incorporate them with the establishments at Leith. The Excise-office in St. Andrew's Square has been recently purchased by the Royal Bank, the Excise board occupying Bellevue House. There are three commissioners of excise, a secretary, and numerous officers.

The Post Office forms part of the splendid buildings in Waterloo Place, and stands to the east of the arch of the Regent Bridge. It has extensive accommodation for the business of this important public establishment. A century ago the revenue of the Post-office of Scotland was inadequate to defray the expense of keeping it up. In 1763, however, it had increased to £11,942 per annum. In 1783 it had reached upwards of £40,000; and now

(1827) it is £150,000. There are subordinate offices in different parts of the city.

The Edinburgh Register Office was suggested by the earl of Morton, lord register of Scotland. The earl, therefore, obtained from his majesty a grant of £12,000 out of the forfeited estates, for building a register-office, or house for keeping the records, and disposing them in proper order. The foundation was laid on the 27th of June, 1774. The building, which is one of the most beautiful of Mr. Adams's designs, was executed in a substantial manner, in about sixteen years, at the expense of nearly £40,000, and is one of the principal ornaments of the city. The lord register has the direction of the whole, and the principal clerks of session are his deputies. These have a great number of clerks under them, for carrying on the business of the court of session. The lord register is a minister of state in this country. He formerly collected the votes of the parliament of Scotland, and still collects those of the peers at the election of sixteen, to represent them in parliament.

The earliest institution of a grammar-school in Edinburgh seems to have been about 1516, and a building which had been erected for the accommodation of the scholars in 1578, continued, notwithstanding the great increase of their number, to be used for the purpose till 1777; when the foundation of the present High School was laid on the 24th of June, by Sir William Forbes. This building is plain, but commodious. The great hall, where the boys meet for prayers, is sixty-eight feet by thirty, with commodious libraries at each end. There are a rector and four masters, who teach about 700 scholars annually. The salaries are trifling, and the fees are 10s. 6d. per quarter, but five quarters are paid. There is also a janitor, who receives one shilling from each of the boys quarterly. To the scholars of prominent merit premiums are awarded annually, chiefly in books; and to the dux of the highest class a gold medal, with a suitable inscription. Edinburgh Academy is the name given to another school erected in 1824, to the north of the Royal Circus. This establishment is under the superintendence of a board of directors; and besides a rector and four masters for the Latin classes, as in the High School, has an English master, and teachers for writing and arithmetic. There are also several other public English schools, the masters of which have small salaries in addition to the fees; and numerous private establishments, not only for teaching English, but the learned and foreign languages, on moderate terms; so that Edinburgh affords facilities for the acquisition of learning and the various ornamental accomplishments, which are hardly

and numbers of respect. Edinburgh, as a settled city with a view to the education. There are various manufacturing neighbourhoods of Edinburgh carried on very extensively. extensive type foundry; in years the manufacture of particularly of the elegant and now so generally used, has carried on to a considerable

In order to contrast the metropolitan society with here necessary to go has well known account of took place in Edinburgh. It is thirty-five years since and it is not going too far to and improvements which this last period infinitely ceded them, and would require than his adequately to do limits do not permit of many of this kind, otherwise we comment on individual has done. We may remark 1793, Edinburgh has extended it was at that time, and the population. The public mind and adorn it, would require them with effect. In sciences, arts, its progress has been remarkable. Wealth and in a like ratio, and the houses squares and streets, then on rank, fashion, and opulence into shops or places of business part of the community. pages, servants, and modes is perhaps as striking as within the period of Mr. C. but the difference of manner where so conspicuous, as refinement displayed in the villas, within a short distance, during the summer months classes of citizens. In order to judge from the general public opinion, and from the of all the decencies of life, rank, there has for some progressive improvement; and, the morals of 1793, those confess, compel us, in spite all our early predilections, preference and the palm of haps the prevailing fault of at present is the man which

ment feature in its history and character to our distinct notice. In 1581 a grant was sent from James VI. for founding a college in the city of Edinburgh; and the citizens, by various donations, purchased part of the house, chambers, and church of the collegiate abbey and prebends of the Kirk-a-field, other called Templum et Prefectura Sancta Marie de Regis, as a suitable site for it. In 1583 the king, magistrates, and council, the patrons of the new institution, prepared the place for the habitation of teachers and students; and in October 1583, Robert Rollock, whom they had introduced from a professorship in the University of Glasgow, began to teach in it. Other professors were soon after elected; and Rollock made principal of the College, and professor of divinity. The offices of principal and professor of divinity remained united till 1620. In 1620 James VI. having visited Scotland, commanded the principal and regents to attend him atirling Castle, where they held a solemn theological disputation, and the king desired that the college should for the future be called College of King James, which name it still bears in all its diplomas and public deeds. For some time the college consisted only of the principal and four regents or professors of philosophy, who each instructed one class of students in three years, in Latin, Greek, logic, mathematics, and physics. It was not till about the year 1710 that the regents began to be divided each to a particular profession; since that time they have been commonly styled professors of Greek, Logic, Moral Philosophy, Natural Philosophy.—The first medical professor instituted at Edinburgh, were Sir Robert Douglas and Dr. Archibald Pitcairn, in 1685. Sixty years afterwards, however, a summer school, on the official plants, and the dissection of the human body, once in two or three years, completed the whole course of medical education at Edinburgh. In 1720 an attempt was made to divide the different branches of physic regularly, which succeeded so well, that ever since, the reputation of the University as a school for medicine has been undisputed. The College has a fine library, founded in 1580, by Mr. James Little, advocate. It is enriched by a list of every book entered in Stationers' Hall, according to statute, and it now contains 70,000 volumes. The students of divinity, who pay for their education, have one belonging to their own particular department. The museum contains a capital collection of natural curiosities, the number of which is daily increasing; and the admirable management of professor Wilson, it promises to become the most interesting and important in Britain. The anatomical and obstetrical preparations are peculiarly fine. This university having been instituted after the Reformation, among a frugal people that had no love for ecclesiastical dignities, which receive the name of Universities in England, or in the Catholic countries of the continent of Europe. It still consists of a

single college, which enjoys the privilege of conferring degrees.

The branches of education at present taught in it are the following: 1. *Literature and Philosophy*, comprehending humanity, or Latin, Greek, mathematics, logic, moral philosophy, natural philosophy, rhetoric, belles lettres, universal history, and natural history. 2. *Theology*, comprehending divinity, church history, and oriental languages. 3. *Law*, comprehending civil law, institutes and pandects, Scots' law, public law, conveyancing. 4. *Medicine*, comprehending dietetics, materia medica, and pharmacy; practice of physic, chemistry, and chemical pharmacy; theory of physic, anatomy, and surgery; theory and practice of midwifery; medical jurisprudence, clinical medicine, clinical surgery, and military surgery. During the Summer session lectures are given on the following branches, viz. botany, natural history, midwifery, clinical lectures on medicine, and clinical lectures on surgery. The principal professors and lecturers are at present thirty-one in all; and the number of students is about 2400. The professorships of church history, natural history, astronomy, law of nature and nations, and rhetoric, are in the gift of the crown. The professor of agriculture was nominated by Sir William Pulteney, the founder of the institution. The remaining chairs are in the gift of the town council. Besides the classes here enumerated, the medical professors alternately give clinical lectures upon the cases of the patients in the Royal Infirmary. The integrity and discernment uniformly displayed in the appointment to professorships in this university, have contributed greatly to extend its reputation both at home and abroad. From confidence in the talents and industry of the professors, it has become a seat of education, not only to the youth of the united kingdom, but, to the honor of our country, students have been attracted to it from every nation in Europe, and from almost every civilised country on the globe. About thirty years ago, the old buildings of the college being thought quite unsuitable to the dignity of such a flourishing seat of learning, the magistrates and council set on foot a subscription for erecting a new structure, according to a design of Robert Adam, Esq., architect. Most of the old fabric was in consequence pulled down, and the new building is now in considerable forwardness. It is upon a superb scale, and the whole, when finished, if not the most splendid structure of the sort in Europe, will be the completest and most commodious. The estimate for completing the whole was about £63,000. The six columns in the front are not to be equalled in Britain. The shaft of each is twenty-three feet high, and three feet diameter, of one entire stone. The botanical garden belonging to the university is situated to the northward of the village of Canon-mills, and consists of about twelve acres. But the funds for the support of this garden are very inadequate to the purpose, not exceeding £170 per annum.

EDINBURGHSHIRE, or MID-LOTHIAN. See MID-LOTHIAN.

EDIT, *v. a.*EDITION, *n. s.*EDITOR, *n. s.*EDITO'RIAL, *adj.*Old Fr. *editer*; Lat. *edo*,*edere*, to set forth. To

publish; and hence to pre-

pare a work for publication.

It is now particularly applied, in our language, to the duty of superintendence and correction, in distinction from the original composition of a book.

These are of the second edition. *Shakespeare.*

The business of our redemption is to rub over the defaced copy of the creation, to reprint God's image upon the soul, and to set forth nature in a second and a fairer edition. *South.*

EDMONDSON (Joseph), a genealogist and herald painter, was appointed, in 1764, Mowbray herald extraordinary. He was also a member of the Society of Antiquaries. He died in 1786. His works are, *Historical Account of the Greville family*, 8vo.; *A Companion to the Peerage*, 8vo.; *A Body of Heraldry*, 2 vols. folio; *Baronagium Genealogicum, or the Pedigrees of English Peers*, 6 vols. folio.

EDMUND I., king of England, the son of Edward the Elder, succeeded his brother Athelstan, A.D. 941, and exhibited proofs of great courage and abilities during a short reign of about eight years. He was murdered by Leolf, a robber, A.D. 948. See ENGLAND.

EDMUND II., surnamed Ironside, from his strength and valor, succeeded his father Ethelred II., A.D. 1016, in that part of England which was not then possessed by the Danes. He was endued with great abilities, but was murdered by the traitor, Edric, duke of Mercia, before he had reigned a year. See ENGLAND.

EDOM, Heb. אֶדְוֹם, i. e. red; or Esau, the son of Isaac and brother of Jacob. The name Edom was given him, either because he sold his birth-right to Jacob for a mess of red pottage, or by reason of the color of his hair and complexion. Idumæa is derived from Edom, and is often called in Scripture the land of Edom. See the next article.

EDOM, or Idumæa, in ancient geography, a district of Arabia Petræa. A great part of the south of Judæa was also called Idumæa, because occupied by the Idumæans, upon the Jewish

captivity. But Edom Proper have been very extensive, from the Israelites, in which they compassed south eastward, till they came to the Moabites. Within this compass Hor, where Aaron died; marching the Israelites fought with king Amalek, who came down the wilderness. And this is the extent of Edom, lying south of the Dead Sea. Solomon's time extending to the 1 Kings ix. 26.

EDRED, king of England, son of the Elder, succeeded to the throne of his brother, Edmund I. (947). In rebellion of the Northumbrian Danes, he expelled Malcolm, king of Scotland, in homage for his English possessions. Active and warlike, he was extensive, and subservient to the celebrated abbot of Glastonbury. Edred died of nine years, and left the crown to his son, Edgar.

EDRIDGE (Henry), A.R.A., F.R.S., a landscape and miniature painter of eminence, was born at Paddington, in 1768. His earlier works were principally drawn on paper, with the Indian ink. It was in later years that he made those elaborate and high-finished paintings, uniting the depth and richness of colour with the freedom and freshness of execution, of which there are so many specimens in his collection. He died in 1821.

EDRISSI (Mohamed ben Mohamed), an Arabian prince and geographer, of the twelfth century, who being expelled from his dominions in the south of Egypt, fled to Sicily, at the court of Roger II. He composed *Geographical Recreations*; and a silver globe, said to have been made of Greek pounds, on which were inscribed the names of the earth, so far as they were known. His book, which has been translated into Latin by the geographer Nubiensis, from its containing information relative to the eastern part of the world, was translated into Latin by Gerard of Cremona, and John Hesronita, and published at Venice, 4to., 1619.

## E D U C A T I O N .

EDUCATE, *v. a.*EDUCATION, *n. s.*

to lead. To bring up from youth; instruct youth. See Hooker's fine definition of the substantive.

Education and instruction are the means, the one by use, the other by precept, to make our natural faculty of reason both the better and the sooner to judge rightly between truth and error, good and evil.

*Hooker.*

The best time for marriage will be towards thirty, or as the younger times are unfit, either to choose or to govern a wife and family, so, if thou stay long, thou shalt hardly see the education of thy children, who, being left to strangers, are in effect lost; and better were it to be unborn than ill-bred.

*Raleigh to his Son.*

Diversity of education, and dissipation of principles wherewith men are at first bred, wherein all our after reasonings are founded. *Lord Dunsford.*

If the children of religious parents, by Christian nurture, shall shame their parents, it takes it more heinously, and reproaches the religion. *Bp. Hall.*

Their young succession all their rage, They breed, they brood, instruct and feed, And make provision for the future age. *Dryden.*

Some independent ideas, of no authority, are, by education, custom, and the authority of their party, so coupled in their minds, that they appear there together.

What education did at first conceive,  
Our ripened age confirms us to believe.

*Pamphlet.*

Education is worse, in proportion to the grandeur of  
the monarch: if the whole world were under one mo-  
narch, the heir of that monarch would be the worst  
and mortal since the creation.

*Swift. On Modern Education.*

Education at our public schools and universities is  
like being in a waggon for expedition, where there is  
no road that will take you by a short cut to Par-  
is, and the polisher has got the key of it.

*Cumberland.*

Only and sensible, and having received an educa-  
tion what above her rank, her conversation was  
agreeable. Ralph read plays to her every even-

*Franklin.*

and then as to her manner; upon my word I  
think is particularly graceful, considering she never  
had the least education: for you know her mother was  
a milliner, and her father a sugar baker at Bris-

*Sheridan.*

E D U C A T I O N. We have explained this term  
by a more ample and satisfactory defini-  
tion than has been given thus: 'Education is that  
of means, by which the human under-  
standing is gradually enlightened, and the dispo-  
sition of the human heart are formed and  
brought forth, between early infancy and the pe-  
riod when a young person is considered as qua-  
lified to take a part in active life.'

The word education, among the ancients, seems  
to have had a signification different from that  
which is affixed to it by the moderns. Educat  
is, says Varro, educat nutrit, instituit  
regulus, docet magister. According to this  
division, education, institution, and instruc-  
tion are as different as the midwife, the nurse,  
the preceptor, and the master. But other writers,  
ancient and modern, have considered edu-  
cation in the comprehensive sense expressed in  
the above definition; and as no subject is of  
greater importance than this, it being the practical  
education of all mental acquirements, as well  
as all virtue, many distinguished authors have  
devoted their minds to the consideration of it.  
Regulus, and others of the most eminent legis-  
lators of antiquity, considered a proper education  
necessary to form good citizens, that they  
incorporated their systems of education with the  
system of laws they gave to their countrymen.  
Among all the legislators and authors of an-  
tiquity, of whose works any relics have come  
down to us, none appears to have written with  
more propriety on this subject, than the cele-  
brated Quintilian, who taught rhetoric in Rome  
under Domitian, Nerva, and Trajan.

Among the moderns, the sublime Milton,  
the judicious Locke, have left treatises on  
this important topic. The late lord Kames too  
is the author of an excellent tract, entitled  
Hints on Education; and the fanciful  
Boswell, whose genius and eccentricities are  
well known to the public, devoted his pen to the  
consideration of this subject. To these  
and other of respectable modern names might be  
added. But we do not consider a Dictionary of  
Education as the proper depository for extensive  
speculations of this kind. Our whole work,  
indeed, is a course of elementary, and therefore  
Vol. VII.

educational treatises; what is more must be either  
purely speculative; or it must involve details  
which are varied with the designs of every parent,  
and the talents, station in life, and destiny of  
every young person. It will suffice, therefore,  
here briefly to review the principal ancient and  
modern systems of education, adding a more  
particular account of one or two modern and  
material improvements.

The system of Lycurgus, however well  
adapted to a state just emerging from barbarism,  
was but a species of detached military training;  
designed to form the heroic at the expense of all  
the other virtues, and extinguishing all regard to  
the interest of other states as well as family and  
personal interests, in an exclusive spirit of sup-  
posed patriotism. For, in reality, his system was  
too confined to be truly patriotic. It had no  
tendency to elevate the human intellect, or to  
stimulate into activity many of the noblest and  
best affections of our nature. Had his institu-  
tions been preserved in their pristine vigor, the  
Spartans might have continued precisely the  
same; but they would have been incapable of  
receiving the knowledge of those arts which  
adorn and improve mankind. The system, in-  
deed, of a state education has always been too  
cumbersome for management: it has the appear-  
ance at the best of endeavouring to mould all  
minds into one form, and, by having a strong ten-  
dency to produce habitual submission to the will of  
one, of being highly unfavorable to public liberty.  
No doubt can exist which is to be preferred, the  
total neglect of education, or this artificial and  
forced method of attempting it; but all that the  
state has legitimately to do is, to take care that  
none shall be without the means of instruction,  
and to leave private persons to follow the bent  
of their own inclinations in the employment of  
them. In those nations which were first civilised,  
the power of the parent was considered as abso-  
lute; and as implicit submission was, from the  
first, inculcated upon the young, the labor of  
education was greatly diminished, and the lim-  
ited knowledge and sentiments of the parent  
were very easily communicated to youth. The  
round of duty was less extensive, and its parts  
less complicated than at present. Among the  
Israelites, where moral education appears to have  
made the greatest advances, the system of duty  
was completely laid down in the written law;  
so that all the knowledge which the age and  
country possessed was certainly to be gained,  
and the moral principles certainly to be regulated  
aright, where the parent employed wisely that  
authority which the law enforced, and which the  
customs of the times would otherwise have  
allowed.

The necessity of a tolerably correct direction  
of the early propensities, in order to promote do-  
mestic comfort, must in a great number of cases  
have led to such direction of them, without any  
view to the future advantage of the individual.  
But with respect to those who were to come for-  
wards in the employments of the state, or in any  
other way to be exposed to the notice of their  
countrymen, the advantages of early instruction  
in knowledge, and of the early cultivation of  
those qualities which the wants of the age and

country made of great estimation, were so obvious, that they appear to have led, in a variety of cases, to great attention to the work of education; and though we have not, in many instances, any account of the procedures of the ancients, yet, in the few circumstances which have been recorded, we perceive that, long before any thing like a systematic plan of education was adopted, individuals made education an object of primary concern.

One grand object of moral education, so far as it respects rectitude of dispositions and affections, is to cultivate the habit of self-control. Religious people, of all periods, who have possessed the light of revelation, have, in a particular manner, been sensible that this habit lies at the foundation of moral worth; and where the authority of the parent is generally preserved, the cultivation of this habit follows as a matter of course. It requires a wise choice of means to prevent filial submission from being the submission of a slave, rather than of a child: but where it is acquired, and rightly directed, the foundation is laid for submission and obedience to the will of God; and, where *this principle* takes a firm hold on the mind, almost every thing is done that could be wished, to further the progress of the individual towards moral worth. A maxim of the highest authority, now indeed, is felt in all its truth, 'The fear of the Lord is the beginning of wisdom.' In reading almost the only systematic work of antiquity on the subject of education, that of Quintilian, we become convinced of the writer's great good sense, excellence of disposition, and extensive information; and from his work, though it had a particular object in view, much may be learned by the modern instructor. Most excellent principles are scattered up and down in those general parts, which amply repay our perusal, though we are seldom invited to proceed by elegance of diction, or brilliance of thought: and the different facts he mentions, give us reason to suppose that, in his time, education was in a most degraded state at Rome.

Among the moderns few names are more justly venerated than that of John Milton. His life was devoted to study; and part of it was employed in instructing youth. Among his other works we find a Treatise on Education. He had himself been educated according to the plan long established in the English universities. The object of his directions is to exhibit a plan of 'a better education, in extent and comprehension far more large, and yet of time far shorter, and of attainment far more certain, than any that had yet been in practice.' The following is the substance of his treatise:—'The end of learning is to cultivate our understandings, and to rectify our dispositions, by enriching our minds with the treasures of wisdom. But, in the present modes of education, this design does not appear to be kept in view. The learner of Latin is burdened with rules, themes, verses, and orations; but no care is taken to make him master of the valuable knowledge which the classics contain. And, when he advances farther, he is driven into the thorny paths of logic and metaphysics. So, when his studies are completed, he

is almost  
he first.

of some of these, will have the happiest effect in elevating their genius. Let this stately man be crowned with logic and rhetoric. This unite the advantages of an Athenian and an Italian education: for the pupils should be in the exercises of wrestling and fencing, and in the whole military discipline.' Such are the sentiments of our admired poet on education—a man to be expected from one who was an enthusiastic admirer of the sciences, arts, and institutions of Greece and Rome; and who, at the same time, from his religious and political principles, was no friend to the universities.

The name of Locke is almost equally calculated to attract the attention of every reader. He was not a man of thinking for himself; but, unlike many, more desirous of rendering himself useful, than of being admired for singularity: he examined without prejudice the effects of various modes of education of which he disapproved. To render himself useful to mankind, he descended from the heights of science to the humble task of translating *Æsop's Fables*.

Locke, in his *Treatise on Education*, proposes the two great objects, of preserving and improving the bodily constitution; and increasing the understanding with useful knowledge, while we cherish good dispositions in the mind.

In his directions on the first of these, he recommends plain fare, simple and plentiful clothing, with abstinence from strong liquors, and as much as possible from medicine, and temperance and early rising. In England, however, few parents will be willing to comply with Mr. Locke's advice. He not only directs that children's feet be frequently washed in cold water; but even wishes that their feet were always kept in such a condition as to be washed in water freely. This he thinks likely to strengthen the constitution in such a manner, as to render them less liable, in the course of life, to diseases as arise from any unusual exposure to heat or cold. Whatever may be thought of this, his method of cultivating the understanding, and forming the dispositions, deserves the attention of parents and preceptors. By a virtuous indignation he reprobates that indolence which we generally corrupt the heart with, and render the temper of children, in infancy; so render them incorrigible as they advance in age.

On the other hand he reckons it neither necessary nor prudent to treat them with harshness or severity. Let them be formed to obedience from their earliest years: let them be accustomed to submit implicitly to the direction of those on whom they depend. But beware of indulging their tempers, and depressing their spirits with sadness; as well as of accustoming them to neglect their duty, except when allured to it by the hopes of reward. Inspire them with a sense of shame, and with a generous thirst for knowledge. Caress and honor them when they do well; treat them with neglect when they act badly. This will produce much better effects than if you were at one time to chide and beat, and at another, to reward them with a profusion of foolish indulgencies.

Locke does not approve of forming children at too early an age, to that politeness and

propriety of manners which should distinguish them when they become men. This great man was of opinion that a private education is more favorable than a public one to virtue, and scarcely less favorable to learning. He advises us more particularly to keep our pupil at a distance from evil example; to choose the most favorable seasons for instruction; to enforce obedience strictly, but rarely by blows. If his engagements in life prevent the parent from superintending and directing his son's education personally, let him commit him to the care of a virtuous and judicious tutor, who is rather a man of experience in the world than of profound learning; for it is more necessary that the pupil be formed for conducting himself with prudence in the world, and be fortified against those temptations to which he will be exposed in active life, than that his head be stuffed with Latin and logic. Mr. Locke, although his own mind was stored with Grecian and Roman literature, is against that application to ancient learning, which was then indispensably required in the education of youth. He considers languages and philosophy as rather having a tendency to render the youth unfit for acting a prudent and becoming part in life, than forming him for it; and he therefore insists that these should be but in a subordinate degree the objects of his attention.

Curiosity, he thinks, ought to be industriously roused in the breast of the child, and cherished by meeting the readiest gratification. He should be indulged in play, while he continues to play with keenness and activity; but not suffered to loiter about in indolence. To restrain him from fool-hardy courage, point out to him the dangers to which it exposes him; to raise him above timorous cowardice, and inspire him with manly fortitude, accustom him from the earliest period of life to an acquaintance with such things as he is most likely to be afraid of: subject him now and then to pain, and expose him to danger; but let such trials be judiciously conducted. When, from idleness or curiosity, children treat dogs, cats, birds, butterflies, &c., with cruelty, Mr. Locke advises that they be carefully watched, and every means used to excite them to generous sensibility. Allow them to keep tame birds, dogs, &c., only on condition of their using them with tenderness. He supposes that this unhappy disposition to cruelty is occasioned, or fostered, by people's laughing when they behold the impotent efforts of children to do mischief; and encouraging them in mistreating those creatures which are within their reach. He censures the practice too of entertaining them with stories of fighting and battles; and representing characters distinguished for atrocious acts of inhumanity as great and illustrious. Let such practices be refrained from, if you wish to inspire your child with generous and humane sentiments. Teach him gentleness and tenderness, not only to brutes but also to servants and companions. The enquiries of a child ought to be answered readily, that great man insists, though his questions be put in awkward language. Curiosity is natural, and, if not repressed, he will often be excited by it to the pursuit of knowledge. Let him find

his eagerness in this pursuit a source of applause and esteem. Avoid the folly of those who sport with the credulity of children, by answering their questions in a ludicrous or deceitful manner. When he attempts to reason on such subjects as are offered to his observation, be careful to encourage him: praise him if he reasons with any degree of plausibility; even if he blunders, beware of laughing at him. With regard to amusements; while you indulge him freely in innocent diversions, encourage him to exercise his own ingenuity in constructing them for himself. In virtue, wisdom, breeding, and learning, he comprehends all that is necessary to enable his pupil to act a respectable part in life. In forming a boy to virtue, he advises first to inform him of the relation subsisting between human creatures and a supreme independent Being, and to teach him, that obedience and worship are due to that Being, but beware of impressing his mind with any notions concerning spirits or goblins, which may render him incapable of bearing darkness or solitude. Next labor to impress his mind with a veneration for truth; habituate him to a strict adherence to it; and endeavour to render him gentle and good-natured.

Good breeding forms no inconsiderable part of a good education. In teaching this, Mr. Locke advises, 1st, To inspire a youth with a disposition to oblige all with whom he is conversant; next, to teach him how to express that disposition in a becoming manner. Let boisterous roughness, contempt of others, censoriousness, impertinent raillery, and a spirit of contradiction, be banished from his temper and behaviour. But beware of leading him to regard the mere forms of intercourse as matters of the highest importance. Teach him that genuine good breeding is only an easy and graceful way of expressing good sense and benevolence in his conversation and deportment.

Mr. Locke advises to initiate the child in reading, as an amusement, without letting him know that he is engaged about a matter of any importance: or teach him to consider it as a high honor to be permitted to learn his alphabet; otherwise he will turn from it with disgust. Such books only as are plain, entertaining, and instructive, should at this time be put into his hands. Mr. Locke disapproves of an indiscriminate perusal of the Bible at this period of life; but reckons it highly proper, to cause him to peruse some of its beautiful historical passages, with its elegant and simple moral precepts. He advises next to proceed with writing, and drawing, if the boy be not naturally incapable of acquiring the latter.

The scholar must now begin an acquaintance with other languages. Yet, says Mr. Locke, let none waste their time in attempting to acquire a knowledge of Latin, but such as are designed for some of the learned professions, or for the life of a gentleman without a profession. To these last it may be useful; to others this writer thinks it is wholly unserviceable. But in learning the Latin tongue, he proposes, as a much happier method than burdening and perplexing a boy with rules of grammar, to make him speak it

with a tutor sufficiently master of it for use. He proposes, that if we conveniently have the boy taught Latin, the introductory books, accompanied with an English version, he may have recourse, for the explanation of Latin. And he again prohibits perusing books with grammatical difficulties, as it is impossible to enter into the spirit of them.

Skill in grammar, says Mr. Locke, is useful to those whose lives are to be devoted to the study of the dead languages; knowledge, which the gentlemen and ladies of the world may have occasion to derive from the ancient languages, may be acquired without a painful study of precisely or syntactically learning of any language its meaning and words; if possible, let it be acquired by the acquisition of some real knowledge, such as the nature of plants, animals, &c. insists that the boy be not burdened with the composition of Latin and verses. Neither let his memory be clogged with whole pages and chapters from the classics. Such ridiculous exercises have no tendency to improve him either in the knowledge of languages or of nature.

Mr. Locke, however, wishes that the language were learned along with the Latin, these to be accompanied with the study of arithmetic, geography, history, and chronology. These branches of knowledge being combined, the learner in one of the two languages will thus, he thinks, acquire the Latin with greater facility. We fear, however, that the study of acquiring these sciences, particularly the study of history, would thus be proportionably retarded. One method which Mr. Locke recommends for facilitating the study of language is, to let the youth's hand, as soon as he has acquired a tolerable knowledge of chronology, and the most entertaining Latin historians, the interesting nature of the events which they do not fail to command his attention, in the study of which he must find in making sense of meaning. The Bible and *Cæsar de Bellis* be his best guides in the study of the law of nature and nations, as well as the study of political institutions of his country. Mr. Locke recommends as important objects, that the youth ought to study with the most exactness Rhetoric and logic, with all their rules, which will contribute little to render him a reasoner or an eloquent speaker. Mr. Chillingworth will be more beneficial to him to reason and to persuade, than to study the lectures on those arts which he can peruse in the lectures which he can hear.

In every art and science, Mr. Locke recommends practice and experience to rules. Philosophy, as contributing to inspire the mind with warmer sentiments of devotion, and many useful purposes in life, ought to be a part in the young gentleman's studies. He prefers the humble experimental philosopher to the lofty builders of systems. Mr. Locke does not think Greek necessary to a gentleman or man of the world!

recommends dancing, as contributing to and gracefulness of carriage; with riding fencing, as necessary branches of a young man's education. He also advises that he learn some mechanical trade, with the use of which he may agreeably fill up some leisure hours: and insists that he should means be unskilled in the management of farts. Travelling, he thinks, will do more than good to the understanding and morals of a traveller, unless deferred to a later period, than at which young gentlemen are usually out.

Watts subjoins a Discourse on the Education of Children and Youth, to his excellent Essay on the Improvement of the Mind. It consists of, 1. Instructing children in religion, which he thinks should be attempted 'as soon as they begin to know almost any thing.' 2. The Improvement of their natural powers: 3. Self-government, which he proposes children to be instructed in: 4. Reading and writing: 5. Employment: 6. Rules of prudence: 7. Accomplishments in life; among which are enumerated the Greek, Latin, and French languages, mathematics, arithmetic, algebra, geography, astronomy, natural philosophy, history, music, drawing, fencing, riding, and dancing; in which last accomplishment the Dr. observes he sees no evil, though he thinks that dancing has most sensible dangers; 'over which a wise parent will keep a watchful eye on the child.' 8. Of evil influences, from terrible stories, bloody histories, &c. 9. Of sports and diversions. 10 and 11, His two last sections, of the proper degrees of liberty and restraint in parents and daughters. Dr. Johnson has said, 'never has the care of instructing others may be charged with deficiency in his duty if this is not recommended.'

In 1762 the celebrated John James Rousseau addressed the public with his *Emilius*; a moral treatise in 4 vols. 12mo. We quote, with very great pleasure, the character given of it, by Mr. Bayle, in the *Encyclopedie Britannica*.

'The originality of thought, affecting sentiment, and bold vehemence, this book,' observes this writer, 'is one of the noblest pieces of composition, not only in the French language, but even in the compass of ancient and modern literature. The regularity of his method, however, renders his task to give an abridged view of his work. He conducts his pupil, indeed, from infancy to manhood. But instead of being a system of education, his work is besides a treatise of moral and philosophical knowledge. He has chosen a path, and follows it from the bottom to the summit of the hill: yet whenever he appears, on the right or left hand, he is by steps made to pluck it; and sometimes, when he has once stopped aside, a new object catches his eye and seduces him still farther. However, he returns. His observations are in many places loosely thrown together, and many things are introduced, the want of which could by no means have injured either the unity or regularity of his work. If we attempt to state the principles on which he proceeds, in

reprobating the prevalent modes of education, and pointing out a new course, his primary and leading one seems to be, that we ought to watch and second the designs of nature, without anticipating her. As the tree blossoms, the flowers blow, and the fruit ripens each at a certain period; so there is a time fixed in the order of nature for the sensitive, another for the intellectual, and another for the moral powers of man to display themselves. We in vain attempt to teach children to reason concerning truth and falsehood, concerning right and wrong, before the proper period arrive: we only confound their notions of things, and load their memories with words without meaning; and thus prevent both their reasoning and moral powers from attaining that strength and acuteness of which they are naturally capable. He attempts to trace the progress of nature, and to mark in what manner she gradually raises the human mind to the full use of all its faculties. Upon the observations which he has made, in tracing the gradual progress of the powers of the human mind towards maturity, his system is founded.

'As it is impossible to communicate to the blind any just ideas of colors, or to the deaf of sounds; so it must be acknowledged, that we cannot possibly communicate to children ideas which they have not faculties to comprehend. If they are, for a certain period of life, merely sensitive animals, it must be folly to treat them during that period as rational and moral beings. But is it a truth that they are, during any part of life, guided solely by instinct, and capable only of sensation? Or, how long is the duration of that period? Has nature unkindly left them to be, till the age of twelve, the prey of appetite and passion? So far are the facts of which we have had occasion to take notice, concerning the history of infancy and childhood, from leading to such a conclusion, that to us it appears undeniable that children begin to reason very soon after their entrance into life. When the material world first opens on their senses, they are ignorant of the qualities and relations of surrounding objects: they know not, for instance, whether the candle which they look at be near or at a distance; whether the fire with which they are agreeably warmed may also affect them with a painful sensation. But they remain not long in this state of absolute ignorance. They soon appear to have acquired some ideas of the qualities and relative situation of bodies. They cannot, however, acquire such ideas, without exerting their reasoning powers in a certain degree. Appearances must be compared, and inferences drawn, before knowledge can be gained. It is not sensation alone which informs us of the relative distances of bodies; nor can sensation alone teach us, that the same effects which we have formerly observed will be again produced by the same cause.

'But, if children appear capable of reasoning at a very early period, they appear also to be at a very early period subject to the influence of the passions: they are angry or pleased, merry or sad, friends or enemies, even while they hang at the breast, instead of being selfish, they are naturally liberal and social. And, if we observe

them with attention, we shall find that the passions do not display themselves sooner than the moral sense. As it is wisely ordered, that we should not see, and hear, and feel, without being able to compare and draw inferences from our perceptions; so it is a no less certain and evident law of nature, that the passions no sooner begin to agitate the human breast, than we become able, in a certain degree, to distinguish the beauty and the deformity of virtue and vice. The child is not only capable of gratitude and attachment to the person who treats him with kindness; he is also capable of distinguishing between gratitude and ingratitude, and of viewing each with proper sentiments. He cries when you refuse to gratify his desires; but he boldly insists that he is injured when you use him cruelly or unjustly. It is indeed impossible to attend to the conduct of children during infancy, without being convinced that they are, even then, capable of moral distinctions. So little are they acquainted with artificial language, that we and they do not then well understand each other. But view their actions; consider those signs by which nature has taught them to express themselves. Our limbs, our features, and our senses, are not gradually and by piecemeal bestowed as we advance towards maturity; the infant body comes not into the world mutilated or defective: why then, in point of mental abilities, should we be for a while brutes, without becoming rational and moral beings till the fulness of time be accomplished? all the differences between the phenomena of manhood and those of infancy and childhood may be accounted for, if we only reflect, that, when children come into the world, they are totally unacquainted with all the objects around them; with the appearances of nature, and the institutions of society; that they are sent into the world in a feeble state, in order that the helplessness occasioned by their ignorance may attract the notice and gain the assistance of those who are able to help them; and that they attain not full strength in the powers either of mind or body, nor a sufficient acquaintance with nature, with artificial language, and with the arts and institutions of society, till they arrive at manhood.

‘Even Rousseau, notwithstanding the art with which he lays down his system, cannot avoid acknowledging indirectly, on several occasions, that our social dispositions, our rational and our moral powers, display themselves at an earlier period, than that at which he wishes us to begin the cultivation of them.

‘But though the great outlines of his system be merely theory, unsupported by facts, nay plainly contradictory to facts, yet his observations on the impropriety or absurdity of the prevalent modes of education are very often just, and many of the particular directions which he gives for the conducting of education are judicious. He is often fanciful, and often deviates from the common road, only to show that he is able to walk in a separate path: yet his views are liberal and extensive: his heart seems to have glowed with benevolence: his book contains much observation of human actions; displays an intimate acquaintance with the motives

which sway the human heart—means a perfect system for superior to what many other done upon the subject.”

With those who estimate the value of the blessing the business of education is task. It is the formation of the mind to cheerfulness, to wisdom. It is the teaching his eyes to the circumstances rounded; to distinguish virtue from falsehood; beauty from happiness from misery: to contribute neither more nor less importance to every acquisition, and, instead of being borne above them to that degradation and moral excellence, him to judge distinctly of earthly enjoyments, and, by own faculties, to select those which will contribute to his good. Education, says Dr. A. developing its influence upon it, duces to an intimate acquaintance with less objects which are totally ignorant; and every object of a pleasant or unpleasantly multiplying or disagreeable or disagreeable sensation, objects are comparatively before them are of no great these are overlooked by the years pass away in a kind of without apathy or affection, ever, a natural acuteness is observable among the most, nined with lively sensations and tions; and when they are objects that appear interesting most violent. What they appear important to them—and possess is their all. Their concentrated in that which gives the powers of body and mind whatever gives pain. This cause of that remarkable strong affections, both of the benevolent kind, so observable in savage impetuosity of character so, among the active and unimpaired.

The cultivated mind, by acquaintance with innumerable objects, discovers some pleasant object of its pursuit: of attention and affections are divided into innumerable rays, although enjoyment may be augmented by aggregate individual quality possesses the of influence. The young are generally affected by simple of their joy or anger, sorrow complex. As the powers are enlarged, the affections are and rendered more complicated perception of favors and

The excellent founder of them, Mr  
Desa, a gentleman of Gloucestershire

(in which county he was born 1735), seems at  
first to have had his attention engaged to the  
general condition of the poor, by observing the  
miserable moral state of the prisoners confined  
for less crimes in the county jail. In a letter  
to a gentleman who had applied to him for the  
particulars of the nature and origin of his plan,  
he thus expresses himself :—

‘Some business leading me one morning into  
the suburbs of the city, where the lowest of the  
people (who are principally employed in the pit  
manufactory) reside, I was struck with concern at  
seeing a group of children, wretchedly ragged, at  
play in the street. I asked an inhabitant whether  
those children belonged to that part of the town,  
and lamented their misery and idleness. Ah ! sir,  
said the woman to whom I was speaking, could  
you take a view of this part of the town on Sun-  
day, you would be shocked indeed ; for then the  
street is filled with multitudes of these wretches,  
who, released on that day from their employment,  
spend their time in noise and riot, playing at  
chuck, and cursing and swearing in a manner so  
horrid, as to convey to any serious mind an idea  
of hell rather than any other place. We have a  
worthy clergyman, said she, minister of our  
parish, who has put some of them to school ; but  
upon the sabbath they are all given up to fol-  
low their inclinations without restraint, as their  
parents, totally abandoned themselves, have no  
idea of instilling into the minds of their children,  
principles to which they themselves are strangers.

‘This conversation suggested to me, that it  
would at least be a harmless attempt, if it were  
productive of no good, should some little plan be  
formed to check this deplorable profanation of  
the sabbath. I then enquired of the woman if  
there were any decent, well-disposed women in  
the neighbourhood, who kept schools for teaching  
to read. I was presently directed to four. To  
these I applied, and made an agreement with  
them, to receive as many children as I should  
send on the Sunday, whom they were to instruct  
in reading and the church catechism. For this I  
engaged to pay them a shilling for their day’s  
employment. The women seemed pleased with  
the proposal. I then waited on the clergyman  
before-mentioned, and imparted to him my plan.  
He was so much satisfied with the idea that he  
engaged to lend his assistance by going round to  
the schools on a Sunday afternoon, to examine  
the progress that was made, and to enforce order  
and decorum among such a set of little heathens.

‘This, sir, is the commencement of the plan.  
It is now about three years since we began, and  
I could wish you were here to make enquiry into  
the effect. A woman who lives in a lane where  
I had fixed a school, told me some time ago,  
that the place was quite a heaven upon Sundays,  
compared to what it used to be. The numbers  
who have learned to read and say their catechism  
are so great that I am astonished at it. Upon the  
Sunday afternoon the mistresses take their  
scholars to church, a place into which neither  
they nor their ancestors ever entered with a view  
to the glory of God. But what is yet more ex-  
traordinary, within this month, these little raga-  
muffins have in great numbers taken it into their  
heads to frequent the early morning prayers,

which are held every morning at the cathedral at seven o'clock. I believe there were near fifty this morning. They assemble at the house of one of the mistresses, and walk before her to church, two and two, in as much order as a company of soldiers. I am generally at church, and after service they all come round me to make their bow; and, if any animosities have arisen, to make their complaint. The great principle I inculcate is to be kind and good-natured to each other; not to provoke one another; to be dutiful to their parents; not to offend God by cursing and swearing; and such little plain precepts as all may comprehend. As my profession is that of a printer, I have printed a little book, which I give amongst them; and some friends of mine, subscribers to the Society for promoting Christian Knowledge, sometimes make me a present of a parcel of Bibles, Testaments, &c., which I distribute as rewards to the deserving. The success that has attended this scheme, has induced one or two of my friends to adopt the plan, and set up Sunday schools in other parts of the city, and now a whole parish has taken up the object; so that I flatter myself in time the good effects will appear so conspicuous as to become generally adopted. The number of children at present thus engaged on the sabbath are between 200 and 300; and they are increasing every week, as the benefit is universally seen. I have endeavoured to engage the clergy of my acquaintance that reside in their parishes. One has entered into the scheme with great fervor; and it was in order to excite others to follow the example, that I inserted in my paper the paragraph which I suppose you saw copied into the London papers. I cannot express to you the pleasure I often receive in discovering genius and innate good dispositions among this little multitude. It is botanising in human nature. I have often too, the satisfaction of receiving thanks from parents, for the reformation they perceive in their children. Often I have given them kind admonitions, which I always do in the mildest and gentlest manner. The going among them, doing them little kindnesses, distributing trifling rewards, and ingratiating myself with them, I hear, have given me an ascendancy, greater than I ever could have imagined; for, I am told by their mistresses, that they are very much afraid of my displeasure. If you ever pass through Gloucester, I shall be happy to pay my respects to you, and to show you the effects of this effort at civilisation. If the glory of God be promoted in any, even the smallest degree, society must reap some benefit. If good seed be sown in the mind, at an early period of human life, though it shows itself not again for many years, it may please God, at some future period, to cause it to spring up, and to bring forth a plenteous harvest.

Mr. Raikes's first effort bears date about the close of the year 1781, or the beginning of 1782; and the system began to extend itself in the city of Gloucester. Having tried the experiment for more than a year, he determined to invite the public attention to a scheme which he perceived to be fraught with such benefits. For this purpose he inserted a paragraph in a weekly newspaper, of which he was the editor and printer.

The following is a copy of notice:—

*Gloucester Journal.*

'Some of the clergy in different counties, bent upon attempting a reformation of the children of the lower class, are now setting up day schools for rendering the labour of the poor more servient to the ends of instruction. Hitherto been prostituted to bad purposes, and other inhabitants of the villages, complain that they lose their property on the sabbath week besides; this in a great measure from the lawless state of the young, who are allowed to run wild on that day every restraint. To remedy this, the most duly qualified are employed to teach those that cannot read; and those that can read, are taught the catechism and the principles of religion to church. By thus keeping the day engaged, the day passes profitably and agreeably. In those parishes where this system has been adopted, we are assured that the behaviour of the children is greatly improved, and the barbarous ignorance in which they have lived, being in some degree dispelled, give proofs that those persons who consider the lower orders of the people as incapable of improvement, and therefore attempt to reclaim them imprudently, not worth the trouble.'

His statement of the good effects of this system caught the attention of a gentleman before alluded to, who wrote immediately to Mr. Raikes, and received the latter's permission of its author, this appeared in one of the numbers of the *Gloucester Journal* for 1784 (vol. iv. p. 410). This publication, the paper of the day, was read by thousands of the most intelligent of society in the kingdom. Mr. Raikes was anxious to answer the enquiries of others anxious to gain information on this important subject.

The scheme began now to be known and adopted. Christians of all denominations, wondering that it should have been devised before, seemed determined to do as much as possible, the mischief of the system, by applying with the utmost diligence of this new discovery in the world of religion. Several public-spirited gentlemen in the metropolis, perceiving that the cause was greatly aided by the establishment of such schools, which should combine the patronage of all denominations of Christians, met at a preparatory meeting August 30th, 1784, and brought into consideration the propriety of a society for establishing and supporting day schools for the instruction of the children of different parts of the kingdom. A resolution was then passed, a public meeting was held on the 7th of September, 1784, formed, bearing the title of 'The Society for the Support and Encouragement of the Day Schools in the different Counties of England.' The establishment was exceedingly a growing cause. By the respectable

the public confidence; by their  
 tined the public mind; by their  
 ated the public zeal; and, by  
 it assisted the public expendi-

et of importance with the com-  
 day School Society, to engage  
 of episcopal authority within the  
 blished religion of the country;  
 pken to the honor of the bishops,  
 tly came forward, and cast the  
 nitres into the scale of this good  
 the dignitaries of the church,

 igh the kingdom.'

ment in the mode of popular  
 uced by Dr. Bell and Mr. Lan-  
 we shall immediately advert in  
 t manner, must be considered as  
 era in the history of Sunday  
 advantage derived from these  
 does not merely consist in a ser-  
 all their arrangements, but in  
 p the world, more clearly than  
 before, that education is an art  
 definite improvement, and in  
 fr, before unknown, to carry it

p of Sunday schools was now  
 in this kingdom. Every city,  
 had warmly espoused the cause.  
 One thing wanting to raise the

system to the highest degree of efficiency, and  
 that was union. Reasoning upon the general  
 principle, many were led to conclude, that great  
 benefits would result to this particular case, from  
 an association of counsel and energy. After  
 much private intercourse on this subject, be-  
 tween many persons in London, a public meet-  
 ing was holden, July 13th, 1803, in the school-  
 rooms belonging to Surrey chapel, and the  
 Sunday School Union was then formed.

This new society commenced its operations  
 with no less prudence than vigour. Carefully  
 abstaining from even the appearance of a desire  
 to interfere with the private management of any  
 of the associated schools, it aimed to diffuse  
 new life and energy through them all. One of  
 its first objects was the compilation of a new  
 spelling book, more adapted to moral and reli-  
 gious instruction than any they could find already  
 in existence. This production reflects no small  
 degree of credit on its industrious compilers.  
 The next object of the committee was to ascer-  
 tain, by an extensive correspondence, what parts  
 of the country were most destitute of schools.  
 Finding, in many places, that the advantages of  
 the system were greatly diminished by the want  
 of method and order which prevailed in the  
 schools, they published in 1806, 'A plan for  
 the Formation and Regulation of Sunday  
 Schools.'

The example of the metropolis was soon  
 imitated by many of the large towns, and se-  
 veral counties. Unions were formed in different  
 parts of the kingdom, from which the happiest  
 effects have resulted; among which may be  
 reckoned the establishment of new schools in  
 neglected parts of large towns, and amidst the  
 darkness of benighted villages;—a fresh excite-  
 ment given to those employed in the work of  
 tuition;—the diffusion of Christian affection;—  
 and in some instances a great improvement in  
 the mode of instruction. The formation of the  
 Sunday School Union must, therefore, be re-  
 garded as an event of vast importance to the  
 success of this valuable scheme. Surprising it  
 is to state, but it was not until the year 1810,  
 that the first Sunday school in America was  
 opened at New York. The Wesleyan Metho-  
 dist Missionaries had opened one the year  
 previous in the heart of the island of Ceylon.

In an account like the present, the establish-  
 ment of the Scotch Sabbath Evening Schools,  
 ought not to be omitted, as they may be fairly  
 stated to have arisen out of the English Sunday  
 School Institution. The children of the poor,  
 so far as common education is concerned, are all  
 taught to read in the parochial schools, which  
 are established in the southern parts of that  
 enlightened country. Still, however, as it re-  
 spects the observance of the sabbath, and the  
 more direct business of religious instruction, like  
 the children in this kingdom, they are left of  
 course to the care of their parents, multitudes  
 of whom, indifferent to the welfare of their own  
 souls, feel no solicitude for the salvation of  
 their offspring. Observing and commiserating  
 the condition of those neglected youth, who in  
 great numbers spent the sabbath, and especially  
 the sabbath evenings, in profanity and vice,

the friends of religion in Edinburgh formed the pious resolution of collecting them together on the Lord's day evenings, for the purpose of imparting religious knowledge. They assemble at six o'clock, and are dismissed about eight; during which time every effort is made to instruct them in the way of eternal salvation, and to urge them forward in the path of life. This admirable system commenced in Edinburgh, in the year 1787, and soon spread through all the principal towns of Scotland. How desirable that it should pass the Tweed, and be adopted in England! There is one class of youth, to whom it might become an incalculable blessing; i. e. the elder boys and girls, who have just left other schools, and who are generally considered as gone beyond their care. Thus abandoned, it is too commonly the case, that they lose all the little impression they have received while under instruction. Could they be collected together on a sabbath evening, to be taught by those who would interest themselves in their welfare, what a blessing might be expected to accrue!

*Adult Schools* were originally a ramification of the Sunday school system. The first school for the instruction of adult persons exclusively, was opened in the summer of 1811, in North Wales, through the efforts of the Rev. T. Charles, episcopal minister of Bala, Merionethshire. The success of the undertaking was considerable; multitudes in every district repaired to the chapels, or other places appropriated to the purpose, for instruction, and the most beneficial results became every where observable. Mr. Charles's own account is as follows:—

'My maxim has been for many years past to aim at great things; but if I cannot accomplish great things, to do what I can, and be thankful for the least success; and still to follow on without being discouraged at the day of small things, or by unexpected reverses. For many years I have laid it down as a maxim to guide me, never to give up a place in despair of success. If one way does not succeed, new means must be tried; and if I see no increase this year, perhaps I may the next. I almost wish to blot out the word impossible from my vocabulary, and obliterate it from the minds of my brethren. We had no particular school for the instruction of adults exclusively, till the summer of 1811; but many attended the Sunday schools with the children, in different parts of the country, previous to that time. What induced me first to think of establishing such an institution, was the aversion I found in the adults to associate with the children in their schools. The first attempt succeeded wonderfully, and far beyond my most sanguine expectations. The report of the success of this school soon spread over the country, and in many places the illiterate adults began to call for instruction. In one county, after a public address had been delivered to them on the subject, the adult poor, even the aged, flocked to the Sunday school in crowds; and the shop-keepers could not immediately supply them with an adequate number of spectacles. Our schools, in general, are kept in our chapels; in some districts, where there are no chapels, farmers, in the summer time, lend their barns. The adults and children are

sometimes in the same room, and sit in different parts of it. When they are seated and fixed, they soon learn; and, by a little difference, if they are able, to see the letters. As they are so apt to lose, we endeavour, before we instruct them without delay, to repeat the principles of Christianity. We read a portion of Scripture, comprising the lesson, and repeat them to the learners, till they can retain them in their memory, and then they are to repeat the next time.

Soon after this, at the suggestion of the Bristol Auxiliary Bible Society, intelligence communicated to me from Keynsham was read the following sentence:—'We are so far from being obliged to omit a grain of truth to the inhabitants who could not be benefited by it, that we are not likely to be benefited by it, if we omit a grain of a bible.' This statement of the value of an individual present, by Mr. Smith. To be deprived of it, by an inability to peruse it, was a loss worse than for a man to be deprived of it through ignorance of the way to it. His benevolent mind meditated on it, and he longed to relieve them, but he saw a dilemma he consulted Stephen, a respectable merchant in the neighbourhood, who stands high in the long list of benefactors; and, in the advice and counsel of a gentleman, the scheme of Smith was carried into effect. He slept on it, and upon his plan, after he had received the advice of his generous friend, he commenced the undertaking, before he commenced the subscription for the Bible Association. As he was employed the next day, he met with persons who asked them if they would like to have a school should be opened, and the offer with expressions of gratitude, and names were taken down. The school was immediately obtained, and the school was commenced. So little could I expect to endure delay, that in nineteen days, I disclosed his mind to Mr. Fox, who opened with eleven men and women, and the number rapidly increased, till it amounted to some active friends to the cause of humanity, met the founder of the school, and formed themselves into a society, under the title of 'An Institution for the Instruction of Persons to read the Holy Scriptures.' The society continued to attract, and engage the support of Christians; and at length received an accession in the active co-operation of Mr. Pole, M. D., a physician in the society of Friends. Within a few years, this society admitted a membership of 276 who were taught to read, and were giving to several dissenting congregations. Public adult tuition has been established, both at Bristol and at Keynsham, in conformity with the aversion

to an exposure of their ignorance. The of private schools has accordingly been set, by which a few neighbours are associated together, and taught at their own habitations, or in private manner at some convenient place.

In this period, adult schools have been established in various parts of the kingdom; at South, Salisbury, Uxbridge, Sheffield, Norwich, and other places; and these exercises of benevolence have not been disregarded or limited by the metropolis.

One of the most brilliant of all our modern discoveries and improvements in this important branch of sciences, is the *New System of Education*, which, however warmly opposed for a time, is now regarded as established. With Dr.

originally a superintendent of the Military Asylum at Madras, the first idea of this system clearly originated. This was a charity resembling the Royal Military Asylum at Chelsea. A salary of 1200 pagodas was attached to Dr. Bell's office when he applied upon it, but this he declined; accepting of it solely for the sake of being more useful; and, in his station than he could hope to be by other means.

'Here,' he reasoned with himself, 'is a field for a clergyman to animate and exertion, and encourage his diligence. Here success is certain, and will be in proportion to the ability he shall discover, the labor he bestow, and the means he shall employ. By instilling principles of religion and morality into the minds of the young, that he can accomplish the ends of his ministry: it is in forming them to habits of diligence, industry, honesty, and honesty, and by instructing them in useful knowledge, that he can best promote individual interest, and serve the state to which they belong,—two purposes which cannot, in policy, or even in reality, exist apart.'

These feelings, and with this sense of duty, he began his task. He had to work upon the most unpromising materials. It was an established opinion, that the half-caste children were of inferior race, both in moral and intellectual qualities, as if a certain milish obliquity of nature had been produced by crossing colors in the human species. This opinion was like one of those prophecies which bring about their own fulfillment. Dr. Bell knew how deeply it was rooted, and saw but too plainly that it rested upon apparent experience; he knew also, that children learnt from their unhappy mothers cunning, and selfishness, and deceit, which were the defensive instincts of a despised and low generation; the baleful prejudice which he had against them inevitably producing the result which it pre-supposed. The boys placed under his care were in general stubborn and addicted to trick, lying, and duplicity; some among them who were farther advanced in age were, for the most part, trained in habits and customs incompatible with that without which no system of education could proceed.

among the pupils trained for the purpose. For a long time I kept both these objects in view; but was in the end compelled, after the most painful efforts of perseverance, to abandon entirely the former, and adhere solely to the latter. I found it difficult beyond measure to new-model the minds of men of full years, and that whenever an usher was instructed so far as to qualify him for discharging the office of a teacher of this school, I had formed a man who could earn a much higher salary than was allowed at this charity, and on far easier terms. My success, on the other hand, in training my young pupils in habits of strict discipline, and prompt obedience, exceeded my expectation: and every step of my progress has confirmed and rivetted in my mind the superiority of this new mode of conducting a school through the medium of the scholars themselves.'—*Experiment*, first edition, p. 10.

'It is in this mode of conducting a school that the discovery consists; this mode, which is briefly termed self-tuition, is the principle of the new school, and the new system rests wholly upon it. This is the key-stone of the arch,—the main-spring of the watch,—the moving power of the whole machine. Dr. Bell did not come to the superintendence of the Madras Asylum prepared with his theory, and ready to put it in execution. He found the school with an establishment of one master and two ushers, and as the school increased one of the boys was added as head-teacher, so that there were four nominal masters continued to the 22d of January, 1796. But when the report was drawn up five months afterwards (June 28), and the school had increased farther to the number of 200, the masters were reduced to three. 'None of these masters had made a progress in letters equal to the boys in the first class.' Their duty, it is expressly stated, was not to teach, but to look after the various departments of the institution. As teachers they had been gradually superseded, and from the 1st of June, 1793, the school was 'entirely taught by the boys.' This was one of the cases in which practice led to theory.'

Dr. Bell perceived the expense of time, labor, and punishment, which the common system of tuition requires, and, having found a remedy, perceived also wherein the principle of that remedy lay, and as a principle acted upon it and announced it to the world. Every class had its teacher and assistant. Give me four and twenty children to-day, was a saying of Dr. Bell, and I will give you as many teachers to-morrow as you want. There was no hesitation in degrading a teacher who failed in any of the tasks required of him, and making trial of another, till one was found fit for the office; these teachers had no other occupation, no other pursuit, nothing to employ their minds but this single object; they could do that only which they were assigned to do, and they did it the better, because they themselves knew nothing more than what was perfectly level to the capacities of their pupils.

The first attempt which Dr. Bell made to introduce a new practice in the school, proved to him the necessity of proceeding upon this principle. At first sight of a Malabar school, his attention had been caught by the manner in

which the letters were taught in sand; yet he could not fully establish even so simple a practice as this, till he had trained boys whose minds he could command, and who, as he says, 'only knew to do as they were bidden, and were not disposed to dispute or evade the orders given them.' Many advantages arise from this easy improvement, besides the great and obvious saving of expense. A distinct notion of the different form of the letters is immediately obtained, and the difficulty of distinguishing those letters whose very difference of form is founded upon their similarity (b and d, p and q, for instance), by which children are so long perplexed, is removed at once. The scholar, at the same time, learns so much of the art of writing, as materially to facilitate his progress when he arrives at that class wherein it is taught.

The next improvement of the Madras school, was the practice of syllabic reading: the child, after he had learnt to read and spell monosyllables, was not allowed to pronounce two syllables till he had acquired, by long practice, a perfect precision; upon the common plan, children make continual blunders, in the beginning and middle, and more especially in the termination of words: to prevent this confusion, they were taught to read syl-la-ble by syl-la-ble, and, when so far advanced as to read sentences, to pause awhile at the end of every word. 'So much,' says Dr. Bell, 'for the first minutiae: were I to pursue this subject through all its stages I should fill a volume.' From the commencement of his experiment, he made the scholars, as far as possible, do every thing for themselves. If a bad subject came to school, a good boy was chosen to take care of him, teach him right principles, treat him kindly, reconcile him to the school, and render him happy like the rest in his situation. The consequence of such a system was, that the boys, feeling themselves happy, felt also that their advantage was the only object which the master had in view; they were sure of his favor if they continued to do right, they were certain of his disapprobation and displeasure if they offended; but knowing that he was just, and feeling that he was good, they regarded him as their friend, and benefactor, and common parent. An annual saving of not less than 2400 pagodas, or £960, upon the education and support of 200 boys, was produced in the institution at Madras, by Dr. Bell's regulations and improvements!

After superintending the school for seven years, he found it necessary for his health to return to Europe. The directors of the charity passed a resolution for providing him a passage in any ship in which he might wish to sail; declaring at the same time, that, under the wise and judicious regulations which he had established, the institution had been brought to a degree of perfection and promising utility 'far exceeding their most sanguine expectations when it was established.'

These testimonies Dr. Bell published in 1797, on his arrival in Europe, in a little duodecimo pamphlet, under the title of *An Experiment in Education*, made at the Male Asylum of Madras; suggesting a system by which a school or

family may teach itself under the guidance of the master or parent.

When the manuscript of this was put into the hands of the public, of his, whose account of the matter Dr. Bell said to him, 'You will be a enthusiast; but in a thousand years tuition will spread over the world by 'the system' is apparent, and the whole tenor of the writing in sand, not syllabic, and the improvements in detail, the principle and main-spring of the system, a school or family may teach itself under the peritendence of the master or of a mode of conducting a school, a medium of the scholars themselves, done no more than conceive a new system, and publish it, it would have done enough. I have been the first person to put it into effect, the discovery would and to have imputed it to me, would have been as unreasonable as to ascribe the great discovery respecting the sameness of electricity not to him but to the French C. Franklin waited for the erection of a building at Philadelphia, to affix his metallic rod, set up a kite to the American philosopher, and verified Franklin's theory, down the lightning, before it reached Europe that Franklin had verified his means of a paper-kite.'

The Charity school of St. Paul was the first place in England where this discovery was adopted. 'The new system,' says another writer on this topic, 'essentially consists in teaching the scholars, in classical languages, by short, easy, and plain sentences, not in any of the practices of the male asylum by Dr. Bell. The system by Mr. Lancaster is most clearly and fully proved by this simple and plain method, all the peculiar practices of the school, and, if the tuition by this method is carried on, the difference of progress is greatly material. On the other hand, the practices, the charm, the diligence cannot be so readily resumed, the school is comparatively inert, therefore, is evidently one and the same, and in all its applications, the Koran, or a brahmin to the Shroff, or a Hindoo to the Hindoo, or a hominadan or the Hindoo system, Lancaster to call it Lancaster, prove that it originated with him.'

Having thus fairly traced the system to its inventor, we may be allowed to say, that Mr. Lancaster, the great merit of whose indefatigable zeal, first made the system known in England, and of his own patronage of many excellent

als, with the Sovereign at their head-  
 ened his free school in the Borough in the year

In the year 1803, in the first edition of his  
 ovements in Education, (part 3rd. page 44)  
 ote thus;—'I ought not to close my ac-  
 without acknowledging the obligations I lie  
 to Dr. Bell, of the male asylum at Madras,  
 nobly gave up his time, and liberal  
 that he might perfect that institution,  
 flourished greatly under his fostering care.  
 ublished a tract in 1798, entitled an Expe-  
 on Education, made at the male asylum  
 adras, suggesting a system whereby a schoolor  
 may teach itself, under the superintendence  
 master or parent. From this publication  
 adopted several useful hints; I beg leave  
 commend it to the attentive perusal of the  
 ds of education, and of youth. I am per-  
 othing is more conducive to the promo-  
 of a system than actual experiment. Dr.  
 had 200 boys, who instructed themselves,  
 their own pens, ruled their books, and  
 all that labor in school, which among a  
 boy is light, but resting on the shoulders of  
 well-meaning, and honest, though unwise  
 ter, often proves too much for his health,  
 embitters or perhaps costs him his life. I  
 regret that I was not acquainted with the  
 ty of his system, till somewhat advanced in  
 plan; if I had known it, it would have  
 me much trouble, and some retrograde  
 ments. As a confirmation of the goodness  
 f Bell's plan, I have succeeded with one  
 similar in a school attended by almost 300  
 en.

Lancaster was afterwards vain enough to  
 in the public papers, that having 'invented  
 the blessing of Divine Providence, a new  
 mechanical system of education, for the use of  
 As, he feels anxious to disseminate the know-  
 of its advantages through the united king-  
 and vanity was his complete overthrow.  
 the merit we have willingly ascribed to him,  
 in addition to this, he invented a few eco-  
 nomical practices in the use of slates and spelling  
 which are equally applicable to all schools  
 acted on the new system, and which have  
 adopted in Dr. Bell's school, without any  
 of their origin, just as the sand-writing  
 syllabic spelling were confessedly borrowed  
 Dr. Bell. He invented also a variety of  
 punishments, in the application of which his  
 ars were made the correctors, no less than  
 instructors of each other; and many of which  
 of a nature very questionable in their  
 ing on the moral character; that is, calcu-  
 to make the pupils insolent, turbulent, and  
 sharing.

By we are to add, that not only was the  
 on of originality agitated at first with  
 bitter personal feelings between the friends  
 the parties, but it immensely mingled itself  
 religious controversy. An advocate on the  
 f Dr. Bell, and the Madras system, says  
 great candor: 'We are sorry to admit that  
 as no great appearance of acceleration in  
 proceedings of the Church, till Mr. Lancas-  
 tered up with all the eagerness and activity  
 tary—with all the zeal of a missionary—

with all the adventitious motives and practices  
 of a person whose subsistence and reputation  
 depended upon the success of his plan; and  
 fortified with all the countenance and support of  
 the host of sectaries, whose eagle-eyes perceived  
 at a glance what an opportunity was offered, at  
 once to place the cause of humanity in oppo-  
 sition to that of the Church,—what a glorious  
 occasion was presented to associate in the minds  
 of the people the ideas of charity and dissent  
*British Review*, No. 6.

Mr. Lancaster, and what was now called the  
 British system, admitted and taught the reading  
 of the Bible, in fact, into the schools founded  
 upon his plan, but excluded all catechisms.  
 Impelled by all these aids and motives, con-  
 tinues the above writer, Mr. Lancaster soon be-  
 came the prominent character on the canvass, and  
 by the great mass, both of the clergy and laity,  
 who had never heard of Dr. Bell, was consider-  
 ed as the necessary, indeed the only instrument  
 through whom the new system could be carried  
 into practice. And we shall ever consider it as  
 reflecting immortal honor on many zealous  
 ministers of the church, that the practicability of  
 the plan was no sooner shown by Mr. Lancas-  
 ter, than they immediately lent him their coun-  
 tenance; and finding to their regret that no  
 propositions, having in view the general instruc-  
 tion of the poor, were then circulated and  
 enforced by the authority of the church as a  
 body, they trusted to their own individual exer-  
 tions to make Mr. Lancaster's plan square as  
 well as they could with the interests of the  
 church. We should certainly have been glad to  
 see her interfere sooner, as soon indeed as it was  
 evident and publicly notified by experience that  
 the new system imported by Dr. Bell was a  
 practicable one for the instruction of the poor.  
 We should then have been furnished with a  
 stronger argument than we now possess for  
 repelling the sneering insinuations of those, who  
 lose no opportunity of observing, that, but for  
 the exertions of Mr. Lancaster and his partisans,  
 and the fear and emulation which they have  
 excited, the prospects of general instruction for  
 the poor would have been very different from  
 what they now are. By whatever means, how-  
 ever, the effect was produced, the Church is at  
 length roused, and those who wish to secure in  
 the rising generation of the people a knowledge  
 of the excellence of her doctrines, may now do so  
 without any alloy of danger, which even the most  
 trembling solicitude for her safety can entertain.'

The question of the comparative economy of  
 the two schools has been thus stated:—Dr.  
 Bell introduced the knowledge of sand-writing  
 and syllabic spelling, which Mr. Lancaster  
 confessedly borrowed from him. Mr. Lancaster,  
 having first opened a large school, introduced  
 the economical use of slates in many cases where  
 paper-books were necessarily used at Madras.  
 But these slates are now used in Dr. Bell's  
 schools. Mr. Lancaster also invented a large  
 card, with the letters and short words printed  
 thereon, one of which stuck against the wall  
 serves the whole class to read from; whereas  
 Dr. Bell prefers that each child should have a  
 small card of its own, which it may look at and

con over at its pleasure. The difference in the first cost of these instruments amounts to about seven shillings per 100 children yearly; and the use of either is a matter of mere opinion as to the advantage of giving each child's lesson into its own hand. Many of Dr. Bell's schools use the large cards, many of Mr. Lancaster's the small ones; a few Bibles and Testaments are admitted to be as necessary in Mr. Lancaster's schools as in Dr. Bell's. So that in fact the two schools are now on a perfect equality as to expense. The use of slates, or of paper books, for writing and ciphering, depends on the respective tastes of the master or patrons. If they think the pride and pleasure which a child and his parents take in looking back upon the records of the progress he has made will more than repay the expense of paper books, they will adopt them. If they think otherwise, or if their funds are very confined, they will reject them. The system will be neither the better nor the worse for their determination either way, or for the adoption or omission of the small or the large card, or for a multitude of other things, about which much noise has been made.

The Madras system has become the basis of the National Schools connected with the established church throughout the kingdom; and large and well earned are its triumphs over the wretchedness and ignorance of the poor. The British and Foreign School Society, into which the British system is now merged, is, on the other hand, principally in the hands of dissenters; nor can it be denied the meed of praise for great and noble exertions in the cause of universal education. Mr. Lancaster, as we have intimated, has worn out his warmest friends in this country by his personal vanity and extravagant conduct; but the system is under very respectable and disinterested management. It is said, by competent judges, that the pupils of the National Schools excel in reading; while those of the British and Foreign School system are superior in their acquaintance with arithmetic.

But the plans of Dr. Bell were yet more extended. He himself gave the public, in 1815, an interesting, though somewhat verbose, publication, entitled '*Ludus Literarius: the Classical and Grammar School; or an Exposition of an Experiment in Education, made at Madras in the years 1789—1796; with a view to its Introduction into Schools for the Higher Orders of Children*,' 8vo.; and at the Charter-house, and some respectable private seminaries, the advantages of mutual instruction among pupils have been most successfully applied.

'In proposing,' says Dr. Bell, 'to transfer the Madras system of education into schools of a higher order, and especially into grammar schools, I make no pretension to superior attainments in literature, nor do I presume to vie with the learned preceptors of our classical schools in skill in languages, or in sciences.

To teach a teacher ill becometh me.

'The task I have in hand is of a less elevated description, and does not require deep erudition. It is not the science of letters, but the art of tuition, or the mode of communicating that science,

of which I am to treat. I do not add to the master's stock of knowledge, by which he is to teach down his learning to the level of the children, disseminate his knowledge to his pupils, and by the simplest and gentlest means, establish order, and uphold virtue. For such schools, discovery to develop, no new method, no improvement on the Madras offer. All I propose is, to show more fully than I have heretofore done, the utility of that invention to schools of all sorts, than those in which it has been employed with uniform success. My reader need expect nothing new at the same time, it is true, that in the Latin grammar, independent of the machinery, which will embrace even the scholars' studies, other methods will be recommended with regularity, and the introduction to and prosody, than those which have been hitherto followed. In the principles, however, of these processes depend, may, perhaps, be said, the master's success; but what has been suggested is, to see nothing but what he knew, and will think, as soon as he has read before—so simple, so plain, so easy. But my solicitude is, that in the way which may avail best, and his pupil.'

He afterwards proceeds to present a school on the model of the Madras system, in which, as it is a key to this general system in all its forms, we subjoin some particulars.

'1. The asylum, like every other school, is arranged into forms, composed of as many scholars as can make similar progress, unite together, and advance.

'The scholar ever finds his own place in his class, but also in the school, being promoted or degraded according to his relative proficiency.

'So much for the general form. Now more particularly of the details.

'2. Each class is, when prepared, by themselves, paired off into two.

'Thus in a class of thirty, the eighteen best and most trustworthy are paired off with the twelve worst.

'This arrangement, by no means a link in the chain of self-tuition, is dispensed with, and when convenient, as in the schools of the higher orders, it is of course superseded.

'3. To each class is attached a teacher, whose business it is, as to act under, with, or for the class.

'4. The teacher who, with the aid of the class, is in charge of the class, as well as of the progress of their lessons, and is responsible for their order, behaviour, diligence, and progress.

'Both the teacher, and his assistant, are to be assisted by the scholars.

'5. A sub-usher, and a sufficient number of ushers, as necessary, to inspect the scholars, and to assist the teacher.

and give their instruction and assistance ever wanted, as the agents and ministers of order.

The schoolmaster, whose province it is to direct and conduct the system in all its ramifications, and to see all the subordinate offices put into effect.

Last of all comes the superintendent (who is the chaplain of the establishment, parson, minister, secretary, treasurer, trustee, or any whose scrutinising eye must pervade the machine, whose active mind must give it life, and whose unbiassed judgment must inspire confidence, and maintain the general order and harmony.

That goes before comprises the system of instruction by teachers and ushers, or, as they are called, monitors.

That follows is for the purposes of precision and inspection, and as checks and instruments of order in the execution and superintendence of the above plan.

On the front of the teachers' and assistant-teacher's books, when taken in hand, is written with the year and day of the month; and throughout the books, the end of each lesson, when it is noted by a score with a pencil. The sum of the daily lessons (so noted in the assistant-teacher's book), and the other tasks of the day, and the individual proficiency of each scholar entered in a register book for the master's and the visitors' reference and inspection.

Black book, as the boys call it, or register of offences as require serious animadversion and a weekly scrutiny by

3. A jury of twelve boys—the peers of the school.

Under perfect instruction, and the able and judicious administration of the laws of the school, the 10th regulations become a dead letter. The general laws of inspection and emulation being found sufficient for the purpose of discipline.

This, in brief, is the scheme of the Madras system of education, framed on an extensive and in a multiplied form, fitted for a numerous school.

We can only admit his further observations on the effects of equalised classification.

Equalised classification extends perfect instruction to every member of a school.

From the law of classification, by which every scholar claims and assumes his place, not according to his standing or length of time in school, but to his actual proficiency and acquirements.

Determined by a fair and constant comparison with his school-fellows, and is ranked, according to an impartial and unerring law, with those

from whom he is on a footing of equality; it necessarily follows that no scholar either retards

or is retarded in their daily course, or is retarded in his station in the school, and progress in

learning, always bear a just proportion to his talents and industry. No idleness, on the one

hand, is occasioned by the want of sufficient employment, from his having his lessons prepared

before those with whom he is associated; on the other hand, no scholar is oppressed

by a burden of tasks, to which he is unequal,

nor his progress stayed by the length and difficulty of lessons, which he cannot overtake.

Hence it is, that, in a Madras school, a complete acquaintance with every lesson is not, as too frequently happens, confined to scholars of superior parts or industry, but is extended and insured to every scholar in every class; hence too it is, that while there is no let or hindrance to the career of memory, judgment, or genius, there is also an end to dunces in our schools. One boy outstrips another in his gymnasium—his scholastic career; but he who is left behind is master of the inferior ground which he occupies, as well as the other is of the superior station which he has attained. *Falsa enim est querela, paucissimis hominibus vim percipiendi cum tradantur, esse concessam; plerosque vero laborem ac tempora tarditate ingenii perdere, &c.*

It is an unfounded complaint, that very few learners are naturally endowed with the faculty of understanding the lessons which are prescribed to them, and that most do in reality lose their labor and time from defect of genius. Quite otherwise is the fact: for you will find the generality of men quick in conception, and prompt to learn. This is the characteristic of man. As birds are destined by nature to fly, horses to run, and wild beasts to be ferocious: so to us is peculiar the (agitation) working and sagacity of the mind. Hence it is believed, that the human soul is of celestial origin. The dull and the indocile are no more conformable to the nature of man, than bodies which are accounted prodigies and monsters. But these are very rare. Of this fact the good promise, which the generality of children display, is a sufficient proof. And, when it dies away and disappears with age, it is manifest that the fault does not originate in any real deficiency of nature; but arises from want of due culture. It cannot indeed be denied that one excels another in genius, and that some make greater, some less, proficiency. But none can be found who have derived no benefit from study.

How happily has the Madras system of education illustrated this position, to a degree beyond the conception of the greatest minds of former times! And what an acquisition is it, to the science of instruction, that every scholar who enters a school shall derive continual and progressive improvement during the period of his stay, having his understanding cultivated, and his memory exercised and improved in exact proportion to the strength of the faculties which he possesses! No longer will even a single learner quit a school thus conducted, without having all along been duly occupied in the improvement of his talents, and in the increase of his attainments. None will now by reason of the difficult and disproportioned course of their studies, and the ill assortment of the classes, and by imperfect instruction in the beginning, pass through the forms of their school, as those who wander through a dark and dreary wilderness, toiling and fatiguing themselves to find an exit, without a ray of light, of comfort, or of profit, to their benighted minds—a state in which many were wont to remain till they left school. To others, and those I fear few in number, the true

comes when, after a tedious, irksome, and unprofitable process, age ripens their faculties, and they begin to understand and to relish their daily exercises, and to derive from them profit and pleasure—that profit and pleasure, which, by a sad perversion of instruction, are commonly denied them at the early periods of their studies.

'2. But the new classification not only extends the benefit of perfect instruction to every member of a school alike; but also, by the love of imitation which it indulges, and feeds, and by the emulation which it creates, calls forth the exertion, and accelerates the progress, of each and every scholar.

'As those children, whose talents or rather acquirements are nearly equal, rank in the same class, a spirit of imitation and competition is kept in perpetual action. A lively degree of interest is given to all their occupations, their attention is kept constantly awake, and the several powers of their minds are called forth into constant exercise, by the incessant application of two of the most powerful principles of our nature—the desire of eminence and distinction, and the dread of shame and degradation.'

Dr. Bell's proposals for adapting Lilye's

grammar to his new system, and his of instruction with respect to the Latin language, occupy the latter part, and we can only refer our readers to further information on this point. he says, 'What I seek, as the gratification of my labors, and completion is to put into the hands of our able masters, that new organ of which is fitted, in a wonderful degree to their ease, comfort, and utility, the satisfaction, delight, and improvement of scholars: and by which alone their institutions in future, what for the past—faithful and true nurseries to the good of the nation, to the chivalry, and to the glory of God. I have been done towards these ends by my method of cultivating their rich soil, so that the crops may not be comparative from the vast improvements in the human mind, to which the has given rise?'

We may add that a Latin, as Grammar, has been published on commends, by the Charter House

**EDUCE**, *v. a.* Lat. *educō*. To bring out; extract.

That the world was *educed* out of the power of space, give that as a reason of its original: in this language, to grow rich, were to *educē* money out of the power of the pocket. *Glanville.*

This matter must have lain eternally confined to its beds of earth, were there not this agent to *educē* it thence. *Woodward.*

The eternal art *educēs* good from ill,  
Grafts on this passion our best principle. *Pope.*  
Just so the Omnipotent, who turns  
The system of a world's concerns,  
From mere minutiae can *educē*  
Events of most important use;  
And bid a dawning sky display  
The blaze of a meridian day. *Cowper.*

The *education* of electricity from the earth is shown by an insulated cushion soon ceasing to supply either the vitreous or resinous ether to the whirling globe of glass or of sulphur. *Darwin.*

**EDULCORATE**, *v. a.* } Fr. *eduleor*; Lat.  
**EDULCORATION**, *n. s.* } *eduleo*, *a dulcis*,  
sweet. To sweeten; the act of sweetening, or purifying.

(Swine's dung) though not so proper for a garden, is said yet to *edulcorate* and sweeten fruit so sensibly, as to convert the bitterest almond into sweet. *Keelyn.*

**EDULCORATION**, in chemistry, properly signifies the rendering substances more mild. It consists almost always in taking away acids and other saline substances; and this is effected by washing the bodies to which they adhere in a large quantity of water. The washing of diaphoretic timony, powder of algaroth, &c., till the water comes off quite pure and insipid, are instances of chemical *edulcoration*.

**EDULCORATION**, in pharmacy, is merely the sweetening of juleps, potions, and other medicines, by adding sugar or syrup.

**EDWARD FORT**, a fort in Norway town of Windsor in Hans count large enough to contain 100 men on Avon River, which is navigated vessels of 400 tons: those of it two miles higher.

**EDWARDS** (George), F. R. A. at Stratford, in Essex, April 3d, leaving school he was put apprentice in Fenchurch-street; but relation of his master's, having left which were removed to an apartment by Edwards, he eagerly employed hours in perusing them, which on him of all inclinations for business solved to travel. In 1716 he visited towns in Holland, and in returned to England. Two years a voyage to Norway, at the invitation of a gentleman, who was nephew to the ship in which he embarked Charles XII. was besieging the consequence of which our young confined by the Danish guard, him to be a spy against the king, ever, upon obtaining testimonial evidence, a release was granted. He returned to England, and next year by the way of Dieppe. During his he made two journeys of 100 miles first to Chalons, in Champagne, the second on foot, to Orleans and edict happening at that time to be curing vagrants, to transport them as the banks of the Mississippi, our author narrowly escaped voyage. On his arrival in England he closely pursued his favorite history, applying himself to coloring such animals as fell on

attention to natural, more than picturesque, claimed his earliest care: birds first engaged his attention; and, having purchased some best pictures of these subjects, he was induced to make a few drawings of his own; which were admired by the curious, who encouraged him to proceed, by paying a price for his labors. Among his first patrons may be mentioned James Theophilus Esq., of Lambeth. Our artist, thus unexpectedly encouraged, increased in skill and industry; and procured, by his application to the pursuit, both a decent subsistence and a large acquaintance. In 1731 he made a journey to Holland and Brabant, where he collected several scarce books and prints, and saw original pictures of several great masters. In December 1733, by the recommendation of Sir Hans Sloane, Bart., president of the College of Physicians, he was chosen librarian, and apartments in the college. By degrees he became one of the most eminent ornithologists in any other country. His merit is so well known in this respect, as to render any eulogium on his performances unnecessary. He never failed to others what he could perform himself; and he found it so difficult to give satisfaction to his own mind, that he frequently made three or four drawings to delineate the object in its lively character and attitude. In 1743 the first volume of his *History of Birds* was published.

His subscribers exceeding even his most sanguine expectations, a second volume appeared in 1747. The third was published in 1750; and the fourth in 1751. This volume being the last intended to publish, he seems to have considered it as the most perfect of his productions in natural history, and wrote a curious dedication to the great God of nature. Our author, however, continued his labors under a new title, *Gleanings of Natural History*. A second volume of the *Gleanings* was published in 1760. The third part, which made the seventh and last volume of his works, appeared in 1764. The

majority of his works contain engravings and descriptions of more than 600 subjects in natural history, not before described or delineated. He also added a general index in French and Latin; which was afterwards perfected, with the assistance of names, by Linnaeus himself, who was acquainted with him with his friendship and correspondence. On St. Andrew's day, 1750, Mr. Edwards was presented, by the president and council of the Royal Society, with the gold Copland Medal. He was a few years afterwards elected F.R.S. and F.A.S., London; and a member of various academies of sciences and literary societies in different parts of Europe. His collection of drawings, which amounted to upwards of 900, was purchased by the earl of

After the publication of his last work, he arrived at his seventieth year, he retired from public employment to a house which he had purchased at Plaistow; where he was afflicted with a cancer in the eyes, and the stone, a complaint to which, at different periods of his life, he had been subject. Yet, in the severest pains of misery, he was scarcely known to

utter a complaint. Having completed his eightieth year, emaciated with age and sickness, he died July 23d, 1773, lamented by a numerous acquaintance.

EDWARDS (Richard), a minor English poet and dramatist of considerable powers, was born in Somersetshire in 1523, and educated at Corpus Christi College, Oxford. He afterwards became a student, and graduated at Christ Church. At the beginning of the reign of queen Elizabeth, he was one of the gentlemen of the royal chapel, and teacher of the children. Much esteemed as a poet and musician by his contemporaries, his death, in 1566, was greatly lamented. He wrote *Damon and Pythias*, a comedy, acted at court and printed in 1570; *Palemon and Arcite*, a comedy acted before queen Elizabeth at Christ Church; *Sonnets to the beauties of the courts of Mary and Elizabeth* in MS., in the British Museum, and several poems, included in his *Paradise of Dainty Devices*.

EDWARDS (John), an English divine, and controversial writer, born at Hertford in 1637. His father, Thomas Edwards, was a furious presbyterian, and wrote with equal zeal against the episcopalians and independents; but, when the latter party prevailed, he withdrew to Holland, where he died in 1646. A work of his, entitled *Gangrena*, exhibits a curious picture of the religious divisions of that period. John received his education first at Merchant Taylor's school, London, and afterwards St. John's College, Cambridge, where he was chosen fellow. He married in 1676, and was soon after presented to the living of St. Peter's, Colchester. Here he continued only about three years, when he removed to Cambridge, took his degree of D.D., and from this time employed himself chiefly in writing. He published a vast number of books, not a few of them practical, but the greater part on controversial subjects. His opinions were Calvinistic. He died in 1716. The most esteemed of his works is his *Preacher*, in 3 vols.

EDWARDS (Jonathan), an American divine, was born at Windsor, in Connecticut, in 1703, and educated at Yale College, where he took his degrees in arts. In 1722 he became preacher to a presbyterian congregation at New York; and, in 1724, was chosen tutor of Yale College; which station he resigned in 1726, and removed to Northampton to assist his grandfather, who was minister there. He remained at Northampton till 1750, when he was dismissed from his situation for refusing to administer the sacrament to those who could not give proofs of their conversion. In 1751 he went as a missionary among the Indians, and, in 1757, was elected president of the college of New Jersey, which station he did not long enjoy; for next year, 1758, he was attacked by the small pox, which proved fatal. Mr. Edwards's works demonstrate him to have been an acute metaphysician, and strict Calvinist. He wrote, 1. *A Treatise concerning Religious Affections*; 2. *The Life of David Brainerd*, a Missionary; 3. *Narrative of the Work of God in the Conversion of many Hundred Souls in Northampton*; 4. *An Enquiry into the Modern prevailing Notion of that Freedom of Will*, which

is supposed to be essential to Moral Agency;  
5. The great Doctrine of Original Sin defended;  
6. Sermons, &c. &c.

EDWARDS (Edward), a London artist, of great ingenuity, was born in 1738, and brought up to his father's business of a chair-maker and carver. This he soon quitted for drawing, in which he acquired skill enough to become a teacher, and by that means supported his mother when a widow, and a brother and sister. The society of arts encouraged his efforts by two premiums, for historical pictures, and in 1773 he became an associate of the Royal Academy. He now visited Italy, and on his return was employed by Mr. Horace Walpole, Mr. Hamilton of Bath, and several other gentlemen. In 1788 he became teacher of perspective in the Royal Academy, and in the course of his duties composed his *Treatise on Perspective*, 4to. He died in 1806: after his death were printed his *Anecdotes of Painters*, 4to., with his life prefixed.

EDWARDS (Bryan), a literary gentleman principally known for his *History of the West Indies*, was born in 1743, at Westbury in Wiltshire. Educated at a private dissenting seminary at Bristol, he acquired on the death of his father the protection of an uncle, of considerable property in Jamaica, and was placed by him under the tuition of a clergyman resident there. Together with the large fortune of his uncle, he inherited that of a Mr. Hume of Jamaica, and, becoming a considerable merchant, returned to England, and took his seat in 1796 for the borough of Grampound, which he represented until his death in July 1800. He published *Thoughts on the Trade of the West India Islands with the United States*, 8vo. 2. *A Speech on the Slave Trade*. 3. *History of the British Colonies in the West Indies*, 2 vols. 4to. and 3 vols. 8vo. 4. *The Proceedings of the governor and assembly of Jamaica in regard to the Maroon negroes*, 8vo.

EDWARDS (George), a physician and political writer of respectable literary attainments, left the following productions. *The Aggrandisement and National Perfection of Great Britain*, 2 vols. 4to., 1787; *Royal and Constitutional Regeneration of Great Britain*, 2 vols. 4to.; *Practical Means of exonerating the public Burthens, and of raising the Supplies of War without new Taxes*, 4to., both in 1790; *Great and important Discovery of the Eighteenth Century*, &c., 8vo.; *First Volume of the Franklinian Improvement of Medicine*, 4to., both in 1791; *Effectual Means of providing against the Distress apprehended from Scarcity*, &c., 8vo. 1800; *Practical Means of counteracting the present Scarcity*, &c., 8vo.; *Political Interests of Great Britain*, 8vo., both 1801; *Peace on Earth, Good will towards Men*, &c., 1805, 8vo.; *Measures as well as Men*, &c. 8vo., 1806; *A plain Speech to the Imperial Parliament of Great Britain*, 8vo.; *Means adequate to the present Crisis*, 8vo.; *Discovery of the natural Era of Mankind*, all in 1807; and *The National Improvement of the British Empire*, &c., 1808. Dr. Edwards died at his house in Suffolk Street, February 17th, 1823, in the seventy-second year of his age.

EDWARDS (Thomas), an English divine, born

at Coventry in 1729, and educated at Cambridge, of which he printed a translation of the year following was a grammar-school at Coventry sent to the rectory of that city. In 1759 he published *The Doctrine of Irresistible no Foundation in the New* he became the defendant of of the Hebrew Metre again took the degree of D.D. years after obtained the Warwickshire, where he did the works above noticed, he from Theocritus, with notes.

EDWARDS (Thomas), born in London in 1709. bar, and became a member of coln's Inn, yet he scarcely attacked Warburton's edition 1744, after which he published humorous work, entitled *C* with a Glossary, which editions. He added to this and an account of the trial died in 1757. A tract of tion, was published some time

**EFFECT**, *n. s. & v. a.*

**EFFECTIBLE**, *adj.*

**EFFECTIVE**, *adj.*

**EFFECTIVELY**, *adv.*

**EFFECTLESS**, *adj.*

**EFFECTOR**, *n. s.*

**EFFECTUAL**, *adj.*

**EFFECTUALLY**, *adv.*

**EFFECTUATE**, *v. a.*

Fr. *effect*; Ital. *effetto*; Span. *efecto*, *efecto*; Port. *efecto*.  
Lat. *effectus*, *e* ex-  
pletive, and *facio*, to  
make. That which  
is produced by a real  
or supposed cause;  
completion; reality;

hence, in the plural, palpable and moveable property; hence also consequence or event accomplished or proposed; success; advantage: as a verb to bring to pass; produce; cause; particularly as an agent. Effectible means, that may be accomplished; practicable: effective is, having the power to accomplish objects or effects: efficient is, serviceable: effectless, useless; impotent: effector, he who produces an effect, applied to the First Cause: effectual is, actually productive of effects; practically operative of them: to effectuate, derived to us from the Fr. *effectuer*, is synonymous with to effect.

They spoke to her to that *effect*. *2 Chron.*  
Christ is become of no *effect* unto you.

*Gal. v. 3.*

The communication of thy faith may become *effectual*, by the acknowledging of every good thing.

*Philom. 6.*

I have the taught division between  
Friends of *effects*, and friends of countenance.

*Chaucer*

In shew, a marvellous indifferently composed accurate recreational was to govern, but in *effect* none only man should, as the spirit and soul of the resident, do all to all.

*Homer*

The reading of scripture is *effectual*, as well to lay even the first foundation, as to add degrees of farther perfection, in the fear of God.

*Id.*

What form of prayer

Can serve my turn? Forgive me my foul murmur  
That cannot be, since I am still possessor  
Of those *effects* for which I did the murder.  
My crown, mine own ambition, and my queen.

*Shakspeare*

I'll chop off my hands;  
In bootless prayer have they been held up,  
And they have served me to *effectless* use.

*Id.*

Reprove my allegation, if you can;  
Or else conclude my words *effectual*.

*Id.*

No man, in *effect*, doth accompany with others, but he learneth, ere he is aware, some gesture, or voice, or fashion.

*Racine's Sarmis Thmy.*

They are not *effective* of any thing, nor leave no work behind them.

*Deane.*

Being consult, I doubt not 't *effect*  
All that you wish.

*Ben Jonson.*

2 4 2

Though the means cannot *effect* that which we desire; yet God will have us use the likeliest means on our part to *effect* it. *Bp. Hall. Contemplations.*

If either the curses of men, or the endeavours of the powers of darkness, should be *effectual*, all would be hell. *Id.*

Anger is the most impotent passion that accompanies the mind of man; it *effects* nothing it goes about. *Clarendon.*

He should depart only with a title, the *effect* whereof he should not be possessed of, before he deserved it. *Id.*

That a pot full of ashes will still contain as much water as it would without them, is not *effectible* upon the strictest experiment. *Broune's Vulgar Errors.*

Nor do they speak properly who say that time consumeth all things; for time is not *effective*, nor are bodies destroyed by it. *Id.*

If a mischief become public and great, acted by princes, and *effected* by armies, and robberies be done by whole fleets, it is virtue, and it is glory. *Bp. Taylor.*

Whosoever is an *effective* real cause of doing his neighbour wrong is criminal, by what instrument soever he does it. *Taylor.*

If any mystery, rite, or sacrament, be *effective* of any spiritual blessings, then this much more, as having the prerogative and principality above every thing else. *Id.*

This *effectively* resists the devil, and suffers us to receive no hurt from him.

*Taylor's Rule of Holy Living.*

Recovering shankers, crystallines,  
And nodes and blotches in their rinds,  
Have no *effect* to operate  
Upon that duller block your pate? *Hudibras.*

State and wealth, the business and the crowd,  
Seem at this distance but a darker cloud;  
And is to him, who rightly things esteems,  
No other in *effect* than what it seems. *Denham.*

The change made of that syrup into a purple color, was *effected* by the vinegar. *Boyle on Colours.*

We commemorate the creation, and pay worship to that infinite Being who was the *effector* of it. *Derham.*

The students of nature, conscious of her more cryptick ways of working, resolve many strange *effects* into the near efficiency of second causes. *Glanville. Apology.*

The institution has hitherto proved without *effect*, and has neither extinguished crimes, nor lessened the number of criminals. *Temple.*

You may see by her example, in herself wise, and of others beloved, that neither folly is the cause of vehement love, nor reproach the *effect*. *Sidney.*

He found means to acquaint himself with a nobleman, to whom discovering what he was, he found him a fit instrument to *effectuate* his desire. *Id.*

*Effect* is the substance produced, or simple idea introduced into any subject, by the exerting of power. *Locke.*

These men's opinions are not the product of judgment, or the consequence of reason; but the *effects* of chance and hazard, of a mind floating at all adventures, without choice, and without direction. *Id.*

Sometimes the sight of the altar, and decent preparations for devotion, may compose and recover the wandering mind more *effectually* than a sermon. *South.*

I took pleasure to trace out the cause of *effects*, and the dependence of one thing upon another in the visible creation. *Burnet's Theory.*

Semblant art shall carve the  
And full achievement of thy

To say of a celebrated piece that  
it, is, in *effect*, to say that the author

We see the pernicious *effects*  
ancient Romans, who immediately  
poor as soon as this vice got footing

The emperor knew that they could  
many of their *effects*.

A subject of that vast latitude,  
one man will scarcely be sufficient  
it out.

A fatal instance of this in our  
upon sacred record; the unhappy  
but too visible in all.

The morality of an action depends  
from which we act. If I sling bal-  
gar with intention to break his head  
up and buys victuals with it, the  
good; but, with respect to me,  
wrong.

This idea he immediately carried  
ing a bar of iron of the depth be-  
side of the keel, moving upon hinges  
being moved in one direction, but  
bent back in the opposite direction.

A true artist should put a general  
spectators, and *effect* the noblest  
methods.

EFFEMINATE, *adj., v. a., &*

EFFEMINACY, *n. s.* [*&*

EFFEMINATELY, *adv.*

EFFEMINATENESS, *n. s.*

EFFEMINATION.

*minced*; Lat. *effeminatus*, *effem-*  
and *femina*, a woman. Woman-  
der; nice; voluptuous. The word  
been derived, in our language,  
tive.

Know ye not that the unrighteous  
the kingdom of God? Be not de-  
nicators, nor *effeminate*. *Bp.*

The king, by his voluptuous  
riage, became *effeminate*, and less

After the slaughter of so many  
Shall we at last conclude *effeminate*

As well we know your tenderness  
And gentle, kind, *effeminate* re-  
Vices the hare figured; not  
usury, from its fecundity and suc-  
nerate *effemination*. *Brown.*

From man's *effeminate* slack  
Who should better hold his place

But foul *effeminacy* held me  
Her bond slave: O indignity,  
To honour and religion!

What boots it at one game to  
And at another to let in the  
*Effeminately* vanquished?

So long as idleness is quite ob-  
all the sins of wantonness, and  
prevented.

The more *effeminate* and  
The more his fame to strengthen

Poetry—not being an art of  
nateness, but of acrobatic stirring

ous and *effeminate* their minds to suffer complain, and if they endure sometimes pain from others, without being permitted strange or intolerable, it will do them no harm sufferance, and harden them early.

Locke.

ful peace both courage will *effeminate* and corrupt.

Pope.

And I can feel

ollies too; and with a just disdain  
at *effeminate*s, whose very looks  
dishonour on the land I love.

Cowper.

that *effeminacy*, folly, lust,  
rate and enfeeble, and needs must;  
that a nation shamefully debased  
be despised and trampled on at last,  
a sweet Penitence her powers renew,  
th, if history itself be true.

Id.

in a handsome suit of clothes:  
man's, true: but then there is a cause  
I should wear the'—What though my soul  
thes

*feminine*!—Thus, after a short pause,  
as, muttering also some slight oaths,  
the devil shall I do with all this cause?"

Byron.

NDI, in the Turkish language, signifies  
and accordingly it is a title very exten-  
plied; as to the mufti and emirs, to  
of mosques, to men of learning, and  
e. The grand chancellor of the empire  
eis effendi.

RVESCE, *v. n.* } Lat. *effervesco*;  
FES'CE, *n. s.* } *efferveo*, *c* and *fer-*  
VES'CENT, *adj.* } *veo*, to burn. To  
erment ebullition: to generate heat by  
motion.

halk, ignite it in a crucible, and then  
put it into strong spirit of nitre, 'till it  
weethish, and makes no *effervescence* upon  
m of the chalk.

Greene.

round spirit of nitre, put to oil of cloves,  
the even to a flame.

Mead on Poisons.

ngs do not owe their heat to any collecta-  
fervescence of the minerals in them, but to  
an heat or fire.

Woodward's Natural History.

hemical sense, *effervescence* signifies an in-  
tion, produced by mixing two bodies together  
a rest before; attended sometimes with a  
ise, frothing and ebullition.

Arbuthnot on Aliments.

ve an agreeable imitation of acidulous  
ader the term of what is called the *effe*-  
taught. This consists of two solutions,  
alkaline carbonate, and the other of the  
the other vegetable acid, which are directed  
together, and swallowed during the act  
tance.

Dr. A. Rees.

VESCENTS are commonly attended with  
vapors, small jets of the liquid, &c.,  
ed by the air which then disengages  
ometimes, also, they are accompanied  
eat degree of heat, the cause of which  
well known. Formerly the word *fer*-  
t was also applied to *effervescences*;  
that word is confined to the motion na-  
tured in animal and vegetable matters,  
which new combinations among their  
s take place.

EFFETE', *adj.* Lat. *effatus*, (*e* privative, young).  
Barren; and *feto*, to bear young; disabled from  
producing young; worn out.

All that can be allowed him now, is to refresh his  
decrepit, *effete* sensuality, with the history of his for-  
mer life.

South.

In most countries the earth would be so parched and  
*effete* by the drought, that it would afford but one  
harvest.

Bentley.

EFFICACIOUS, *adj.* } Old Fr. *efficace*,  
EFFICA'CIOUSLY, *adv.* } power; Lat. *efficax*,  
E'FFICACY, *n. s.* } *efficacis*, from *efficio*,  
to EFFECT, which see. Powerful; productive of  
intended objects or consequences.

Whatever is spoken concerning the *efficacy* or  
necessity of God's word, they tie and restrain only  
into sermons.

Hooker.

Whether if they had tasted the tree of life before  
that of good and evil, they had suffered the curse of  
mortality; or whether the *efficacy* of the one had not  
overpowered the penalty of the other, we leave it unto  
God.

Bruce.

*Efficacy* is a power of speech which represents a  
thing, by presenting to our minds the lively ideas or  
forms.

Peacham.

If we find that any other body strikes *efficiently*  
enough upon it, we cannot doubt but it will move that  
way in which the striking body impels it.

Digby on Bodies.

The apostle tells us of the success and *efficacy* of  
the gospel upon the minds of men; and, for this  
reason, he calls it the power of God unto salvation.

Tillotson.

A glowing drop with hollowed steel  
He takes, and, by one *efficient* breath,  
Dilates to cube or square.

Philips.

The arguments drawn from the goodness of God,  
have a prevailing *efficacy* to induce men to repent.

Rogers.

Bad as the world is, there is reason to think it  
would be a thousand times worse, if it were not for  
this institution; the wisdom and humanity of which  
can never be sufficiently admired; and which, if it  
were as strictly observed as it is positively commanded,  
would operate with singular *efficacy* in advancing  
public prosperity, as well as private virtue.

Beattie.

EFFICIENCE, *n. s.* } Lat. *efficio*. See  
EFFICIENCY, } EFFICACIOUS. Act or  
EFFICIENT, *adj.* & *n. s.* } power of producing  
EFFICIENTLY, *adv.* } effects or consequen-  
ces; agency: as a substantive, efficient is syn-  
onymous with causer, or with effector.

The manner of this divine *efficiency* being far above  
us, we are no more able to conceive by our reason,  
than creatures unreasonable by their sense are able  
to apprehend after what manner we dispose and order  
the course of our affairs.

Hooker.

God, which moveth meer natural agents as *eff*  
*efficient* only, doth otherwise move intellectual crea-  
tures, and especially his holy angels.

Id.

Observations of the order of nature carry the mind  
up to the admiration of the great *efficient* of the world.

Hale.

That they are carried by the manuduction of a rule,  
is evident, but what that regulating *efficiency* should  
be, is not easily determined.

Glennell.

A pious will is the means to enlighten the under-  
standing in the truth of Christianity, upon the ac-  
count of a natural *efficiency*: a will so disposed, will  
engage the mind in a severe search.

South.

Logical or consequential necessity is when a thing does not *efficiently* cause an event but yet by certain infallible consequences does infer it. *South.*

Gravity does not proceed from the *efficiency* of any contingent and unstable agents; being entirely owing to the direct concurrence of the power of the Author of nature. *Woodward.*

Your answering in the final cause, makes me believe you are at a loss for the *efficient*.

*Collier on Thought.*

I look upon indolence as a sort of suicide; for the man is *efficiently* destroyed, though the appetite of the brute may survive. *Chenierfeld.*

EFFIGIATE, *v. a.* } Lat. *effigio*, (*c.* and *fin-*  
EFFIGIATION, *n. s.* } go, to fashion). To form  
EFFIGIES, *n. s.* } into resemblance; to  
EFFIGY. } image: effigies or effigy  
is resemblance, generally of a rough, uncouth, or of the French caricature kind: but our older writers use these words more seriously, and for 'actual image,' or idea.

We behold the species of eloquence in our minds, the *effigies* or actual image of which we seek in the organs of our hearing.

*Dryden's Dufrenoy, Preface.*

Observe those numerous wrongs in *effigy*,  
The gods have saved from the devouring sea.

*Garth.*

EFFIGY is also used for the print or impression of a coin, representing the prince's head who struck it.

EFFIGY, TO EXECUTE OR DEGRADE IN, denotes the execution or degradation of a condemned criminal, who cannot be apprehended. In France, before the revolution, they used to hang a picture on a gibbet, wherein was represented the criminal, with the manner of punishment; at the bottom was written the sentence of condemnation. Those who were sentenced to death were executed in effigy.

EFFINGHAM, a county of the United States, in the lower district of Georgia, bounded by the Savannah River on the north-east, which separates it from South Carolina, and by the Ogeechee River on the south-west, which divides it from Liberty county. Chief towns, Ebenezer and Elberton.

EFFINGHAM, a township of New Hampshire, in Stafford county, seated on the Ossipee, south-east of Ossipee Pond.

EFFLORESCENCE, *n. s.* } Lat. *effloresco*,  
EFFLORESCENCY, } *e* expletive, and  
EFFLORESCENT, *adj.* } *florco*, to flower;  
from *flos*, *floris*, a flower. The production of flowers; hence any excrescence of the shape or appearance of flowers.

Where there is less heat, there the spirit of the plant is digested, and severed from the grosser juice in *efflorescence*. *Bacon.*

Excrescencies in the form of flowers.

Two white sparry incrustations, with *efflorescencies* in form of shrubs, formed by the trickling of water.

*Woodward.*

Yellow *efflorescent* sparry incrustations on stone.

*Id.*

It has lately been found in large quantities in a natural basin of calcareous earth at Molfetta in Italy, both in thin strata between the calcareous beds, and in *efflorescences* of various beautiful leafy and hairy forms. *Darwin.*

A writ to an *efficient*.

EFFLORESCENCE formation of surface of occasioned by The efflorescent pyrites is of crystals of the latter is also a species which is in vegetation tartar, acidulous acids, served to at the common have the of an efflorescence mixed with lime. When of, there is effluence. The sea-salt the though the form of Glauber's efflorescence nor will the effluence be sea-salt. T commonly salt. In silic alkali. not known. there seems spot of a which we very evident salt; and, effluence, at the prolific least impaired  
EFFLORESCENT TEMPORARY the precise every plant  
EFFLUENT  
EFFLUX  
EFFLUXION  
A flowing  
Or, as Dr. is more properly effluence

There are when men body.

The first of the faith, in seasons.

By effluence earth.

These acids upon the cold inflammable collided.

Bright

Five thousand and some odd centuries of years  
 were *effused* since the creation.

*Boyle's Seraphick Love.*

Through the copious *efflux* of matter, through the  
 effluence of a deep ulcer, he was reduced to a skeleton.

*Harvey.*

From the bright *effluence* of his deed  
 They borrow that reflected light,  
 With which the lasting lamp they feed,  
 Whose beams dispel the damps of envious night.

*Prior.*

Prime chearer, light!

Of all material beings, first and best!

*Efflux* divine!

*Thomson's Summer.*

**EFFLUVIUM**, *n. s. sing.* } *Lat. effluo.* See  
**EFFLUVIA**, *n. s. plur.* } **EFFLUENCE.**

Small particles that exude, i. e. flow as it were,  
 from bodies, commonly applied in modern times  
 to the smell or scent they yield.

If the earth were an electric body, and the air but  
 an *effluvia* thereof, we might believe that, from at-  
 traction, and by effusion, bodies tended to the earth.

*Brown.*

Neither the earth's diurnal revolution upon its axis,  
 nor any magnetick *effluvia* of the earth, nor the air,  
 nor atmosphere which environs the earth, can produce  
 any.

*Woodward.*

If these *effluvia*, which do upward tend,

Because less heavy than the air, ascend;

Why do they ever from their height retreat,

And why return to seek their central seat?

*Blackmore.*

**EFFORCE**, *v. a.* *Fr. efforcer.* To force;  
 to break through by violence; strain; violate.

At that room was nothing to be seen,

But huge great iron chests and coffers strong;

Barred with double bonds, that never could ween,

Them to *efforce* by violence or wrong.

*Fairie Queens.*

Then 'gan her beauty shine as brightest sky,  
 And burnt his beastly heart t' *efforce* her chastitie.

*Spenser.*

The palmer lent his ear into the noise,

To wheet who called so importunately;

Again he heard a more *efforced* voice,

That bade him come in haste.

*Id.*

**EFFORM**, *v. a.* } *Latin, efformo.* To  
**EFFORMATION**, *n. s.* } make in any certain  
 manner; to shape; to fashion.

Nature begins to set upon her work of *efformation*.

*Moss.*

Merrifal and gracious, thou gavest us being, raising  
 us from nothing, and *efforming* us after thy own image.

*Taylor.*

They pretend to solve phenomena, and to give an  
 account of the production and *efformation* of the uni-  
 verse.

*Ray.*

**EFFORT**. *Fr. effort*; most probably from  
 the Latin *firtis*, strong, bold. Struggle; earnest  
 endeavour; vehement action. It is accented by  
 good writers on either syllable.

If, after having gained victories, we had made the  
 same *efforts* as if we had lost them, France could not  
 have withstood us.

*Addison. On the State of the War.*

Though the same sun, with all diffusive rays,

Shine in the rose, and in the diamond blaze,

We prize the stronger *effort* of his power,

And always set the gem above the flower.

*Pope.*

Blackmore himself for any grand *effort*.

*Id.*

There is not so poor a book in the world, that would  
 not be a prodigious *effort* were it wrought out entirely  
 by a single mind, without the aid of prior inventors

*Johnson.*

And bathing his chill temples tried to sooth

Each pulse to animation, till beneath

Its gentle touch and trembling care, a sigh

To these kind *efforts* made a low reply.

*Dryden.*

Good without *effort*, great without a foe.

*Id.*

**EFFUSION**, *n. s.* *Lat. effudio.* The act of  
 digging up from the ground: deterration.

He set apart annual sums for the recovery of ma-  
 nuscripts, the *effusion* of coins, and the procuring of  
 mummies.

*Arbutnot.*

**EFFRAIABLE**, *adj.* *Fr. effrayable.* Dread-  
 ful; frightful; terrible. A word not used.

Pestilential symptoms declare nothing a proportion-  
 ate efficient of their *effrayable* nature but arsenical  
 fumes.

*Harvey.*

**EFFRONTERY**. *Fr. effronterie*; *Lat. effrons*,  
 shameless; from *frons*, *frontis*, the forehead, often  
 put for impudence or assurance (from modest fe-  
 males wearing it veiled). Shamelessness; im-  
 modesty; contempt of reproach.

They could hardly contain themselves within one  
 unworthy act, who had *effrontery* enough to commit or  
 countenance it.

*King Charles.*

A bold man's *effrontery*, in company with women,  
 must be owing to his low opinion of them, and his  
 high one of himself.

*Clarissa.*

Others with ignorance and insufficiency have self-  
 admiration and *effrontery* to set up themselves.

*Watts.*

His pride, that scorns to obey or to submit,

With them is courage, his *effrontery* wit.

*Cooper.*

**EFFULGE**, *v. n.* } *Lat. effulgeo*, to shine  
**EFFULGENCE**, *n. s.* } out, from, out of, and  
**EFFULGENT**, *adj.* } *fulgeo* to shine. To emit  
 light, lustre. Effulgence is the lustre, light, or  
 brightness, emitted.

On thee

Impressed, the *effulgence* of his glory abides.

*Milton.*

Thy lustre, blest *effulgence*, can dispel

The clouds of error, and the gloom of hell.

*Blackmore.*

How soon the *effulgent* emanations fly

Through the blue gulf of interposing sky!

*Id.*

The downward sun

Looks out *effulgent*, from amid the flash

Of broken clouds.

*Thomson's Spring.*

The topaz charms the sight,

Like these *effulgent* yellow streams of light.

*Savage.*

The west is indeed on fire with his descending glo-  
 rious. In what broad and *effulgent* day do they reveal  
 the insatiation of the duke of Bedford; sharpening  
 the axe for his own neck, and for the necks of all men  
 of rank and property in the kingdom!

*Seward.*

*Effulgent* maids! you round deciduous day,

Tressed with soft beams, your glittering bands array.

*Darwin.*

**EFFUMABILITY**, *n. s.* *Lat. fumus.* The  
 quality of flying away, or vaporizing in fumes.  
 A useful word, but not adopted.

They seem to define mercury by volatility, or, if I  
 may coin such a word, *effumability*.

*Boyle.*

**EFFUSE**, *v. a. & n. s.* } Fr. *effusion*, Ital. *effusione*, *n. s.* }  
*Span. and Portug.* }  
*effusione*; Lat. *effusio*, *adj.* }  
*effundere*, to pour out, i. e. *e.* out, and  
*fundere*, to pour. To pour out; shed; spill.  
 Shakspeare uses *effuse* for *effusion*. The act of  
 pouring out words or things; the thing poured  
 out.

When there was but as yet one only family in the  
 world, no means of instruction, human or divine,  
 could prevent *effusion* of blood. *Hooker.*

My heart hath melted at a lady's tears,  
 Being an ordinary inundation;  
 But this *effusion* of unmanly drops,  
 'This shower, blown up by tempest of the soul,  
 Startles mine eyes, and makes me more amazed.

*Shakspeare.*

The air hath got into my deadly wounds,  
 And much *effuse* of blood doth make me faint. *Id.*  
 Stop *effusion* of our Christian blood,  
 And 'establish quietness. *Id. Henry VI.*

Purge me with the blood of my Redeemer, and I  
 shall be clean; wash me with that precious *effusion*,  
 and I shall be whiter than snow. *King Charles.*

Such great force the gospel of Christ had upon men's  
 souls, melting them into that liberal *effusion* of all that  
 they had. *Hamm. on Fundam.*

He fell, and, deadly pale,  
 Groaned out his soul, with gushing blood *effused*.  
*Milton.*

Our blessed Lord commanded the representation of  
 his death, and sacrifice on the cross, should be made  
 by breaking bread and *effusion* of wine.

*Taylor's Worthy Communicant.*

Yet shall she be restored, since public good  
 For private interest ought not be withheld,  
 To save the *effusion* of my people's blood.

*Dryden's Homer.*

If the flood-gates of heaven were any thing distinct  
 from the forty days rain, their *effusion*, 'tis likely,  
 was at this same time when the abyss was broken  
 open. *Burnet's Theory.*

At last emerging from his nostrils wide,  
 And gushing mouth, *effused* the briny tide.

*Pope's Odyssey.*

The North-east spends its rage; the *effusive* South  
 Warns the wide air. *Thomson's Spring.*

The several irruptions of Arabs, Tartars, and Per-  
 sians, into India were, for the greater part, ferocious,  
 bloody, and wasteful in the extreme: our entrance  
 into the dominion of that country was as generally,  
 with small comparative *effusion* of blood; being intro-  
 duced by various frauds and delusions, and by taking  
 advantage of the incurable, blind, and senseless ani-  
 mosity, which the several country powers bear towards  
 each other, rather than by open force. *Burke.*

Your myriad trains o'er stagnant oceans tow,  
 Harnessed with gossamer, the loitering prow;  
 Or with fine silms, suspended o'er the deep,  
 Or oil *effusive* lull the waves asleep. *Darwin.*

**EFFUSION**, or **FUSION**, in astronomy, denotes  
 that part of the sign Aquarius, represented on  
 celestial globes and planispheres, by the water  
 issuing out of the urn of the water-bearer.

**EFT**, *n. s.* Sax. *efeta*, from Goth. *vate*, water.  
 A water-lizard.

Pencocks are beneficial to the places where they  
 are kept, by clearing of them from snakes, adders,  
 and *efts*, upon which they live.

*Mortimer's Husbandry.*

The crocodile of Egypt is the lizard of Italy, and  
 the *eft* in our country. *Nicholas.*

**EFT**, in zoology. See **LACERTA**.

**EFT**, *adv.* } Sax. *eft*, and  
**EFTSOON**. } Sax. *eftan*, to  
 quickly; following soon. The  
 lies behind; and our naval word  
 after, afterwards, &c., are of the  
 See **ART**.

But sithen thynges passed cannot  
 make oughte wee the more beware,  
 we have taken soo greute hurt afore,  
 fall not in that occasion agayne.

*Eft* through the thick they heard  
 With noise whereof he from his lofty  
 Down fell to ground, and crept in  
 To hide his coward head from dying.

*Eftsoones* he gan apply

Of salves and medicines.

He in their stead *eftsoones* placed  
 possessed all their lands. *Spenser's*

With hands profane, from being

*Eftsoones*, O sweetheart kind, my love  
 And all the year shall then be

**EGALITE'**, Fr. i. e. equality  
 assumed by Philip Bourbon Capet  
 of Orleans, to ingratiate himself  
 licans, upon the abolition of monar-  
 chy in August, 1792. Neither this  
 however, nor his voting for the  
 fortunate relation, Louis XVI.,  
 from being denounced as a conspirator  
 the liberty of the republic, on the  
 1793, and condemned to be guil-  
 6th November following. He was  
 accordingly at five P. M., three  
 condemnation.

**EGBERT**, the first king of all  
 the last of the Saxon heptarchy  
 scendant of the royal family of  
 prince of great accomplishments  
 young, he was obliged to withdraw  
 where he lived at the court of  
 Brithric, the then king of Wessex;  
 jealousy he had fled, became  
 nobility, through the conduct of  
 bert, who, during his exile, had  
 the arts of war and government.  
 take possession of the kingdom, to  
 legal heir; was proclaimed king  
 800, and in 802 he united all the  
 under him, giving the whole the  
 land. In about five years after,  
 were twice invaded by the Danes  
 force, but he defeated them in  
 tempts. He died in 838, and was  
 Ethelwolf. See **ENGLAND**.

**EGEDE** (Hans), a Danish  
 went to Greenland in 1791. He  
 founder of an establishment there,  
 presided for fifteen years, and was  
 a work on the topography and  
 Greenland, published in Danish  
 afterwards translated into French.

led in 1750, aged seventy-one, in the isle of Arr.

EDGE (Paul), son of the preceding, was his agent in the above mission; and published a list of his own residence in Greenland, from 1770 to 1788. He died at the age of eighty-one, aged, 1789.

ENOTISO, an island in the Eastern Indian Sea, about twenty miles in circumference, miles from the north-east coast of Sumatra.  $104^{\circ} 45' E.$ , lat.  $0^{\circ} 27' S.$

EGRE, *n. s.* See EAGRE. An impetuous regular flood or tide.

In the peculiar disposition of the earth at the bottom wherein quick excitations are made, may arise tides and flows in some estuaries and rivers; as is observable about Trent and Humber in England.

*Brown's Vulgar Errors.*

ER, a river rising in Suabia, which passes Weidlingen, and runs into the Wernitz, six miles north of Donauwert.

ER, a large river of Franconia, which flows into Bohemia, and falls into the Elbe.

ERA, an old fortified town of Bohemia, on the Elbe river. It contains some manufactures; has annual fairs; and in the neighbourhood of a well-known chalybeate spring. It was occupied by the French in 1742, but retaken the following year. It suffered greatly by fire in 1744. Population about 8000. Seventy-six houses in Prague.

ERIA, or EGERIA, a nymph held in great veneration by the Romans. She was courted by Pomilius; and, according to Ovid, became his wife. This prince, to give his laws the authority, solemnly declared, before the people, that they were previously sanctioned and approved by the nymph Egeria. Ovid relates that Egeria was so disconsolate at the death of her husband, that she melted into tears, and was changed into a fountain by Diana. She was afterwards worshipped as a goddess who presided over the destiny of women, whence some reckoned her the same with Lucina.

ERTON (John), an eminent prelate, born in London in 1721, was the son of Henry Egerton, bishop of Hereford. He received the first part of his education at Eton, after which he went to Oriel College, Oxford. In 1745 he received the living of Ross in Herefordshire, the next year a prebend in the cathedral of Hereford. He was preferred to the deanery of Hereford in 1750, and afterwards successively to bishoprics of Bangor, Litchfield, and Durham. He was a liberal contributor to several important public works in his diocese, and his benefactions were extensive. He published several sermons on public occasions; and died in 1787.

ERTON (Thomas), lord chancellor of England under James I., was the natural son of Sir Robert Egerton, in Cheshire, and was born in 1540. He was educated at Oxford, and he removed to Lincoln's Inn. He received the honor of knighthood, and was made a baronet in 1592; and not long after, of the rolls, which was followed by the office of clerk-keeper. In 1603 he was appointed lord chancellor, with the title of baron Ellesmere. In 1616 he was created viscount

Brackley, but died the year following. His Privileges and Prerogatives of the High Court of Chancery, and his Observations concerning the Office of Lord Chancellor, were published after his death.

ERTON (Francis), duke of Bridgewater, descended from the above nobleman, was born in 1736, being the fifth son of the first duke, and the third who held that title. He succeeded his elder brother in 1748. This nobleman exhibited a most enlightened and persevering spirit in his various schemes for making navigable canals for the advantage of his estates in Lancashire and Cheshire, and in his patronage of the celebrated Brindley, by whom his plans were executed. The duke had the satisfaction of witnessing the entire success of his undertakings, prior to his death, which took place in 1803.

EGEST, *v. a.* ? Lat. *egero, egestum*, from *EGESTION, n. s.* *Je, out, and gero, to bear:* to carry forth. To evacuate food naturally.

Divers creatures sleep all the Winter; as the bear, the hedge-hog, the bat, and the bee; these all wax fat when they sleep, and *egest* not.

*Bacon's Natural History.*

The animal soul or spirits manage as well their spontaneous actions, as the natural or involuntary exertions of digestion, *egestion*, and circulation.

*Hale's Origin of Mankind.*

EGG. *Isl. eggia*, to incite; Sax. *eggian*; Dan. *egge*: according to Minshew all derived from Lat. *ago*, to compel, do, &c.

Study becomes pleasant to him who is pursuing his genius, and whose ardour of inclination *eggs* him forward, and carrieth him through every obstacle.

*Durham's Physico-Theology.*

EGG, *n. s.* Goth. and Swed. *egg*; Sax. *æg*; Erse. *ough*; perhaps from the foregoing verb, i. e. that which is excited to life by hatching.

About her commeth all the world to begge.  
He saitheth lande, and he to pas would bryng.  
This toye and that, and all not worth an *egge*:  
He would in louse prosper above all thyng.

*Sir T. More.*

Therefore think him as the serpent's egg,  
Which hatched, would, as his kind, grow mischievous.

*Shakspeare.*

An egg was found having lain many years at the bottom of a moat, where the earth had somewhat overgrown it; and this egg was come to the hardness of a stone, and the colors of the white and yolk perfect.

*Bacon.*

Hear this then, ye careless ostriches, that leave your eggs in the open sand for the sun to hatch, without the fear of any hoof that may crush them in pieces.

*Rij. Hall.*

There was taken a great glass-bubble with a long neck, such as chemists are wont to call a philosophical egg.

*Boyle.*

Every insect of each different kind,  
In its own egg, cheered by the solar rays,  
Organs involved and latent life displays. *Blackmore.*

As true wit generally consists in the resemblance and congruity of ideas, false wit chiefly consists in the resemblance and congruity sometimes of single letters, as in anagrams, chronograms, lipograms, and acrostics: sometimes of words, as in puns and quibbles; and sometimes of whole sentences or poems, cast into the figures of eggs, axes, or altars. *Addison.*

The Aphis is in a similar manner hatched from an egg in the vernal months, and produces a viviparous offspring without sexual intercourse for nine or ten successive generations; and then the progeny is both male and female, which cohabit, and from these new females are produced eggs, which endure the winter; the same process probably occurs in many other insects.

Darwin.

And now the day of woe drew on apace,  
A day of woe to all the pigmy race,  
When dwarfs were doomed, but penitence was vain,  
To rue each broken egg, and chicken slain. *Beattie.*

She and her maid, had promised by day-break  
To pay him a fresh visit, with a dish  
For breakfast, of eggs, coffee, bread, and fish. *Byron.*

Egg, in physiology, a body formed in certain females, in which is contained an embryo, or fetus of the same species, under a cortical surface or shell. The exterior part of an egg is the shell; which in a hen, for instance, is a white, thin, and friable cortex, including all the other parts. It is lined every where with a very thin, but a pretty tough membrane, which dividing at, or very near, the obtuse end of the egg, forms a small bag, where nothing but air is contained. In new-laid eggs this follicle appears very little, but becomes larger when the egg is kept. Within this are contained the albumen, or white, and the vitellus, or yolk; each of which have their different virtues. The albumen is a cold, viscous, white liquor in the egg, different in consistence in its different parts. It is observed, that there are two distinct albumens, each of which is enclosed in its proper membrane. Of these one is very thin and liquid; the other is more dense and viscous, and of a somewhat whiter color; but in old and stale eggs, after some days incubation, inclining to a yellow. As this second albumen covers the yolk on all sides, so it is itself surrounded by the other external liquid. The albumen of a fecundated egg, is as sweet and free from corruption, during all the time of incubation, as it is in new laid eggs; as is also the vitellus. As the eggs of hens consist of two liquors separated one from another, and distinguished by two branches of umbilical veins, one of which goes to the vitellus, and the other to the albumen; so it is very probable, that they are of different natures, and consequently appointed for different purposes. When the vitellus grows warm with incubation, it becomes more humid, and like melting wax or fat, whence it takes up more space. For as the fetus increases, the albumen insensibly wastes away and condenses; the vitellus, on the contrary, seems to lose little or nothing of its bulk when the fetus is perfected, and only appears more liquid and humid when the abdomen of the fetus begins to be formed. The chick in the egg is first nourished by the albumen, and when this is consumed, by the vitellus, as with milk. If we compare the chalazæ to the extremities of an axis passing through the vitellus, which is of a spherical form, this sphere will be composed of two unequal portions, its axis not passing through its centre; consequently, since it is heavier than the white, its smaller portion must always be uppermost in all positions of the egg. The yellowish white round spot, called cicatri-

cula, is a portion, a perior part, exclusion into its end of the time before the chick is hatched, its shell with gradually guts by according color, for of dress hens' egg best. As served, it is first gradually and, how appear, in titude of discerning daily ded the time is much To present to present the method those pot watery kinds of will present are careful mutton for this with any coated or that hence the animal is nated by alive, and to be hatched When egg found new and the their being ration of which M tried on two years and such guish from The at ovens has in a vill About the scatter the each und These ovi ral, they e they usual months; an oven, it is easily different is under son who thirds of

her his care; and he is a gainer by as more than two-thirds of the eggs of these chickens. This useful and admirable method of hatching eggs was discovered

France by the ingenious M. Reaumur, who, by a number of experiments, has brought it to fixed principles. He found that it is necessary for this purpose is nearly the same that marked 32° on his thermometer or 0° on Fahrenheit's. The degree of heat brings about the development of the embryo, and the Turkey pout, is the best which fits for hatching the Canary, and, in all probability, the smallest difference: the difference is only in the degree to which this heat ought to be communicated to the eggs of different birds. After experiments, M. Reaumur found, that heat by means of a baker's oven, superior to those made hot by layers of the furnaces of glass-houses, and the melting of metals, by means of pipes heated into a room, might, no doubt, be employed for the same purpose. As to the heat of the stoves, no great nicety is required. It is necessary but to ascertain the degree of heat, by melting a lump of butter in a walnut, with half as much tallow, and pouring it into a phial. This serves to indicate with sufficient exactness: for when the heat is at this point, this mixture will become as thick as butter; and when the heat is too small, it will be fixed in a lump: but it will flow like syrup, upon inclining the bottle, if it is of a right temper. Great attention should be given to keep the heat at a certain degree, and that all the eggs in the incubator equally share the irregularities of the heat. Reaumur has invented a sort of low wooden boxes, and lined with furs. He calls artificial parents, not only to keep the chickens from the injuries of the air, but to give them the kindly warmth, so that they take the heat of the shelter as readily as they would the heat of the wings of a hen. After a certain time will be necessary to keep the chickens in a room artfully heated, and in these boxes; but afterwards they are exposed to the air in the court-yard, so that it may not be amiss to place one artificial parent to shelter them, if there is occasion for it. They are generally a few days before being hatched, before they take to the air. A few crumbs of bread may be given them for a day or two, after which they pick up insects and grass for themselves, to save the trouble of attending to them. They may be taught to watch them in the same manner as hens do.

**EGG HARBOR, LITTLE,** a township of New York, in Burlington county, consisting of 10 townships. The compact part of the township is called Clam Town. It has a small trade with the Indies.

**EGG RIVER, GREAT,** a river of New York, which rises between Gloucester and Burlington counties. After running E. S. E. it becomes the divisional line between

Cape May and Gloucester counties, and falls into the bay of its own name. The inlet from the Atlantic Ocean lies in 39° 22'. The river abounds with sheephead, rock-fish, perch, oysters, clams, &c., which find a ready market at Philadelphia. This river is navigable twenty miles for vessels of 200 tons.

**EGG HARBOR RIVER, LITTLE, or Little Inlet,** lies about seventeen miles north-east of Great Egg Harbour Inlet. It receives Mulickus River which rises in Gloucester and Burlington counties, and forms part of the divisional line a few miles from the bay. It is navigable twenty miles for vessels of sixty tons.

**EGG ISLAND,** a small island on the west coast of Virginia, at the mouth of York River. 2. A small island in the Straits of Magellan, seven miles north-east of York Minister. 3. A small island on the north-east side of Delaware Bay, Cumberland. Long. 75° 12' W., lat. 39° 16' N.

**EGG-PLANT** (*solanum melongena*); a herbaceous annual, from a foot to eighteen inches high, a little branched, and more or less covered with a substance resembling cotton: the leaves are oval, sinuate, and petiolate; the flowers large, white, or purplish, lateral, and frequently solitary; but sometimes two or three are situated upon a common divided peduncle; the calyx and peduncles are furnished with a few short prickles; the fruit is very large, smooth, and shining, and generally of a violet color, but sometimes yellow or white. It is cultivated in the warm parts of both continents, and the fruit is much used as an article of food, when cooked, which is done in various ways: in India, it is generally served up with sugar and wine, or simply sugared water; in the south of France, with olive-oil. There are several varieties, one of which bears a white fruit, exactly resembling a pullet's egg, and has been sometimes confounded with another species, which is acid and poisonous.

**EGINHART, or EGINHARD,** secretary to Charles the Great, and the most ancient of the German historians. It is said, that he insinuated himself into the favor of Imma, daughter of Charles the Great, and that Charles, having discovered the intrigue, married the two lovers, and gave them an estate in land.

**EGGLANTINE, n. s.** *Fr. cglantier.* A species of rose; sweet-briar.

**EGGLANTINE,** in botany. See *ROSA*.

**EGLON,** a king of the Moabites, who oppressed the Israelites for eighteen years. See Judges iii. 12—14. Calmet confounds this servitude of the Hebrews with that under Chushan-rishathaim, making it to subsist only eight years from A. M. 2591 to 2599; whereas this servitude under Eglon lasted eighteen years, and commenced A. M. 2661, and sixty-two years after they had been delivered by (Gideon), from their subjection to Chushan-rishathaim.

**EGMONT, NEW GUERNSEY, or SANTA CRUZ ISLAND,** one of Queen Charlotte's islands, in the South Pacific Ocean, discovered in 1595, by the Spanish navigator Mandana. He bestowed upon it the name of Santa Cruz, which was changed to Egmont by captain Carteret in 1767. It is high and mountainous throughout, being about

twenty-two miles in length, and eleven in breadth. The soil, from the abundance of small streams, produces several roots and fruits, but not in great profusion. Some of the natives are of a deep olive color, others black, and all of moderate size, with slender extremities. Their physiognomy is disagreeable, and tends to inspire that mistrust and dislike which their treacherous and dishonest conduct but too well justifies. They are tattooed, particularly on the back: wear white powder in their hair, and many ornaments. The men go naked, wrapping a cord several times round the belly: the women have a petticoat which descends to the knees, and cover the head, and part of the body, with a sort of shift. Their huts are large, having windows, and are generally placed under the shade of cocoa-trees along the shore. Their arms are bows, arrows, and darts. They chew betel; and have canoes with outrigger, formed of the trunk of a single tree, about fifteen feet long. Long. 165° 59' E., lat. 10° 46' S.

EGMONT ISLAND, an island in the Gulf of Mexico, on the west coast of East Florida, at the entrance of Spiritu Santo Bay. Long. 82° 55' W., lat. 27° 54' N. Also an island in the South Pacific Ocean, six miles in length, four in breadth, low, and covered with trees. Long. 138° 30' W., lat. 12° 20' N.

EGOOCHSHAC, a harbour on the North coast of the island of Unalashka, entered by captain Cook in the year 1778, who found some Russians settled here for the purpose of purchasing skins of the natives: they had store-houses, and a sloop of about thirty tons burden.

EGOTISM. Fr. *egoisme*, from Lat. pers. pron. *ego*; Gr. *εγω*.

*Egotism* is the coquetry of a modern author; whose epistles, dedicatory prefaces, and addresses to the reader, are so many affected graces, designed to draw the attention from the subject, towards himself; and make it be generally observed not so much what he says, as what he appears, or is, and what figure he already makes, or hopes to make in the fashionable world.

The most violent *egotism* which I have met with, in the course of my reading, is that of Cardinal Wolsey's; *ego et rex meus*, I and my king.

*Spectator*.

A tribe of *egotists*, for whom I have always had a mortal aversion, are the authors of memoirs, who are never mentioned in any works but their own.

*Id.*

EGRA, a town of Bohemia, seated on a river of the same name, formerly imperial, and possessing towns and villages. It contains a great number of able artificers, and is famous for its mineral waters. General Wallenstein was assassinated here in 1634. The French became masters of this town in 1741; but afterwards, being blocked up, they were forced to capitulate Sept. 7th, 1743. It is considered as a town of the greatest consequence in Bohemia, except Prague. It lies seventeen miles south-west of Einbogen, and seventy-six west of Prague. Long. 12° 40' E., lat. 50° 9' N.

EGREGIOUS, *adj.* } Old Fr.

EGREGIOUSLY, *adv.* } Spanish, *egregio*; Lat. *egregius* i. e. *egregius* the flock. Remarkable; extraordinary; generally used in a bad sense, but below) and other good writers form it to eminence and merit.

He might be able to adorn this profuse history with the records of *egregious* both of art and valour. *Moore*

We may be bold to conclude, that for insolence, pride, and *egregious* order, are the worst. *Hall*

I suffered the pangs of an *egregious* stopt in, like a strong distillation, with

Ah me, most credulous fool!

*Egregious* murderess!

Make the Moor thank me, love me, *me*;

For making him *egregiously* an ass. And practising upon his peace and quiet. Even to madness.

The folly of fools, that is, the more of folly that any man can be guilty of, knave.

One to empire born;

*Egregious* prince; whose manly child his mingled parents, and portended joy. Unspeakable.

And hence the *egregious* wizard shall The fate of Louis and the fall of Rome.

An *egregious* and pregnant instance surpasses ingenuity.

He discovered that, besides the every article, he had been *egregiously* *Arminius*

The *cœur-cherry*, which inclined sweeter than the red; but the *egre*

## E G Y P T.

EGYPT, an extensive country of Africa, lying between  $30^{\circ}$  and  $36^{\circ}$  of E. long., and between  $26^{\circ}$  and  $31^{\circ}$  of N. lat. It is bounded by the Mediterranean on the north, by the Red Sea and Gulf of Suez, which divide it from Arabia, on the east, by Abyssinia or Ethiopia on the south, and by the deserts of Barca and Nubia on the west; being 600 miles in length from north to south, and from 100 to 250 in breadth from east to west. Ancient Egypt is by some divided into three parts, the Upper and Lower Egypt: by others into three, the Upper Egypt, properly so called, the Delta, or that space encompassed by the branches of the Nile. The whole area of fertile soil has been recently estimated at 10 square miles.

Egypt may with justice lay claim to as high antiquity as any nation in the world. It was probably peopled by Mizraim the son of Ham and grandson of Noah. By its ancient inhabitants it was called Chemia, and is still called *Chem* in the language of the Copts or native Egyptians. In Scripture it is generally named *Ain*; though in the Psalms it is styled the land of Ham. To us it is best known by the name of Egypt, the etymology of which is more uncertain.

Some derive it from *Egyptus*, a supposed king of the country: others say it signifies no more than the land of the Copts; *Aia* in Greek signifying country, and *Aioptoc*, Aioptos, being easily changed into *Egyptus*. The most probable name, however, seems to be, that it received its name from the blackness of its soil and the color both of its river and inhabitants; for a blackish color is by the Greeks called *choma*, from *χρῶμα*, and *αιγυπτιος*, a vulture; and the Latins, *subvulturius*. For the same reason other names of a similar import have been given to this country by the Greeks; such as *Choma*, and *Melambolus*: the river itself was called *Melo*, or *Melax*; by the Hebrews *Shihor*, by the Ethiopians *Siris*; all signifying

black. The air and climate of Egypt are extremely hot, not only from the height of the sun, which in summer approaches to the zenith, but from the want of rain, and from the vicinity of those burning and sandy deserts which lie to the west. In July and August, according to M. de Reaumur's thermometer stands, even in the most temperate apartments, at  $24^{\circ}$  or  $25^{\circ}$  above the freezing point; and in the southern parts it is said to rise still higher. Hence, he says, only two seasons should be distinguished in Egypt, the cool and the hot, or spring and summer. The latter continues for the greatest part of the year, viz. from March to November, or longer; for by the end of February the sun is intolerable to an European at nine o'clock in the morning. During the whole of this season the air seems to be inflamed, the sky sparkles, every one sweats profusely, even without the least exercise, and when covered with the lightest

dress. This heat is tempered by the inundation of the Nile, the fall of the night dews, and the subsequent evaporation; so that some of the European merchants, as well as the natives, complain of the cold in winter. The dew does not fall regularly throughout the summer, as with us; the parched state of the country not affording a sufficient quantity of vapor for this purpose. It is first observed about St. John's day (June 24th), when the river has begun to swell, and consequently a great quantity of water is raised from it by the heat of the sun, which, being soon condensed by the cold of the night air, falls down in copious dews. It might be imagined that as, for three months of the year, Egypt is in a wet and marshy situation, the excessive evaporation and putrefaction of the stagnating waters would render it very unhealthy. But this is by no means the case. The great dryness of the air makes it absorb vapors of all kinds with the utmost avidity; and these, rising to a great height, are carried off by the winds either to the south or north without communicating any of their pernicious effects. This dryness is so remarkable in the internal parts of the country, that flesh meat exposed to the open air does not putrefy even in summer, but soon becomes hard and dry like wood. In the deserts there are frequently dead carcases thus dried in such a manner, and become so light, that one may easily lift that of a camel with one hand. In the maritime parts, however, this dryness of the air is not to be expected. They discover the same degree of moisture which usually attends such situations. At Rosetta and Alexandria iron cannot be exposed to the air twenty-four hours without rusting. According to the above writer, the air of Egypt is also strongly impregnated with salts. No experiments have ever shown, that any salt was or could be diffused in the air, except volatile alkali, and this is now known to be formed by the union of two permanently elastic fluids: and it is certain that a saline air would quickly prove fatal to the animals who breathed it. The abundance of this kind of salt in Egypt therefore only shows that, by some unknown operation, the heat of the sun forms it from the two ingredients of earth and water, though we do not yet understand the manner, nor are able to imitate this natural operation. To this saline property of the earth M. Volney ascribes the excessive quickness of vegetation in Egypt, which is so great that a species of gourd, called *kara*, will in twenty-four hours send forth shoots of four inches in length; but, in all probability for the same reason, no exotic plant will thrive in Egypt. The merchants are obliged to send annually to Malta for their garden seeds; for, though the plants thrive very well at first, yet, if the seed of them be preserved and sown, they always come up too tall and slender. In consequence of the great dryness of the air, Egypt is exempted from the phenomena of rain, hail, snow, thunder, and lightning. Earthquakes are also seldom heard of in this country; though they have sometimes been very fatal and

of the inundation, and partly from the sea. At Alexandria, after sun-set, in April, the clothes exposed to the air on the terraces are soaked with them as if it had rained. These dews are more or less copious according to the direction of the wind. They are produced in the greatest quantity by the west and north-west, which blow from the sea; but the south and south-east winds, blowing over the deserts of Africa and Arabia, produce none.

Though the climate of Egypt is far from being unhealthy, yet there are not a few diseases which seem to be peculiar to it, and to have their origin either from the constitution of the atmosphere, or the manner of living. One of these has been supposed to be the plague; which opinion was supported by Dr. Mead, who endeavoured to assign a natural reason why it should take its origin in this country. But it is now universally agreed that the plague never originates in the interior parts of Egypt, but always begins at Alexandria, passing successively thence to Rosetta, Cairo, Damietta, and the rest of the Delta. It is likewise observed, that its appearance is always preceded by the arrival of some vessel from Smyrna or Constantinople; and that, if the plague has been very violent in either of these cities, the danger to Egypt is the greater. On proper enquiry, it is found to be much more a native of Constantinople; whence it is exported by the absurd negligence of the Turks, who refuse to take any care to prevent the spreading of the infection. As they sell even the clothes of the dead without the least ceremony, and ships laden with this pernicious commodity are sent to Alexandria, it is no wonder that it should soon make its appearance there. As soon as it has reached Cairo, the European merchants shut themselves up with their families in their khans or lodgings, taking care to have no further communication with the city. Their provisions are now deposited at the gate of the khan, and are taken up by the porter with iron tongs; who plunges them into a barrel of water provided for the purpose. If they have occasion to speak

or convalescent ophthalmia, causes of this disorder, be upon terraces to be a prime wind, he says, cannot be the Bedouins would be equal the Egyptians themselves greatest probability to be is the very poor and little the natives are obliged to milk, honey, confection of and raw vegetables, says ordinary food of the people stomach a disorder which served to affect the sight: cially, which they devour have a peculiar heating qu Syria made me remark on nourished abound in corn are constantly endeavouring verted from the ordinary perspiration, these humors parts, and fix themselves least resistance. r, who was the chief surgeon of e medical staff, divides the climate e calls quatre saisons constitution- ist of which commences about the , when the Nile begins to overflow rom this moment until the autumnal inundation increases; lower Egypt aen, in which the towns and villages many islands: towards the end of he waters retire, and the general

seed-time commences. To this season he gives the name of *saison humide*; the west winds and fogs then prevail, and produce ophthalmia, fever, diarrhoea, and catarrh.

His second season begins with December, and continues to the 1st March. The winds blow mostly from the east; the nights are cold, but during the day the temperature is that of June in France. The various productions of the earth are vigorously on the increase; the surface is spread over with the most lively tints of verdure; the birds and other animals 'se livrent à leurs amours,' and all nature, reanimated by the moderate heat of the sun and the fecundity of the river, seems to grow young again. This period is healthy, if the night airs are avoided, and may justly be called, *la saison fécondante*.

The *saison moribide* of this writer extends from the beginning of March to the end of May. The east winds, which tempered the air during the spring, now pass to the south, which they seldom quit before the end of May or beginning of June. These are the 'winds of fifty days,' blowing over the deserts, and called by the Arabs, 'simoom,' by the Turks 'samul.'

The fourth, which M. Larrey designates under the name of *saison étésienne*, commences about the middle of June, or just before the solstice, and continues to the overflowing of the Nile.

The winds are then variable, but, towards the end of it, fix themselves to the north, when they become regular, rising and falling with the sun. These winds, in passing over the Mediterranean, are generally supposed to carry with them aqueous vapors to the mountains of Ethiopia or Abyssinia; where, being condensed, they are precipitated in torrents of rain, at and after the summer solstice, producing that gradual and constant periodical increase of the Nile, on which the sustenance of the whole population depends. The air is now clear and dry, and, though the heat is excessive, it is the most healthy part of the year.

According to M. Volney, who gives a very particular description of the face of the country, the entrance into Egypt at Rosetta presents a most delightful prospect, by the perpetual verdure of the palm trees on each side, the orchards watered by the river, with orange, lemon, and other fruit trees, which grow there in vast abundance; and the same beautiful appearance is continued all the way to Cairo. As we proceed farther up the river, he says, nothing can more resemble the appearance of the country than the marshes of the lower Loire, or the plains of Flanders: instead, however, of the numerous trees and country houses of the latter, we must imagine some thin woods of palms and sycamores, with a few villages of mud-walled cottages, built on artificial mounds. All this part of Egypt is very low and flat, the declivity of the river being so gentle, that its waters do not flow at a greater rate than one league in an hour. Throughout the country nothing is to be seen but palm trees, single or in clumps, which become more rare as you advance; with wretched villages composed of huts with mud walls, and a boundless plain, which at different seasons is an ocean of fresh water, a miry morass, a verdant

ance. Its name in the Arabic language is *horatani*, or the hewn mountain. The western is nothing but a ridge of rocks covered with sand, which has been very properly termed a natural mound or causeway. In short, that the reader may at once form an idea of this country, let him imagine on one side a narrow sea and rocks; on the other, immense plains of sand; and, in the middle, a river, flowing through a valley of 150 leagues in length, and from three to seven wide, which, at the distance of thirty leagues from the sea, separates into two arms; the branches of which wander over a soil almost free from obstacles, and void of declivity.

This country is still divided into two principal parts, called the Higher, or Upper, and Lower Egypt. It is subdivided into eighteen provinces.

Egypt, Higher, or Upper, says M. Savary, is only a long narrow valley beginning at Sienna and terminating at Cairo. It is bounded by two chains of mountains running from north to south and taking their rise from the last cataract of the Nile. On reaching the latitude of Cairo they separate to the right and left; the one taking the direction of mount Colzoum, the other terminating in some sand banks near Alexandria; the former being composed of high and steep rocks, the latter of sandy hillocks over a bed of calcareous stone. Beyond these mountains are deserts bounded by the Red Sea on the east, and on the west by other parts of Africa; having in the middle that long plain, which, even where widest, is not more than nine leagues over. Here the Nile is confined in its course between these insuperable barriers, and, during the time of its inundation, overflows the country all the way to the foot of the mountains; and Mr. Bruce observes, that there is a gradual slope from the bed of the river to those mountains on both sides. The baron de Tott says, that the mountains four leagues from the Nile, and facing Cairo, are only a ridge of rocks above forty or fifty feet high, which divide Egypt from the plains of Libya; which ridge accompanies the course of the river, at a greater or less distance, and seems as if

pretended to enclose when country, by a kind of black their sounding lines from but this notion, though as Herodotus, has been discovered by Mr. Bruce; who found the vessel was opposite to All along the coast of Egypt to the eastward.

The Egyptians, like the an excessive antiquity, and possess records for 10,000 50,000 years. Thus their involved in obscurity and fall it must be passed over mortal king whom the Egyptians reigned in that country, whom some chronologists Mizraim, the grandson of preceded, however, by a probably founded upon the diluvians), but who, notwithstanding mortality, had left him the situation: for the whole of was a morass; the people tute of religion and every which could render life converted the course of the Nile time had washed the foot near the borders of Egypt Memphis, instructed his plished a variety of which contributed to the founders of time of Menes, the Egyptian with a list of 330 kings, who but did nothing worthy of distinct fact of history we find is the interruption of the country was subdued; the revolution happened cannot affair is thus related by reign of Timaus, king of men, ignoble in their race, into Egypt, made war with submitted to them with

is or Avaris, containing 10,000 acres of land. They were closely besieged by Amosis, with an army of 400,000 men, till at last an agreement was made, in consequence of which the herds withdrew from Egypt with their owners, to the number of 240,000; and, taking the way of the desert, entered Syria; but fearing the Assyrians, who were then very powerful, and the Persians of Asia, they entered the land of Canaan, and built there the city of Jerusalem. According to Mr. Bruce, the shepherds who invaded Egypt were no other than the inhabitants of Barabrah. He says, carriers to the Cushites who dwelt farther to the south. The latter had built many stately temples in Thebes and other parts of Egypt; though, according to him, they had no dwelling places, but holes or caves in the rocks. Being a commercial people, they remained there collecting and preparing their articles, and were dispersed by the Barabers, or shepherds, as above mentioned. These, from the nature of their employment, lived in moveable habitations, as the Tartars do at this day. By the Jews, he tells us, they were called phut but by the Arabs by every other people; and from the Arabic the word Barabrah is derived. By their employment, which was the dispersing the Indian and African goods all over the continent, they had become a great and powerful people; from their opposite dispositions and manners, they were often enemies to the Egyptians. To one Saurour author ascribes the destruction of Thebes in Upper Egypt, so much celebrated by Homer for its magnificence. But this certainly cannot be the case; for Homer wrote long after the time of Joseph: and we find that even then the Egyptians held the shepherds in abhorrence, in probability because they had been grievously oppressed by them. Mr. Bruce reckons three invasions of these people, viz.: 1st, that of Salatis, who overthrew the first dynasty of Egyptian kings from Menes, and destroyed Thebes; 2d, that of Sabaco or So; for, according to him, this was not the name of a single king, but of a people, and signifies shepherds; 3d, after the building of Memphis, where 600,000 of them were besieged, as above mentioned. But these accounts are inconsistent; for it is not possible that the third invasion, antecedent to the building of Jerusalem, could be posterior to the second, if the latter happened only 400 years before the days of Hezekiah? In these early ages, however, it appears that the kingdom of Egypt had been very powerful, and its dominion very widely extended; as it is said, that the Bactrians revolted from Osmandyas, another Egyptian king of very great antiquity, and of whose wealth the most remarkable accounts are given. After an unknown period of time from this monarch, reigned Sesostrius. He was the first great warrior whose exploits are recorded with any degree of distinctness. In what age of the world he lived, is uncertain. Some chronologists, among whom is Isaac Newton, are of opinion, that he is the same as Shishak, who took Jerusalem in the reign of Rehoboam. Others place him much earlier; and Mr. Whiston supposes him to have been the Pharaoh who refused to part with the Israelites, and was at last drowned in the Red

Sea. Mr. Bryant endeavours to prove that no such person ever existed: but that is his history, as well as that of many ancient heroes, we have an abridgment of that of the Cushites, or Babylonians, who spread themselves over great part of the known world, and every where brought the people in subjection to them. His reign is reckoned the most extraordinary part of the Egyptian history; and the following is the least fabulous account that can be obtained of it. The father of Sesostrius was told in a dream, by the god Vulcan, that his son, then newly born, should be lord of the whole earth. Upon the credit of this vision, his father took all the males in Egypt that were born on the same day with Sesostrius, under his protection; appointed nurses and proper persons to take care of them, and had them treated like his own child; being persuaded that they who had been the constant companions of his youth would prove his most faithful ministers and soldiers. As they grew up, they were inured to laborious exercises; and, in particular, were never permitted to taste any food till they had performed a course of 180 furlongs, upwards of twenty-two of our miles. When the king imagined they were sufficiently educated in the martial exercises in which he designed them to excel, they were sent for a trial of their abilities against the Arabians. In this expedition Sesostrius proved successful, and in the end subdued that people, who had never before been conquered. He was then sent to the westward, and conquered the greatest part of Africa; nor could he be stopped in his career till he arrived at the Atlantic Ocean. Whilst he was on this expedition, his father died; and Sesostrius then resolved to fulfil the prediction of Vulcan, by actually attempting the conquest of the world. As he suspected this must take up a long time, he prepared for his journey in the best manner possible. The kingdom he divided into thirty-six provinces, and endeavoured to secure the affections of his people by gifts both of money and land. He forgave all who had been guilty of offences, and discharged the debts of all his soldiers. He then constituted his brother Armais the supreme regent; but forbade him to use the diadem, and commanded him to offer no injury to the queen or her children, or the royal concubines. His army is said to have consisted of 600,000 foot, 24,000 horse, and 27,000 chariots. Besides these land forces, he had at sea two mighty fleets; one, according to Diodorus, of 400 sail. Of these fleets, one was designed to make conquests in the west, and the other in the east, and therefore the one was built on the Mediterranean, and the other on the Red Sea. The first of these conquered Cyprus, the coast of Phoenicia, and several of the Cyclades; the other all the coasts of the Red Sea; but its progress was stopped by shoals and difficult places which the navigators could not pass; so that he seems not to have made many conquests by sea. With the land forces Sesostrius marched against the Ethiopians and Troglodytes, whom he overcame, and obliged them to pay him a tribute of gold, ebony, and ivory. From thence he proceeded as far as the promontory of Dira, near the straits of Babelmandel, where he set up a pillar with an inscription in sacred characters

of an indeterminate length in the Egyptian  
 It concludes with the reign of Amasis,  
 who being a tyrant, his subjects  
 Actisanes the king of Ethiopia to drive  
 him. Thus Actisanes became master of the  
 land; and after his death follows another  
 in the history, during which the em-  
 pire is said to have been in a state of anarchy  
 for generations. This period brings us down  
 to the times of the Trojan war. The reigning  
 king in Egypt was at that time called Cetes; by  
 the Greeks, Proteus. The priests reported that  
 he was a magician; and that he could assume any  
 form he pleased, even that of fire. This fable,  
 by the Greeks, derived its origin from a  
 story among the Egyptians, perhaps introduced  
 from the Greeks, that of adorning and distinguish-  
 ing the heads of their kings with the represen-  
 tation of animals or vegetables, or even with  
 incense, in order to strike the beholders  
 with greater awe. Whilst Proteus reigned,  
 or Alexander, the son of Priam king of  
 Troy was driven by a storm on the coast of  
 Egypt, with Helen, whom he was carrying off  
 as his bride. But when the Egyptian mo-  
 narch heard of the breach of hospitality com-  
 mitted by Paris, he seized him, his mistress, and  
 his companions, with all the riches he had brought  
 from Greece. He detained Helen, with all the  
 treasures belonging to Menelaus her husband, pro-  
 vided to restore them to the injured party when-  
 they were demanded; but commanded Paris  
 and his companions to depart out of his do-  
 main in three days. In what manner Paris  
 prevailed upon Proteus to restore him  
 his wife, we are not told; neither do we know  
 any further of the transactions of this  
 reign nor of his successors, except what  
 is likely the air of fable, till the days of Sa-  
 baon the Ethiopian, who again conquered this  
 land. He began his reign with an act of  
 cruelty, causing the conquered prince to be  
 alive: nevertheless, he no sooner saw him-  
 self firmly established on the throne of Egypt,  
 than he became a new man; so that he is highly  
 praised for his mercy, clemency, and wisdom.  
 He is thought to have been the same mentioned in  
 the Bible, who entered into a league with Hoshea  
 king of Israel against Salmanser king of As-  
 syria. He is said to have been excited to the  
 conquest of Egypt by a dream, in which he was  
 told that he should hold that kingdom for  
 ever. Accordingly, he conquered Egypt,  
 as was foretold; and at the expiration of  
 his above-mentioned reign, he had another dream,  
 in which the tutelary god of Thebes acquainted  
 him that he could no longer hold the kingdom  
 with safety and happiness, unless he  
 treated the priests as he passed through them  
 as guards. Being haunted with this vision,  
 the same time abhorring to hold the king-  
 dom such terms, he sent for the priests, and  
 treated them with what seemed to be the  
 pleasure of the gods. Upon this it was concluded,  
 that as long as Sabacon should  
 reign, he should no longer in Egypt; and therefore he  
 immediately returned to Ethiopia. Of Anysias,  
 Sabacon's immediate successor, we have  
 scarcely worth notice. After him reigned

Sethon, who was both king and priest of Vulcan.  
 He gave himself up to religious contemplation;  
 and not only neglected the military class, but  
 deprived them of their lands. At this they were  
 so much incensed, that they entered into an  
 agreement not to bear arms under him; and in  
 this state of affairs Sennacherib king of Assyria  
 arrived before Pelusium with a mighty army.  
 Sethon now applied to his soldiers, but in vain;  
 they unanimously persisted in refusing to march  
 under his banner. Being therefore destitute of  
 all human aid, he applied to the god Vulcan,  
 and requested him to deliver him from his ene-  
 mies. Whilst he was yet in the temple of the  
 god, it is said, he fell into a deep sleep; during  
 which, he saw Vulcan standing at his side, and  
 exhorting him to take courage. He promised,  
 that if Sethon would but go out against the As-  
 syrians, he should obtain a complete victory over  
 them. Encouraged by this assurance, the king  
 assembled a body of artificers and laborers, and  
 marched towards Pelusium. He had no occa-  
 sion, however, to fight; for the very night after  
 his arrival at Pelusium, an innumerable multi-  
 tude of field rats, entering the enemy's camp,  
 gnawed to pieces the quivers, bowstrings, and  
 shield-straps. Next morning, when Sethon found  
 the enemy disarmed, and beginning to fly, he  
 pursued them to a great distance, making a ter-  
 rible slaughter. In memory of this extraordinary  
 event, a statue of Sethon was erected in the  
 temple of Vulcan, holding in his hand a rat,  
 with these words: 'Whosoever beholdeth me,  
 let him be pious.'

Not long after the death of Sethon, the form  
 of government in Egypt was totally changed.  
 The kingdom was divided into twelve parts, over  
 which as many of the chief nobility presided.  
 This division, however, subsisted but for a short  
 time. Psammiticus, one of the twelve, dethroned  
 all the rest, fifteen years after the division had  
 been made. The history now begins to be di-  
 vested of fable; and from this time may be ac-  
 counted equally certain with that of any other  
 nation. The vast conquests of Sesostrius were  
 now no longer known; for Psammiticus pos-  
 sessed no more than the country of Egypt itself.  
 It appears, indeed, that none of the successors of  
 Sesostrius, or even that monarch himself, had made  
 use of any means to keep in subjection the  
 countries he had once conquered. Perhaps, in-  
 deed, his design originally was rather to pillage  
 than to conquer; and therefore on his return,  
 his vast empire vanished. Psammiticus, how-  
 ever, endeavoured to extend his dominions by  
 making war on his neighbours; but, putting more  
 confidence in foreign auxiliaries than in his own  
 subjects, the latter were so much offended, that  
 upwards of 200,000 fighting men emigrated in a  
 body, and took up their residence in Ethiopia.  
 To repair this loss, Psammiticus encouraged  
 commerce, and opened his ports to all strangers,  
 whom he greatly caressed, contrary to the im-  
 politic maxims of his predecessors, who refused to  
 admit them into the country. He also laid siege  
 to Azotus in Syria which held out for twenty-  
 nine years against the whole strength of the  
 kingdom; from which it appears that Psammiti-  
 cus was no great warrior. He is reported to

have sent to discover the springs of the Nile: and is said to have made an attempt to discover the most ancient language and religion in the world. Necho, the son and successor of Psammiticus, is the Pharaoh-Necho of Scripture, and was a prince of an enterprising and warlike genius. In the beginning of his reign he attempted to cut through the isthmus of Suez, between the Red Sea and the Mediterranean; but was obliged to abandon the enterprise, after having lost 120,000 men in the attempt. After this he sent a ship, manned with some expert Phœnician mariners, on a voyage to explore the coasts of Africa. Accordingly, they performed the voyage; sailed round the continent of Africa: and after three years returned to Egypt, where their relation was deemed incredible. The most remarkable wars in which this king was engaged, are recorded in the sacred writings. He went out against the king of Assyria, by the divine command, as he himself told Josiah (II Chron. xxxv. 21); but, being opposed by this king, he defeated and killed him at Megiddo; after which he made his son Jehoiakim, king, and imposed on him an annual tribute of 100 talents of silver and one talent of gold. He then proceeded against the king of Assyria; and weakened him so much, that the empire was soon after dissolved. Thus he became master of Syria and Phœnicia; but, in a short time, Nebuchadnezzar king of Babylon came against him with a mighty army. The Egyptian monarch, not daunted by the formidable appearance of his antagonist, boldly ventured a battle; but was overthrown with prodigious slaughter, and Nebuchadnezzar became master of all the country to the very gates of Pelusium. The reign of Apries, the Pharaoh Hophra of Scripture, presents us with a new revolution in the Egyptian affairs. He is said to have been a martial prince, and in the beginning of his reign very successful. He took by storm the rich city of Sidon; and, having overcome the Cypriots and Phœnicians in a sea-fight, returned to Egypt laden with spoil. This success probably incited Zedekiah king of Judah to enter into an alliance with him against Nebuchadnezzar king of Babylon. The bad success of this alliance was foretold by the prophet Jeremiah; and accordingly it happened. For Nebuchadnezzar having sat down with his army before Jerusalem, Apries marched from Egypt to relieve the city; but no sooner did he perceive the Babylonians approaching him, than he retreated as fast as he could, leaving the Jews exposed to the rage of their merciless enemies: who were thereupon treated as Jeremiah had foretold: and by this step Apries brought upon himself the vengeance denounced by the same prophet. The manner in which these predictions were fulfilled is as follows: the Cyreneans, a colony of the Greeks, being greatly strengthened by a numerous supply of their countrymen under their third king Battus styled the Happy, and encouraged by the Pythian oracle, began to drive out their Libyan neighbours, and share their possessions among themselves. Hereupon Andrian king of Libya sent a submissive embassy to Apries, and implored his protection against the Cyreneans. Apries complied with his re-

quest, and The Egyptian; and the army be destroyed control of thought almost at Amasis, but a sense of haranguing allegiance royalty as Apries the orders to fore him. fore returning king was bemis's of cruelty of the Egyptian Apries, but bemis, the Amasis. Amasis the body of those for whom he of Apries greatly in rival, as his superior. Nay, so that even of the two of battle ensued: behaved at last over- feated, the Amasis not out of his palace respect. and could life. An obliged to the prediction Apries would live: and than the sepulture intestine ended the death of He had ployed it but an himself some harassed great number of country incursion, however permanent to it met carried on. So

Apries. During the reign of Amasis, Egypt is said to have flourished greatly, and to have contained 20,000 populous cities. That good order might be kept among such vast numbers of people, Amasis enacted a law, by which every Egyptian was bound once a year to inform the governor of his province by what means he gained his livelihood; and if he failed of this, he was put him to death. The same punishment he decreed to those who could not give a satisfactory account of themselves. This monarch very much favored the Greeks, and married a queen of Grecian extraction. To many Greek cities, as particular persons, he made considerations. He also allowed the Greeks in to come into Egypt, and settle either in the city of Naucratis, or carry on their trade on the sea-coast; granting them also temples, and places where they might erect temples to their own deities. He received also a visit from the celebrated Athenian lawgiver, and re-ruled the island of Cyprus under his subjection. The prosperity of Egypt, however, ended with the death of Amasis, or indeed before it. The Egyptian monarch had in some way incensed Cambyses king of Persia. The cause of the quarrel is uncertain; but, whatever it was, the Persian monarch vowed the destruction of Amasis. In the mean time Phanes of Halicarnassus, commander of the Grecian auxiliaries in the pay of Amasis, took some private disgust; and, leaving Egypt, embarked for Persia. He was a wise and able general, perfectly acquainted with every thing that related to Egypt; and had great credit with the Greeks in that country. Amasis was immediately sensible how great the loss of this man would be to him, and therefore sent after him a trusty eunuch with a swift galley. Phanes was accordingly overtaken in Lycia, but not brought back; for, making his guard drunk, he continued his journey to Persia, and presented himself before Cambyses, as he was meditating the overthrow of the Egyptian monarchy.

At this dangerous crisis also, the Egyptian monarch imprudently made Polycrates, tyrant of Samos, his enemy. This prince had hitherto been remarkable for an uninterrupted course of success; and Amasis, being at this time in strict alliance with him, wrote a letter, in which, after congratulating him on his prosperity, he told him that he was afraid lest his successes were too many, and that he might be suddenly overthrown. For this reason he advised him voluntarily to deprive himself of some portion of his happiness; and to cast away that which would grieve him most if he were accidentally to lose it. Polycrates followed his advice, and threw into the sea a signet of inestimable value. This, however, did not answer the intended purpose. The signet happened to be swallowed by a fish, which was taken a few days afterwards, and thus was restored to Polycrates. Of this Amasis was no sooner informed, than, considering Polycrates as really unhappy, and already on the brink of destruction, he resolved to put an end to the friendship which subsisted between them. For this purpose he dispatched an herald to Samos, commanding him to acquaint Polycrates, that he renounced

his alliance, and all the obligations between them; that he might not mourn his misfortunes with the sorrow of a friend. Polycrates now at liberty, therefore, to act against him, accordingly offered to assist Cambyses with a fleet of ships in his Egyptian expedition. Amasis had not, however, the misfortune to see the calamities of his country. He died about A.A.C. 525, after a reign of forty-four years; and left the kingdom to his son Psammenitus, just as Cambyses was approaching the frontiers of the kingdom. The new prince was scarce seated on the throne, when the Persians appeared. Psammenitus drew together what forces he could, to prevent them from entering the kingdom. Cambyses, however, immediately laid siege to Pelusium, and made himself master of it by the following stratagem: he placed in the front of his army a great number of cats, dogs, and other animals, that were deemed sacred by the Egyptians. He then attacked the city, and took it without opposition: the garrison, which consisted entirely of Egyptians, not daring to throw a dart or shoot an arrow against their enemies, lest they should kill some of the holy animals.

Cambyses had not long, however, taken possession of the city, when Psammenitus advanced against him with a numerous army. Before the engagement, the Greeks who served under Psammenitus, to shew their indignation against their treacherous countryman, Phanes, brought his children, it is said, into the camp, killed them in the presence of their father and of the two armies, and then drank their blood. The Persians, enraged at so cruel a sight, fell upon the Egyptians with the utmost fury, put them to flight, and cut the greatest part of them in pieces. Those who escaped fled to Memphis, where they were soon after guilty of a horrid outrage. Cambyses sent a herald to them in a ship from Mitylene: but no sooner did they see her come into the port, than they flocked down to the shore, destroyed the ship, and tore to pieces the herald and all the crew; afterwards carrying their mangled limbs into the city, in a kind of barbarous triumph. Not long after, they were obliged to surrender; Psammenitus thus falling into the hands of his inveterate enemy, now enraged beyond measure at the cruelties exercised upon the children of Phanes, the herald, and the Mitylenean sailors. The rapid success of the Persians struck with such terror the Libyans, Cyreneans, Bactrians, and other dependents or allies of the Egyptian monarch, that they immediately submitted. Nothing now remained but to dispose of the captive king, and revenge on him and his subjects the cruelties which they had committed. This the merciless victor executed in the severest manner. On the 10th day after Memphis had been taken, Psammenitus and the chief of the Egyptian nobility were ignominiously sent into one of the suburbs of that city. Here the king being seated in a proper place, saw his daughter coming along in the habit of a slave with a pail on her head to fetch water from the river, and followed by the daughters of the greatest families in Egypt, all in the same miserable garb

with pitchers in their hands, crowned in tears, and loudly bemoaning their miserable situation. When the fathers saw their daughters in this distress, all but Psammenitus burst into tears; he only cast his eyes on the ground, and kept them fixed there. After the young women, came the son of Psammenitus, and 2000 of the young nobility, with bits in their mouths and halters round their necks, proceeding to execution. This was done to expiate the murder of the Persian herald and the Mitylenean sailors; for Cambyses caused ten of the Egyptians of the first rank to be publicly executed for every one of those that had been slain. Psammenitus, however, observed the same conduct as before, keeping his eyes steadfastly fixed on the ground, though all the Egyptians around him made the loudest lamentations. A little after this he saw an intimate friend and companion, now advanced in years, who, having been plundered of all he had, was begging his bread from door to door in the suburbs. Psammenitus now wept bitterly; and, calling out to his friend by name, struck himself on the head as if he had been frantic. Of this the spies who had been set over him to observe his behaviour, gave immediate notice to Cambyses, who sent to enquire into the cause of such immoderate grief. Psammenitus answered, that the calamities of his own family confounded him, and were too great to be lamented by any outward signs; but the extreme distress of a bosom friend gave more room for reflection, and therefore extorted tears from him. With this answer Cambyses was so affected, that he sent orders to prevent the execution of the king's son; but they came too late, for the young prince had been put to death before any of the rest. Psammenitus himself was then sent for into the city, and restored to his liberty: had he not indeed showed a desire of revenge, he might perhaps have been trusted with the government of Egypt; but, being discovered in some schemes against the government, he was seized, and condemned to drink bull's blood. The Egyptians were now reduced to the lowest degree of slavery. Their country became a province of the Persian empire; the body of Amasis their late king was taken out of his grave; and, after being mangled in a shocking manner, was finally burnt. But, what was felt as a still greater grievance, their god Apis was slain, and his priests ignominiously scourged: this inspired the whole nation with such a hatred to the Persians, that they could never afterwards be reconciled to them. As long however as the Persian empire subsisted, the Egyptians could never shake off their yoke. They frequently revolted indeed, but were always overthrown with loss. At last they submitted, without opposition, to Alexander the Great; after whose death, Egypt again became a powerful kingdom; but, from the conquest of it by Cambyses to the present time, it has never been governed but by foreign princes, agreeably to the prophecy of Ezekiel, 'There shall be no more a prince of the land of Egypt.'

On the death of Alexander the Great, Egypt, together with Libya, and that part of Arabia which borders on Egypt, was assigned to Pto-

lemy the son of Lagus, as governor, Alexander's son by Roxana, who was the infant. Nothing was further from the mind of this governor, than to keep the province trust for another. He did not, however, assume the title of king, till his authority was fully established; and this did not happen till sixteen years after the death of Alexander. Antigonus and Demetrius had attempted the conquest of Egypt. From the time of his first establishment on the throne Ptolemy, who had assumed the title of king, reigned twenty years; which added to the nineteen, make up the thirty-nine years which historians commonly allow him to have reigned alone.—In the thirty-ninth year of his reign he made his son, Ptolemy Philadelphus, master of the empire; declaring him his successor, to the prejudice of his eldest son named Ceraunus, being excited thereto by his violent wife, Berenice, Philadelphus's mother. (See *Ant. Lib.*) Ceraunus immediately quitted the court, and at last into Syria, where he was finally murdered by Seleucus Nicator, whom he afterwards gratefully murdered. The most remarkable transaction of this reign was the enlargement of Alexandria, which Ptolemy made the capital of his new kingdom. See *ALEXANDRIA*. When Soter died about A.A.C. 284, in the fourth year of his reign, and eighty-fourth of his age. He was the best prince of his race, and left behind him an example of probity, justice, and clemency, which few of his successors followed. Besides the provinces originally assigned to him, he added to his empire Coele Syria, Ethiopia, Pamphylia, Lycia, and some of the Cyclades. His successor Ptolemy Philadelphus, added nothing to the extent of his empire; nor did he perform any remarkable except embellishing the city of Alexandria, enriching its library, causing the Old Testament to be translated into Greek (*see BIBLE*), and entering into an alliance with the Romans. In his time, Magas, the king of Libya and Cyrene, revolted; and had the provinces as an independent prince, notwithstanding the utmost efforts of Ptolemy against him. At last an accommodation was proposed, a marriage was proposed between the only daughter of Magas, and Ptolemy's son. The young princess was to receive her father's dominions by way of dowry, and they would again be brought under the dominion of Ptolemy's family. But, as the treaty could be put in execution, Magas and then Apamea, the princess's mother, could not prevent the marriage. Thus, she was not able to do: but her refusal of the purpose produced a destructive war of six years with Antiochus Theos, king of Syria, the acting of a bloody tragedy in the end of the latter. See *SYRIA*. About A.A.C. 246 Ptolemy Philadelphus died; and was succeeded by his eldest son Ptolemy, who had been married to Berenice, the daughter of Antiochus. At the beginning of his reign, he found himself engaged in a war with Antiochus Theos of Syria. From this he returned victorious, brought with him 25000 slaves and

were many of the ancient Egyptian idols been carried away by Cambyses. These were restored by Ptolemy to temples; in memory of which favor, he gave him the surname of Euergetes, saviour. In this expedition he greatly distinguished himself, making himself master of countries that lie between mount Caucasus and the confines of India. An account of his conquests was given by himself, inscribed on a column, to the following effect. 'Ptolemy, having received from his father the kingdom of Egypt, Libya, Syria, Phoenice, Cilicia, Caria, and the other Cyclades, with a mighty army of horse and foot, with elephants, out of Trogloditia, some of which had been taken by the rest by himself, and brought them up for war: with this great army he passed that river with all the conquered countries, and the nations, and reduced Mesopotamia, Persia, Media, and all the countries as far as Bactria. On the king's return, he offered many sacrifices to the Gods; ever afterwards expressed a particular love for the Jews. At this time the tribute to the Egyptian monarchs, was annually twenty talents of silver. However, Onias, who was then king of a very covetous disposition, neglected to pay, so that he incurred a very large sum. Soon after, therefore, Ptolemy sent one of his ministers, named Athenion, to demand the tribute; he desired him to acquaint the Jews, and make war upon them in case of a refusal; but, however, named Joseph, as not only found means to avert the war, but even got himself chosen high priest, and by his faithful discharge of trust, continued in high favor as long as he lived. Ptolemy, king at last concluded a peace with the successor of Antiochus Theos, and enlargement of his dominions on the coast; thus he was attended with such success, that he made himself master of all the coast of the Red Sea, both on the Arabian and Persian, quite down to the straits of Perseus.

On his return he was met by the king of the Achæans, imploring his assistance against the Etolians and Lacedæmonians; he readily promised them: in the mean time engaged Antiochus to support them, Ptolemy flattered that he sent powerful succours; but, however, he was disappointed; for Cleomenes, after having obtained considerable advantages over the king, was entirely defeated in the battle of Sellasia, and obliged to take refuge in Ptolemy. He was received by the

Egyptian monarch with the greatest kindness; a yearly pension of twenty-four talents was assigned him, with a promise of restoring him to the Spartan throne: but, before this could be accomplished, Ptolemy died, in the twenty-seventh year of his reign, and was succeeded by his son Ptolemy Philopater. Thus we have seen the Egyptian empire restored to a considerable height of power; and had the succeeding monarchs been careful to preserve its strength as transmitted to them by Euergetes, it is probable that Egypt might have been able to hold the balance against Rome, and after the destruction of Carthage to have prevented that haughty city from becoming mistress of the world. But after the death of Ptolemy Euergetes, the Egyptian empire, being governed either by weak monarchs, or wicked ministers, quickly declined, and from that time makes no conspicuous figure in history, except in the depravity of some of its kings, in which indeed, it may, vie with any nation.

Ptolemy Philopater began his reign with the murder of his brother Magas; after which, giving himself up to universal licentiousness, the kingdom fell into anarchy. Cleomenes the Spartan king still resided at court; and, being now unable to bear the dissolute manners which prevailed there, he pressed Philopater to give him the assistance he had promised for restoring him to the throne of Sparta. This he rather insisted upon, because he had received advice that Antigonius king of Macedon was dead, that the Achæans were engaged in a war with the Etolians, and that the Lacedæmonians had joined the latter against the Achæans and Macedonians. Ptolemy, when afraid of his brother Magas, had indeed promised to assist the king of Sparta with a powerful fleet, hoping thus to attach him to his own interest; but now, when Magas was out of the way, it was determined by the king, or rather his ministers, that Cleomenes should not be assisted, nor even allowed to leave the kingdom; and this extravagant resolution produced the desperate attempt of Cleomenes, of which an account will be found in the history of Sparta. Of the disorders which now ensued, Antiochus king of Syria, surnamed the Great, took the advantage, and attempted to wrest from Ptolemy the provinces of Cælo-Syria and Palestine. But in this he was finally disappointed; and might easily have been totally driven out of Syria, had not Ptolemy been too much taken up with his debaucheries to think of carrying on the war. The discontent occasioned by this piece of negligence soon produced a civil war in his dominions, and the whole kingdom continued in the utmost confusion till his death, which happened in the seventeenth year of his reign and thirty-seventh of his age. During the reign of Philopater happened a very extraordinary event with regard to the Jews, which is recorded in the third Book of Maccabees, chap. ii. m. iv. v. The king of Egypt, while on his Syrian expedition, had attempted to enter the temple of Jerusalem; but, being hindered by the Jews, he was filled with the utmost rage against the whole nation. On his return to Alexandria, he resolved to make those who dwell in that city feel the first effects of his vengeance. He began with publishing a

the mercenaries who had served under Alexander; and in the third the native Egyptians. Ptolemy now, to be revenged of the Jews, ordered that they should be degraded from the first rank, and enrolled among the native Egyptians; and that all of that nation should appear at an appointed time before the proper officers, to be enrolled among the people, that at the time of their enrolment they should have the mark of an ivy leaf, the badge of Bacchus, impressed with a hot iron on their faces; that all who were thus marked should be made slaves; and, lastly, that if any one should stand out against this decree, he should be immediately put to death. That he might not, however, seem an enemy to the whole nation, he declared, that those [who sacrificed to his gods should enjoy their former privileges, and remain in the same class. Yet, notwithstanding this tempting offer, 300 only out of many thousand Jews who lived in Alexandria could be prevailed upon to abandon their religion in order to save themselves from slavery. The apostates were immediately excommunicated by their brethren: and this their enemies construed as done in opposition to the king's order; which threw the tyrant into such a rage, that he resolved to extirpate the whole nation, beginning with the Jews who lived in Alexandria and other cities of Egypt, and proceeding from thence to Judæa and Jerusalem itself. In consequence of this cruel resolution, he commanded all the Jews that lived in any part of Egypt to be brought in chains to Alexandria, and there to be shut up in the Hippodrome, which was a very spacious place without the city, where the people used to assemble to see horse-races and other public diversions. He then sent for Herman master of the elephants; and commanded him to have 500 of these animals ready against the next day, to let loose upon the Jews in the Hippodrome. But when the elephants were prepared for the execution, and the people were assembled in great crowds to see it, they were for that and the succeeding day disappointed by the king's absence. At last he came to the Hippodrome

the name of Philometor, or the big-bellied, called Physcon, or the big-bellied, the extraordinary size of his belly, and his gluttony and luxury. He was then on the throne, however, when Ptolemy Philometor, returning into Egypt, and restored the whole kingdom to Philometor. His war betwixt the two brothers had not given them an opportunity of doing much. For this reason he kept to his pleasures; by which, being so much engaged, he might at his pleasure re-entire Philometor, apprised of his brother Physcon to an army, was happily effected by him. The brothers agreed to resign the throne to the utmost of their power, whom they considered as their enemies. On this the king of Syria led a great army, but was prevented from conquering it. The king was soon freed from the apprehension of an enemy, than they began to quarrel. Their differences were so great, that the Roman senate, before the ambassadors could express the merits of the cause, ordered Physcon had driven Philometor and obliged him to quit the throne. The dethroned prince fled to Rome, where he appeared meanly dressed, and was very kindly received. He was so well satisfied of the Roman's that they immediately decreed that he should be reconducted home according to the arrival of the ambassadors. The mediation was negotiated, and he was put in possession of Libya and Cyrene, and each of them being declared king of the other. The treaty, as usual, was made with oaths and sacrifices, and soon as made. Physcon was put in possession of the dominions, and

tely to that island and conquer it. But the ambassadors telling him that they were intended to put him in possession of it by fair means and not by force, he dismissed his army, returned to Libya, while one of the ambassadors proceeded to Alexandria. Their design was to bring the two brothers to an interview on the frontiers of their dominions, and there to settle amicably. But the ambassador who went to Alexandria, found Philometor very averse from alliance with the decree of the senate. He detained the ambassador so long, that Physcon sent another also to Alexandria, hoping that the joint efforts of the two would induce Philometor to comply. But the king, after entertaining them for a immense charge for forty days, at last refused to submit, and told the ambassadors that he was resolved to adhere to the first treaty. This answer the Roman ambassadors disliked, and were followed by others from the other brothers. The senate, however, not only rejected their decree in favor of Physcon, but renewed their alliance with Philometor, and ordered his ambassador to leave the city in haste. In the mean time the inhabitants of Alexandria, having heard unfavorable accounts of the king's behaviour, during the short time he had been in Alexandria, conceived so strong an opinion against him, that they resolved to keep out of their country by force of arms. On the intelligence of this resolution, Physcon rejected all thoughts of Cyprus for the present, and hastened with all his forces to Cyrene, where he had established himself in the kingdom. His oppressive and tyrannical conduct, however, increased the aversion of the Cyrenians so much, that some of them, entering into a conspiracy against him, fell upon him one night as he was returning to his palace, wounded him in several places, and left him for dead on the spot. This was the charge of his brother Philometor; and as soon as he was recovered, took another voyage to Rome. Here he made his complaints to the senate, and showed them the scars of his wounds, accusing his brother of having employed assassins to murder him. Though Philometor was known to be a man of a most humane and disinterested disposition, and therefore very unlikely to have been concerned in so black an attempt, the senate, being offended at his refusing to comply with their decree concerning Cyprus, believed to this false accusation, and not only ordered him to hear what his ambassadors had to say, but also ordered them immediately to depart from the city. At the same time they appointed five commissioners to conduct Physcon into Cyprus, and to put him in possession of that island, enjoining his allies in those parts to supply him with provisions.

Physcon having thus got together an army which seemed to be sufficient for the accomplishment of his design, landed in Cyprus; but being there encountered by Philometor in person, he was entirely defeated, and obliged to retire to himself in the city called Lapitho. Here he was closely besieged, and at last obliged to surrender. Every one now expected that Physcon should have been treated as he deserved; but his brother, instead of punishing, restored him to the government of Libya and Cyrene,

adding some other territories instead of the island of Cyprus, and promising him his daughter in marriage. Thus an end was put to the war between the two brothers, for the Romans were ashamed any longer to oppose a prince who had given such a signal instance of his justice and clemency. On his return to Alexandria, Philometor appointed one Archias governor of Cyprus. But he, soon after the king's departure, agreed with Demetrius, king of Syria, to betray the island to him for 500 talents. The treachery was discovered before it took effect; and the traitor, to avoid the punishment due to his crime, killed himself. Ptolemy, being offended with Demetrius for this attempt on Cyprus, joined Attalus, king of Pergamus, and Ariarathes, king of Cappadocia, in setting up a pretender to the crown of Syria. This was Alexander Balas, to whom he even gave his daughter Cleopatra in marriage, after he had placed him on the throne of Syria. But he, notwithstanding these and many other favors, being suspected of having entered into a plot against his benefactor, Ptolemy became his greatest enemy; and, marching against him, routed his army in the neighbourhood of Antioch. He did not, however, long enjoy his victory; for he died in a few days after the engagement, of the wounds he had received.

On the death of Philometor, Cleopatra, the queen, designed to secure the throne for her son. But some of the principal nobility declaring for Physcon, a civil war was about to ensue, when matters were compromised, on condition that Physcon should marry Cleopatra, that he should reign jointly with her during his life, and declare her son by Philometor, heir to the crown. These terms were no sooner agreed upon than Physcon married Cleopatra, and on the very day of the nuptials, murdered her son in her arms. This was only a prelude to the cruelties which he afterwards committed on his subjects. He first put to death all those who had shown any concern for the murder of the young prince: He then wreaked his fury on the Jews, whom he treated more like slaves than subjects, on account of their having favored the cause of Cleopatra. His own people were treated with little more ceremony. Numbers of them were every day put to death for the smallest faults, and often for no fault at all, but merely to gratify his inhuman temper. His cruelty towards the Alexandrians is related under the article ALEXANDRIA. He divorced his queen, who was also his sister, and married her daughter, who was likewise called Cleopatra, and whom he had previously ravished. In short, his behaviour was so exceedingly wicked, that it soon became quite intolerable to his subjects; and he was obliged to fly to the island of Cyprus with his new queen, and Memphis, a son he had by her mother. On the flight of the king, the divorced queen was placed on the throne by the Alexandrians; but Physcon, fearing lest a son whom he had left behind should be appointed king, sent for him into Cyprus, and caused him to be assassinated as soon as he landed. This provoked the people against him to such a degree, that they pulled down and dashed to pieces all the statues which

detestation occasioned by this unparalleled piece of barbarity cannot be expressed. An army was soon raised, and the command of it given to one Marsyas, whom the queen had appointed general, and enjoined to take all the necessary steps for the defence of the country. On the other hand, Physcon having hired a numerous body of mercenaries, sent them, under the command of Hegelochus, against the Egyptians. The two armies met on the frontiers of Egypt, and a bloody battle ensued, wherein, however, the Egyptians were entirely defeated, and Marsyas was taken prisoner. Every one expected that the captive general would have been put to death with the severest torments; but Physcon, perceiving that his cruelties only exasperated the people, resolved to try whether he could regain their affections by lenity; and therefore pardoned Marsyas, and set him at liberty. Cleopatra, being greatly distressed by this overthrow, demanded assistance from Demetrius, king of Syria, who had married her eldest daughter by Philometor, promising him the crown of Egypt for his reward. Demetrius accepted the proposal, marched with all his forces into Egypt, and laid siege to Pelusium. But he being no less hated in Syria than Physcon was in Egypt, the people of Antioch, taking advantage of his absence, revolted against him, and were joined by most of the other cities in Syria. Thus Demetrius was obliged to return; and Cleopatra, being now in no condition to oppose Physcon, fled to Ptolemais, where her daughter the queen of Syria resided. Physcon was then restored to the throne of Egypt, which, notwithstanding his crimes, he enjoyed till his death, which happened at Alexandria, in the twenty-ninth year of his reign, and sixty-seventh of his age.

To Physcon succeeded Ptolemy Lathyrus, about A.A.C. 122; but he had not reigned long before his mother, finding that he would not be entirely governed by her, instigated the Alexandrians, to drive him from the throne, and place on it his youngest brother, Alexander.

Lathyrus's admiral, whom he was ready to land, and which Alexander's fleet was self killed. During the king of Cyrenaica, the son by a concubine, having tranquillity in his dominions, twenty-one years, died, kingdom to the Romans. The empire was again considered as a conquered country. Lathyrus, being all competitors, turned to the city of Thebes, which had not marched in person against them, but were at last obliged to give up to be plundered. They left every where the monuments of their avance and which till that time had been the wealthy cities of Egypt, so that it never afterwards rose again. A.A.C. 76, Ptolemy Lathyrus, Alexander II. the son of Cleopatra. He was first sent by Cleopatra to Cos, with a great sum of money, as thinking that they could be kept. When he was at Pontus, made himself master of the inhabitants delivered up to him, a tian prince, together with a thrudates gave him an education; but he, not thinking of his birth, fled to the camp of the tator, who was then making a siege, that time he lived in the general, till news was brought of the death of Lathyrus. Sylla then came to take possession of the kingdom. At his arrival, the Alexandrians fled to their sovereign. T

he died a few months after. Alexander, he was in Tyre, had sent ambassadors to influence the senate in his favor. But, before the negotiation was finished, he over by his last will all his rights to the people, declaring them heirs to his kingdom out of any affection to the republic, on a view to raise disputes between the king, and his rival Auletes, whom the Egyptians had placed on the throne. The will was sent to Rome, where it occasioned warm debates. Some were for taking immediate possession of Egypt. Others thought no notice should be taken of such a will, because Alexander had no right to dispose of his dominions without notice to his successor, and to exclude the crown those who were of the royal blood of Egypt. Cicero represented, that such a violent imposition would debase the majesty of the Roman people, and involve them in endless and disputes; that the fruitful fields of Egypt would be a strong temptation to the avarice of the people, who would insist on their being divided among them; and lastly, that by this the bloody quarrels about the Agrarian law would be revived. These reasons had great weight with the senate; but what chiefly moved them from seizing on Egypt at this time, was, that they had lately taken possession of the kingdom of Bithynia, in virtue of the will of Commodus; and of Cyrene and Lybia, by the king Apion. They thought, therefore, that if they should, on the like pretence, take possession of the kingdom of Egypt, this might too much increase their design of setting up a kind of universal empire, and occasion a formidable coalition against them. Ptolemy Auletes, who had now raised to the throne by the Egyptians, was thought to have surpassed all the kings that went before him in the effeminacy of his manners. His surname Auletes, which signifies the flutist, was given him because he piqued himself on his skill in performing upon that instrument, and was not ashamed even to contend for the prize in the public games. He took great pleasure in imitating the manners of the bacchanals; he was in a female dress, and in the same manner that they used during the solemnity of their orgies, hence he had the surname of the New Bacchus, or Bacchus. As his title to the crown was questionable, he being only the son of a concubine, his first care was to get himself acknowledged by the Romans, and declared their ally. This was obtained by applying to Julius Caesar, who at that time consul, and immensely popular, Caesar being glad of such an opportunity of raising money, made the king of Egypt very dear for his alliance: 6000 talents, equal to £1,162,500 sterling were given to Caesar himself, and partly to Pompey, the interest was necessary for obtaining the affection of the people. Though the revenues amounted to twice this sum, yet Auletes found it impossible for him to raise it without taxing his subjects. This occasioned a general discontent; and, while the people were almost ready to take up arms, a most unjust decree was passed at Rome for seizing the island of Cyprus. When the Alexandrians heard of this, they pressed

Auletes to demand that island as an ancient appendage of Egypt; and, in case of a refusal, to declare war against that haughty and imperious people, who they now saw, though too late, aimed at nothing less than the sovereignty of the world. With this request the king refused to comply; upon which his subjects, already provoked beyond measure at the taxes with which they were loaded, flew to arms, and surrounded the palace. The king had the good fortune to escape their fury, and immediately leaving Alexandria, set sail for Rome. In his way to that city, he landed on the island of Rhodes, where the celebrated Cato at that time was, being on his way to Cyprus, to put the unjust decree of the senate into execution. Auletes, desirous to confer with a man of his prudence, immediately sent to acquaint him with his arrival. He imagined that, upon this notice, Cato would instantly come and wait upon him; but the proud Roman told the messenger, that if the king of Egypt had any thing to say to Cato, he might come to his house. Accordingly the king went to pay him a visit; but was received with very little ceremony, Cato not even vouchsafing to rise out of his seat when he came into his presence. When Auletes had laid his affairs before this haughty republican, he was blamed by him for leaving Egypt, the richest kingdom in the world, in order to expose himself, as he said, to the indignities he would meet with at Rome. There, Cato told him, nothing was in request but wealth and grandeur. All the riches of Egypt, he said, would not be sufficient to satisfy the avarice of the leading men in Rome. He, therefore, advised him to return to Egypt; and strive, by a more equitable conduct, to regain the affections of his people. He even offered to reconduct him thither, and employ his good offices in his behalf. But though Ptolemy was sensible of the propriety of this advice, the friends he had with him dissuaded him from following it, and accordingly he set out for Rome. On his arrival, he found, to his great concern, that Caesar, in whom he confided, was then in Gaul. He was received, however, by Pompey with great kindness. He assigned him an apartment in his own house, and omitted nothing that lay in his power to serve him. Notwithstanding this protection, however, the Egyptian monarch was obliged to go from house to house like a private person, soliciting the votes of the senators. After he had spent immense treasures in procuring a strong party, he was at last permitted to lay his complaints before the senate; but, at the same time, there arrived an embassy from the Alexandrians, consisting of 100 citizens, to acquaint the senate with the reasons of their revolt. When Auletes first set out for Rome, the Alexandrians, not knowing what was become of him, placed on the throne his daughter Berenice; and sent an embassy into Syria to Antiochus Asiaticus, inviting him into Egypt to marry the queen, and reign in partnership with her. Antiochus was dead before the arrival of the ambassadors; upon which, the same proposal was made to his brother Seleucus, who readily accepted it. This Seleucus is described by Strabo as monstrously deformed in body, and

still more so in mind. The Egyptians nicknamed him Cybiosactes, or the Scullion. He was scarcely on the throne, when he gave a signal instance of his avaricious temper. Ptolemy I. had caused the body of Alexander the Great to be deposited in a coffin of massy gold. This the king seized upon; and thus provoked his wife Berenice to such a degree, that she caused him to be murdered. She then married one Archelaus, the high priest of Comana in Pontus, who pretended to be the son of Mithridates the Great; but was, in fact, only the son of that monarch's general. Auletes was not a little alarmed on hearing of these transactions, especially when the ambassadors arrived, who he feared would overturn all the schemes he had labored so much to bring about. The embassy was headed by one Dion, a celebrated academic philosopher, who had many powerful friends at Rome. But Ptolemy found means to get both him and most of his followers assassinated; and this intimidated the rest to such a degree, that they durst not execute their commission, or, for some time, even demand justice for the murder of their colleagues. The report of so many murders, however, at last spread a general alarm. Auletes, sure of the protection of Pompey, did not scruple to own himself the perpetrator of them. Nay, though an action was commenced against one Ascitius, an assassin, who had stabbed Dion, the chief of the embassy above mentioned, and the crime was fully proved, yet he was acquitted by the venal judges, who had all been bribed by Ptolemy. In a short time, the senate passed a decree, by which it was enacted, that the king of Egypt should be restored by force of arms. All the great men in Rome were ambitious of this commission; which, they well knew, would be attended with immensa profit. Their contests, on this occasion, took up a considerable time; but at last a prophecy of the Sybil was found out, which forbade the assisting an Egyptian monarch with an army. Ptolemy, therefore, wearied out with so long a delay, retired from Rome, where he had made himself generally odious, to the temple of Diana, at Ephesus, there to wait the decision of his fate. Here he remained a considerable time; but as he saw that the senate came to no resolution, though he solicited them by letters, he at last, by Pompey's advice, applied to Gabinus, the proconsul of Syria, a man of most infamous character, and ready to undertake any thing for money. Therefore, though it was contrary to an express law, for any governor to leave his province, without positive orders from the senate and people of Rome, Gabinus ventured to transgress this law, upon condition of being well paid. As a recompense for his trouble, he demanded 10,000 talents; that is, £1,937,500 sterling; and Ptolemy, glad to be restored on any terms, agreed to pay that sum: but Gabinus would not stir till he had received one-half of it. This obliged the king to borrow it from a Roman knight, named Caius Rabirius Posthumus; Pompey interposing his credit and authority for the repayment both of capital and interest. Gabinus now set out for Egypt, attended by the famous

eloquence of Cicero he was acquitted; one of the best orations to be found in the works of that author, was composed on this occasion. Gabinus was also prosecuted; and, when he spoke against him, he very narrowly escaped death. He was, however, condemned to perpetual banishment, after having been stripped of all he was worth; and lived in exile till the close of the civil wars, when he was recalled by Augustus, in whose service he lost his life. Auletes, who re-occupied the throne of Egypt about four years after the re-establishment; and, at his death, left behind him a son and two daughters, the tuition of the Roman people. The eldest of the son was Ptolemy, those of the daughters were Cleopatra and Arsinoë. This Cleopatra, who afterwards became so famous, had so great a share in the civil wars of Egypt. As the transactions of that queen's reign, however, are so closely connected with the history of Rome, that they cannot be well understood without knowing the situation of the Roman empire at that time, we refer for an account of her reign to the history of Rome. With Cleopatra the family of Ptolemy Lagus, the founder of the Greco-Egyptian empire in Egypt, after it had held the country in subjection for the space of 294

years, now became a province of the Roman empire, and continued subject to the emperors till the time of Constantinople. In the year 642 it was conquered by the Arabs under Amr ibn al-As, one of the generals of the khalif

In 869 an independent government was established in this kingdom by Ahmed Ebn Tolun, who rebelled against Al Mokkaddi, khalif of Egypt. It continued to be governed by him and his successors for twenty-seven years, when it was again reduced by Al Moctasi khalif of Egypt. In about thirty years after, we find it again an independent state, being joined with the province of Syria under Mahomet Ebn Taj, who had been appointed governor of these provinces. This government, however, was also but short-lived; for in 969 it was conquered by Jawhar, one of the generals of the Fatemite khalif of Cairo, Ismaïlillah. No sooner was Moer informed of the success of his general, than he prepared an expedition to go and take possession of the province. Accordingly, he ordered all the treasures of gold which he and his predecessors had amassed, to be cast into ingots of a square and figure of mill-stones used in Egypt, and conveyed on camels' backs into Egypt.

To show that he was fully determined to re-establish his dominions in Barbary, and to re-occupy the royal residence, he caused the remains of the three former princes of his race to be removed from Cairo in Barbary, and to be deposited in a stately mosque erected on purpose for the purpose: the most effectual perhaps method to induce his successors to reside in Egypt also, as it was become an established custom among those princes, frequently to pay respectful visits to the tombs of their ancestors. To establish himself the more effectually in his new dominions, Moer suppressed the usual custom of making the khalifs of Bagdad substituted his own name in their stead.

This was complied with, not only in Egypt and Syria, but even throughout all Arabia, the city of Mecca alone excepted. The consequence was, a schism in the Mahomedan faith, which continued upwards of 200 years, and was attended with continual anathemas, and sometimes destructive wars between the khalifs of Bagdad and those of Egypt. Having fully established himself in his kingdom, he died in the forty-fifth year of his age, three years after he had left his dominions in Barbary; and was succeeded by his son Abu Al Mansur Barar, surnamed Aziz Billah.

The new khalif succeeded at the age of twenty-one; and committed the management of affairs entirely to the care of Jawhar, his father's long experienced general and prime minister. In 978 he sent this famous warrior to drive out Al Aftakin, the emir of Damascus. The Egyptian general accordingly undertook the siege of that place; but, at the end of two months, was obliged to raise it, on the approach of an army of Karmatians under the command of Al Hakem. As Jawhar was not strong enough to venture an engagement with these Karmatians, it was impossible for him to hinder them from effecting a junction with the forces of Al Aftakin. He therefore retreated, or rather fled towards Egypt with the utmost expedition; but, being overtaken by the two confederate armies, was soon reduced to the last extremity. He was, however, permitted to resume his march, on condition that he passed under Al Aftakin's sword and Al Hakem's lance; and to this disgraceful condition Jawhar found himself obliged to submit. On his arrival in Egypt, he immediately advised Al Aziz to undertake an expedition in person into the east, against the combined army of the Turks, Karmatians, and Damascenes, under the command of Al Aftakin and Al Hakem. The khalif followed his advice; and advancing against his enemies overthrew them with great slaughter; Al Aftakin himself escaped out of the battle but was afterwards taken and brought to Al Aziz, who made him his chamberlain, and treated him with great kindness. Jawhar, in the mean time, was disgraced on account of his bad success; and in this disgrace he continued till his death, which happened A. D. 990, and in the year of the Hegira 381. This year Al Aziz having received advice of the death of Saadoddawla, prince of Aleppo, sent a formidable army under the command of a general named Manjubekin, to reduce that place. Lulu, who had been appointed guardian to Saadoddawla's son, finding himself pressed by the Egyptians, who carried on the siege with great vigor, demanded assistance from the Greek emperor. Accordingly, he ordered a body of troops to advance to Lulu's relief, when Manjubekin, being informed of their approach, immediately raised the siege, and advanced to give them battle. An obstinate engagement ensued, in which the Greeks were at last overthrown with great slaughter. After this victory, Manjubekin pushed on the siege of Aleppo very briskly; but finding the place capable of defending itself much longer than he at first imagined, and his provisions beginning to fail, he raised the siege. The khalif upon this sent him a very threatening letter and commanded him to return before Aleppo

He did so; and continued the siege for thirteen months; during all which time it was defended by Lulu with incredible bravery. At last the Egyptians, hearing that a numerous army of Greeks was on their way to relieve the city, raised the siege, and fled with the utmost precipitation. The Greeks then took and plundered several of the cities which Al Aziz possessed in Syria; and Manjubekin made the best of his way to Damascus, where he declared himself independent. Aziz, informed of this revolt, marched in person against him with a considerable army; but, being taken ill by the way, he expired in the twenty-first year of his reign and forty-second of his age. Aziz Billah was succeeded by his son Abu Al Mansur, surnamed Al Hakem; who, being only eleven years of age, was put under the tuition of an eunuch of approved integrity. This reign is remarkable for nothing so much as the madness with which the khalif was seized at the latter part of it. This first manifested itself by his issuing many preposterous edicts; but at length grew to such a height, that he fancied himself a god, and found no fewer than 16,000 persons who owned him as such. These were mostly the Dararians, a new sect sprung up about this time, and so called from their chief Mohammed Ebn Ishmael, surnamed Darari. He is supposed to have inspired the khalif with this impious notion; and, as Darari set up for a second Moses, he did not scruple to assert that Al Hakem was the great Creator of the universe! For this reason, a zealous Turk stabbed him in the khalif's chariot. His death was followed by a three days' uproar in the city of Cairo, during which Darari's house was pulled down, and many of his followers massacred. The sect, however, did not expire with its author. He left behind him a disciple named Hamza, who, being encouraged by the mad khalif, spread it through his dominions. This was quickly followed by an abrogation of all the Mahommedan fasts, festivals, and pilgrimages, the grand one to Mecca in particular; so that the zealous Mahommedans were now greatly alarmed, as justly supposing that Al Hakem designed entirely to suppress the worship of the true God, and introduce his own in its place. From this apprehension, however, they were delivered by the death of the khalif; who was assassinated, by a contrivance of his own sister, A. D. 1020. Al Hakem was succeeded by his son Al Thaber, who reigned fifteen years; and left the throne to a son under seven years of age, named Al Mostanser Billah. In the year 1041, a revolt happened in Syria; but Al Mostanser having sent a powerful army into that country, under the command of one Anushtekin, he not only reduced the rebels, but considerably enlarged the Egyptian dominions in Syria. In 1054 a Turk named Al Bassasiri, having quarrelled with the vizier of Al Kayem, khalif of Bagdad, fled to Egypt and put himself under the protection of Al Mostanser. The latter, imagining this would be a favorable opportunity for enlarging his dominions, and perhaps seizing on the city of Bagdad, supplied Bassasiri with money and troops. By this assistance he was enabled to possess himself of Arabian Irak, and ravaged that province to the very gates of Bagdad. On this,

Al Kayem wrote to Togrol Beg, or Tuglak, the Turkish sultan, to come to his aid. The sultan immediately complied, and soon arrived at Bagdad with a formidable army of eighteen elephants. Of this Bassasiri gave notice to Al Mostanser, and intreated him to assist himself further for his support against so powerful an enemy. This was accordingly done; nothing worthy of notice happened till the year 1062, when Bassasiri having excited Ibrahim, Togrol's brother to revolt, Togrol Beg was obliged to employ all his force against him. This gave Bassasiri an opportunity of sending word to Bagdad; and the unfortunate khalif, who, to some, was taken prisoner, or, among others, fled. Bassasiri, on his entry into Bagdad, proclaimed himself khalif, and ordered Al Mostanser to be immediately proclaimed in all quarters of the city. Al Mostanser, however, he caused to be led on a camel through the streets of Bagdad, dressed in a woollen garment of high red bonnet, and a leather cord round his neck; a man lashing him behind, and being sewed up in a bull's hide, and with horns placed over his head, and dog's ears, he was beaten without ceasing till he died. The imperial palace was plundered, and the khalif himself detained a close prisoner. His success was but short lived; for, in 1063, Togrol Beg defeated his brother Ibrahim, and he was taken prisoner and strangled him. He then returned to Bagdad, which Bassasiri abandoned without approach. Here the khalif Al Kayem was taken up by Mahras, the governor of a province, who had the charge of him, and was immediately restored to his throne. Bassasiri no sooner understood this, than he advanced towards the city. Al Kayem, however, sent a part of his army under several generals, while he himself followed him. A battle ensued, in which the army of Bassasiri was defeated, and he himself taken prisoner, and was brought to Togrol Beg, who carried him on a pike through the streets of Bagdad. Thus the hopes of Al Mostanser were completely frustrated; and from this period we may date the declension of the Egyptian empire under the khalifs. They had made themselves masters of almost all Syria; but no sooner was this bad success known, than the young citizens of Aleppo revolted, and set up Azzoddawla, who immediately besieged the citadel. Al Mostanser sent a powerful army against him, which Azzoddawla repulsed, and took the general himself prisoner. After this he made himself master of the citadel, with all their dependencies, and destroyed every thing with fire, and making frequent incursions into the neighboring provinces, which he treated with great cruelty. This disaster was soon followed by a more terrible. In 1066 a famine seized on Egypt and Syria, with such fury, that cats were sold for four at five denars each, and other provisions in proportion. Multitudes of people died in Cairo, and in the provinces, so great was the scarcity, that but one servant left who was carried off to the khalif's palace, and was

his horse when he alighted at the gate. On his return, he was surprised to find that his horse had been carried off, killed, and by the famished people. Complaining to the khalif, he caused three of them to be carried off the horse to be hanged. Nay, however, he was still more surprised, that all the flesh had been picked off the of the three unhappy criminals, so that but the skeletons was left. And to such of misery were the inhabitants, not only to but through all Egypt, reduced, that masses of those who died were sold for food at great price. The khalif at this time is have showed the greatest kindness and clemency towards his unhappy subjects; in that of 10,000 horses, mules, and camels which he had in his stables when the began, he had only three left when it moved. The famine was followed by a and this by an invasion of the Turks Abu Ali Al Hassan Haseeroddawla, the general who had been sent against the rebel lawla and defeated by him. He began besieging the khalif in his own palace; the unhappy prince being in no condition to resistance was obliged to buy himself off at the expense of every thing valuable that was in his exhausted capital. This, however, did not hinder these merciless plunderers from taking all the Lower Egypt from Cairo to Adria, and committing the most horrid crimes through that whole tract. This happened in 1067 and 1068; and in 1069 and 1070 happened two other revolts in Syria, so that the country was now almost entirely ruined. He died the khalif Al Mostanser, having reigned sixty years; and was succeeded by his son Al Kasem, surnamed Al Mostali. The remarkable transaction of this prince's reign, his taking the city of Jerusalem from the crusaders in 1098: but this success was only of short duration; for it was, the same year, taken by the crusaders. From this time to 1164, Egyptian history affords little else than an account of the intestine broils and contests between the viziers, who were now become so powerful that they had in a great measure stripped the khalifs of their civil power, and left them only but a shadow of spiritual dignity. These broils at last gave occasion to a revolution, which brought the race of Fatemite khalifs was extinguished: a revolution which was accomplished in the following manner. One Shawer, who had overcome all his competitors, became the khalif Al Aded, the eleventh khalif of Egypt. He had not been long in possession of that office, when Dargam, an officer of rank, endeavoured to depose him of it. Both parties quickly had recourse to arms; and a battle ensued, in which Shawer was defeated, and obliged to fly to Nurroddin, prince of Syria, by whom he was graciously received, and who promised to reinstate him in his office of vizier. As an inducement to him to assist him more powerfully, Shawer told him that the crusaders had landed in Egypt, and were making a considerable progress in the conquest of it. He promised also, that, in case he

was reinstated in his office, he would pay Nurroddin annually the third part of the revenues of Egypt; and would, besides, defray the whole expense of the expedition. As Nurroddin bore an implacable hatred to the Christians, he readily undertook an expedition against them, for which he was to be so well paid. He therefore sent an army into Egypt, under the command of Shawer and a general named Asadoddin. Dargam, in the mean time, had cut off so many generals whom he imagined favorable to Shawer's interest, that he thereby weakened the military force of the kingdom, and in a great measure deprived himself of the power of resistance. He was thus easily overthrown by Asadoddin, and Shawer reinstated in the office of vizier. The faithless minister, however, no sooner saw himself firmly established in his office, than he refused to fulfil his engagements to Nurroddin by paying the stipulated sums. Upon this, Asadoddin seized Pelusium and some other cities. Shawer then entered into an alliance with the crusaders, and Asadoddin was besieged by their combined forces in Pelusium. Nurroddin, however, having invaded the Christian dominions in Syria, and taken a strong fortress, called Harem, Shawer and his confederates thought proper to hearken to some terms of accommodation, and Asadoddin was permitted to depart for Syria. In the mean time Nurroddin, having subdued the greatest part of Syria and Mesopotamia, resolved to make Shawer feel the weight of his resentment. He therefore sent back Asadoddin into Egypt with a sufficient force, to compel Shawer to fulfil his engagements: but this the vizier took care to do before the arrival of Asadoddin; and thus, for the present, avoided the danger. It was not long, however, before he gave Nurroddin fresh occasion to send this general against him.

That prince had now driven the crusaders almost entirely out of Syria, but was greatly alarmed at their progress in Egypt; and consequently offended at the alliance which Shawer had concluded with them, and which he persisted in observing. This treaty was also thought to be contrived on purpose to prevent Shawer from being able to fulfil his promise to Nurroddin, of sending him annually a third of the revenues of Egypt. Nurroddin therefore again despatched Asadoddin into Egypt, in 1166, with a sufficient force, and attended by the famous Saladin, his own nephew. They entered the kingdom without opposition, and totally defeated Shawer and the crusaders. They next made themselves masters of Alexandria; and, after that, overran all the Upper Egypt. Saladin was left with a considerable garrison in Alexandria; but Asadoddin was no sooner gone, than the crusaders laid siege to that city. This at last obliged Asadoddin to return to its relief. The great losses he had sustained in this expedition probably necessitated his agreeing to a treaty with Shawer, by which he engaged to retire out of Egypt, upon being paid a sum of money. Asadoddin was no sooner gone, than Shawer entered into a fresh treaty with the Franks. By this new alliance he was to attack Nurroddin in his own dominions, as he was at

that time engaged in quelling some revolters, which would effectually prevent his sending any more forces into Egypt. This treaty so provoked the Syrian prince, that he resolved to suspend his other conquests for some time, and exert his whole strength in the conquest of Egypt. By this time the crusaders had reduced Pelusium, and made a considerable progress in the kingdom, as well as in some other countries, through the divisions which reigned among the Mahomedan princes. In such places as they conquered, they put many to the sword, Christians as well as Mahomedans; selling the rest for slaves, and giving up the towns to be plundered by the soldiers. From Pelusium they marched to Cairo; which was then in no posture of defence, but in the utmost confusion, by reason of the divisions which reigned in it. Shawer, therefore, as soon as he had heard of their approach, caused the ancient quarter called Mesr to be set on fire, and the inhabitants to retire into other parts. He also prevailed upon the khalif to solicit the assistance of Nuroddin; which the latter was indeed much inclined to grant, as it gave him the fairest opportunity both of driving the crusaders out of Egypt, and of seizing the kingdom to himself. For this purpose he had already raised an army of 60,000 horse under his general Asadoddin; and, on the receipt of Al Aded's message, gave them orders to set out immediately. The crusaders were now arrived at Cairo; and had so closely besieged that place, that neither Shawer nor the khalif knew anything of the approach of the Moslem army, which was hastening to their relief. The vizier, therefore, finding it impossible to hold out long against the enemy, had recourse to his old subterfuge of treaties and high promises. He sent the enemy 100,000 dinars, and promised them 900,000 more, if they would raise the siege; which they, dreading the approach of Asadoddin, very readily accepted. The army of Nuroddin now approached the capital by hasty marches, and were every where received with the greatest demonstrations of joy. Asadoddin, on his arrival at Cairo, was invited by Al Aded to the royal palace, where he, with Saladin and the other principal officers were most magnificently treated. Shawer was no less assiduous in attending punctually upon them. But, having invited the general and some others to an entertainment, he had formed a scheme of having them seized and murdered. The plot, however, being discovered, Shawer's head was cut off, and Asadoddin was made vizier in his stead. He died, however, two months and five days after his instalment, and was succeeded by his nephew Saladin. The new vizier was the youngest of all the grandees who aspired to that office, but had already given some signal proofs of his valor. Some of his rivals were highly displeased with his promotion, and even publicly declared that they would not obey him. To gain these to his interest, therefore, Saladin distributed among them part of the vast treasures left by his uncle; by which means he soon governed Egypt without control. Soon after his being installed into office, he totally defeated the negroes who guarded the royal palace, and had opposed his election; by which means, and

by placing a strong garrison in Cairo, his power became firmly established. Though he had no intention of declaring his allegiance to Nuroddin, he did not hesitate at first to declare himself independent of him. His father, however, and the rest of his family, were in Nuroddin's dominions, and he said, to make them partakers of his power and happiness. Nuroddin did not refuse to deny this request; though he was jealous of the great power of Saladin, he insisted that his family should continue as one of his generals in Egypt. Saladin, therefore, subsisted between Nuroddin and Saladin for some time, which raised the credit of the latter with Nuroddin. In 1169 Nuroddin sent him the name of Al Aded, the khalif of public prayers, and substitute that of Hagdad in its place. This was an attempt; as it might have produced favor of Al Aded; and at any rate, it gave Saladin an opportunity of engraving a small remnant of power which he retained as khalif. Al Aded, however, was disgraced: for he was on his deathbed, when Nuroddin executed. After his death, Saladin's wealth and valuable effects: a great quantity of jewels of prodigious size, and a library containing 100,000 volumes. His family he caused to be close, the most retired place of the palace, manumitted his slaves, or kept them in chains. Saladin was now arrived at the height of his wealth, power, and grandeur. He was obliged to behave with great civility with regard to Nuroddin; who treated him as his vassal, and was obliged to dispute the least of his claims. He relied for advice chiefly on his father, who was a consummate politician, and was of seeing his son raised to the throne. He therefore advised Saladin, who was Nuroddin with feigned submission, to use a method to secure himself in the possession of a kingdom. Nuroddin, however, was too great a master in dissimulation to be easily imposed on by others; though he pretended to be well pleased with Saladin's conduct, he was all the while forming a powerful army, with which he determined to invade Egypt the next year. But while he meditated this expedition, he was seized with a quinsy at the corner of his eye, which put an end to his life in 1174. Though now freed from the apprehension of a formidable enemy, did not retain the title of Sovereign, while he was the successor of Nuroddin at the head of a powerful army. His first care therefore was to himself an asylum, in case he should be obliged to leave Egypt altogether. For this purpose he chose the kingdom of Syria, having despatched his brother Malek thither, at the head of a considerable army. The latter was so much struck with the desolate appearance of the country, that he turned without attempting any conquest.

his brother into Arabia Felix, to subdue a tribe, which had been for some time held in abeyance. Malek entered the country without opposition; and, having taken the city of Hama, he sent Abdalrhabi to a general action, entirely victorious, took him prisoner, and threw him into prison. He then overran and reduced under his power the greater part of the country, and took fewer than eighty castles of considerable strength. Saladin, now sure of a convenient refuge, assumed the title of Sultan of Egypt, and was acknowledged as such by the sultan of the state. The zeal of the Egyptian Fatemite khalifs, however, soon provoked a rebellion. One Al Kanz, or Kanzad, governor of a city in Upper Egypt, raised a great army of blacks, or rather natives; and, marching into the lower Egypt, was there joined by great numbers of Egyptians. Against them Saladin despatched his brother Malek, who soon entirely dispersed them. This, however, did not prevent another rebellion under an impostor, who pretended to be the son of Al Aded, and had collected about 100,000 men. But, before these had done any great damage, they were surprised by the sultan's forces, and entirely defeated. Above 300 were publicly hanged, and a number perished in the field, insomuch that they left scarcely a fourth part of the whole army. About this time Saladin gained a considerable advantage over the Crusaders, led by William II. king of Sicily. That king had invaded Egypt with a numerous fleet, and with which he laid close siege to Alexandria by sea and land. Saladin, however, to the relief of the city with such expedition, that the crusaders were seized with a sudden panic, and fled with the utmost precipitation, leaving all their military engines, stores, and baggage behind. In 1175 the inhabitants of Jerusalem begged of Saladin to accept the sovereignty of that city and its dependencies; being advised by the minister, who had the tuition of the prince, and who governed with an absolute authority. The sultan set out with the utmost expedition to Damascus, at the head of a chosen army of 700 horse. Having settled his affairs in that city, he appointed his brother Saif ad-Din governor of it; and set out for Hama, where he immediately laid siege. Making himself master of this place, he then proceeded to Hama, which soon surrendered, but he held out for some time. Saladin pretending that he accepted the sovereignty of Jerusalem, and the other places he had conquered, only as deputy to Al Malek Al Saleh, successor of Nuroddin, and who was then in Egypt; and that he was desirous of sending him, who commanded in the citadel, with a detachment to Aleppo, where the young prince resided. He pleased Arzadin, that he took the oath of fealty to Saladin, and immediately set out on his journey. He had not, however, been long gone before he was, by the minister's order, thrown into prison; upon which his brother had been appointed governor of the city of Hama in his absence, delivered it up to him. The sultan then marched to Aleppo, Vol. VII.

but, being vigorously repulsed in several attacks, he was at last obliged to abandon the enterprise. At the same time, Kamschlegin, Al Malek's minister or vizier, hired the chief of the Assassins, or Assassins, to murder him; but the attempt made in consequence miscarried. See ASSASSINS. After raising the siege of Aleppo, Saladin returned to Hama, which the crusaders had invested. On his approach, however, they retired; after which, the sultan made himself master of its strong castle. This was soon followed by the reduction of Balbec; and these rapid conquests so alarmed the ministers of Al Malek, that, entering into a combination with some of the neighbouring princes, they raised a formidable army, with which they designed to crush the sultan at once. Saladin, fearing the event, offered to cede Hama and Hamah to Al Malek, and to govern Damascus only as his lieutenant; but these terms being rejected, a battle ensued in which the allied army was utterly defeated, and the shattered remains of it shut up in Aleppo. This produced a treaty, by which Saladin was left master of all Syria, excepting only the city of Aleppo and its territory. In 1176 Saladin returned from the conquest of Syria, and made his triumphal entry into Cairo. Here, having rested himself and his troops for some time, he began to encompass the city with a wall 29,000 cubits in length, but which he did not live to finish. Next year he led a very numerous army into Palestine against the crusaders. But here his usual good fortune failed him. His army was entirely defeated; 40,000 of his men were left dead on the field; and the rest fled with so much precipitation, that, having no towns in the neighbourhood where they could shelter themselves, they traversed the vast desert between Palestine and Egypt, and scarcely stopped till they reached the capital itself. Thus the greatest part of the army perished; and, as no water was to be had in the desert, almost all the cattle died of thirst before the fugitives arrived on the confines of Egypt. Saladin himself seemed to have been greatly intimidated; for in a letter to his brother Al Malek, he told him, that he was more than once in the most imminent danger; and that God, as he apprehended, had delivered him, to reserve him for the execution of some grand and important design. In 1182 he set out on an expedition to Syria with a formidable army, amidst the acclamations and good wishes of the people. He was, however, repulsed with loss both before Aleppo and Al Mawzel, after having spent much time and labor in besieging these two important places. In the mean time a most powerful fleet of European ships appeared on the Red Sea, which threatened the cities of Mecca and Medina with the utmost danger. The news of this armament no sooner reached Cairo, than Abu Beer, Saladin's brother, who had been left viceroy, caused another to be fitted out with all speed under the command of Lala, a brave and experienced officer; who quickly came up with them, and a dreadful engagement ensued. The Christians were defeated after an obstinate resistance, and all the prisoners butchered in cold blood. This proved such a terrible blow to the Europeans, that they never more ventured on a like at-

tempt. In 1183 Saladin continued to extend his conquests. The city of Amida in Mesopotamia surrendered to him in eight days; after which, being provoked by some violence committed by Amadoddin, prince of Aleppo, he resolved to make himself master of that place. His army being now numerous, he pushed on the siege with the utmost vigor; upon which Amadoddin capitulated, on condition of being allowed to possess certain cities in Mesopotamia, which had formerly belonged to him, and being ready to attend the sultan on whatever expedition he pleased. After the conquest of Aleppo, Saladin took three other cities, and then marched against the crusaders. Having sent out a party to reconnoitre, they fell in with a considerable detachment of Christians, whom they easily defeated, taking about 100 prisoners, with the loss of only a single man on their side. The sultan, animated by this first instance of success, advanced against the crusaders, who had assembled their whole army at Sepphoris in Galilee. On viewing the sultan's troops, however, and perceiving them to be greatly superior in strength to what they had at first apprehended, they declined an engagement, nor could Saladin with all his skill force them to it. But, though he found it impossible to bring the crusaders to a decisive engagement, he harassed them greatly, and destroyed great numbers of them. He also carried off many prisoners, dismantled three of their strongest cities, laid waste their territories, and concluded the campaign with taking another strong town. For three years Saladin continued to gain ground on the crusaders, yet without any decisive advantage; till 1187, when the cruel ravages committed in their territories obliged the Christians to venture a battle. Both armies, therefore, being resolved to exert their utmost efforts, a most fierce and bloody battle ensued. Night prevented victory from declaring on either side, and the fight was renewed with equal obstinacy next day. The victory was still left undecided; but on the third day Saladin's troops, finding themselves surrounded by the enemy on all sides but one, and there also hemmed in by the river Jordan, so that there was no room to fly, fought like men in despair, and at last gained a most complete victory. Vast numbers of the Christians perished on the field. A large body retired to the top of a neighbouring hill covered with wood; but being surrounded by Saladin's troops, who set fire to the wood, they were all obliged to surrender at discretion. Some of them were butchered by their enemies, as soon as they delivered themselves into their hands, and others thrown into irons. Among the latter were the king of Jerusalem himself, Arnold prince of Al Shawbec and Al Carac, the masters of the Templars and Hospitallers, with almost the whole body of the latter. So great was the consternation of the Christians on this occasion, that one of Saladin's men is said to have taken thirty of them prisoners, and tied them together with the cord of his tent, to prevent them from making their escape. The masters of the Templars and Hospitallers, with the knights acting under them, were no sooner brought into Saladin's presence,

than he ordered them all to be bound. After the engagement, Saladin sent a magnificent tent, placing the king on his right hand, and Arnold of Shawbec and Al Carac on his left. He drank to the former, and at the same time him a cup of snow water. This was received; and the king immediately prince of Al Carac, who sat next him, said Saladin, suffer this cup to be drunk; as that, according to the generous custom of the Arabs, was him his life.' Then turning towards him he reproached him with having sent an expedition while in alliance with him, having intercepted an Egyptian caravan at a time of profound peace, and a people of which it was composed, withstanding all this, he told him, grant him his life, if he would enter into mediation. This condition, however, he refused; and the sultan, with one scymitar, cut off the prince's head, and notified the king of Jerusalem; insuring him he had nothing to fear. Arnold had brought on himself a curse by his want of common honesty. Being thus totally defeated and dispersed, Saladin next laid siege to Tibérias, which he took, as did also Acca or Ptolemais. He found 4000 Mahomedan prisoners, whom he immediately released. The inhabitants of Acca enjoyed a very extensive freedom there not only vast sums of money, but likewise a great variety of valuable goods which he seized. About the same time, Saladin also attacked and took the fortress in the neighbourhood; Saladin divided his army into three parts, and soon made himself master of Neapolis, Sepphoris, and other cities in the neighbourhood of Ptolemais, where his soldiers killed or taken prisoners. His next object was Joppa, which was taken by a vigorous resistance. Every thing was settled, and a distribution made of the booty and captives, Saladin marched to Tybrien, a strong fortress in the neighbourhood of Sidon; which he took by assault, after a siege of six days, and ordered the fortress and the garrison put to the sword. Tybrien he proceeded to Sidon, which was surrendered by its prince, surrendered at the first summons. Berytus was next taken, and surrendered in seven days. Among the prisoners Saladin found in this place a territory called Hobel, who he immediately delivered up his dominions to him, on the consequence released. About the same time a Christian ship, in which was a man of courage and experience in war, was in the harbour of Ptolemais, not knowing of the hands of Saladin. The prince easily secured the vessel, and took the opportunity, she was in the harbour, to above-mentioned noblemen, and the prince of Hobel, contributed to retrieve the affairs of the Christians.

to make a stand for four years longer. In the mean time went on with his con-

Having made himself master of Ascalon, a siege of fourteen days, he next invested Acre. The garrison was numerous, and an obstinate defence; but Saladin having made a breach in the walls by sapping, besieged desired to capitulate. This was refused; upon which the Christian ambassador boldly said to him:—'If that be true, O sultan, know that we who are extremely numerous, and have been restrained fighting like men in despair, only by the prospect of an honorable capitulation, will kill all wives and children, commit all our wealth to valuable effects to the flames, massacre 5000 men now in our hands, leave not a single of burden or animal of any kind belonging alive, and level with the ground the rock you stand on, together with the temple Al Aksa. Thus we will sally out upon you in a body; slay not but we shall either cut to pieces a greater number of you than we are, or you to abandon the siege.' This desperate threat had such an effect upon Saladin, that he immediately called a council of war, at which all general officers declared, that it would be proper to allow the Christians to depart untroubled. The sultan therefore allowed them to go out freely with their wives, children, and their effects; after which he received ten talents from every man who was capable of payment, five from every woman, and two from every young person under age. For the rest who were not able to pay any thing, the inhabitants raised the sum of 30,000.

Most of the inhabitants of Jerusalem escorted by a detachment of Saladin's army to Tyre; and, soon after, he advanced his army against that place. As the port was locked up by a squadron of five men of Saladin imagined that he should easily be master of it. But in this he found himself mistaken. For one morning, by break of day, a Christian fleet fell upon his squadron, and defeated it; nor did a single vessel escape pursuit. A considerable number of the Christians threw themselves into the sea during the engagement; most of whom were killed, though some few escaped. About the same time Saladin himself was vigorously resisted by land; so that, after calling a council of war, it was thought proper to raise the siege. In consequence Saladin reduced the city of Laodicea and others, together with many strong castles; and also with several repulses. At last he proceeded to Antioch; and having reduced

the fortresses that lay in his way, many of which had been deemed impregnable, Bohemond, king of Antioch, was so much intimidated that he offered a truce for seven or eight months. Saladin found himself obliged to comply on account of the prodigious fatigues his army sustained, and because his auxiliaries demanded leave to return home. All these losses of the Christians, however, proved respects an advantage, as they were thus enabled to lay aside their animosities, which had previously proved the ruin of their affairs. Those

who had defended Jerusalem, and most of the other fortresses taken by Saladin, having retreated to Tyre, formed there a very numerous body. This proved the means of preserving that city and also of re-establishing their affairs for the present. For, having received powerful succours from Europe, they were enabled, in 1189, to take the field with 30,000 foot and 2000 horse. Their first attempt was upon Alexandretta; from whence they dislodged a strong party of Mahomedans, and made themselves masters of the place with very little loss. They next laid siege to Ptolemais; of which Saladin had no sooner received intelligence, than he marched to its relief. After several skirmishes with various success, a general engagement ensued, in which Saladin was defeated with the loss of 10,000 men. This enabled the Christians to carry on the siege of Ptolemais with greater vigor; which place, however, they were not able to reduce for two years. This year the sultan was greatly alarmed, by an account that the emperor of Germany was advancing to Constantinople with an army of 260,000 men, to assist the other crusaders. This prodigious armament, however, came to nothing. The multitude were so reduced with sickness, famine, and fatigue, that scarcely 1000 of them reached the camp before Ptolemais. The siege of that city was continued, though with bad success on the part of the Christians. They were repulsed in all their attacks, their engines were burnt with naphtha, and the besieged always received supplies of provisions in spite of the utmost efforts of the besiegers; while a dreadful famine and pestilence raged in the Christian camp, which sometimes carried off 200 people a-day. In 1191 the Christians received powerful succours from Europe. Philip II. of France, and Richard I. of England, arrived before the camp at Ptolemais. The latter was esteemed the bravest and most enterprising of all the generals the crusaders had; and the spirits of his soldiers were greatly elated by the thoughts of acting under such an experienced commander. Soon after his arrival, the English sunk a Mahomedan ship of vast size, having on board 650 soldiers, and a great quantity of arms and provisions, going from Berytus to Ptolemais. Of the soldiers and sailors who navigated this vessel, only one person escaped; who, being taken prisoner by the English, was despatched to the sultan with the news of the disaster. The besieged still defended themselves with the greatest resolution; and, the king of England happening to fall sick, the operations of the besiegers were delayed. On his recovery, however, the attacks were renewed with such fury, that the inhabitants found themselves under a necessity of surrendering the place. One of the terms of the capitulation was, that the crusaders should receive a very considerable sum of money from Saladin, upon delivering up their Mahomedan prisoners. With this article Saladin refused to comply; in consequence of which, Richard caused 3000 of those unfortunate men to be slaughtered at once. After the reduction of Ptolemais, the king of England, now made generalissimo of the crusaders, took the road to Ascalon in order to besiege that place; after which, he intended to

three weeks, three days, and three hours; soon after which Richard set out on his return to England. In 1193 Saladin died, to the inexpressible grief of the Mahommedans, who held him in the utmost veneration. His dominions in Syria and Palestine were divided among his children and relations into many petty principalities. His son Othman succeeded to the crown of Egypt; but, as none of his successors possessed the enterprising genius of Saladin, the history from that time to 1250 affords nothing remarkable.

In 1250 the reigning sultan, Malek Al Salek, was dethroned and slain by the Mamelukes or Mamlouks, as they are called, a kind of mercenary soldiers who served under him. In consequence of this revolution, the Mamelukes became masters of Egypt, and chose a sultan from among themselves. These Mamelukes were originally young Turks or Tartars, sold to private persons by the merchants, from whom they were bought by the sultan, educated at his expense, and employed to defend the maritime places of the kingdom. The reason of this institution originally was, that the native Egyptians were become so cowardly, treacherous, and effeminate, from a long course of slavery, that they were unfit for arms. The Mamelukes, on the contrary, made most excellent soldiers; for, having no friends but among their own corps, they turned all their thoughts to their own profession. According to M. Volney, they came originally from Mount Caucasus, and were distinguished by the flaxen color of their hair. The expedition of the Tartars, in 1227, proved indirectly the means of introducing them into Egypt. These horrible conquerors, having slaughtered and massacred till they were weary, brought along with them an immense number of slaves of both sexes, with whom they filled all the markets in Asia. The Turks purchased about 12,000 young men, whom they bred up in the profession of arms, in which they soon attained to great perfection; but at last, becoming mutinous, they turned their arms against their masters, and in 1250 deposed and murdered the

new sultan obtained the expedient the Mamelukes able to secure themselves they were mistaken. In Mamelukes grew proud, the Borgites, taking advantage of their masters, deprived and transferred it to them. The Borgites, however, Mamelukes; and became valor. They were almost in wars either foreign or minion lasted till 1517, by Selim I., the Mamelukes defended themselves notwithstanding which numbers, they were dependent. The same year, Cairo, was taken, and of those who defended Bey, was forced to fly; his forces, he ventured most romantic efforts of sufficient to cope with the which composed the Mamelukes were cut in pieces, himself was at last obliged to fly. He was dragged where he had stood up and soon after put to the glory, and almost the lukes, who were now and cut in pieces.

Selim gave a specimen very day after his being it by the death of Tuman a theatre to be erected, the banks of the Nile, he upwards of 30,000, to his sense, and their bodies. But notwithstanding this not attempt the total extinction of the Mamelukes, but seems to have established a pacha in power with which he

motify to this council the orders of the to send the tribute to Constantinople, and for the safety of government both external; while, on the other hand, the of the council had a right to reject the of the pacha, or even of deposing him, and they could assign sufficient reasons. and political ordinances must also be by them. Besides this, he formed the body into a kind of republic; for which he issued an edict, stating: 'Though, help of the Almighty, we have con- the whole kingdom of Egypt with our ble armies, nevertheless our benevo- is willing to grant to the twenty-four of Egypt (see SANGIAC) a republi- vernment with the following conditions. 1. Our sovereignty shall be acknowledged republic; and, in token of their obedi- our lieutenant shall be received as our sative, but to do nothing against our the republic; but, on the contrary, shall ate with it for its welfare on all occa- Or, if he shall attempt to infringe any privileges, the republic is at full liberty pend him from his authority, and to our Sublime Porte a complaint against e. 2. In time of war the republic shall 12,000 troops at its own expense, to be ded by a sangiac or sangiacs. 3. The republic, fulfil- articles, shall have a free government ll the inhabitants of Egypt, independent lieutenant; and shall execute the laws of entry with the advice of the mollah, or iest, under our authority, and that of our tors. 8. The republic shall be in pos- of the mint as heretofore; but with the on that it shall be under the inspection of utenant, that the coin may not be adul- 9. That the republic shall elect a bellet out of the number of beys, to be ed by our lieutenant; and that the said bellet shall be our representative, and shall ed by all our lieutenants, and all our e, both of high and low rank, as the head republic; and if our lieutenant is guilty pression, or exceeds the bounds of his ty, the said sheik bellet shall represent avances of the republic to our Sublime But in case any foreign enemy or ene- turb the peace of the republic, we and accessors engage to protect it with our e power, until peace is re-established, it any cost or expense to the republic. and signed by our clemency to the repub-

lic of Egypt.' Thus the power of the Mamelukes still continued in a very considerable degree, and gradually increased so much as to threaten a total loss of dominion to the Turks. During the last sixty years, the Porte having relaxed from its vigilance, such a revolution took place, that the Turkish power is now almost reduced to nothing. But to understand this we must consider the way in which the race of Mamelukes was continued or multiplied in Egypt. This is not in the ordinary way, by marriage; on the contrary, M. Volney assures us, that 'during 550 years in which there have been Mamelukes in Egypt, not one of them has left subsisting issue; all their children perish in the first or second descent. Almost the same thing holds good with regard to the Turks; and it is observed, that they can only secure the continuance of their families by marrying women who are natives, which the Mamelukes have always disdained. The means by which they are perpetuated and multiplied are the same by which they were first established, viz. by slaves brought from their original country. From the time of the Moguls this commerce has been continued on the banks of the Cuban and Phasis, in the same manner as it is carried on in Africa by the wars among the hostile tribes, and the misery or avarice of the inhabitants, who sell their children to strangers. The slaves thus procured are first brought to Constantinople, and afterwards dispersed through the empire, where they are purchased by the wealthy. When the Turks subdued Egypt (says M. Volney), they should undoubtedly have prohibited this dangerous traffic; their omitting which seems about to dispossess them of their conquest, and which several political errors have long been preparing. For a considerable time the Porte had neglected the affairs of this province: and, in order to restrain the pachas, had suffered the divan to extend its power till the chiefs of the janizaries and arabs were left without control. The soldiers themselves, become citizens by the marriages they had contracted, were no longer the creatures of Constantinople: and a change introduced into their discipline still more increased these disorders. At first the seven military corps had one common treasury; and, though the society was rich, individuals not having any thing at their own disposal, could effect nothing. The chiefs finding their power diminished by this regulation, got it abolished, and obtained permission to possess distinct property, lands, and villages. And as these lands and villages depended on the Mameluke governors, it was necessary to conciliate them, to prevent their oppressions. From that moment the beys acquired an ascendancy over the soldiers, who till then had treated them with disdain: and this continually increased, as their government procured them considerable riches. These they employed in creating friends. They multiplied their slaves; and, after emancipating them, employed all their interest to advance them in the army. These upstarts, retaining for their patrons the same superstitious veneration common in the East, formed factions implicitly devoted to their pleasure.' Thus, about 1716, Ibrahim, one of the Kayas of the

junizaries (see *KRAYA*), rendered himself in reality master of Egypt; having managed matters so well, that of the twenty-four beys, or sanguins, eight were of his household. His influence too was augmented by always leaving vacancies, in order to enjoy the emoluments himself, while the officers and soldiers of his corps were attached to his interest; and his power was completed by gaining over Rodoan, the most powerful of all the colonels, to his interest. Thus the pacha became altogether unable to oppose him, and the orders of the sultan were less respected than those of Ibrahim. On his death, in 1757, his family, i. e. his enfranchised slaves, continued to rule in a despotic manner. Waging war, however, among each other, Rodoan and several other chiefs were killed; but, in 1766, Ali Bey, who had been a principal actor in the disturbances, overcame his enemies, and for some time rendered himself absolute master of Egypt. Of this man there are various accounts. The following is given by M. Volney:—It is supposed that Ali was born among the Abazans, a people of Mount Caucasus; from whom, next to the Circassians, the slaves most valued by the Turks are obtained. Having been brought to a public sale at Cairo, Ali was bought by two Jew brothers, named Isaac and Yousef, who made a present of him to Ibrahim. At this time he is supposed to have been about thirteen or fourteen years old, and was employed by his patron in offices similar to those of the pages belonging to European princes. The usual education was also given him, viz. that of learning to manage a horse well; fire a carbine and pistol, and throw the djerid, a kind of dart used in the diversions of that country. He was also taught the exercise of the sabre, and a little reading and writing. In all these feats of activity he discovered such impetuosity, that he obtained the surname of Djendali, or the madman; and, as he grew up, discovered an ambition proportionable to the activity displayed in his youth. About the age of eighteen or twenty Ibrahim gave him his freedom; the badge of which among the Turks is letting the beard grow, for among that people it is thought proper only for women and slaves to want a beard. By his kind patron also he was promoted to the rank of kachef, or governor of a district, and at last elected one of the twenty-four beys. By the death of Ibrahim, in 1757, he had an opportunity of satisfying his ambition; being now engaged in every scheme for the promotion or disgrace of the chiefs, and having had a principal share in the ruin of Rodoan, Rodoan's place was quickly filled by another, who did not long enjoy it; and in 1762 Ali Bey, then styled Sheik el Beled, having got Abdelrahman, the possessor, exiled, procured himself to be elected in his room. However, he soon shared the fate of the rest, being condemned to retire to Gaza. This town, being under the dominion of a Turkish pacha, was by no means a safe retreat; for which reason, Ali having turned off to another place, kept himself concealed for some time, until in 1766 his friends at Cairo procured his recall. On this he appeared suddenly in that city, and killed in one night four

the armies of the Turks and Mamelukes are  
 thing but a confused multitude of horsemen  
 without uniforms, on horses of all colors and  
 without either keeping their ranks or  
 serving any regular order.' This rabble took  
 road to Acre, leaving wherever they passed  
 marks of their rapacity and want of  
 discipline. At Acre a junction was formed with  
 troops of sheik Daher, consisting of 1500  
 Sadians, the name of sheik Daher's subjects,  
 and a village of Galilee, originally under  
 his domination. These were on horseback, and  
 accompanied by 1200 Mameluk cavalry, under  
 command of sheik Nasif, and about 1000  
 Sadian infantry. Thus they proceeded  
 to Damascus, while Osman prepared to  
 meet them by another army equally numerous  
 and regulated. 'The Asiatics,' says M. Vol-  
 taire, are unacquainted with the elements of  
 war. Their armies are mere mobs, their marches,  
 their campaigns inroads, and their bat-  
 tles bloody frays. The strongest or most adven-  
 turous party goes in quest of the other, which  
 frequently flies without making any resistance.  
 If they stand their ground they engage pell mell,  
 discharge their carbines, break their spears, and  
 attack each other with their sabres; for they have  
 seldom any cannon, and when they have, they  
 are but of little service. A panic frequently  
 diffuses itself without cause; one party flies,  
 the other shouts victory; the vanquished sub-  
 mit to the will of the conqueror, and the cam-  
 paign often terminates without a battle. Such,  
 in a great measure, were the military opera-  
 tions in Syria in 1771. The combined army  
 of Ali Bey and sheik Daher marched to  
 Damascus. The pachas waited for them; they  
 approached, and, on the 6th of June, a decisive  
 action took place: the Mamelukes and Sadians  
 rushed on the Turks with such fury, that, terrified  
 at their courage, they immediately took flight,  
 and the pachas were not the last in endeavouring  
 to make their escape. The allies became masters  
 of the country, and took possession of the city  
 without opposition, there being neither walls nor  
 soldiers to defend it. The castle alone resisted.  
 Its ruinous fortifications had not a single cannon,  
 much less gunners; but it was surrounded by a  
 muddy ditch, and behind the ruins were posted a  
 few musqueteers; and these alone were sufficient  
 to check this army of cavalry.—As the besieged,  
 however, were already conquered by their fears,  
 they capitulated the third day, and the place was  
 to be surrendered next morning, when, at day-  
 break, a most extraordinary revolution took place.  
 This was no less than the defection of Mohammed  
 Bey himself, whom Osman had gained over in  
 a conference during the night. At the moment,  
 therefore, that the signal of surrender was ex-  
 pected, this treacherous general sounded a re-  
 treat, and turned towards Egypt with all his  
 cavalry, flying with as great precipitation as if  
 he had been pursued by a superior army. Mo-  
 hammed continued his march with such celerity,  
 that the report of his arrival in Egypt reached  
 Cairo only six hours before him. Thus Ali Bey  
 found himself at once deprived of all his expec-  
 tations of conquest; and, what was worse, found  
 a traitor whom he durst not punish at the head

of his forces. A sudden reverse of fortune now  
 took place. Several vessels laden with corn for  
 Sheik Daher were taken by a Russian privateer;  
 and Mohammed Bey, whom he designed to have  
 put to death, not only made his escape, but was  
 so well attended, that he could not be attacked.  
 His followers continuing daily to increase in  
 number, Mohammed soon became sufficiently  
 strong to march towards Cairo; and, in April  
 1772, having defeated the troops of Ali in a ren-  
 contre, entered the city sword in hand, while the  
 latter had scarce time to make his escape with  
 800 Mamelukes. With difficulty he was enabled  
 to get to Syria by the assistance of Sheik Daher,  
 whom he immediately joined with the troops he  
 had with him. The Turks under Osman were  
 at that time besieging Sidon, but raised the siege  
 on the approach of the allied army, consisting  
 of about 7000 cavalry. Though the Turkish  
 army was at least three times their number, the  
 allies did not hesitate to attack them, and gained  
 a complete victory. Their affairs now began to  
 wear a more favorable aspect; but the military  
 operations were retarded by the siege of Yafa,  
 which had revolted, and though defended only  
 by a garden wall, without any ditch, held out  
 for eight months. In the beginning of 1773 it  
 capitulated, and Ali Bey began to think of re-  
 turning to Cairo. For this purpose Sheik Daher  
 had promised him succours; and the Russians,  
 with whom he had now contracted an alliance,  
 made him a similar promise. Ali, however,  
 ruined every thing by his own impatience. De-  
 ceived by an astrologer, who pretended that the  
 auspicious moment when he was highly favored  
 by the stars was just arrived, he set out without  
 waiting for the arrival of his allies. He was also  
 farther deceived by a stratagem of Mohammed,  
 who had by force extorted from the friends of Ali  
 Bey letters pressing his return to Cairo, where  
 the people were weary of his ungrateful slave,  
 and wanted only his presence in order to expel  
 him. Ali Bey accordingly set out with his  
 Mamelukes and 1500 Sadians given him by  
 Daher; but no sooner entered the desert which  
 separates Gaza from Egypt, than he was attacked  
 by a body of 1000 chosen Mamelukes who were  
 lying in wait for his arrival. They were com-  
 manded by a young Bey, named Mourad; who,  
 being enamoured of the wife of Ali Bey, had  
 obtained a promise of her from Mohammed, in  
 case he could bring him her husband's head.  
 As soon as Mourad perceived the dust by which  
 the approach of Ali Bey's army was announced,  
 he rushed upon him, attacked and took prisoner  
 Ali Bey himself, after wounding him in the fore-  
 head with a sabre. Being conducted to Mo-  
 hammed Bey, the latter pretended to treat him  
 with extraordinary respect, and ordered a mag-  
 nificent tent to be erected for him; but in three  
 days he was found dead of his wounds, as was  
 given out; though some affirm, with equal pro-  
 bability, that he was poisoned. After the death  
 of Ali Bey, Mohammed took upon him the  
 supreme dignity; but this change of masters  
 proved of very little service to the Egyptians.  
 At first he pretended to be only the defender of  
 the rights of the sultan, remitted the usual tribute  
 to Constantinople, and took the customary oath

of unlimited obedience: after which he solicited permission to make war upon Sheik Daher, the ally of Ali Bey. The reason of this request was a mere personal pique; and, as soon as it was granted, he made the most diligent preparations for war. Having procured an extraordinary train of artillery, he provided foreign gunners, and gave the command of them to an Englishman, named Robinson. He brought from Suez a cannon sixteen feet long, which had for a considerable time remained useless; and at length, in February 1776, he appeared in Syria with an army equal to that which he had formerly commanded under Ali Bey. Daher's forces, despairing of being able to cope with such a formidable armament, abandoned Gaza, of which Mohammed immediately took possession, and then marched towards Yafa. The history of this siege M. Volney gives as a specimen of the Asiatic manner of conducting operations of the kind. 'Yafa,' says he, 'the ancient Joppa, is situated on a part of the coast, the general level of which is very little above the sea. The city is built on an eminence, in the form of a sugar-loaf, in height about 130 feet perpendicular. The houses, distributed on the declivity, appear rising above each other, like the steps of an amphitheatre. On the summit is a small citadel, which commands the town; the bottom of the hill is surrounded by a wall without a rampart, of twelve or fourteen feet high, and two or three in thickness. The battlements on the top are the only tokens by which it is distinguished from a common garden wall. This wall, which has no ditch, is environed by gardens, where lemons, oranges, and citrons grow in this light soil to a most prodigious size. The city was defended by 500 or 600 Sa-fadians and as many inhabitants, who, at the sight of the enemy, armed themselves with their sabres and musquets; they had likewise a few brass cannon, twenty-four pounders, without carriages; these they mounted as well as they could, on timbers prepared in a hurry: and, supplying the place of experience by hatred and courage, they replied to the summons of the enemy with menaces and cannon shot. Mohammed, finding he must have recourse to force, formed his camp before the town; but was so little acquainted with the business that he advanced within half cannon-shot. The bullets, which showered upon the tents, apprising him of his error, he retreated; and, by making a fresh experiment, was convinced he was still too near. At length he discovered the proper distance, and set up his tent, in which the most extravagant luxury was displayed: around it, without any order, were pitched those of the Mamelukes, while the Barbary Arabs formed huts with the trunks and branches of the orange and lemon trees, and the followers of the army arranged themselves as they could: a few guards were distributed here and there; and, without making a single entrenchment, they called themselves encamped. Batteries were now to be erected, and a spot of rising ground was made choice of to the south-east of the town, where, behind some garden walls, pieces of cannon were pointed, at 200 paces from the town, and the firing began, notwithstanding the musquetry of the enemy, who,

It known in Egypt, than Mourad Bey had to Cairo in order to dispute the sovereignty Ibrahim Bey, who had been entrusted with government on his departure from that place Syria. Preparations for war were made on sides; but at last both parties, finding that contest must be attended with great difficulties, as well as very uncertain in the event, to an accommodation, by which it was that Ibrahim should retain the title of El Beled, and the power should be divided between them. But now the beys and who had been promoted by Ali Bey, perceiving their own importance totally annihilated by his new faction, resolved to shake off the yoke, and therefore united in a league under the name of the House of Ali Bey. They conducted their matters with so much silence and dexterity, that both Mourad and Ibrahim were obliged to leave Cairo. In a short time, however, they met and defeated their enemies though three times their number; but, notwithstanding this success, it was not in their power totally to suppress the party. This indeed was owing to their unskilfulness in the art of war, and their operations for some time were very trifling. At last, a new combination having been formed by the beys, five of them were sentenced to be executed in the Delta. They pretended to comply with this order, but took the road of the desert of the Pyramids, through which they were pursued for three days to no purpose.

Arriving safe at Miniah, a village situated on the Nile, four leagues above Cairo, they took up their residence, and, being masters of the river, soon reduced Cairo to distress by stopping its provisions. Thus a new expedition became necessary, and Ibrahim took the lead of it upon himself. In October, 1783, he set out with an army of 3000 cavalry; the armies soon came in sight of each other, but he thought proper to terminate the affairs by negotiation. This gave such offence to Mourad, who suspected some plot against himself, that he left Cairo. A war betwixt the two rivals was daily expected, and the armies continued twenty-five days in sight of each other, only separated by the river. Negotiations took place; but five exiled beys finding themselves abandoned by Mourad, took to flight, but were pursued and brought back to Cairo. Peace seemed to be re-established; but, the jealousy of the rivals producing new intrigues, Mourad was more obliged to quit Cairo in 1784. Leaving his camp, however, directly at the gates of the city, he appeared so terrible to Ibrahim, that the latter thought proper in his turn to retreat into the desert, where he remained till March 1785. A new treaty then took place; by which the rivals agreed to share the power between them. At that time, we have no accounts of any remarkable transaction in Egypt till the French entered that country in 1798; and of this, with events that followed, we shall now take a survey.

Among all the powers which the conduct of French republicans brought against them, Britain was the most formidable; the rulers of France, therefore, made her humiliation a

leading object in all their designs: and they were most likely to effect this by the destruction of her commerce. The French then looked forward, through Egypt, to the subjugation of the East Indies; and, to execute this daring and desperate undertaking, Buonaparte was appointed commander in chief of the army of the East. In this station he accordingly embarked at Toulon with about 35,000 men, and after stopping at Malta, which he plundered, he pursued his voyage for the coast of Egypt, where he arrived on the 1st of July 1798. The army disembarked the same night, and on the 2nd they reached Alexandria, which was taken by assault on the evening of the 5th. From Alexandria the French marched for Cairo, in the course of which they had several skirmishes with the Mamelukes; but arrived on the 20th within six miles of Grand Cairo, which surrendered on the 23d of the same month. On the 25th the French general attacked one of the enemy's posts at Lambabe, in which about 300 of the enemy fell; but this was only a prelude to the battle of the Pyramids, which took place on the 26th, and from the issue of which the French appeared masters of Egypt. Of about 10,000 Mamelukes, 1000 were killed, 1000 drowned, and the rest fled, many of them wounded: 400 camels loaded with baggage, 300 horses richly accoutred, and fifty pieces of artillery, fell into the hands of the conquerors. But though the good fortune of Buonaparte seemed thus far to have followed him in Egypt, he soon experienced a reverse of an irreparable nature. This was no less than the destruction of his fleet: an event so disastrous to him, he appeared to have no suspicion of, and its effects, heightened by the disappointment he met with at Acre, were displayed in his future desperate conduct. After the surrender of Cairo, Buonaparte formed his army into three divisions, one of which, under Desaix, he destined for Upper Egypt, to pursue the flying Mamelukes; another he appointed for the defence of Cairo, while he marched himself, at the head of the third, in pursuit of Ibrahim Bey, who had taken his route towards Syria with a valuable caravan. In order, however, to oppose and prevent the execution of Buonaparte's designs in Egypt, the British government entered into an alliance with the Porte, and a plan was concerted betwixt them, the chief preparations for the accomplishment of which were made in Syria, under the superintendence of the pacha Djezzar. An army from Asia Minor was to make an attack upon the frontiers of Egypt towards Syria, while its operations were to be favored by making a powerful diversion towards the mouths of the Nile, as well as by different assaults to be made in Upper Egypt, with the remains of Mourad Bey's army. Sir Sidney Smith sailed from Portsmouth to direct the execution of this extensive plan, and to co-operate, as much as possible, towards its success, with the maritime force under his command. Care was taken, in the mean time, to block up the harbour of Alexandria with four ships of the line and five frigates, under the command of commodore Hood, who, without the assistance of a land force sufficient to attack Alexandria, found it impracticable to burn or destroy the French fleet.

of transports. The report that the French vessels in the old port were burnt, he also found to be groundless; and he had made no use of the light vessels sent him by the combined fleet of Turks and Russians. Buonaparte, understanding what was going on, quickly formed the design of leaving Egypt, and of marching into Syria, for the purpose of destroying the preparations of the pacha Djezzar, and of disconcerting the plans of Sir Sidney Smith; but the result of this enterprise proved the reverse of the hero's expectations. Jaffa, the ancient Joppa, did not surrender till it had made an obstinate defence, and even then it was only to the superiority of European tactics. From Jaffa the hitherto triumphant general marched his army, in three divisions, against St. Jean d'Acre; but here he was obliged to stop, for the pacha, encouraged and supported by Sir Sidney Smith, baffled all his attempts upon the place, during a siege of about two months; and, after the loss of nearly the half of his army, he was forced to return to Egypt. Perhaps, however, the ultimate cause of Buonaparte's mortification at Acre, was the interception of his heavy artillery by the British, on their way from Damietta and Rosetta. The French troops reached Grand Cairo in twenty-six days after raising the siege of Acre; yet, in the course of this rapid march, they ravaged the whole country, burnt the harvests, destroyed the defences of the different ports, the magazines, and every thing that could be of avail to the Turks in approaching the frontiers of Egypt. In the mean time Sir Sidney Smith, with the greatest promptitude, had continued the execution of the remaining parts of the plan of operations against the French in Egypt, in which he was seconded by the increasing zeal of the Turks. Seid Mustapha Pacha had assembled, at the different ports in the island of Rhodes, the troops which were to attack Alexandria, under the conduct of European officers; and the combined fleet of Turkey and Britain were to sail for Egypt as soon as a convoy, to be sent by the captain pasha, then lying at anchor in the Dardanelles, should arrive at Rhodes. Buonaparte, on his part, was no less active: after subduing, in a great measure, a spirit of rebellion which had been industriously raised in the minds of the inhabitants in his absence, he turned his attention to the re-organisation of his army, which had suffered severely in the expedition to Syria; and so assiduous was he in this matter, that his troops were fit for action in about three weeks. But when in the neighbourhood of the Pyramids, intending to pursue Mourad Bey in his retreat to Fayoum, intelligence was brought him from Alexandria, that a Turkish fleet of 100 ships had anchored in the bay of Aboukir, from which 3000 troops had landed, and taken the fort of Aboukir by assault, and massacred the garrison of 500 men. He accordingly directed his officers to lead their forces towards the place of landing, and appointed the first rendezvous of the army to be at Ramanieh, on the left bank of the Nile. General Murat, with the advanced guard under him, took the route to Gizeh, and the moveable column under general Menou, together with the park of artillery and the staff, formed a junction at Ramanieh on the 20th of

ilitary implements: Mourad him-  
with difficulty, and being obliged  
ough the inhospitable deserts of  
in quest of an asylum, and the  
life. This man having been a  
midable opponent to the French,  
sined, if possible, to cut him off,  
urpose, he quickly organised two  
fantry, mounted on dromedaries,  
mand of one himself, and giving  
jutant-general Boyer, who came up  
in the desert of Sediman on the  
r, after a forced march of three days.  
ate conflict ensued, in which the  
emed determined to get possession  
aries, but the republicans soon put  
and pursued them back to the de-  
ish fleet of eighteen sail had come  
e Damietta on the 24th September,  
end of October, was increased to  
with Sir Sidney Smith on board  
naval commander. From this  
st November, about 4000 Turks  
who were quickly attacked by  
e at the head of 1000 men; and  
ual the contest would seem, the  
ld, lost no fewer than 3000 men  
boners, including Ismael Bey the  
mand, thirty-two stand of colors,  
t of cannon. This was succeeded  
of battles of less note, in which  
the French was various; and they  
ag to evacuate Egypt upon cer-  
s, which were signed at El-Arish  
ber and Sir Sidney Smith. These,  
e afterwards rejected, through a  
icy not easily accounted for, and  
e started against the evacuation  
sch, in the opinion of some, was  
h to be desired by the remains of  
e east, while the republicans re-  
ere was any occasion for such a  
ing out that they had still 20,000  
in that quarter of the globe, sharing  
the affections of the inhabitants.  
ere accordingly renewed, and the  
l Kleber, though now in unfavora-  
ces, after defeating the Turks with  
mbars, took Cairo by storm, and  
nce with Mourad Bey; but was af-  
terously assassinated by a janissary,  
ng the commander with a memo-  
usal. Upon this, after some other  
cularly Reynier, had declined the  
d, it was accepted of by Menou;  
rifice had subsisted between him  
sised suspicions that he had hired  
but the dying assertions of the  
e was impaled alive, his right hand  
l his body left to be devoured by

e combined powers, as the grand  
olved to march against the enemy

with 30,000 men, if he did not listen to the pro-  
posals. They were soon given to understand  
that he would hearken to no overtures of accom-  
modation which they could make; for he had  
resolved to advance against Syria with the prin-  
cipal part of his army. This was an enterprise  
in which Buonaparte had failed, when opposed by  
Sir Sidney Smith: but Menou had lately been  
joined by a number of the Beys, with a view o.  
securing their independence, having been alarmed  
with the idea that the sublime Porte was deter-  
mined to subdue Egypt and destroy the Mame-  
lukes: among others, the junction of Mourad  
Bey was of considerable importance to Menou,  
on this occasion. Alexandria, Damietta, and  
Rosetta, were strongly fortified by Menou, who  
also finished the lines begun by colonel Bromley  
at Aboukir, making several important addi-  
tions; every place was put in such a state of  
defence, as appeared to defy any attack from the  
Turks. Great Britain, in the mean time, had  
determined on compelling the French troops to  
evacuate Egypt, that all apprehensions might be  
quieted respecting the East Indies from that  
quarter; and, with this view, an army was or-  
ganised for the invasion of Egypt, the command  
of which was given to one of the most eminent  
and worthy officers of the brilliant age in which  
he lived, general Sir Ralph Abercromby. The  
ships with the troops anchored in the bay of  
Aboukir on the 2nd of March, but on account  
of the unfavorableness of the weather they  
did not begin to disembark till the morning  
of the 8th. In order to oppose the landing  
of the British forces, about 4000 of the French  
had marched from Alexandria, and taken  
their station on the heights of Aboukir; thus  
an action soon took place between the hostile  
armies, but after about two hours fighting the  
republicans retreated, and they were pursued to  
the walls of Alexandria. Passing over the  
skirmishing occurrences of the few following  
days, an action of the utmost moment took place  
on the 21st of March, when the French ad-  
vanced with their whole force, amounting to  
11,000 men, and attacked the British, about  
four miles from Alexandria, two hours before  
day-break. They commenced by a false attack  
on the left of the British army, but were still  
more desirous to have turned the right of their  
opponents, which they attempted in vain. Nor  
were they more successful in their attack upon  
the central division. The conflict, however,  
was obstinate and bloody; and though the  
French were completely defeated, with the loss  
of 3000 men killed and wounded (among whom  
were three generals; Roize, who was left dead  
on the field, and Lanusse and Rodet, who both  
died of their wounds soon after), this was not  
effected without considerable loss on the part of  
the British, who had soon to lament the death of  
their illustrious commander. The brave general  
Abercromby 'was mortally wounded early in the  
action, but continued delivering his orders with  
that coolness and perspicuity which ever dis-  
tinguished him. His situation was not known  
till after the battle, when, having fainted with  
loss of blood, he was carried on board lord  
Keith's ship, where he died eight days after the

engagement, in which, like Epaminondas, and like Wolfe, he lost his life, after having led on his soldiers to a glorious victory.' Had it not been for the inferiority of the British cavalry (the wretched horses they were obliged to purchase at Marmorice Bay) to that of the enemy, whose retreat was also covered with cannon on the top of the hills, British valor would have this day completed the purpose for which it was displayed in this quarter. But general (since lord) Hutchinson, succeeding the gallant Abercromby as commander in chief of the British forces, was now to direct them to the expulsion or the exclusion of the French. The town and castle of Rosetta were taken by a division of the British army under colonel Spencer, aided by a body of the Turks; and early in May a strong detachment was sent against Cairo. On the 19th of the same month the French were attacked near Ramanieh, by a body of the Turks assisted by the British when they were repulsed, and obliged to retire towards Cairo; and about the middle of June the city of Cairo was invested on all sides by the united forces of the British and the grand vizier. On the 22nd of June the garrison of Cairo sent a flag of truce to the British general, and, after a negotiation of several days, a convention was agreed to, by which the French troops at Cairo and its dependencies were to be conveyed in ships of the allied powers, and at their expense, together with their baggage, arms, ammunition, and effects, to the nearest French ports in the Mediterranean. Alexandria held out some time longer, and Menou had resolved on defending it to the last, but he was soon obliged to surrender, upon the conditions of the convention of Cairo, for himself and the army under his command; and thus the whole of Egypt was left in the possession of the allies. After the evacuation of Egypt, by the French, the English endeavoured to effect a reconciliation between the Mamelukes and the Turks, to restore the former government of the country: but the Turks treacherously assassinating a number of the beys, the remainder fled into Upper Egypt, and the Porte, being unable to subdue them, concluded a treaty with them, allowing them the possession of that part of the country. In consequence, however, of mutinies and intestine contentions among the Turkish troops, the Mamelukes soon returned into Lower Egypt, making the country a scene of anarchy and confusion, alternately ravaged by the contending parties. A small body of British troops, under the command of general Fraser, again landed on the coast of Egypt, on the 17th of March 1807, to whom the town and fortress of Alexandria surrendered on the 21st of the same month, though they were afterwards unfortunate; but as this enterprise took place in consequence of a rupture betwixt Britain and the Ottoman Porte, through the ascendancy of the French ambassador in the Turkish councils, it will fall more properly to be noticed under the article TURKEY.

At this period Mohammed Aly, the present pacha of Egypt, had recently been invested with that authority. He is a singular despot who, beginning his career in blood (for in the year

ry on each side of the Nile, as far as Sennaar under his subjection, and for this purpose an army, under his youngest son Ismael. His activity and rapid progress of this young man, his humanity and traits of generosity to his prisoners and the conquered inhabitants, several instances are recorded. One act of severity, however, proved fatal to him. He had ordered, when at Sennaar, one of the chiefs of that country to be bastinadoed, seized the first favorable occasion to avenge himself. Ismael had gone to a village at some distance from Sennaar, with a small guard of men; the chief, with a party, followed him thither, and, surprising his lodgings by night, stabbed him to the heart with a poniard, and most of his guards fell in the scuffle.

One of the objects of this expedition was that of uniting his army with the blacks of Sennaar, Kordofan, and the neighbouring countries, which was accomplished to the number of 16,000 to 18,000 men. These unhappy creatures were all of them, in the first place, vacillating, and were then instructed in manual and military evolutions, in the European manner, by some French officers. The hopes of them, however, were greatly disappointed in the black troops. They were strong able-bodied men, and not averse from being taught; when attacked by disease, which soon broke out in the camp, they died like sheep infected with the rot; such was the dreadful mortality that, at the end of the campaign, that, out of 18,000 of these unfortunate creatures, 1000 did not remain alive at the end of two

months. He now had recourse to a regular conscription of the Arabs or Fellahs, of whom he seized 30,000 indiscriminately, and had them conveyed to Upper Egypt under a military guard, with the remains of the black slaves, the Mamelukes, and the Mameluke officers, composed the pacha's present army. Twelve Europeans, chiefly Italians, were employed as instructors, at their head is placed colonel Léveillé, and the camp is under the command of Marshall Ney. A conscription took place in 1814, of 15,000 men, it being the intention of Mohammed Aly to raise up an army of 40,000 men, one battalion of which is to be stationed at Alexandria, trained as marines for his navy, which is composed of forty vessels of different rates, the crews being entirely Arabs. His adoption of European tactics has been thought by some to be preparatory to throwing off his allegiance to the Porte, to whom it is supposed he has given irreparable offence by his former expulsion of the Greeks: he has lately, however, made the amende honorable, we presume, by his expedition against the Greeks; and his negotiations with the Porte have been splendid and successful.

We again advert to the statistical and other particulars of this interesting country, with a view to furnishing the reader with the latest information of travellers on these points.

The river Nile, when swelled by the rains that in Abyssinia, begins to rise in Egypt the month of May; but the increase is insensible till towards the end of June, when

it is proclaimed by a public crier through the streets of Cairo. About this time it has usually risen five or six cubits; and, when it has risen to sixteen, great rejoicings are made, and people cry out *Waffah Allah*, i. e. God has given abundance. This commonly takes place about the end of July, or before the 30th of August; and the sooner it takes place, so much the greater are the hopes of a good crop. Sometimes, though rarely, the necessary increase does not take place till later. In 1705 it did not swell to sixteen cubits till the 19th of September, the consequence of which was, that the country was depopulated by famine and pestilence. We may easily imagine, that the Nile cannot overflow the whole country of itself, in such a manner as to render it fertile. There are, therefore, innumerable canals cut from it across the country, by which the water is conveyed to distant places, and almost every town and village has one of these canals. In those parts of the country which the inundation does not reach, and where more water is required than it can furnish, as for watering of gardens, &c., they have recourse to artificial means for raising it from the river. Formerly they made use of Archimedes's screw, but now, in place of it, they have the Persian wheel. This is a large wheel turned by oxen, having a rope hung with several buckets which fill as it goes round, and empty into a cistern at the top. Where the banks of the river are high, they frequently make a basin in the side of them, near which they fix an upright pole, and another with an axle across the top of that, at one end of which they hang a great stone, and at the other a leathern bucket; this bucket, being drawn down into the river by two men, is raised by the descent of the stone, and emptied into a cistern placed at a proper height. This kind of machine is used chiefly in the upper parts of the country, where the raising of water is more difficult than in places near the sea. When any of their gardens or plantations want water, it is conveyed from the cisterns into little trenches, and from thence conducted all round the beds in various rills, which the gardener easily stops by raising the mould against them with his foot, and diverts the current another way as he sees occasion. The rise of the inundation is measured by an instrument adapted for the purpose, called *mikeas*, which we translate *nilometer*. It is a round tower near Cairo, with an apartment, in the middle of which is a cistern neatly lined with marble. The bottom of this cistern reaches to that of the river, and there is a large opening by which the water has free access to the inside. The rise of the water is indicated by an octagonal column of blue and white marble, on which are marked twenty cubits of twenty-two inches each. The two lowermost have no subdivisions, but each of the rest is divided into twenty-four parts, called *digits*; the whole height of the pillar being thirty-six feet eight inches. When the river has attained its proper height, all the canals are opened, and the whole country laid under water. During the time of the inundation a certain vertical motion of the waters takes place; but, notwithstanding this, the Nile is so easily managed, that many fields

lower than the surface of its waters are preserved from injury merely by a dam of moistened earth, not more than eight or ten inches in thickness. This method is used particularly in the Delta when it is threatened with a flood. As the Nile does not always rise to a height sufficient for the purposes of agriculture, the former sovereigns of Egypt were at vast pains to cut proper canals to supply the deficiency. Those which convey the water to Cairo, into the province of Fayoom, and to Alexandria, have always been best taken care of by the government.

The lands inundated by the Nile, as we have observed, are exceedingly fertile; and though they have successively from year to year, without intermission, borne one and frequently two crops, and without any rational system of invigoration by manure or otherwise, for more than 3000 years, they still continue to do the same without any perceptible impoverishment, and without any further tillage than the adventitious top-dressing of black slimy mould, by the overflowing of the river. But the productiveness of the soil, where the inundation does not reach, has been greatly over-rated. The crops of wheat in particular are scanty, not above five or six for one; but for maize and dourra, or millet, the soil appears to be peculiarly adapted; and these two species of grain, with rice, lentils, and various kinds of pulse, constituting the principal food of nine-tenths of the inhabitants, allowed the government, who usurped the monopoly, to export the greater part of the wheat produced. Since the peace of Europe, however, this branch of commerce has nearly ceased, in consequence of the increased cultivation of that grain in other countries. At one period not less than 800 or 900 European vessels annually sailed from Alexandria, for Marseilles, Genoa, Leghorn, Trieste, Malta, and Constantinople, freighted with articles of raw produce in exchange for hard money or for the manufactures of those respective countries; while two or three cargoes were all that could be got together for England. But, in the year 1821, an experiment was made by an English merchant, of a cargo of linseed for crushing; when it was found that, notwithstanding the freight (on account of the greater distance) doubled that which is paid from Russia, it would answer as a return for British exports, if relieved from the heavy quarantine duty, to which Baltic seed is not subject; this duty was accordingly mitigated by the lords of the treasury, and, in consequence, the exportation direct from Egypt to England increased last year to 25,000 quarters, and gave employment to more than twenty British ships. An article of the very first importance to the commerce and manufactures of England has recently been raised in Egypt, and to such an extent as to have surpassed all expectation. We allude to cotton wool, not of the usual coarse kind hitherto grown in Egypt, but of a very superior quality, raised from Brasil seed. The first essay was made by order of the pacha, in the year 1822, when the crop yielded about 25,000 bags, of two cwt. each. A few bags of this cotton, sent to Liverpool on

trial, were per pound interval, to South of the country it is calculated to be exported to year; and of this use neglected, and digging Nile; so the double the years will, what is now is by no means supply acquisition in British increase of

Mohamm opening the ones. Am is particularly the harbor Fouah; by can be brought to the port, when a sea Europe, still abundance, of the Nile, weather also conveyed in the Alexandria, which ultimately others went came incalculable was now the canal were set about the laboring class requisition, provide business and district it. The Am and tens of chiefs, along however extremely best authorities employed at or about six weeks, and the occupations were called, and make the considerable by eight miles from fifteen opened with cember 1811

Until late were at a Even the motions are still their cabinet is clumsy; powder and

still indifferent. The only thing in which they can be said to have arrived at any degree of perfection, is the manufacture of silk stuffs; though even these are far less highly finished than those of Europe, and likewise bear a much higher price. One extraordinary art indeed is still extant among the Egyptians, and appears to have existed in that country from the most remote antiquity; a power of enchanting the most deadly serpents in such a manner, that they allow themselves to be handled, nay even hurt and wounded severely, without offering to bite the person who injures them. Those who have this art are named *PSYLLI*, or serpent charmers. But the pacha has introduced colleges and academies for the instruction of youth in foreign languages and mathematics; afforded toleration to all the European and other religious sects; and encouraged the practice of vaccination and the surgery and pharmacy of Europe.

Mr. Bruce gives a long account of the sources of the vast quantities of marble, met with in the remains of ancient buildings in this country; and which supplied in ancient times, we know, the materials of many of the public buildings of Italy. These he discovered during his journey from Kenne to Cosseir on the Red Sea, before he went to Abyssinia. At Hamra the Porphyry Mountains and quarries begin, the stone of which is at first soft and brittle; but the quantity is immense, as a whole day was taken up in passing by them. These Porphyry Mountains begin in the latitude of nearly  $24^{\circ}$ , and continue along the coast of the Red Sea to about  $22^{\circ} 30'$ , when they are succeeded by the marble mountains; these again by others of alabaster, and these last by basaltic mountains. From the marble mountains our author selected twelve kinds, of different colors, which he brought along with him. Some of the mountains appeared to be composed entirely of red and others of green marble, and by their different colors afforded an extraordinary spectacle. Not far from the Porphyry Mountains the cold was so great, that his camels died on his return from Abyssinia, though the thermometer stood no lower than  $42^{\circ}$ . Near Cosseir he discovered the quarries whence the ancients obtained those immense quantities of marble, with which they constructed so many wonderful works. The first place, where the marks of their operations were very perceptible, was a mountain much higher than any they had yet passed, and where the stone was so hard that it did not yield to the stroke of a hammer. In this quarry he observed that some channels for conveying water terminated; which, according to him, shows that water was one of the means by which these hard stones were cut. In four days, during which our author travelled among these mountains, he says, that he had 'passed more granite, porphyry, marble, and jasper, than would build Rome, Athens, Corinth, Syracuse, Memphis, Alexandria, and half a dozen such cities.' It appeared to him that the passages between the mountains and what he calls defiles, were not natural but artificial openings; where even whole mountains had been cut out, in order to preserve a gentle slope towards the river. This descent

Mr. Bruce supposes not to be above one foot in fifty; so that the carriages must have gone very easily, and rather required something to retard their velocity than any force to pull them forward. Concerning the mountains in general, he observes, that the porphyry is very beautiful to the eye, and is discovered by a fine purple sand without any gloss. An unvariegated marble of a green color is generally met with in the same mountain; and where the two meet, the marble becomes soft for a few inches, but the porphyry retains its hardness. The granite has a dirty brown appearance, being covered with a sand; but, on removing this, it appears of a gray color with black spots, with a reddish cast all over it. The granite mountains lie nearer to the Red Sea, and seem to have afforded the materials for Pompey's pillar. The redness above mentioned seems to go off on exposure to the air; but re-appears on working or polishing the stone farther. The red marble is next to the granite, though not met with in the same mountain. There is also a red kind with white veins, and vast quantities of the common green serpentine. Some samples of that beautiful marble named Isabella, were likewise observed; one of them of that yellowish cast called quaker color, the other of the bluish kind named dove color. The most valuable kind is that named *verde antico*, which is found next to the Nile in the mountains of serpentine. It is covered by a kind of blue fleaky stone, somewhat lighter than a slate, more beautiful than most kinds of marble, and when polished having the appearance of a volcanic lava. In these quarries the *verde antico* had been uncovered in patches of about twenty feet square. There were small pieces of African marble scattered about in several places, but no rocks or mountains of it; so that our author conjectures it to lie in the heart of some other kind. The whole is situated on a ridge with a descent to the east and west, by which means it might easily be conveyed either to the Nile or Red Sea; while the hard gravel and level ground would readily allow the heaviest carriages to be moved with very little force. In the Red Sea in lat.  $25^{\circ} 3'$ , at a small distance from the south-west coast, there is an island called the Mountain of Emeralds; but none of these precious stones are to be met with there. Here, as well as on the continent, there were found many pieces of a green pellucid substance; but vemed, and much softer than rock crystal, though somewhat harder than glass. A few yards up the mountain he found three pits, which are supposed to have been the mines whence the ancients obtained the emeralds; but, though many pieces of the green substance above mentioned were met with about these pits, no signs of the true emerald could be perceived. The substance, however, he conjectures to have been the *smaragdus* of the Romans. In the mountains of Cosseir, as well as in some places of the deserts of Nubia, our author found some rocks exactly resembling petrified wood. The only metal said by the ancients to be produced in Egypt is copper. On the road to Suex are found great numbers of Egyptian flints and pebbles, though the bottom is a hard, calcareous,

and sonorous stone. Volney tells us that the stones above-mentioned, which resemble petrified wood, are to be met with here. They are in the form, he says, of small logs cut slanting at the ends, and might easily be taken for petrifications, though he thought them real minerals.

Besides camels, horses, asses, mules, sheep, black cattle, and other domestic quadrupeds, there are many wild animals in Egypt; particularly tigers, hyenas, antelopes, crocodiles, apes with heads resembling those of dogs, hippopotamuses, ichneumons, chameleons, yellow lizards, and a species of rat's resembling ferrets, remarkably useful for destroying the crocodiles' eggs. Among the feathered tribe, there are ostriches, eagles, hawks, pelicans, and water fowls of various kinds, among which last the most remarkable is the ibis, a bird of the duck kind, which was deified by the ancient Egyptians, on account of its usefulness in destroying serpents, and noxious insects. These are numerous, and among the different species of serpents the cerastes, or horned viper, abounds, whose bite proves mortal, except to those who have the secret of charming it.

F. Sicard mentions two salt lakes situated in the desert west of the Delta, three or four leagues in length, and about a quarter of a league in breadth, with a solid and stony bottom. For nine months in the year they are without water; but in winter there oozes out of the earth a reddish violet-colored water, which fills the lakes to the height of five or six feet. This being evaporated, by the return of the heat, there remains a bed of salt two feet thick and very hard, which is broken in pieces with iron bars: and from these lakes no less than 30,000 quintals of salt are procured every year.

Besides the ordinary winds before mentioned, Egypt is infested, as we have also intimated, with the destructive blasts common to all warm countries which have deserts in their neighbourhood. These have been distinguished by various names, such as poisonous winds, hot winds of the desert, Samiel, the wind of Damascus, Kamsin, and Simoom. In Egypt they are denominated 'winds of fifty days, because they most commonly prevail during the fifty days preceding and following the equinox, though, should they blow constantly during one-half of that time, a universal destruction would be the consequence. Of these travellers have given various descriptions. M. Volney says that the violence of their heat may be compared to that of a large oven at the moment of drawing out the bread. They always blow from the south, and are undoubtedly owing to the motion of the atmosphere over such vast tracts of hot sand, where it cannot be supplied with a sufficient quantity of moisture. When they begin to blow, the sky loses its usual serenity, and assumes a dark, heavy, and alarming aspect, the sun laying aside his usual splendor, and becoming of a violet color. This terrific appearance seems not to be occasioned by any real haze or cloud in the atmosphere at that time, but solely by the vast quantity of fine sand carried along by those winds, and which is so excessively subtile that it penetrates every where. The motion of this wind is always rapid, but its

heat is not for some time, and putrefies of such a nature is soon evaporated, withered, and putrefies by the sun, lasts three, if it continues the greatest of travellers without a case is to a kerchief. their noses, the squall, an opportunity, stantly, pits made, be over. which over is still more

There are principally every kind, money trans, Greek Chris, 3000 in Cal

**Egypt:** they were formerly the wholesale merchants who supplied the land proprietors and others with various kinds of articles, and were in general wealthy; but the monopoly of the viceroy has very considerably impoverished them. There are about 5000 descendants of the ancient Greek colonists, who form quite a distinct race from the modern Greeks: these people have lost their ancient language, and speak a kind of Arabic; many of them are mariners, but in general they pursue the inferior and handicraft trades. According to the latest computations, there are about 4000 Jews in Egypt. 3000 of whom inhabit a part of Cairo, called after them the Jews' quarter, of which the streets are so narrow as to be almost impassable; the houses are dark, crowded together, filthy, and so infectious that, when the plague breaks out, the first enquiry is, If it has appeared in the Jews' quarter?

M. Mengin, the author of *L'Histoire de l'Egypte, sous le Gouvernement de Mohammed Aly*, reckons, in Cairo, eight persons to each house, and in the provinces four. The account then stands thus:

	Houses.	Inhabit.
In Cairo . . . . .	25,000	200,000
In the provincial towns of Alexandria, Rosetta, Damietta, Old Cairo, and Boulak . . . . .	14,532	58,123
In fourteen provinces, containing 3475 villages . . . . .	564,168	2,256,272
	<hr/> 603,700	<hr/> 2,514,400

Cairo being the only city of Egypt which contains any great accumulation of inhabitants, built by Gaubar, a general in the service of the first khalif of the race of the Fatemites of Egypt, in the year 358 of the hegira (968 of the Christian era), it was surrounded with walls by Saladin. For the last 300 years its splendor has declined considerably; and the palaces of Mohammed Aly are mean and ill contrived. But here are 240 principal streets, forty-six public places, eleven bazaars, 140 schools, 300 public cisterns, and 400 mosques.

The Copts are by far the most numerous class of Christians in Egypt, amounting at least to 160,000, of whom about 10,000 inhabit the two most populous quarters of Cairo. In towns they practise different trades, but the greater part of them labor on the lands, among the Fellahs. Under the government of the Mamelukes the Copts were employed in taking an account of, and collecting, the revenues of the villages; and many of them still hold situations of this kind, and as writers about the court. They are austere and forbidding in their manners, generally silent, and wearing an air of melancholy; but are said to be tyrannical when in authority.

The oriental race of Fellahs compose the chief part of the population of Egypt, a mixture, perhaps, of ancient Egyptians, Arabians, and Syrians; they approach nearest to the Copts, in general appearance and manners, but they are rigid Mussulmen, and strictly observe the rites and ceremonies laid down by their sheiks or

priests. They labor hard on the soil, and live in the most abstemious manner on dourra, dwell in cottages of unbaked bricks, are clothed in coarse woollen cloth, and sleep on mats: those in the towns exercise handicraft trades, and keep shops in the bazaars, which they only quit to attend the mosques. Like all orientals, they are fond of frequenting coffee-houses, and listening to the tales of pretended magicians, or the rude music of strolling singers. In meekness and apathy they cannot be exceeded.

'The tented Arab,' says an able article on Egypt in the *Quarterly Review*, 'hovering with his flocks along the borders of the fertile valley of the Nile, is the same in character, manners, and customs, as he every where else is, and apparently has been, in all times since the days of the patriarchs, regarding with disdain and proud independence all other classes of mankind, but more particularly those of his own nation, who, in his eyes, have degraded themselves by taking up their abodes in fixed habitations, and whom he calls in contempt haty, or Arabs of the walls. Those who turn cultivators are equally despised, and considered in the light of Fellahs, with whom an alliance by marriage would be regarded as dishonorable. The Arab women have fine features and complexions; they are much fairer than the Egyptian women, and far more correct in their conduct. In cases of infidelity, the injured party takes the law into his own hands, and the culprit is generally punished with death.'

The Egyptian women, like other oriental females, are the mere slaves of their husbands' or their owners' caprices; and thus their degraded condition is one of the greatest obstacles to the civilisation of Egypt, and one of the last that will probably be removed, connected as it is with the precepts of the Mahomedan law. M. Mengin, however, states the women of late, whether married, or slaves from Georgia, Circassia, and Mongrelia, are allowed frequently to quit the harem, and that accompanied by a confidante, under pretext of going to the bath, or of making visits, they indulge with impunity in illicit amours.

A *cady*, or judge, sent from the Porte annually, settles all lawsuits and criminal prosecutions: under him are the sheiks and others, learned in the law. A civil process is stated to cost about 4 per cent. of the value in dispute, of which the cady takes four-fifths for himself, and gives one-fifth to the other lawyers. All minor disputes and complaints are brought before the Kiaya-bey. His officers are the Agha of the janissaries, who is charged with maintaining good order, and especially among the soldiers; the ouah, or agha of the police, who looks after the thieves and prostitutes, on both of whom he levies contributions for the support of himself and his myrmidons. The motecb regulates the weights and measures; the bache-aghia has the direction of the patrols, and the spies who frequent the coffee-houses, bazaars, and other public places; and, in addition to these, there is a head-man in every quarter of the city for settling disputes and preserving peace. This is said to be so effectually done, that the streets of Cairo are as safe as those of London, except on occa-

sions when the military break loose or want of pay, or to avenge themselves of some grievance.

Of the information upon Egypt, afforded to us by the intelligent Dr. Clarke, the following is a summary:—In his passage from Acre to Aboukir, he witnessed a phenomenon, formerly noticed, but also by some writers strenuously disputed. 'As we were sitting down to dinner, the voice of a sailor employed in heaving the lead, was suddenly heard calling 'half four!' The captain, starting up, reached the deck in an instant; and almost as quickly putting the ship in stays, she went about. Every seaman on board thought she would be stranded. As she came about, all the surface of the water exhibited a thick black mud: this extended so widely, that the appearance resembled an island. At the same time no land was really visible, not even from the mast-head, nor was there any notice of such a shallow in any chart on board. The fact is, as we learned afterwards, that a stratum of mud, extending for many leagues off the mouth of the Nile, exists in a moveable deposit near the coast of Egypt, and, when recently shifted by currents, it sometimes reaches quite to the surface, so as to alarm mariners with sudden shallows, where the charts of the Mediterranean promise a considerable depth of water. These, however, are not, in the slightest degree, dangerous. Vessels no sooner touch them than they become dispersed; and a frigate may ride secure, where the soundings would induce an inexperienced pilot to believe her nearly aground.'—Vol. iii. p. 13.

He left Rosetta on the morning of August 10th, and proceeded up the Nile to Cairo, then occupied by the English and their Turkish allies. 'A vessel leaving Rosetta, is driven by the wind,' he says, 'with extraordinary velocity against the whole force of the torrent to Cairo, or into any part of Upper Egypt. For the purpose of her return, with even greater rapidity, it is only necessary to take down the mast and sails, and leave her to be carried against the wind by the powerful current of the river. It is thus possible to perform the whole voyage from Rosetta to Bulac, the quay of Cairo, and back again, with certainty, in about seventy hours, a distance equal to 400 miles.'—p. 32.

Of the population, fertility, and beautiful groves of Lower Egypt, our traveller speaks with his usual eloquence.

Throughout the Delta irrigation is carried to a vast extent, but it is effected, for the most part, by artificial means; and an exaggerated idea of the effects of the Nile is conveyed by the beautiful description of Gray. Extensive canals on each side of the river conduct its waters to the utmost extent of their level, but the fields are many of them supplied by water-wheels, or the still simpler process of lading. The soil thus treated produces three crops in the year—clover, corn, and rice, of which the last is sown while the field is actually under water, a practice which, as Dr. Clarke observes, is alluded to by Solomon (Eccles. ii. 1). The eastern sycamore attains an enormous size, and its boughs are so bent by the prevalent winds as to make them resemble a peacock's tail. The fruit resembles

in shape the common fig, but is smaller, less insipid. The thermometer stood at 90° in shade, and the inhabitants of the country walking about or engaged in the avocations of husbandry, in a state of perfect nakedness displaying a complexion of the darkest brown. They arrived at Bulac at midnight, and aroused the next morning with intelligence the pyramids were in sight. What follows Dr. Clarke's best style.

'Never will the impression made by the appearance be obliterated. By reflecting that rays, they appeared as white as snow, of such surprising magnitude, that nothing previously conceived in our imagination prepared us for the spectacle we beheld; sight instantly convinced us that no description, no delineation can convey adequate to the effect produced in viewing stupendous monuments. The formality of structure is lost in their prodigious magnitude, the mind, elevated by wonder, feels the force of an axiom, which, however deeply experience confirms,—that in vastness, what its nature, there dwells sublimity. In proof of their indescribable power is, that one ever approached them under other feelings than those of terror; which is another source of the sublime. In certain instances, an irritable feeling, this impression of awe has been so great, as to cause pain rather than pleasure; of which we shall have to meet very striking instance in the sequel. The pyramids, which represent them as deformed gloomy masses, without taste or beauty. Few who have derived no satisfaction from the contemplation of them, may not have been conscious that the uneasiness they experienced a result of their own sensibility. Other acknowledged ideas widely different, even every wonderful circumstance of character, situation; ideas of duration, almost endless power, inconceivable; of majesty, supreme solitude, most awful; of grandeur, of desolation and of repose.'—Vol. ii. pp. 44—46.

Dr. Clarke's description of Cairo is so very curious and interesting. He was at first disgusted with it as the dirtiest metropolis of the world; but the picturesque crowd of streets, and on its canals, and the foliage of gardens, no less than the splendid panorama from the heights of the citadel, had such beauty and novelty to repay this moment. Here, as in South America, the least harmless inhabitant of all the gardens is seen hanging on the walls and ceilings of the best apartments. Swarms of flies filled the dish and every drinking vessel, and the men though extolled as delightful by the British officers who had arrived from India, appeared to Dr. Clarke only tolerable to those who could condescend themselves to the listless and slothful activity of the natives and settled Franks. Clarke recognised in the funeral cries of the same mournful notes, and the repetition of the same syllables which are used, on such occasions, by the Russians and the less his observations on the mummy-pit, he is

animadvert on the falsehood of the common opinion, that the mummies were placed upright in these cemeteries, and supposes that the words of Herodotus, which have been generally quoted to this effect, relate only to those particular mummies which were kept in the houses of their descendants. The horses of our author's Arab guides were the finest he had seen in the whole course of his travels; and the Arab grooms were regarded by the English officers as superior to those even of their own country. These horses do not lie down at night, but sleep standing, with one foot fastened to the piquet.

Dr. Clarke supposes, from the decay of the obelisks at Alexandria, and from similar appearances on other ancient buildings, that granite, namely, from the decomposition of its felspar by exposure to the atmosphere, is less calculated for works of duration than pure homogeneous marble, or even than common limestone. Of the two obelisks known by the name of Cleopatra's Needles, one only is now standing. A subscription was raised by several officers of our army and navy to remove to Great Britain its fallen companion, which, as it now lies on the sand, measures seven feet square at the base, and sixty-six feet in length. Lord Cavan presided in this undertaking, which was worthy of the ancient Romans, and would, probably, have been attended with complete success, had not, for some unexplained reason, the sailors of our fleet been forbidden to assist in the labor. Dr. Clarke gives some probable reasons why the emperor named in the inscription on the base of Pompey's Pillar is not, as is generally supposed, Dioclesian but Hadrian, and attempts also to prove that this magnificent monument was really erected to the unfortunate general whose name tradition has assigned to it. The Arabs, it seems, call it the ruins of 'Julius Cæsar's palace.' Our author is among the first who has done sufficient justice to the regularity of the plan of the catacombs of Alexandria; the chaste and awful simplicity of their ornaments, and the long and gloomy arcades of this subterranean city of death. Twelve large halls, besides many smaller apartments, surrounded with places adapted to receive bodies in a recumbent posture, are disposed in a form not very dissimilar from the ancient symbol of the trident, and conclude with a circular sanctuary covered with a simple dome, which is hewn, like all the rest, in the solid rock. In this part of the excavation an ornament appears, which colonel Squire took for a crescent, but which Dr. Clarke more probably apprehended to be the winged globe, which, according to Macrobius, was the Egyptian symbol of Serapis, the lord of the dead. With this visit to Alexandria, Dr. Clarke's Egyptian travels concluded.

#### SEE ALEXANDRIA.

The splendid antiquities and ancient literature of Egypt have been abundantly illustrated by recent travellers and writers. The labors of the French Institute at Cairo are entitled, perhaps, to our first notice, for their stupendous and magnificent *Description de l'Égypte*. We may next mention Mr. William Hamilton's *Ægyptiaca*, etc. Lond. 1809, originating with the first British expedition. In October, 1801, captain Leake

and lieutenant Hayes were appointed by general Hutchinson, to make a survey of Egypt, and of the country beyond it, if it should be found practicable; and Mr. Hamilton joined these gentlemen in their expedition. Partly, however, on account of the disturbed state of the country, they were unable to proceed further south than a few hours' journey beyond Syene, to a village called Debod, opposite to which they observed the ruins of Barambre, the Parembolæ of the ancients; here also they found a Greek dedication of a temple to Isis, by Ptolemy Philometor and his queen. But they collected a variety of inscriptions from other parts of Egypt, to which they added drawings and descriptions of the architectural remains to which they belonged. At Alexandria Mr. Hamilton was enabled, in company with some other gentlemen, by examining the inscription on Pompey's pillar, in different positions of the sun, to ascertain the name Dioclesian, as that of the emperor to whom it was dedicated; and to find some traces of the name of Pompeius, a prefect of Egypt under that emperor.

Mr. Legh visited Egypt in 1812, and extended his observations as far as Itrim, within about three days' journey of the second cataract of the Nile. Accompanied by the Rev. Mr. Smelt, he engaged as an interpreter, on leaving Cairo for Upper Egypt, an American, of the name of Barthow, who had resided many years in the country. They sailed on the 13th January, and their first landing was at the ruined village of Benihasen, where they visited the excavations which Norden ascribes to 'holy hermits, who made their abodes there.' The principal chamber is sixty feet in length, and forty in height; to the south of it are seventeen smaller chambers, and probably the like number to the north. Mr. Legh says, they found it difficult to follow Mr. Hamilton's descriptions of the paintings which cover the walls of the chambers. At Ashtemoun, the site of the ancient Hermopolis, they partook of the enthusiasm with which Denon speaks of its splendid ruins; but Mr. Legh observes, that his delineation of them denotes the haste with which he travelled, for that the winged globe, represented by him on the frieze, does not exist in the original. Indeed, he found that Denon is very little to be depended on, where he does not copy from preceding travellers, or from the actual fragments carried away by the French. By his own account, he has drawn and described objects seen only in galloping past them; and, at the best, laboring under the horror of a hostile visit from the Arabs or Mamelukes. At Sout, which has succeeded to Girgeh, as the capital of Upper Egypt, they fell in with Burchardt, travelling as Stokh Ibrahim, on his way to the Great Oasis, where a tribe of Bedouins had lately established themselves. Ibrahim Bey, the eldest son of the pacha, here received them with considerable civility. Reaching Gaw-el-Kebir, the ancient Antaeopolis, on the 23th, they found the portion of the temple still standing, in the midst of a thick grove of dates, and consisting of three rows, each of six columns; they are eight feet in diameter, and, with their entablature, sixty-two feet high. Mr.

Legh thinks this venerable and gigantic ruin the most picturesque in Egypt; the columns, architraves, and every part of the building, are covered with hieroglyphics. At the farthest extremity of the temple is an immense block of granite, of a pyramidal form, twelve feet high, and nine feet square at the base, in which is cut a niche, seven feet high, four feet wide, and three feet deep.

Our travellers were forcibly struck with the luxuriant fertility of the soil along the banks of the Nile, as contrasted with the wretched state of poverty and misery of the inhabitants. 'The fields, enriched by the Nile, teem with plenty; the date-trees here are loaded with fruit; cattle of every kind, poultry, and milk, abound in every village; but the wretched Arab is compelled to live on a few lentils, and a small portion of bread and water, while he sees his fields plundered and his cattle driven away, to gratify the insatiable wants of a mercenary soldier, and the inordinate claims of a rapacious governor. After having paid the various contributions, and answered the numerous demands made upon him, not a twentieth of the produce of his labor falls to his own share; and without the prospect of enjoying the fruits of his toil, the Fellah, naturally indolent himself, allows his fields to remain uncultivated, conscious that his industry would be but an additional temptation to the extortion of tyranny.' p. 42.

Between Cafr Saide, supposed to be the site of Chenoboscia, and Diospolis Parva, the modern How, they observed, for the first time, some crocodiles basking on the sand-banks in the river, the largest apparently about twenty-five feet long. Mr. Legh thinks Girgeh the limit below which they do not descend; and they appear to be most numerous between this place and the cataracts. The superstitious natives, we are told, attribute the circumstance of crocodiles not being observed in the lower parts of the Nile, to the talismanic influence of the Mikkias, or Nilometer, at Cairo.

A fair wind wafted the travellers past Dendera, Koptos, and Kous, and on the 7th February they landed on the plain of Thebes, the city of a hundred gates, the theme and admiration of ancient poets and historians, and the wonder of every traveller in every age. The ruins extend from each bank of the Nile to the sides of the enclosing mountains. The objects which most powerfully attract the attention on the eastern side, are the magnificent temple of Karnac, and the remains of the temple of Luxor; the latter of which, Mr. Legh says, mark the southern extremity of the walls of the city on that side of the river. On the opposite, or western bank, are the Memnonium, the two colossal statues, and the remains of Médinet-Abou. The Necropolis, or celebrated caverns, known as the sepulchres of the ancient kings of Thebes, are excavations in the mountains, covered with sculptures and paintings, still in the highest degree of preservation. Of these, Mr. Legh gives no description, which indeed, without engravings, would have been of little use. For the most ample, laborious, and accurate details of these ancient ruins, says the Quarterly Reviewer,

we must consult the most reliable Po-

The time employed by Philé, and says, 'it contains one of the most woods, granite combine to form an island of Egypt not exceeded by Legh thinks temples, the ancient Egyptian masses, and finishing them with the sculptor passing to the also, that the mountains, the wedge; columns, as in great power and mighty

The boundaries of Egypt was above the earnestly exhort not to think Mamelukes the Barabra they proceed character to low sandy Jews. The or Berberins and the inhabitants have given honest people and a few medans. Faint are leaving but sibly he explained with travellers, Narrative of

down the Nile, they again visited the neighbourhood of Thebes, and landed at Manfalout, to examine some mummy-pits in the desert, near the village of Anubdi, of which they had heard an extraordinary account from a Greek, of the name of Demetrius. He told them, that in pursuing some fugitives, they were suddenly observed to disappear. On coming to the place, they found a pit, which he and some others descended; at the bottom were fragments of mummies of crocodiles scattered about, but no fugitives to be seen. This story raised the curiosity of our travellers, and they determined to visit those subterranean chambers, in which the hated crocodiles had been interred, and which to see this was not permitted to see.

The party was composed of Mr. Legh, Mr. Smith the American interpreter, an Abyssinian servant of the name of Fadlallah, and three of their boat's crew, Harabras, whom they had brought from the Cataracts. Having wandered about four hours in search of Anubdi, they at length observed four Arabs cutting wood. These people showed an unwillingness to give them any information—talked of danger—and were heard to mutter that—'if one must die all must die':—this, however, did not deter the party from proceeding. The story of this adventure is so well told, and so interesting, that, though rather long, we give it in Mr. Legh's own words.

'We were bent on going, and the Arabs at last undertook to be our guides for a reward of twenty-five piastres. After an hour's march in the desert, we arrived at the spot, which we found to be a pit or circular hole of ten feet in diameter and about eighteen feet deep. We descended without difficulty, and the Arabs began to strip, and proposed to us to do the same: we partly followed their example, but kept on our trousers and shirts. I had by me a brace of pocket pistols, which I concealed in my trousers, to be prepared against any treacherous attempt of our guides. It was now decided that three of the four Arabs should go with us, while the other remained on the outside of the cavern. The Abyssinian merchant declined going any farther. The sailors remained also on the outside to take care of our clothes. We formed therefore a party of six: each was to be preceded by a guide—our torches were lighted—one of the Arabs led the way,—and I followed him.

'We crept for seven or eight yards through an opening at the bottom of the pit, which was partly choked up with the drifted sand of the desert, and found ourselves in a large chamber about fifteen feet high.

'This was probably the place into which the Greek, Demetrius, had penetrated, and here we observed what he had described, the fragments of the mummies of crocodiles. We saw also great numbers of bats flying about, and hanging from the roof of the chamber. Whilst holding up my torch to examine the vault, I accidentally scorched one of them. I mention this trivial circumstance, because afterwards it gave occasion to a most ridiculous, though to us a very important, discussion. So far the story of the Greek was true, and it remained only to explore the galleries where the Arabs had formerly taken refuge, and where, without doubt, were deposited

the mummies we were searching for. We had all of us torches, and our guides insisted upon our placing ourselves in such a way, that an Arab was before each of us. Though there appeared something mysterious in this order of march, we did not dispute with them, but proceeded. We now entered a low gallery, in which we continued for more than an hour, stooping or creeping as was necessary, and following its windings, till at last it opened into a large chamber, which, after some time, we recognised as the one we had first entered, and from which we had set out. Our conductors, however, denied that it was the same, but on our persisting in the assertion, agreed at last that it was, and confessed they had missed their way the first time, but if we would make another attempt they would undertake to conduct us to the mummies. Our curiosity was still unsatisfied; we had been wandering for more than an hour in low subterranean passages, and felt considerably fatigued by the irksomeness of the posture in which we had been obliged to move, and the heat of our torches in those narrow and low galleries. But the Arabs spoke so confidently of succeeding in this second trial, that we were induced once more to attend them. We found the opening of the chamber which we now approached guarded by a trench of unknown depth, and wide enough to require a good leap. The first Arab jumped the ditch and we all followed him. The passage we entered was extremely small, and so low in some places as to oblige us to crawl flat on the ground, and almost always on our hands and knees. The intricacies of its windings resembled a labyrinth, and it terminated at length in a chamber much smaller than that which we had left, but, like it, contained nothing to satisfy our curiosity. Our search had hitherto been fruitless, but the mummies might not be far distant; another effort, and we might still be successful.

'The Arab whom I followed and who led the way, now entered another gallery, and we all continued to move in the same manner as before, each preceded by a guide. We had not gone far before the heat became excessive; for my own part, I found my breathing extremely difficult, my head began to ache most violently, and I had a most distressing sensation of fullness about the heart.

'We felt we had gone too far, and yet were almost deprived of the power of returning. At this moment the torch of the first Arab went out; I was close to him and saw him fall on his side—he uttered a groan—his legs were strongly convulsed, and I heard a rattling noise in his throat—he was dead. The Arab behind me, seeing the torch of his companion extinguished, and conceiving he had stumbled, past me, advanced to his assistance, and stooped. I observed him appear faint, totter, and fall in a moment—he also was dead. The third Arab came forward, and made an effort to approach the bodies, but stopped short. We looked at each other in silent horror. The danger increased every instant; our torches burnt faintly; our breathing became more difficult; our knees tottered under us, and we felt our strength nearly gone.

'There was no time to be lost—the American, Barlow, cried to us 'take courage,' and we

began to move back as fast as we could. We heard the remaining Arab shouting after us, calling us Caffres, imploring our assistance, and upbraiding us with deserting him. But we were obliged to leave him to his fate, expecting every moment to share it with him. The windings of the passages through which we had come increased the difficulty of our escape; we might take a wrong turn, and never reach the great chamber we had first entered. Even supposing we took the shortest road, it was but too probable our strength would fail us before we arrived. We had each of us separately and unknown to one another observed attentively the different shapes of the stones which projected into the galleries we had passed, so that each had an imperfect clue to the labyrinth we had now to retrace. We compared notes, and only on one occasion had a dispute, the American differing from my friend and myself; in this dilemma we were determined by the majority, and fortunately were right. Exhausted with fatigue and terror, we reached the edge of the deep trench which remained to be crossed before we got into the great chamber. Mustering all my strength, I leaped, and was followed by the American. Smelt stood on the brink, ready to drop with fatigue. He called to us 'for God's sake to help him over the fosse, or at least to stop, if only for five minutes, to allow him time to recover his strength.' It was impossible—to stay was death, and we could not resist the desire to push on and reach the open air. We encouraged him to summon all his force, and he cleared the trench. When we reached the open air it was one o'clock, and the heat of the sun about 160°. Our sailors, who were waiting for us, had luckily a bardak full of water, which they sprinkled upon us, but, though a little refreshed, it was not possible to climb the sides of the pit; they unfolded their turbans, and slinging them round our bodies, drew us to the top.

The Arab who remained at the entrance anxiously enquired for his hahabebas, or friends; he was told they were employed in bringing out the mummies; the travellers then mounted their asses, and rode forward towards the boats with all speed, but were pursued; and being brought back to Manafout, found great difficulty in escaping the vengeance of its inhabitants.

The accomplished, but unfortunate, Mr. Borchardt left England on the 21 of March, 1809, for Malta, whence he set out for Aleppo, which he reached on the 6th of July. At this place and Damascus, he spent the principal part of the next three years; during which he made a variety of excursions into the Hauran and the Lesge, visited the ruins of Palmyra and Balbec, and perfected himself in the knowledge of the religion, manners, and language of the Mahomedan Arabs. On the 18th of June, 1812, he set out from Damascus for Cairo, avoiding the usual route of the sea coast and desert between El Arish and the borders of Egypt, and directing his course, in the disguise of the poorest of the Bedouins, from the Holy Land, east of the Jordan, by Szalt, into Arabia Petrea, and across the great desert El Ty; he reached Cairo on the 4th September, with the intention of availing

himself of his passage into Africa; but, as he was on the banks of the Nile, he was obliged to stop, and he did not time in Egypt. The Cataract of Assuan is two very fine of the ancient banks of the Nile on the first of February was covered with Nubian as such as are other between year, three. The details of the vessels, are seen in Europe manufacture of all the

Captain 1818, and a but tolerable quities which contributed to European decorations in Nubia. The persons of the consul at A Montague ramid, Mr unknown, contains three succ He also we dria. The count of the Egypt by I obligations of Egypt n gant two-cl ing also a cataract; t

'By the Belzoni and the Quarter richest dep tiquities. sphynx, w

unexpected as extraordinary, were developed, pieces which, for many centuries, had not been exposed to human eyes. Among other things, a beautiful monolithic temple of very considerable dimensions was discovered between the legs of the sphynx, having within it a sculptured lion and a small sphynx. In one of the paws of the great sphynx was another temple, with a sculptured lion standing on an altar. In front of the great sphynx were the remains of buildings, apparently temples, and several granite slabs with inscriptions cut into them, some entire and others broken. One of these is by Claudius Caesar, recording his visits to the pyramids, and another by Antoninus Pius; both of which, with the little lions, are now in the British Museum. Several paint-pots were also found fronting the sphynx, with paint of different colors in them. At Thebes, M. Belzoni made many new and curious discoveries, and found many valuable relics which had escaped the ravages of the invading Persians and the modern Arabs: he has also uncovered six tombs of the kings of Egypt, which for centuries had not been entered, or, indeed, known. That of Apis he represents as uncommonly magnificent and interesting. 'It is certainly,' he says, 'the most curious and astonishing thing in Egypt, and impresses one with

the highest idea of the workmanship of the ancient inhabitants. The interior, from one extremity to the other, is 120 feet, containing a great number of apartments and galleries. The walls are every where covered with hieroglyphics and bas-reliefs, in fresco colors, which are brighter than any color we have, and as fresh as if they had been only just laid on. But the finest antique in this place is in the principal chamber. It is a sarcophagus, formed of a single piece of alabaster, nine feet seven inches long, three feet nine inches wide, the interior and the exterior being equally covered with hieroglyphics and figures, hollowed with a chisel. This sarcophagus sounds like a silver bell, and is as transparent as ice; no doubt, when I shall have it transported to England, as I hope to do successfully, it will be esteemed as one of the most precious treasures of which any European museum can boast.'

The most important, however, of M. Belzoni's labors in Egypt was the opening of the second pyramid of Gihza, known by the name of Cephrenes. But, for the particulars of this interesting operation and its results, see PYRAMIDS or EGYPT; and, for some recent discoveries in regard to THEBES, the article of that title.

**EHRENBREITSTEIN**, a once celebrated fortress of Germany, in the Lower Electorate, considered as the key of the Rhine and the Moselle, is situated near Coblenz, on the opposite side of the Rhine. It included three fortresses, the chief of which was thus named, and the other two Thal and Vallendar. The value and strength of Ehrenbreitstein have been often mentioned by travellers, but were never so fully proved, as by the resistance it made to the French, during a siege and blockade of two years, in 1795 and 1796. In 1797 it was restored to Prussia; but the works were previously blown up. Though it is closely connected with the country behind the dreary district of Weteravia, it has the appearance towards the Rhine of being nearly insular, and perfectly pyramidal. The abruptness of its elevation above Coblenz, is so little diminished by the breadth of the river, that the rock may almost be said to threaten the city like a precipice; the streets being as open to inspection from the fortress, as those of a model on a table. The only entrance into the castle from the Rhine, is by a road cut in the solid rock, under four gateways. So long ago as the fifteenth century, three years were spent in digging a well through the solid rock, to the depth of 280 feet, as is mentioned in an inscription within the castle. The possession of this castle was confirmed to the elector of Treves, in 1660, by the treaty of Westphalia; but as it was considered one of the keys of Germany, towards France, the governor always took the oath to the emperor and the empire, as well as the elector. The French plenipotentiaries at Rastadt demanded the cession of the fortress to the republic, which was obstinately refused by the deputies of the empire. At last it was mutually agreed that its fortifica-

tions should be demolished, but this was protested against by the Austrian deputy. From that period the French troops laid siege to it, notwithstanding the armistice concluded in 1795, and closely blockaded it till the 21st of January 1799, when it surrendered. At the bottom lies the small town of Thal-Ehrenbreitstein, which contains 3500 inhabitants; and carries on a brisk trade with Coblenz, by a bridge of boats across the Rhine.

**EHRET** (George Dionysius), F. R. S. an eminent botanical painter, son of a gardener of the prince of Baden Durlach, was born in 1710. Visiting Paris, he was employed in the garden of plants under the celebrated Jussieu, and then came to England. He went in 1736 to Holland, and made drawings for Chiffart of Amsterdam. Under the direction of Linnaeus, who gave him lessons in botany, he formed the figures of plants for the *Hortus Cliffortianus*, published in 1737, and returning to England, in 1740, finally settled here. He was patronised by the duchess of Portland, Drs. Stoney, Mead, and Fothergill, Ralph Willet, Esq., and other persons of taste. He died in 1770.

**EHRETIA**, in botany, a genus of the monogynia order, and pentandria class of plants; natural order forty-first, asperifoliae: fruit is a bilocular berry; stamens solitary and bilocular; the stigma emarginated.

**EHRLHARTIA**, in botany, a genus of the monogynia order, and hexandria class of plants: cal. is a two-valved, abbreviated, and one-flowered glume: cor. a double glume, each two-valved, the exterior one compressed, and somewhat shaped, transversely wrinkled, and gashed at the base. There are six stamens, three on each side the petal in a parallel line. The stigma is simple, compressed, four-tufted, and

torn at the top. Species nine, natives of the West Indies, and South America.

**EJACULATE**, *v. a.* } Lat. *ejaculator*, from *e*  
**EJACULATION**, *n. s.* } forth, and *jaculator* to  
**EJACULATORY**, *adj.* } hurl or throw, as a dart.  
 To dart out or shoot forth: applied metaphorically, to words or to acts of the mind. Ejaculation is used both for the act of darting or throwing out, and words (hence prayers) or things ejaculated: ejaculatory is throwing, or having the power of throwing out: hence, uttered shortly or suddenly, and sudden or hasty.

There seemeth to be acknowledged, in the act of envy, an *ejaculation* or irradiation of the eye.

*Bacon's Essays.*

In your dressing let there be *ejaculations* fitted to the several actions of dressing; as at washing your hands, pray to God to cleanse your soul from sin.

*Taylor's Guide to Devotion.*

The continuance of this posture might incline to ease and drowsiness; they used it rather upon some short *ejaculatory* prayers, than in their larger devotions.

*Guyar's Devotion.*

We are not to value ourselves upon the merit of *ejaculatory* repentances, that take us by his end starts.

*L'Estrange.*

Being rooted so little way in the skin, nothing near so deeply as the quills of fowls, they are the more easily *ejaculated*.

*Grew's Museum.*

The mighty magnet from the centre darts  
 This strong, though subtle force, through all the parts:

Its active rays *ejaculated* thence,

Irradiate all the wide circumference.

*Blackmore.*

He whose *ejaculatory* uses of God's name are not prayers for some one, will find them curses to himself.

*Thomas.*

**EICHSFELD**, a province of Prussia (in part ceded to that power by Hanover, in 1818), and part of the present principality of Calenberg. It is divided into the Upper and Lower Eichsfeld, and contains 90,000 inhabitants. The other and larger part, not belonging to Hanover, was a part of the electorate of Mentz.

**EICHSTADT**, a town and bishop's see of Bavaria, in the circle of the Upper Danube, situated in a valley on the Alt. The king of Bavaria conferred the title of prince of Eichstadt on Eugene Beauharnois, his son-in-law, formerly viceroy of Italy. A convent in this town is much visited by zealous Catholics as containing a supposed relic of St. Wilibald. Population 6000. Thirty-two miles N. N. E. of Augsburg.

**EICK** (John Van), a celebrated Flemish painter, commonly called John of Bruges, from his birth place, flourished in the fifteenth century, and was the first who discovered the method of painting in oil. Being a chemist, he found in the course of his experiments, that, by grinding colors with linseed or nut oil, he could form them into a solid body which would resist water, and not need the varnish used in painting in water colors or in fresco. He presented the first picture painted in this manner to Alphonsus I. king of Naples, who was much pleased with it.

**EIDEN DECK.** See **ANAS**.

**EIGG**, an island of the Hebrides, six miles in length and from one to three in breadth, containing a superficial area of about eleven square miles. Kelp and wool are yielded here, together

with all other a visiting twenty-Roman shore of

possession, and gives notice at the bottom for him to appear and defend his title; or that he, the feigned defendant, will suffer judgment by default, whereby the true tenant will be turned out of possession; to this declaration the tenant is to appear at the beginning of next term by his attorney, and consent to a rule to be made defendant, instead of the casual ejector, and take upon him the defence, in which he must confess waste, judgment, entry, and ouster, and at the trial stand upon the title only: but in case the tenant in possession does not appear, and enter into the said rule in time, after the declaration served, then, on affidavit being made of the service of the declaration, with the notice to appear as aforesaid, the court will order judgment to be entered against the casual ejector by default; and thereupon the tenant in possession, by writ habere facias possessionem, is turned out. On the trial in ejectment, the plaintiff's title is to be set forth from the person last seized in fee, under whom the lessor claims down to the plaintiff, proving the deeds, &c., and the plaintiff shall recover only according to the right which he has at the time of bringing his action. And here, another who has title to the land, may be defendant in the action with the tenant in possession; for the possession of the lands is primarily in question, and to be recovered, which concerns the tenant, and the title thereto is tried collaterally, which may concern some other.

Ejectment ought to be brought for a thing that is certain; and if it be of a manor, the manor of A, with the appurtenances; if of a rectory, the rectory of B, &c. And so many messuages, cottages, acres of arable land, meadow, &c., with the appurtenances in the parish of, &c. For land must be distinguished, how much of one sort, and how much of another, &c., Cro. Eliz. 339. 3 Leon. 13. Ejectment lies of a church, as of an house called the parish church of, &c. And a church is a messuage, by which name it may be recovered: and the declaration is to be served on the parson who performs divine service. 11 Rep. 25. 1 Salk. 256. A rector may recover in ejectment against his lessee, on the ground of the lease of the rectory being avoided on account of his own non-residence, by force of the 13 Eliz. c. 20, and the lease to the defendant, describing him as doctor in divinity, produced by him at the trial in support of his title, is *prima facie* evidence of his being such as he is therein described to be, so as to avoid the lease under stat. 21 Hen. 8. c. 13. § 3. It lies de uno messuagio sive burgagio; but not de uno messuagio sive tenemento, unless it have a vocat A. &c. to make it good, because of the uncertainty of the word tenement. 1 Sid. 295. But for a messuage and tenement hath been allowed. 1 Term Rep. 11. So indeed for a messuage or tenement. 3 Wils. 23. 3 Mod. 323. 1 Sid. 295. but see contra, 1 East's Rep. 441, 2. It will lie for a moiety, or third part of a manor or messuage, &c. And for a chamber or room of a house well set forth. 11 Rep. 55. 20. 3 Leon. 210. It lieth de dono, which hath convenient certainty for the sheriff to deliver possession, &c. Cro. Jac. 654. It lies of a cottage or curtilage; of a coal-mine, &c. but not

of a common, piscary, &c. Cro. Jac. 150. For underwood it lies, though a precept doth not. 2 Roll. Rep. 482, 483. But for uno clauso, or una pecia terra, &c. without certainty of the acres, and their nature, it doth not lie. 11 Rep. 55. 4 Mod. 1. It lieth of a close, containing three acres of pasture, &c. Also of so many acres of land covered with water; though not de aqua curru. Cro. Jac. 435. 1 Brownl. 242. It also lies for a prebendal stall, after collation to it. 1 Wils. 14.

EIGHT, *adj.*

EIGHTH,

EIGHTEEN,

EIGHTEENTH,

EIGHTFOLD,

EIGHTIETH, *adv.*

EIGHTIETH, *adj.*

EIGHTSCORE,

EIGHTY.

Sax. eahta, æhta; Belg. agt; Scottish and Teut. acht; Goth. ahta, attha, and aht; Dan. attē; Fr. huit; Lat. octo; Gr. oero. A word of number; twice four. Eighth is the ordinal of eight: eightfold is eight times the number or quantity; eighthly is in the eighth place; eighteen, eight and ten; eightscore, eight twenties; eighty, eight ten times told.

And it was don aftir these wordis almeest *eight* dayes: and he took Petre and James and Jon, and he stide into an hill to preye. *Wiclif. Luke ix.*

And it was doon in the *eightithe* day thei camen to circumside the child, and thei clepiden him Zacarye by the name of his fadir. *Id. Luke i.*

And as the *eyghthene* on which the tower in Siloa fel down and slough hem, gessen ye for thei weren dettouris more than alle men that dwellen in Jerusa-lem? *Id. Luke xiii.*

In the *eighteenth* year of Jeroboam died Abijam. *1 Kings.*

Another yet?—A seventh! I'll see no more; And yet the *eighth* appears. *Shakespeare. Mucheb.*

He can't take two from twenty, for his heart, And leave *eighteen*. *Id. Cymbeline.*

What! keep a week away? seven days and nights? *Eightscore* eight hours? and lovers absent hours, More tedious than the dial *eightscore* times? Oh weary reckoning! *Id. Othello.*

*Eighty* odd years of sorrow have I seen. And each hour's joy wrecked with a week of teen. *Shakespeare.*

In the *eighth* month should be the reign of Saturn. *Bacon.*

*Eightly*, living creatures have voluntary motion, which plants have not. *Bacon's Natural History.*

This island contains *eightscore* and *eight* miles in circuit. *Sandys's Journey.*

Among all other climacterick threes are most remarkable, that is, seven times seven, or forty-nine; nine times nine or eighty one; and seven times nine, or the year sixty-three, which is conceived to carry with it the most considerable fatality.

*Brown's Vulgar Errors.*

If men naturally lived but twenty years, we should be satisfied if they died about *eighteen*; and yet *eighteen* years now are as long as *eighteen* years would be then. *Taylor.*

A pedant values phrases, and elects them by the sound, and the *eight* parts of speech are his servants. *Overbury.*

Some balances are so exact as to be sensibly turned with the *eightieth* part of a grain.

*Withins's Math. Magic.*

I stay reluctant seven continued years, And water has ambrosial couch with tears;

The *eight* she voluntarily moves to part,  
Or urged by *Jove*, or her own changeful heart.

*Pope.*

I thus passed about *eighteen* months in London,  
working almost without intermission at my trade,  
avoiding all expense.

*Franklin.*

Oft, where his feathered foe had reared her nest,  
And laid her eggs and household gods to rest,  
Burning for blood in terrible array,  
The *eighteen*-inch militia burst their way;  
All went to wreck; the infant foemen fell,  
When scarce his chirping bill had broke the shell.

*Beattie.*

**EIGNE**, *adj.* Fr. *aisne*. In law, denotes  
the eldest or first born. Here it signifies un-  
alienable, as being entailed.

It happeneth not seldom, that, to avoid the yearly  
oath, for avowment of the continuance of some estate  
for life, which is *eigne*, and not subject to forfeiture  
for the alienation that cometh after it, the party will  
offer to sue for a pardon uncompelled before the time;  
in all which, some mitigation of the uttermost value  
may well and worthily be offered.

*Bacon.*

**EIMBECK**, an old town of Hanover, on the  
Ilme, with 5000 inhabitants. It belonged to the  
Hansentic confederacy, and has some manufact-  
ures, but is not thriving. Great part of its for-  
tifications were demolished by the French in  
1761. Forty-eight miles S.S.W. of Brunswick.

**EIMEO**, or **MOVEA**, one of the Society  
Islands in the South Pacific, about ten miles in  
length by five in breadth. The harbour of Taloo  
on the north coast is the best; and here the  
water is so clear, that the branching of beautiful  
coral is visible at great depths. The island is  
hilly and rocky, with valleys interposed. Twelve  
miles west of Otaheite.

**EINURA**, or **YENMOOR**, a town in the district  
of South Canara, Hindostan, containing eight  
temples belonging to the Jain, and one to  
the Siva Brahmins. The former have an annual  
allowance of fourteen and the latter ten pagodas.  
There is an immense colossal image here of  
one of the gods of the Jains, which stands in  
the open air. It is formed of one solid piece of  
granite. The hills and neighbourhood about this  
place are considered unproductive.

**EISEL**, *n. s.* Sax. *eoril*. Vinegar; ver-  
juice; any acid. An old word.

Cast in thy mind

How thou resemblest Christ, as with sowre poison

If thou paine thy taste; remember therewithall,

How Christ for thee tasted *eisel* and gall.

*Sir T. More.*

**EISENACH**, a principality of Germany in  
Thuringia, and circle of Upper Saxony, situated  
on the confines of Hesse. It is mountainous,  
and scarcely produces corn enough for the in-  
habitants. Some indifferent wine is made; but  
it has mines of copper, iron, vitriol, and alum,  
with some salt springs. It gave a vote to the  
duke of Saxe Weimar, in the diets and assem-  
blies of the circle. Population 62,000. Its rivers  
are the Warra, Slade, Unstrut, and Fulda.

**EISENACH**, the capital of the above province,  
is situated on a rising ground near the junc-  
tion of the Hesse and Horsa. It has a castle in  
the market-place as old as the eleventh century,  
and formerly the residence of the princes of Eise-

by *either* of the three, but that the other two would set the balance of Europe upright again. *Bacon.*

We never heard of any ship that had been seen to arrive upon any shore of Europe; no nor of *either* the East or West Indies. *Id. New Atlantis.*

Our infirmity will not suffer any long intention, *either* of body or mind. *Bp. Hall. Contemplations.*

Giorio made a fast friendship with Digby, *either* of them believing he could deceive the other. *Clarendon.*

In the process of natural beings, there seem to be some creatures placed, as it were, on the confines of several provinces, and participating something of *either*. *Hale.*

Seven times the sun has *either* tropick viewed,  
The Winter banished and the Spring renewed. *Dryden.*

I do not ask whether bodies do so exist, that the motion of our body cannot really be without the motion of another, to determine this *either* way, is to beg the question for or against a vacuum. *Locke.*

So like in arms these champions were,  
As they had been a very pair;  
So that a man would almost swear,  
That *either* had been *either*. *Deighton's Nymph.*

What perils shall we find,  
If *either* place, or time, or other course,  
Cause us to alter the order now assigned. *Daniel.*

*Either* your brethren have miserably deceived us, or power confutes virtue. *Swift to Pope.*

The food of the cod is *either* small fish, worms, crustaceous animals, such as crabs, large whelks, &c. and their digestion is so powerful, as to dissolve the greatest part of the shells they swallow. *Pennant.*

EJULATION, *n. s.* Lat. *ejulatio*. Outcry; lamentation; moaning; wailing.

Instead of hymns and praises, he breaks out into *ejulations* and effeminate wailings.

*Government of the Tongue.*

With dismal groans  
And *ejulation*, in the pangs of death,  
Some call for aid. *Philips.*

EKATERINADARA, a town in the government of Caucasus, Kuban Tartary, the capital of the Tchernomorsk, or Cossacks of the Black Sea. The late empress Catherine, after whom it is called, removed a great body of Cossacks from the banks of the Dnieper to the eastern shores of the sea of Azoph, for the purpose of repelling the incursions of the Tartars, and granted them, in 1791, a territory of about 1000 square miles, including the Isle of Taman. In the succeeding year they founded their capital, which resembles an extensive village in a forest. Each cottage has an area in front, with an avenue of the finest oaks. The inhabitants choose their own chief, and preserve the European manners.

EKATERINEBURG, or CATHERINESBURG, a town of Asiatic Russia, in the province of Isett, on the left bank of the river of Irtys, and on the eastern side of the Uralian chain. It is surrounded by an earthen rampart, with a chevaux de frise. Here are five churches, and several well built stone houses. The neighbouring mountains afford vast variety of minerals, and great works are carried on in Ekaterineburg, by the Russian government, as iron foundries, forges, &c., which manufacture cannon and anchors. An immense copper coinage also pro-

duces 12,530 pieces daily. The workhouses are of brick, covered with thin iron plates. This is the seat of the supreme college for the administration of the mines and foundries of Siberia, Cusan, Perm, and Orenburg, and takes cognizance of 114 foundries. There is besides a chamber for superintending the gold mines. Provisions are cheap and plentiful. Houses 2000.

EKATERINOGRAD, a town and fortress of Asiatic Russia, in the government of Caucasus, situated on the Malka, or Balk, a little above its junction with the Terek. It was founded in the year 1776, and remained the capital of the province of Caucasus, before being constituted a government in 1785. It is the strongest place on the Caucasian line of posts. Twenty-four miles north-west of Mozdok.

EKATERINOSLAV, or CATHERINOSLAF, a town and government of European Russia, constituted by the empress Catherine in 1794. When Paul I. incorporated it with the Crimea he gave the whole the name of New Russia, and changed the name of this town to Nowo-Rossisk. The present emperor, however, restored the division of Catharine, distributing New Russia into the three governments of Cherson, Taurida, and Ekaterinoslav. The last, though reduced in some measure from its original size, is still considerable, extending from 23° 40' to 39° 20' E. long., and from 47° to 49° N. lat., between the governments of Poltawa, Charkov, Voronez, the Donski Cossacks, Taurida, and Cherson, and containing about 35,000 square miles, the surface consisting for the most part of dry steppes, little susceptible of culture, except on the banks of the Dnieper, Don, Donetz, Samara, and the other rivers. The climate is mild. The chief productions are hemp, corn, millet melons, and fruits. Here are all the common domestic animals, and an unusual quantity of bees. It is divided into eight counties. The inhabitants are computed at 560,000; the majority deriving their subsistence from the breeding of cattle. The most intelligent and thriving part are of foreign descent, viz. Greeks, Germans, or Moldavians.

EKE, *v. a. & conj.* Goth. *aukan*; Sax. *ecan*; Icel. *auka*, to increase. Spenser frequently writes this word *ek*. To protract; lengthen; increase; supply deficiency. Hence, as a conjunction, it signifies also, likewise; beside; but is obsolete.

Yet hold thine anker, and thou maiest arrive  
There bountie beareth the key of my substance,  
And *ek* thou haste thy besta friends alive. *Chaucer.*

And *ek* full ofte a littell shere,  
Upon a bank, her men be ware,  
Let in the streame, whilest with greet paine,  
If any man it shall retriene. *Gower.*  
I dempt there much to have *eked* my store,  
But such *eking* hath made my heart sore. *Spenser.*  
And *ek* huge mountains from their aerie seat,  
She would command themselves to beare away. *Id. Pastore Quecus.*

If any strength we have, it is to ill,  
But all the good is God's, both power and *ek* will. *Id.*

The little strength that I have, I would it were with you.

—And mine to *ek* out her's.

*Shakespeare. As You Like It.*

I speak too long; but 't is to piece the time,  
To *che* it, and to draw it out in length,  
To stay you from election.

*Id. Merchant of Venice.*

Now, if 'tis chiefly in the heart,  
That courage does itself exert,  
'Twill be prodigious hard to prove,  
That this is *che* the throne of love. *Prior.*

Your ornaments hung all,  
On some patched doghole *ched* with ends of wall.

*Pope.*

EKRON, a city and government of the Philistines. It fell by lot to the tribe of Judah, in the first division made by Joshua (xv. 45.) but was afterwards given to the tribe of Dan, (xix. 43.) It was situated near the Mediterranean, between Ashdod and Jamnia. Ekron was a powerful city, and it does not appear that the Jews were ever sole peaceable possessors of it: the Ekronites were the first who said that it was necessary to send back the ark of the God of Israel, in order to be delivered from those calamities which the presence of it brought upon their country. 1 Sam. v. 10. The idol Baalzebub was principally adored at Ekron. 2 Kings i. 2. &c.

ELA'BORATE, *v. a. & adj.*

ELA'BORATELY, *adv.*

ELA'BORATENESS, *n. s.*

ELABORA'TION.

*e*, out, and *laboro*, to labor. To produce or improve by labor: as an adjective, highly or laboriously finished or performed.

Formalities of extraordinary zeal and piety are never more studied and *elaborate* than when politicians most agitate desperate designs. *King Charles*

At least, on her bestowed

Too much of ornament, of outward shew

*Elaborate*, of inward less exact. *Milton.*

Man is thy theme, his virtue or his rage

Drawn to the life in each *elaborate* page.

*Waller.*

To what purpose is there such an apparatus of vessels for the *elaboration* of the sperm and eggs; such a tedious process of generation and nutrition? *Ray.*

Politick conceptions, so *elaborately* formed and wrought, and grown at length ripe for delivery, do yet prove abortive. *South.*

Some coloured powders which painters use, may have their colours a little changed, by being very *elaborately* and finely ground. *Newton's Opticks.*

I will venture once to incur the censure of some persons for being *elaborately* trifling. *Bentley.*

Consider the difference between *elaborate* discourses upon important occasions, delivered to parliaments, and a plain sermon intended for the common people. *Swift.*

It is there *elaborately* shewn, that patents are good. *Id.*

They in full joy *elaborate* a sigh. *Young.*

In the theatre, the first intuitive glance, without any *laborate* process of reasoning, would show, that this method of political computation would justify every extent of crime. *Burke.*

As the glands which produce the prolific dust of the anthers, the honey, wax, and frequently some odoriferous essential oil, are generally attached to the corol, and always fall off and perish with it, it is evident that the blood is *elaborated* or oxygenated in this pulmonary system for the purpose of these important secretions. *Darwin.*

ELÆAGNUS, the oleaster, or wild olive of the monogynia order, and tetrandria plants; natural order sixteenth. calv. none: cal. campanulated, quadrifid, FRUIT a plum below the campanulated calyx. This genus must not be confounded with the or wild olive of Gerard, Parkinson, which is only a particular species of *olea* by Tournefort and Casper Barthelemy. See OLEA. There are ten species.

1. *E. inermis*, without thorns, is commonly preserved in the garden country. The leaves are more than half an inch long, and half an inch broad, and have appearance like satin. The flowers at the foot-stalks of the leaves, sometimes in other times two, and sometimes the same place. The outside of the empalement is silvery and studded; the inside of a pale green. It has a very strong scent. The flowers in July, and are sometimes succeeded by fruit.

2. *E. latifolia*, with oval leaves, is of Ceylon, and some other parts of Asia. This country it rises with a woody stem or nine feet, dividing into many branches, garnished with oval and smooth leaves, which have several irregular spots of black color on the surface. They are placed alternately on the branches, and continue year.

3. *E. spinosa*, the eastern broad-leaved, with a large fruit, is a native of the Levant, some parts of Germany. The leaves are two inches long, and one and a half the middle. They are placed alternately on the branches, and are of a silver color: at the foot-stalk of the fruit there comes out a pretty long sharp thorn, which are alternately longer: the flowers are inside of the empalement is yellow, and have a strong scent when fully open.

The first and last species may be propagated by laying down the young shoots in the autumn. They will take root in one year; when they be cut off from the old trees, and planted into a nursery for two or three years, and then into places where they are to remain for ever. The first time is in the beginning of March, in autumn. They should be secured from high winds; for they grow very freely, and apt to be split by the wind, if too much exposed. The *latifolia* is too tender to endure the air of this country; and therefore may be raised in a warm stove, except during a severe winter, the warmest part of summer. From these plants an aromatic and cordial has been drawn, which is said to be successfully used in pueril and peccilic diseases.

ELEOCARPUS, in botany, a monogynia order, and polyandria class. cor. pentapetalous and lacerated. FRUIT a plum with a kernel. Species five, natives of India, Zealand.

ELEOMELI, in ancient medicine, an oil, as thick as honey, said to flow in Syria, and to have been useful in the cure of many complaints.

ELEOTHESIUM, in antiquity, a room, or place where those who

wreath or had bathed, anointed themselves. See GYMNASIUM.

ELAH, the son of Baasha, the fourth king of Israel after the separation of the ten tribes from Judah. He was murdered while in a state of intoxication, by Zimri, when he had reigned only two years, A. M. 3014, and A. A. C. 934.

ELAM, in ancient geography, a valley of Israel, famous for the defeat and death of Goliath, the Philistine, by David.

ELAM, in ancient geography, a country frequently mentioned in Scripture, lying south-east of Shinar. In the time of Daniel, (viii. 2.) Susiana seems to have been part of it; and, before the captivity, it does not appear that the Jews called Persia by any other name. Elymæ and Elymais are often mentioned by the ancients. Ptolemy, though he makes Elymais a province of Media, places Elymæ in Susiana, near the sea coast. Stephanus takes it to be a part of Assyria; but Pliny and Josephus more properly of Persia, whose inhabitants, the latter tells us, sprang from the Elamites. The best commentators agree, that the Elamites, who were the ancestors of the Persians, were descended from Elam, the son of Shem. It is likewise allowed, that the inspired writers constantly intend Persia, when they speak of Elam and the kingdom of Elam.

ELANCE, *v. a.* Fr. *clancer*. To throw out; to dart; to cast as a dart.

While thy unerring hand elanced  
Another, and another dart, the people  
Joyfully repeated to! *Prior.*  
Hark words, that once elanced, must ever fly  
Irrevocable. *Id.*

ELAPHEBOLIA, from *ελαφος*, a deer; in Grecian antiquity, a festival in honor of Diana the huntress. In the celebration a cake was made in the form of a deer, and offered to the goddess. It owed its institution to the following circumstance:—When the Phocians had been severely beaten by the Thespians, they resolved, by the persuasion of one Deiphantus, to raise a pile of combustible materials, and burn their wives, children, and effects, rather than submit to the enemy. This resolution was unanimously approved by the women, who decreed Deiphantus a crown for his magnanimity. When every thing was prepared, before they fired the pile, they engaged their enemies, and fought with such desperate fury, that they totally routed them, and obtained a complete victory. In commemoration of this unexpected success, this festival was instituted to Diana, and kept with great solemnity.

ELAPHEBOLIUM, in Grecian antiquity, the ninth month of the Athenian year, answering to the latter part of February and beginning of March. It consisted of thirty days, and took its name from the elaphebolia which was celebrated in it.

ELAPSE, *v. n.* Lat. *elapsus*. To pass away; to glide away; to run out without notice.

There is a docile season, a learning time in youth, which, suffered to elapse, and no foundation laid, education returns. *Clarissa.*

For when an old wood perished, and produced a morass, many centuries would elapse before another wood could grow and perish again upon the same ground, which would thus produce a new stratum of

morass over the other, differing indeed principally in its age, and perhaps as the timber might be different in the proportions of its component parts.

*Darwin.*

Though years

Elapse, and others share as dark a doom,  
They but augment the deep and sweeping thoughts  
Which overpower all others, and conduct  
The world at last to freedom! *Byron.*

ELASMIS, in natural history, a genus of tales, composed of small plates in form of spangles, and either single, and not farther fissile, or, if complex, only fissile to a certain degree, and that in somewhat thick laminae. Of these tales there are several varieties, some with large and others with small spangles, which differ also in color and other peculiarities.

ELA'STIC, *adj.* } Fr. *elastique*, from Gr.  
ELA'STICAL, } *ελαστος*, of the verb *ελαω*;  
ELA'STICITY, *n. s.* } Heb. *קָוָה*, to impel or cast off. Springy; energetic. The force whereby bodies restore themselves to a position from which they have been displaced.

By what elastic engines did she rear  
The starry roof and roll the orbs in air.

*Blackmore.*

If the body is compact, and bends or yields inward to pressure, without any sliding of its parts, it is hard and elastic, returning to its figure with a force rising from the mutual attraction of its parts.

*Newton's Opticks.*

The most common diversities of human constitutions arise from the solids, as to their different degrees of strength and tension; in some being too lax and weak, in others too elastic and strong.

*Arbuthnot on Aliments.*

A lute-string will bear an hundred weight without rupture; but at the same time cannot exert its elasticity: take away fifty, and immediately it raiseth the weight. *Id.*

A fermentation must be excited in some assignable place, which may expend itself by its elastic power, and break through, where it meets with the weakest resistance.

*Bentley.*

No emptiness and dulness could inspire,  
And were my elasticity and fire. *Pope.*

His form robust and of elastic tone,  
Proportioned well, half muscle and half bone,  
Supplies with warm activity and force  
A mind well lodged, and masculine of course.

*Cowper.*

We can have no idea of a natural power, which could project a sun out of chaos, except by comparing it to the explosions or earthquakes owing to the sudden evolution of aqueous or of other more elastic vapours; of the power of which, under immeasurable degrees of heat and compression, we are yet ignorant. *Darwin.*

ELASTIC GUM, or ELASTIC RESIN. See GUM, ELASTIC.

ELASTIC VAPORS are such as may, by any external mechanical force, be compressed into a smaller space than they originally occupied; restoring themselves, when the pressure is taken off, to their former state, with a force exactly proportioned to that with which they were at first compressed. Of this kind are all the aerial fluids, without exception, and all kinds of fumes raised by heat, whether from solid or fluid bodies. Of these some retain their elasticity only when a considerable degree of heat is applied to them, or to the substances which produce them; while

force we apply, but every succeeding moment the resistance will become stronger, and a greater and greater force must be applied in order to compress it farther. As the compression goes on, the vessel containing the air becomes hot; but no power whatever has yet been able to destroy the elasticity of the continued fluid in any degree; for, upon removing the pressure, it is always found to occupy the very same space that it did before. The case is the same with aqueous steam, to which a sufficient heat is applied to keep it from condensing into water. This will yield to a certain degree; but every moment the resistance becomes greater, until at last it will overcome any obstacles whatever. An example of the power of this kind of steam we have every day in the steam engine; and the vapors of other matters, both solid and fluid, have frequently manifested themselves to be endowed with an equal force. Thus the force of the vapors of spirit of wine has occasioned terrible accidents when the worm has been stopped, and the head of the still absurdly tied down to prevent an explosion; the vapors of mercury have burst an iron box; and those of sal ammoniac, volatile salts, nitrous acid, marine acid, phosphorus, &c., have all been known to burst the chemical vessels which confined them, in such a manner as to endanger those who stood near them. In short, from innumerable observations, it may be laid down as an undoubted fact, that there is no substance whatever capable of being reduced into a state of vapor, but what in that state is endowed with an elastic force ultimately superior to any obstacle we can throw in its way. It has been a desideratum among philosophers to give a satisfactory reason for this astonishing power of elasticity in vapor, which is seemingly so little capable of accomplishing any great purpose when in an unconfined state. As air is that fluid in which, from the many experiments made upon it by the air-pump and otherwise, the elastic property has most frequently been observed, the researches of philosophers

proceed, and reason as each other. Hence, the case of the air-pump and condensation is a satisfactory explanation; to account for the power of case by heat, as it could no element had a very great : the elasticity of the atmosphere be the only cause of elasticity. It does not appear that Sir Isaac Newton, but contented himself to heat the property of and ascribing this to another called rarefaction. Thus a great discovery made by Sir Isaac Newton has the power of known manner the elements parting with it afterwards, of the body which had also same properties that it has. Hence, many phenomena of evaporation, were explained more satisfactory than had been or even expected before. (C) remarkable property of metals hammering; during which Sir Isaac Newton's opinion, the elements out from between the particles of water is from the pores of it between the fingers. Of the phenomenon above-mentioned, violently compressed become the quantity of more subtle out from among the particles it appears, that heat and the Sir Isaac Newton are the diminishing the heat of an elasticity is effectually diminished itself shrink into a smaller : by mechanical pressure. ] what may be called ocular truth of this doctrine, viz. the focus of a strong burning quantity of charcoal in vacuo

ded by a small vessel of water, the ether violently, and is dissipated in vapor, while water freezes, and is cooled to a great degree. Dissipation of this vapor shows that it has elastic force; and the absorption of the from the water shows, that this element only produces the elasticity, but actually is into the substance of the vapor itself; so we have not the least reason to conclude there is any other repulsive power by which particles are kept at a distance from one another than the substance of the heat itself. In manner it acts, we cannot pretend exactly to explain, without making hypotheses concerning the form of the minute particles of matter which must always be very uncertain. All phenomena, however, concur in rendering theory now laid down extremely probable. Elasticity of the steam of water is exactly ascribed to the degree of heat which flows in from without; and, if this be kept to a sufficient degree, there is no mechanical force which can reduce it into the state of water. This, however, may very easily be done by abstracting a certain portion of the latent heat remains: when the elastic vapor will become a liquid and heavy fluid. The same thing may be done in various ways with the permanently elastic air. Thus the purest dephlogisticated air, when made to part with its latent heat, by being with iron, is converted into a graving substance of an unknown nature, which is strongly to the metal. If the decomposition is performed by inflammable air, both together unite into a heavy, aqueous, or acid fluid; mixture with nitrous air, still the heat is sensible, though less violent than in the two former cases. The decomposition indeed is slower, less equally complete, and the dephlogisticated air becomes part of the nitrous acid, from which it may be again expelled by proper means: of these means heat must always be one; for only the elasticity can be restored, and the heat recovered in its proper state. The same takes place in fixed air, and all other permanently elastic fluids capable of being absorbed by iron. The conclusion therefore, which we may draw from what data we have, concerning the composition of elastic vapors, is, that all of them are formed of a terrestrial substance, mixed with the element of heat in such a manner, that part of the latter may be squeezed out among the terrestrial particles; but in such manner, that, as soon as the pressure is taken off the surrounding fluid rushes in, and expands to their original bulk: and this expansion is in proportion to the degree of heat, just as the expansion of a gas would be exceedingly augmented, if we contrived to convey a stream of water into part of it, and make the liquid flow out with force through every pore in the circumference. In case, it is evident that the water would act with power of repulsion among the particles of sponge, as well as the fire does among the particles of the water, charcoal, or whatever other substance is employed. Thus far we may reason by analogy, but in all probability the internal essential texture of these vapors will ever remain unknown. It has been ima-

gined by some, that the artificial elastic fluids have not the same mechanical property with common air, viz. that of occupying a space inversely proportional to the weights with which they are pressed: but this is found to be a mistake. All of them likewise have been found to be non-conductors of electricity, though probably not all in the same degree. See AIR and ELECTRICITY.

**ELASTICITY.** The cause or principle of elasticity, or springiness, is variously assigned. The Cartesians account for it from the materia subtilis making an effort to pass through pores that are too narrow for it. Other philosophers, in lieu of the subtle matter, substitute ether, or a fine ethereal medium that pervades all bodies. Others, setting aside the precarious notion of a materia subtilis, account for elasticity from the great law of attraction, or the cause of the cohesion of the parts of solid and firm bodies. Thus, say they, when a hard body is struck or bent, so that the component parts are moved a little from each other, but not quite disjointed or broken off, or separated so far as to be out of the power of that attracting force whereby they cohere; they must certainly, on the cessation of the external violence, spring back to their former natural state. Elasticity has also been resolved into the pressure of the atmosphere: for a violent tension, or compression, though not so great as to separate the constituent particles of bodies far enough to let in any foreign matter, must yet occasion many little vacuola between the separated surfaces; so that upon the removal of the force they will close again by the pressure of the aerial fluid upon the external parts. See ATMOSPHERE. Lastly, others attribute the elasticity of all hard bodies to the power of resiliency in the air included within them: and so make the elastic force of the air the principle of elasticity in all other bodies. These are clearly the mere conjectures of philosophy.

M. Libes, the author of the *Nouveau Dictionnaire de l'Physique*, has in that work given a new explication of the phenomena of elasticity, which depends upon the following principles:—

1. The signs of elasticity suppose a compression effected, that is, an alteration in the figure of bodies produced by the mutual approach of the molecules: whence it results, that bodies, whose molecules yield with a very great facility to the slightest pressure, so as to roll one over another without changing their figure, cannot give sensible signs of elasticity. Such in general are liquids. 2. When an elastic body is compressed, some of its integrant molecules are brought nearer to one another, while others undergo a farther separation nearly equal to the approach of the former. 3. At the habitual degree of heat and pressure which we experience, all bodies have a volume determined by the ratio of equality, which exists between the attractive force of their particles, and the repulsive force communicated by the caloric combined with those particles.

These being granted, the re-establishment of solid bodies, after the compression, appears to be the result of the combined action of the caloric and of attraction. For in the molecules brought nearer by the compression, the repulsive force augments, and the attractive force likewise aug-

ments; but the augmentation of the former force exceeds that of the latter. For, at the epoch of the formation of the body, such as it existed previous to the compression, the repulsive force communicated to its molecules by the caloric, was sufficient to give the degree of separation that was peculiar to the body: it was, therefore, superior to the attractive force until the moment when the molecules had become so far separated as was consistent with the natural state of the body. Whence it results, that if the particles are brought nearer together by compression, that is, if they are contracted with the caloric into a smaller space, the ratio of equality which subsisted between the attraction and the repulsion before the compression, must be destroyed in favor of the repulsion; and consequently, on the cessation of the compression, this surplus of repulsive force will act so as to separate again the molecules brought nearer by the compression, until the equilibrium is re-established between the attraction and the repulsion: and this equilibrium can only be re-established, when the molecules have recovered the degree of separation which they had previous to the compression. For similar reasons the attraction will predominate over the repulsion in those particles which have suffered a farther separation than is due to the natural state: it must, therefore, act to draw the particles nearer, and re-establish the equilibrium of those forces: and this equilibrium cannot be re-established until the molecules have recovered the relative distance which they had before the compression.

This theory M. Libes applies to an elastic sphere, as an ivory ball when falling upon a plane, to a plate of steel, whose extremities are brought towards each other by bending, and to the known effects of tempered metals, &c. In explaining the elasticity of æriform fluids, M. Libes calls in to his aid a new force. For, in this kind of substances, the repulsion having prevailed over the attraction, their particles are retained in their mutual position by the pressure of the atmosphere. But this force, it may be observed, being constant, makes no change in the results just stated; except that, if the pressure be taken away, the particles of the gas will be separated from one another, until their relative distance attains a point determined by the equality between the attraction of the earth and the repulsion of those particles. Now, since all bodies contain caloric, it may be asked how it happens that all bodies are not elastic, if caloric be the principle of elasticity?

To this M. Libes replies by the following remarks:—1st. Since there is not in nature any body, either perfectly hard, or perfectly soft, there is none but what possesses some degree of elasticity. 2dly. Perceptible signs of elasticity suppose the compression effected: it is not there-

fore a prodigious elastic principle of which 1.
